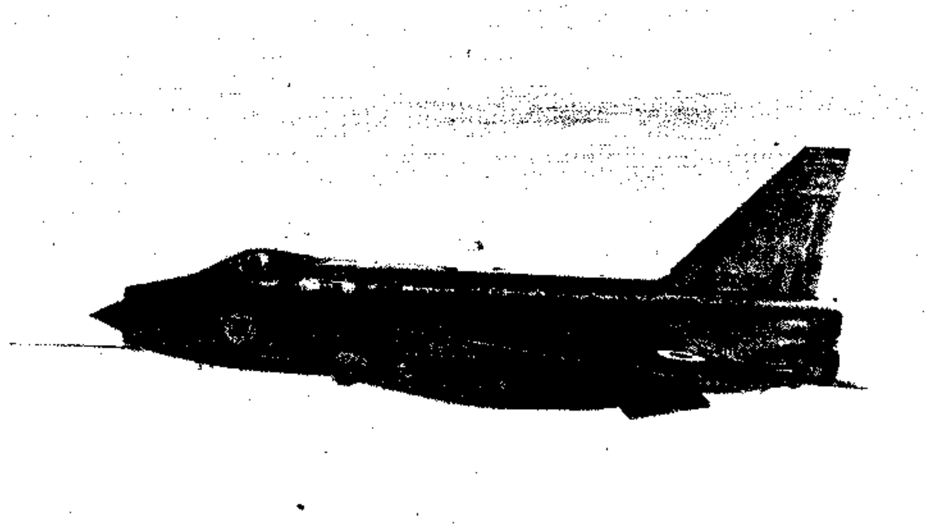
ALL WEATHER INTERCEPTORS

8004.302
LIGHTNING F Mk 53
BAC (UK)
Role(s): Single-seat supersonic all-weather interceptor, strike and reconnaissance aircraft
Power Plant: 2 × Rolls-Royce Avon 302-C turbojet engines (each 16,300 lb (7,393 kg) st with reheat)
Wing Span: 34 ft 10 in (10.61 m)
Length Overall: 55 ft 3 in (16.84 m)
Weapons:
Interceptor role weapons:
2 × Red Top or 2 × Firestreak missiles.
44 × 2 in rockets.
2 × 30 mm Aden guns with 120 rounds each.
Ground attack role weapons:
Guns and 44 × 2 in rockets plus 144 × 68 mm SNEB rockets in two Matra Type 155 launchers, or 6 × 1,000 lb (454 kg) HE, retarded or fire bombs
Max Level Speed: At operational height, above Mach 2
In Service with: The Air Forces of Saudi Arabia and Kuwait.



BAC Lightning interceptor armed with Red Top missiles

8005.302
LIGHTNING F Mk 6
BAC (UK)
Role(s): Single-seat supersonic fighter
Power Plant: 2 × 16,360 lb (7,420 kg) st Rolls-Royce Avon 301 turbojets with reheat
Wing Span: 34 ft 10 in (10.61 m)
Length Overall: 55 ft 3 in (16.84 m)
Installed Weapons: None
Other Weapons: 2 Red Top or Firestreak air-to-air missiles on pylons projecting from fuselage. Provision for 48 × 2 in unguided air-to-air rockets in 2 Microcell reinforced plastic retractable packs
Max Level Speed: Over Mach 2
In Service with: Royal Air Force.

8016.302
F-102A DELTA DAGGER
CONVAIR (USA)
Role(s): Single-seat all-weather interceptor fighter
Power Plant: 1 × 11,700 lb (5,307 kg) (17,200 lb (7,082 kg) with reheat) Pratt and Whitney J-57-P-23 or -25 turbojet
Wing Span: 38 ft 1½ in (11.62 m)
Length Overall: 68 ft 4½ in (20.84 m)
Max Take-Off Weight: 32,000 lb (approx) (14,515 kg)
Other Weapons: 6 × Hughes AIM-4A, -4C, -4E or -4F Falcon air-to-air missiles in internal missile bay, plus 24 × 2.75 in rockets in missile bay doors
Max Level Speed: Mach 1.25 at 36,000 ft (11,000 m)
Typical Range: Approx 1,100 miles (1,770 km)
In Service with: US Air Force, Greek and Turkish Air Forces.

F-102A Delta Dagger interceptor

8017.302
F-106A DELTA DART
CONVAIR (USA)
Role(s): Interceptor fighter
Power Plant: 1 × 17,200 lb (7,801 kg) st (24,500 lb (11,123 kg) with reheat) Pratt and Whitney J75-P-17 turbojet
Wing Span: 38 ft 3½ in (11.67 m)
Length Overall: 70 ft 8¾ in (21.56 m)
Max Take-Off Weight: 35,000 lb (15,875 kg)
Other Weapons: 1 × Douglas AIR-2A Genie or rocket and 4 × Hughes AIM-4E or AIM-4F Super Falcon air-to-air missiles in internal weapon bay
Max Level Speed: Mach 2.3 at 36,000 ft (11,000 m)
Typical Range: 1,150 miles (1,850 km)
In Service with: US Air Force.

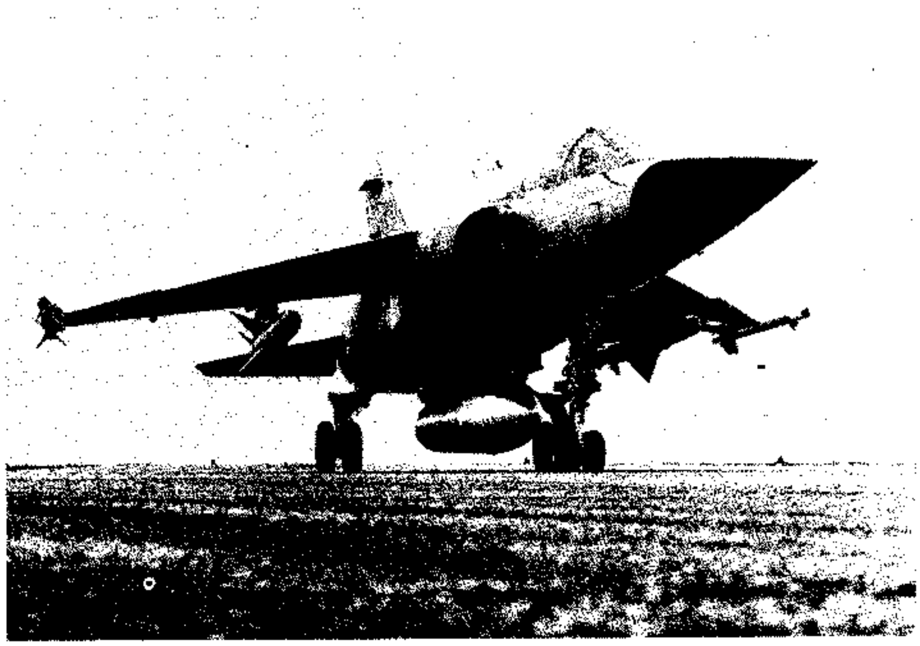
F-106A Delta Dart interceptor

8019.302
MIRAGE IIIC
DASSAULT (FRANCE)
Role(s): Single-seat fighter
Power Plant: 1 × SNECMA Atar 9B turbojet engine with afterburner 13,225 lb (6,000 kg) st, or Rolls-Royce RB 146 turbojet engine with afterburner 15,650 lb (7,100 kg) st plus optional and jettisonable SEPR 841 single-chamber rocket motor 3,700 lb (1,680 kg) st
Wing Span: 27 ft 0 in (8.22 m)
Length Overall: 43 ft 10 in (13.35 m)
Max Take-Off Weight: 27,700 lb (12,560 kg)
Installed Weapons: Provision for 2 × 30 mm DEFA cannon in fuselage, each with 125 rounds of ammunition
Other Weapons:
Normal interceptor armament comprises of:
1 × MATRA R 530 air-to-air missile under fuselage or 2 × underwing missiles.
Ground attack armament can include:
3 × Nord AS 20 or AS 30 air-to-surface missiles or bombs.
Alternative underwing stores include:

JL-50 pod containing 36 × 37 mm unguided rockets.
JL-100 pod with 16 rockets, (plus an amount of fuel) or JL-200 with 36 rockets, (plus an amount of fuel)
Max Level Speed: Mach 2.15 at 36,000 ft (11,000 m)
Typical Range: At Mach 1.8 at 59,000 ft (18,000 m), 365 ml (590 km). At Mach 0.85 at 39,370 ft (12,000 m), 930 miles (1,500 km)
In Service with: French Air Force, South African Air Force and Israeli Air Force.

The two-seat IIIB and IIID versions are also used by the Air Forces of Argentina, Australia, Brazil, France, Israel, Lebanon, Pakistan, Switzerland, Spain, South Africa and Venezuela.

8023.302
MIRAGE F1
DASSAULT (FRANCE)
Role(s): Single-seat all-weather multi-purpose fighter
Power Plant: 1 × 15,785 lb (7,160 kg) st (with reheat) SNECMA Atar 9K-50 turbojet
Wing Span: 27 ft 10½ in (8.50 m)
Length Overall: 49 ft 2½ in (15.00 m)
Max Take-Off Weight: 32,630 lb (14,800 kg)
Weapons: Standard armament comprises 2 Matra R 530 semi-active radar homing or infra-red homing air-to-air missiles. In addition, 2 Sidewinder air-to-air missiles and 2 30 mm guns can be carried. For ground attack duties, the 2 30 mm guns are supplemented by external stores carried on 6 underwing attachments and 1 underfuselage attachment.
Typical loads are:
14 × bombs.
72 × air-to-ground rockets or 2 × Nord AS 30 air-to-surface missiles.
Provision is made for carrying the AS 37 Martel anti-radar missile
Max Level Speed: (Above) Mach 2.2
Typical Range: With max fuel 2,050 miles (3,300 km)
In Service with: French Air Force, South African Air Force and Spanish Air Force.



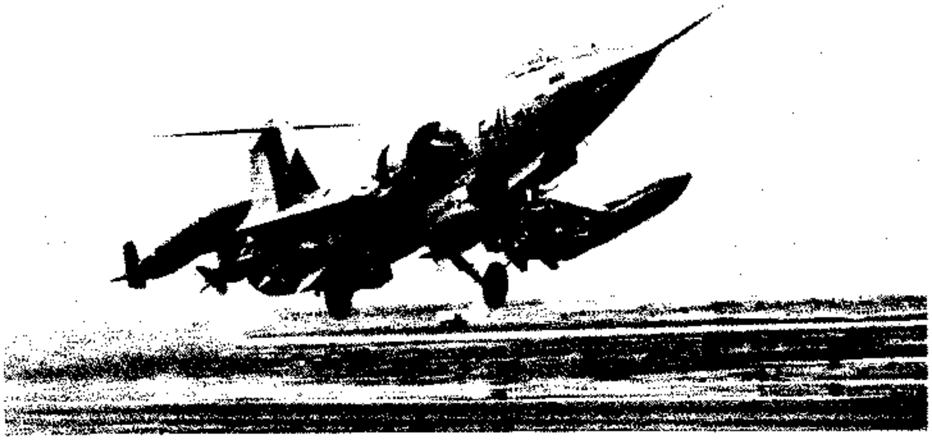
Mirage F1 carrying 1,100 litre external fuel tank, two Matra R.530 missiles and two Sidewinders

---

8024.302
SUPER MYSTERE B-2
DASSAULT (FRANCE)
Role(s): Single-seat interceptor and tactical strike fighter
Power Plant: 1 × 7,495 lb (3,399 kg) st SNECMA Atar 101G turbojet
Wing Span:
34 ft 5¾ in (10.51 m)
46 ft 1 in (14.04 m)
Max Take-Off Weight: 22,046 lb (10,000 kg)
Installed Weapons: 2 × 30 mm DEFA cannon and a pack of 55 air-to-air rockets in fuselage
Other Weapons:
Under-wing loads made up of:
38 × rockets in two honeycomb launchers, or
2 × 1,100 lb (500 kg) bombs, or
2 × napalm tanks, or
12 × heavy air-to-surface rockets, or
2 × Matra air-to-air guided missiles
Max Level Speed: Mach 1.13 at 36,000 ft (11,000 m)
Typical Range: 600 miles (965 km)
In Service with: French Air Force, Indian Air Force and Israeli Air Force.

8052.302
F-104S STARFIGHTER
LOCKHEED (USA)
Role(s): Interceptor aircraft
Power Plant: General Electric J79/J10 turbojet with redesigned afterburner, giving 17,900 lb (8,120 kg) st
Wing Span: Without tip-tanks 21 ft 11 in (6.68 m)
Length Overall: 54 ft 9 in (16.69 m)
Other Weapons: 9 external attachments for stores, including rockets, bombs and Sidewinder missiles. Normal primary armament will consist of Raytheon Sparrow air-to-air missiles
Max Level Speed: Mach 2.4
In Service with: Italian Air Force.

Other versions of the Starfighter are in service with the Air Forces of China (Taiwan), Jordan, Pakistan, West Germany, Belgium, Denmark, Greece, Netherlands, Norway, Spain, Turkey, Canada and Japan.

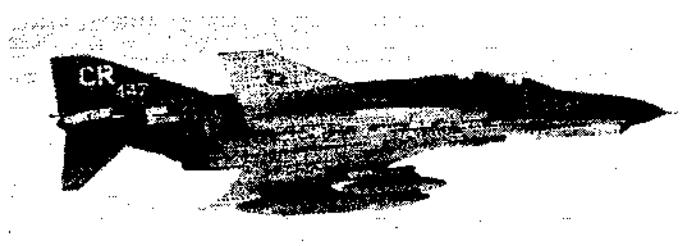


Italian F-104S Starfighter

1669.302
F-15A EAGLE
McDONNELL DOUGLAS (USA)
Role(s): Air superiority fighter
Power Plant: 2 × Pratt and Whitney F100-PW-100 turbofan engines of about 29,000 lb (13,155 kg) st
Wing Span: 49 ft 9¾ in (13.05 m)
Length Overall: 69 ft 9¾ in (19.45 m)
Max Take-Off Weight: 40,000 lbs (18,144 kg) approx
Weapons: 4 × AIM-7F Sparrow, or 4 × AIM-9L Sidewinder missiles. Internally mounted M61A1 20 mm gun
In Service with: US Air Force.

1408.302
PHANTOM II F-4E
McDONNELL-DOUGLAS (USA)
Role(s): 2-seat all-weather interceptor and tactical interdictor
Power Plant: 2 × General Electric J79-GE-17 17,900 lb (8,120 kg) st turbojet engines
Wing Span: 38 ft 5 in (11.70 m)
Length Overall: 58 ft 3 in (17.76 m)
Max Take-Off Weight: 54,600 lb (24,765 kg)
Installed Weapons: 1 × M61 Vulcan gun
Other Weapons:
6 × Sparrow III AAM or
4 × Sparrow III + 2 × Sidewinder AAM,
5 external weapon pylons for 16,000 lb (7,250 kg) weapons, eg Nuclear or HE bombs
Rockets
Bullpup ASM
Flares
Napalm / external fuel
Max Level Speed: Mach 2.4
Typical Range: 1,500 nm (2,780 km) plus

In Service with: (in different marks) US Navy, USAF, USMC, RAF, RN, Federal German AF, Japanese ASDF, Israel AF, and the Air Forces of Iran, South Korea, Turkey and Greece.



Phantom II F-4

8059.302
MiG-25 (NATO "FOXBAT")
MIKOYAN (USSR)
Role(s): Single-seat supersonic interceptor and strike reconnaissance aircraft
Power Plant: 2 × turbojets with reheat, giving 24,250 lb (11,000 kg) st each at take-off
Wing Span: (Estimated) 40 ft 0 in (12.30 m)
Length Overall: (Estimated) 69 ft 0 in (21.00 m)
Weapons: 4 × Ash or Atoll air-to-air missiles. Other unspecified armament options provide for ground attack operations
Max Level Speed: Mach 3
In Service with: Soviet Air Force, Egyptian Air Force.

8071.302
J35F DRAKEN
SAAB (SWEDEN)
Role(s): Interception/ground attack
Power Plant: 1 × 18,000 lb (8,164 kg) st (with afterburning) Svenska Flygmotor RM6C (Rolls-Royce Avon 300 srs)
Wing Span: 30 ft 10 in (9.4 m)
Length Overall: 50 ft 4 in (15.4 m)
Max Take-Off Weight: 35,280 lb (16,000 kg)
Max Weapon Load: 9,000 lb (4,080 kg)
Installed Weapons: 2 × 30 mm Aden guns with 100 rpg
Other Weapons: 6 attachments under wings, 3 under fuselage
Typical weapon loads:
(a) With internal fuel only:
9 × 1,000 lb (453 kg) bombs.
14 × 500 lb (226 kg) bombs.
4 × 19-round air-to-air rocket packs.
(b) With 2,280 IG (1,275 litre) drop tanks:
4 × 1,000 lb (453 kg) bombs.
8 × 500 lb (226 kg) bombs.
2 × air-to-surface missiles
12 × 13.5 cm Bofors air-to-ground rockets.
(c) With 2,280 IG (1,275 litre) and 2,110 IG (500 litre) drop tanks:
2 × 1,000 lb (453 kg) bombs.
4 × 500 lb (226 kg) bombs
Max Level Speed: Mach 2
Typical Range: Radius of action (hi-lo-hi, internal fuel) 350 miles (564 km). Radius of action (hi-lo-hi, 2 drop tanks, 2 × 1,000 lb (453 kg) bombs) 447 miles (720 km)
In Service with: Swedish Air Force (J35F, 35E, 35C), Danish Air Force (35X), Finnish Air Force (J35XS)

Saab J35F interceptor/ground attack aircraft

Draken Variants: Developed from the Swedish Air Force J35F, the 35X version is a long-range fighter/attack and reconnaissance aircraft. It has increased internal tankage as well as considerably increased external load carrying capability. The 35X has two internally mounted 30 mm Aden guns and can carry up to 4,500 kg of external stores distributed between nine attachment points. Stores can include heavy radio-directed air-to-surface missiles, air-to-surface rockets, bombs, and fuel tanks. Two reconnaissance versions exist. The Swedish Air Force version is the 35E, used mainly for pure photo-recce and equipped with seven cameras. Five of these are in the pressurised nose, and two in the gun compartments. Up to four external fuel tanks can be mounted to increase range. Cameras can be supplemented by ECM and other reconnaissance equipment. A variant of the 35E is for combined ground attack and reconnaissance. The trainer version is designated 35C.

8082.302
Su-9 (NATO "FISHPOT")
SUKHOI (USSR)
Role(s): Single-seat all-weather fighter
Power Plant: 1 × 22,046 lb (10,000 kg) st (with afterburning) TRD 31 turbojet
Wing Span: 26 ft 0 in (7.90 m)
Length Overall: 56 ft 0 in (17.0 m)
Other Weapons: 2 × "Anab" missiles under wings, one with radar homing head and one with infra-red homing head
Max Level Speed: Mach 1.8 at 36,000 ft (11,000 m)
In Service with: Soviet Air Force.

8083.302
Su-11 (NATO "FLAGON-A")
SUKHOI (USSR)
Role(s): Single-seat interceptor
Power Plant: 2 × turbojets with reheat
Wing Span: 30 ft 0 in (9.15 m) (estimated)
Length Overall: 68 ft 0 in (20.5 m) (estimated)
Other Weapons: 2 × "Anab" air-to-air missiles under wings
Max Level Speed: Mach 2.5
In Service with: Soviet Air Force.

Su-11, Flagon-A interceptor, armed with Anab missiles

8087.302
Tu-28 (NATO "FIDDLER")
TUPOLEV (USSR)
Role(s): Twin-jet all-weather fighter
Power Plant: 2 × unidentified turbojets with afterburners, dry rating about 18,000 lb (8,164 kg) st each
Wing Span: 65 ft 0 in (20.0 m)
Length Overall: 58 ft 0 in (25.9 m)
Max Take-Off Weight: 100,000 lb (45,000 kg)
Other Weapons: 2 air-to-air missiles under each wing (NATO "Ash"), one usually of radar homing type and the other of the infra-red homing type
Max Level Speed: Mach 1.75
In Service with: Soviet Air Force

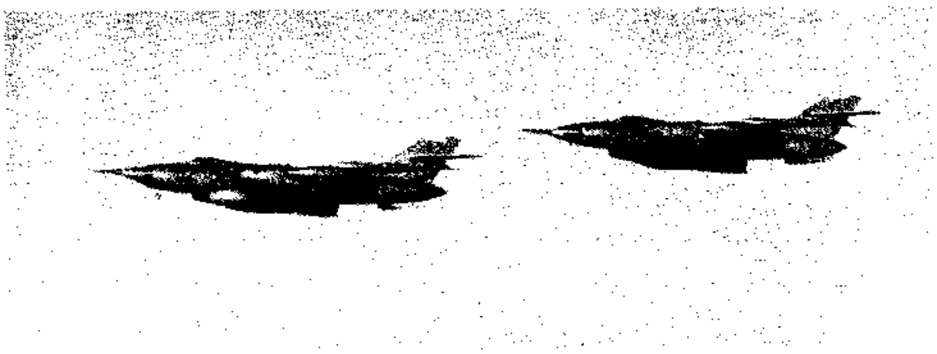
8090.302
Yak-25 (NATO "FLASHLIGHT-A")
YAKOVLEV (USSR)
Role(s): 2-seat all-weather fighter
Power Plant: 2 × 8,818 lb (4,000 kg) st Type 37V turbojets
Wing Span: 36 ft 0 in (10.97 m)
Length Overall: 51 ft 0 in (15.54 m)
Max Take-Off Weight: 22,000 lb (9,979 kg)
Installed Weapons: 2 × 37 mm guns in lower front fuselage
Other Weapons: Provision for an under-fuselage pack of unguided air-to-air rockets
Max Level Speed: Mach 0.9 at sea level
Typical Range: Low level radius of action at Mach 0.75 200 miles (321 km)
In Service with: Soviet Air Force

8091.302
Yak-25 (NATO "FLASHLIGHT-D")
YAKOVLEV (USSR)
Role(s): 2-seat all-weather fighter and tactical reconnaissance aircraft
Power Plant: 2 × 8,820 lb (4,000 kg) st Type 37V turbojets
Wing Span: 38 ft 6 in (11.75 m)
Length Overall: 62 ft 0 in (18.90 m)
Max Take-Off Weight: 25,000 lb (11,350 kg)
Installed Weapons: 1 × 30 mm gun in fairing under starboard side of front fuselage
Other Weapons: Provision for bombs, missiles or rocket pods under wings
Max Level Speed: Mach 0.95 at 36,000 ft (11,000 m)
In Service with: Soviet Air Force

8092.302
Yak-28 (NATO "FIREBAR")
YAKOVLEV (USSR)
Role(s): 2-seat all-weather fighter
Power Plant: 2 × TDR Mk R37F turbojets (with afterburning)
Other Weapons: "Anab" air-to-air missile under each wing. Can also carry an "Atoll" under each wing
Max Level Speed: Mach 1.1
In Service with: Soviet Air Force.

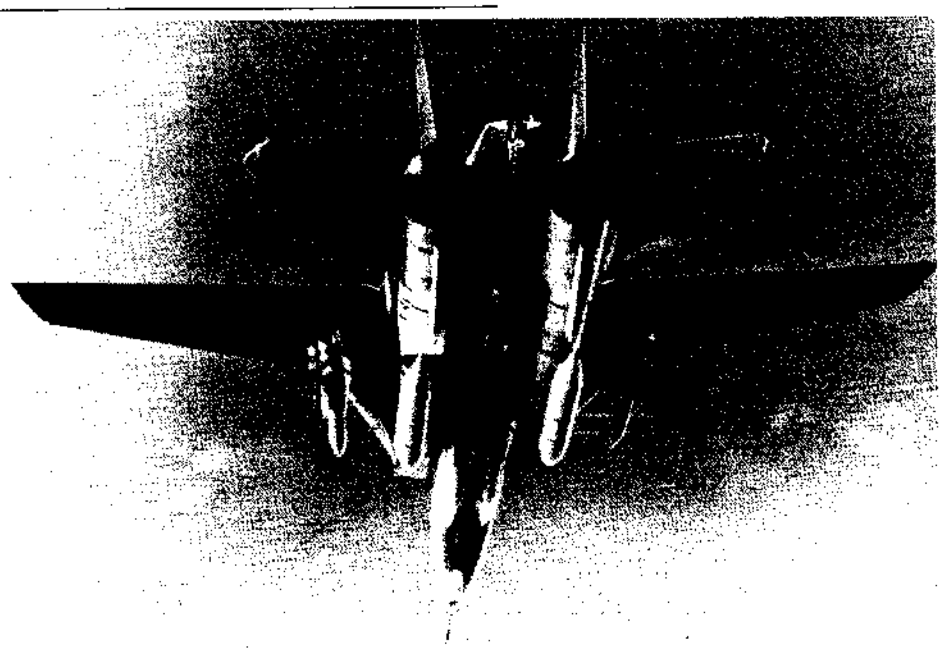
Yak-28 Firebar interceptor, armed with Anab missiles

8093.302
Yak-28 (NATO "BREWER")
YAKOVLEV (USSR)
Role(s): Two-seat all-weather fighter
Power Plant: 2 × 9,500 lb (4,309 kg) st TDR Mk R37F turbojets, with afterburning on current aircraft
Wing Span: 38 ft 6 in (11.73 m)
Length Overall: 59 ft 0 in (17.98 m)
Max Take-Off Weight: 35,000 lb (15,875 kg)
Installed Weapons: Semi-submerged guns in each side of fuselage on some aircraft
Other Weapons: Internal bomb-bay between the under-fuselage radome and the rear main landing gear unit
Max Level Speed: Mach 1.1
In Service with: Soviet Air Force.



Yak-28 Brewer all-weather interceptor

1407.302
TOMCAT F-14A
GRUMMAN (USA)
Role(s): 2-seat naval all-weather interceptor
Power Plant: 2 × Pratt & Whitney TF-30-P-412 22,500 lb (10,205 kg) st
Wing Span: 64 ft 1½ in (19.47 m) swept forward; 32 ft 11½ in (10.05 m) swept back
Length Overall: 61 ft 10 in (18.86 m)
Max Take-Off Weight: 53,000 lb (24,040 kg)
Installed Weapons: 1 × 20 mm Vulcan gun
Other Weapons:
4 × Sparrow III AAM
8 × Sidewinder AAM
Other external stores on 2 underwing pylons
Max Level Speed: Mach 2 +
In Service with: US Navy, Iran (ordered).



F-14 Tomcat armed with six AIM-54 Phoenix missiles

BASIC TRAINERS AND LIGHT STRIKE AIRCRAFT

8000.302
MB 326
AERMACCHI (ITALY)

Role(s): Two-seat basic trainer and tactical ground-attack aircraft

Power Plant: 1 × 3,410 lb (1,547 kg) st Rolls-Royce Bristol Viper 20 Mk 540 turbojet engine

Wing Span: Without tip-tanks 33 ft 3¾ in (10.15 m)

Max Take-Off Weight: With 1,695 lb (769 kg) armament 11,500 lb (5,216 kg)

Other Weapons:

Up to 4,000 lb (1,814) kg of armament can be carried on 6 underwing attachments.

Typical weapon loads include the following alternatives:

2 × LAU-3/A packs each containing 19 2.75 in FFAR rockets and 2 × packs each containing 8 Hispano-Suiza SURA 80 mm rockets.

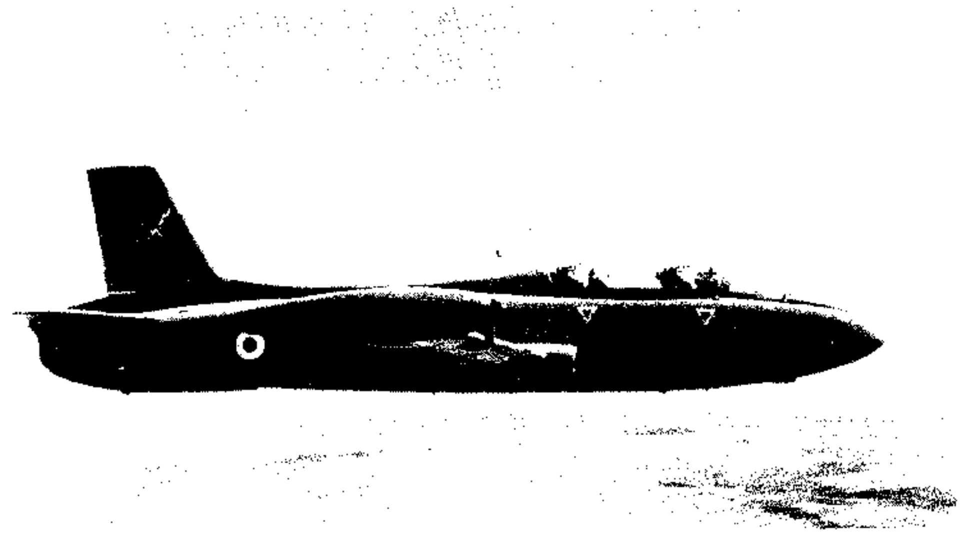
2 × 12.7 mm gun pods and 4 packs each containing 6 SURA 80 mm rockets.

1 × 7.62 Minigun, 1 × 12.7 mm gun pod, 2 × Matra 122 rocket packs and 2 × packs each containing 6 SURA 80 mm rockets.

2 × 500 lb (226 kg) bombs and 8 5 in HVAR rockets.

2 × Nord AS 12 missiles

1 × 12.7 mm gun pod, plus drop tanks and reconnaissance pack or 2 × Matra SA-10 packs each containing a 30 mm Aden gun and 150 rounds



MB326 strike/trainer aircraft

Max Level Speed: 539 mph (867 kmh)

Typical Range: With max fuel, 1,695 lb (769 kg) armament, 200 lb (90 kg) fuel reserve, out at 20,000 ft (6,100 m), return at 25,000 ft (7,620 m) 403 miles (648 km)

In Service in: Argentina, Australia, Bolivia, Brazil, Congo, Ghana, Italy, South Africa, Tunisia and Zambia.

1580.302
ALPHA JET
DORNIER/DASSAULT-BREGUET (FRANCE/WEST GERMANY)

Role(s): Two-seat multi-purpose strike/trainer aircraft. For basic and advanced training, and can also be used for close air support missions

Power Plant: 2 × SNECMA-Turbomeca Larzac 04 fan jet engines, each of 2,975 lb (1,349 kg) st

Wing Span: 30 ft 1 in (9.16 m)

Length Overall: 39 ft 5 in (12.05 m)

Max Take-Off Weight: 13,230 lb (6,000 kg)

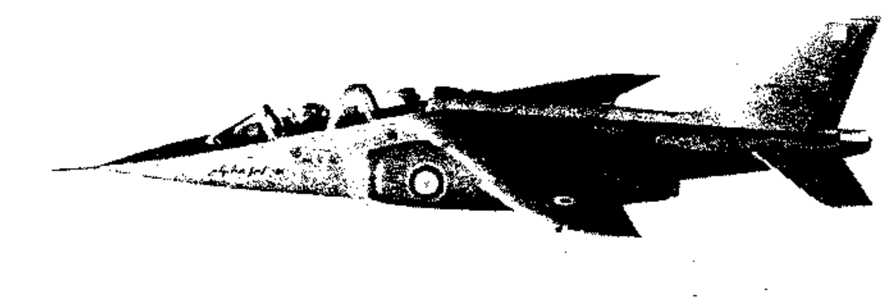
Weapons: Underwing hardpoints will be provided for bombs, cluster dispensers, or rocket pods, and a removable 30 mm gun will be carried under the fuselage of some versions. Armament arrangements will vary between the several French versions of the Alpha Jet and the West German version

Max Level Speed: Mach 0.85

Ceiling: 50,000 ft (15,240 m)

In Production for: French and German air forces

Systems Description: French and German avionics fits will differ. The former will include UHF, VHF, Tacan, VOR, and IFF; German aircraft will have installations that include UHF/VHF, Tacan and radio altimeter.



Franco/German Alpha Jet strike trainer

8003.302
BAC 167
BAC (UK)

Role(s): Light attack aircraft

Power Plant: 1 × Rolls Royce (Bristol) Viper Mk 535 turbojet engine (3,410 lb (1,547 kg) st)

Wing Span: 35 ft 4 in (10.77 m)

Length Overall: 33 ft 7½ in (10.25 m)

Max Take Off Weight: 11,500 lb (5,215 kg)

Max Weapon Load: 3,000 lb (1,360 kg)

Installed Weapons: 2 × 7.62 mm FN machine-guns

Other Weapons: Typical underwing loads include

12 × 3 in Mk 6 rockets with 60 lb (27 kg) warheads.

32 × Hispano Suiza Sura Type 3 rockets.

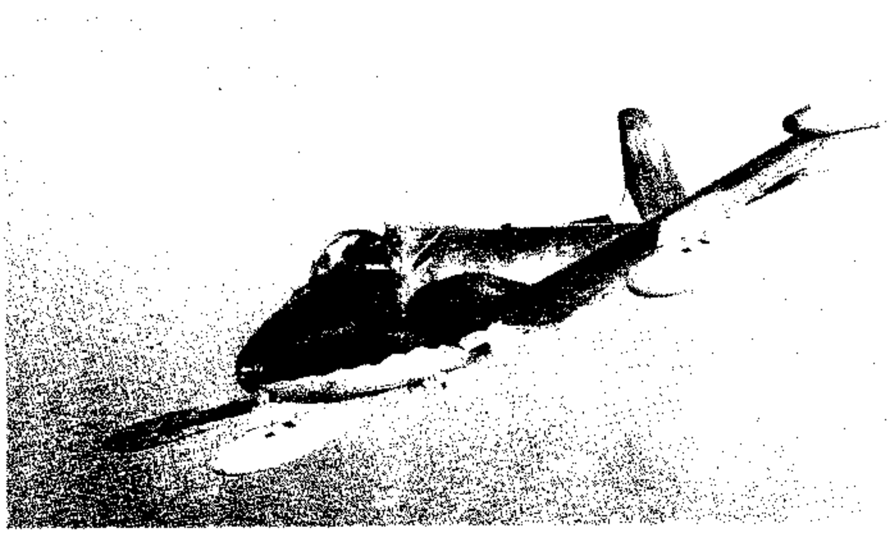
96 × 2 in Mk 1 rockets with 3¼ lb (1.47 kg) warheads in four pods.

4 × 500 lb (266 kg) bombs.

2 × 50 gallon (227 litre) napalm tanks.

72 × 2 in rockets in two pods

Max Level Speed: With 50% fuel, clean 470 mph (756 kmh) at sea level



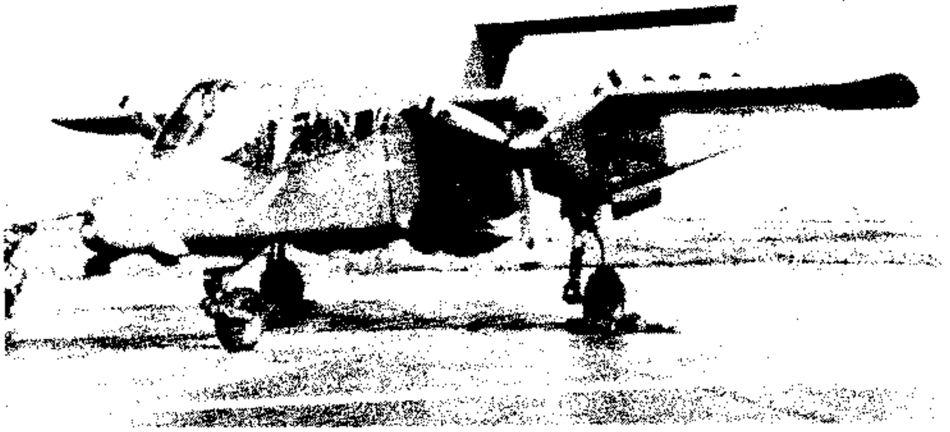
BAC 167 Strikemaster of Singapore Air Defence Force

Typical Range: 10% fuel reserve. With full internal fuel at 40,000 ft (12,200 m) 777 miles (1,250 km). With max fuel at 30,000 ft (9,150 m) over 1,380 miles (2,225 km)
In Service in: Ecuador, Kenya, Kuwait, Muscat, New Zealand, Oman, Saudi Arabia, Singapore, South Yemen.

8014.302
F-51D MUSTANG
CAVALIER (USA)
Role(s): 2-seat fighter bomber and operational trainer
Power Plant: 1 × 1,695 hp Packard V-1650-7 (Rolls Royce Merlin) piston engine
Wing Span: 37 ft 0½ in (11.29 m)
Length Overall: 32 ft 2⅓ in (9.81 m)
Max Take-Off Weight: 12,500 lb (5,669 kg)
Installed Weapons: 6 × 0.50 in machine-guns
Other Weapons:
Stores are carried on 4 hard points under each wing
Each inboard hard-point can carry 1 × 1,000 lb (454 kg) bomb or 110 US gallon (415 l tre) fuel tank.
The other 6 hard-points carry 5 in (12.7 cm) air-to-surface rockets
Max Level Speed: 457 mph (735 kmh) at 28,000 ft (8,534 m)
Typical Range: 1,980 miles (3,186 km) at 290 mph (466 kmh)
In Service with: Standard single-seat North American F-51D Mustangs of World II vintage remain in first-line service in Bolivia, Dominica, El Salvador, Guatemala and Indonesia.

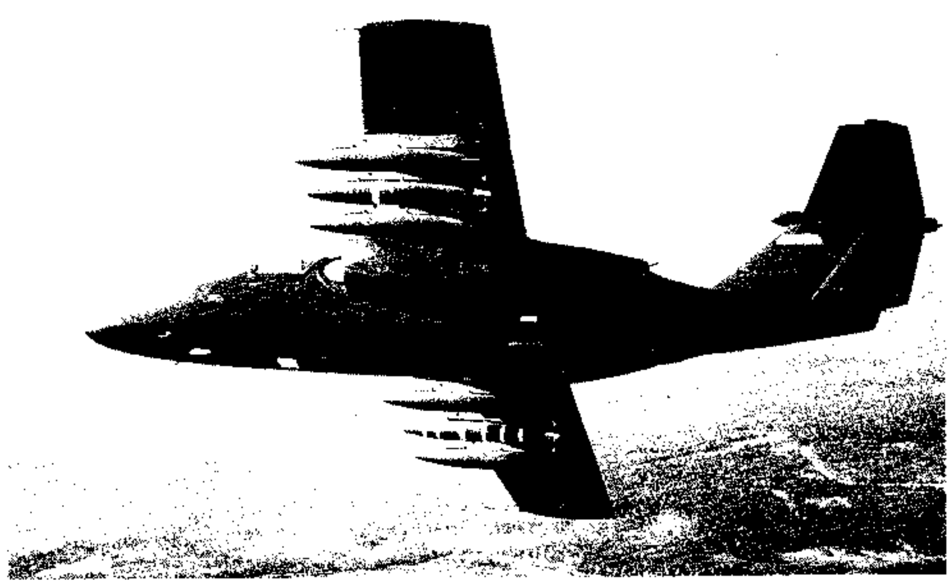
8015.302
A-37B
CESSNA (USA)
Role(s): Light attack aircraft
Power Plant: 2 × 2,850 lb (1,293 kg) st. General Electric J85 GE-17A turbojets
Wing Span: 35 ft 9½ in (10.91 m)
Length Overall: 29 ft 3 in (8.92 m)
Max Take-Off Weight: 12,800 lb (5,805 kg)
Max Weapon Load: Over 5,000 b (2,267 kg)
Installed Weapons: 1 × 7.62 mm multi-barrel Minigun
Other Weapons:
Each wing has 4 pylon stations, the 2 inner ones carrying 800 lb (363 kg) each, the intermediate one 600 lb (272 kg) and the outer one 500 lb (227 kg). The following weapons in various combinations, can be carried on those underwing pylons:
SUU-20 bomb and rocket pod.
MK-81 or MK-82 bomb.
BLU/32/B fire bomb.
SUU-11/A gun pod.
CBU-24/B or CBU-25/A dispenser and bomb.
M117 demolition bomb.
LAU-3/A rocket pod.
CBU-12/A, CBU 14/A or CBU-22/A dispenser and bomb
BLU-1C/B fire bomb.
LAU-32/A or LAU 59/A rocket pod.
CBU-19/A canister cluster and SUU-25/A flare launcher
Max Level Speed: 476 mph (766 kmh)
Typical Range: Ferry range 1,200 miles (1,931 km)
In Service with: US Air Force, South Vietnamese Air Force, Guatemala.

8064.302
OV-10A BRONCO
NORTH AMERICAN (USA)
Role(s): 2-seat observation and COIN aircraft
Power Plant: 2 × 715 shp Garrett AiResearch T76-G-10/12 turboprops
Wing Span: 40 ft 0 in (12.19 m)
Length Overall: 41 ft 7 in (12.67 m)
Max Take-Off Weight: 14,466 lb (6,563 kg)
Max Weapon Load: 3,600 lb (1,633 kg)
Installed Weapons: 2 × 0.30 in M60C machine-guns carried in each sponson
Other Weapons:
4 weapon attachment points, each with a capacity of 600 lb (272 kg), under short sponsor extending from bottom of fuselage on each side, under wings.
Fifth attachment point, capacity 1,200 lb (544 kg) under centre fuselage.
Provision for carrying Sidewinder AAM on each wing
Max Level Speed: 281 mph (452 kmh) at sea level without weapons
Typical Range: Combat radius with max weapon load, no loiter 228 miles (367 km). Ferry range with auxiliary fuel 1,428 miles (2,300 km)
In Service with: US Marine Corps, US Air Force, Germany (Fed. Republic), Thailand, Venezuela.



OV-10A ground attack aircraft

1583.302
105 G
SAAB-SCANIA (SWEDEN)
Role(s): Two-seat light close support and trainer aircraft. Missions include: ground attack, training, reconnaissance, limited air-to-air combat
Power Plant: 2 × 2,650 lb (1,293 kg) st General Electric J85-17B turbojet engines
Wing Span: 31 ft 2 in (9.5 m)
Length Overall: 35 ft 6 in (10.8 m)
Max Take-Off Weight: 14,330 lb (6,500 kg)
Weapons: Six underwing hardpoints are provided with a total capacity of 5,180 lb (2,350 kg), and a variety of weapon options are possible, depending upon the range and mission profiles selected. 30 mm gun-pods, rockets, bombs and missiles can be carried at speeds up to Mach 0.86. Camera pod, Sidewindar, 110 US gal tanks, Saab RB05A air-to-surface missiles, or IR homing Swedish-built Falcon air-to-air missiles, can also be carried
Max Level Speed:
Ground level 525 kt (970 km/h).
At 10,000 m – 475 kt (875 km/h)
Attack Radius:
6 × 500 lb bombs:
hi-lo-hi 375 nm (695 km)
lo-lo-lo 162 nm (300 km)
4 × 500 lb bombs, plus 2 external tanks:
hi lo-hi 538 nm (995 km)
lo-lo-lo 224 nm (415 km)
Systems Description: The 105 G has a new nav-attack system which is available in four different versions:
(1) 2 × VHF or VHF plus UHF
ADF/DME
VOR/ILS
IFF
Dual flight instruments
Gyro sight, with depressed sight line facility.
(2) 2 × UHF or UHF plus VHF



Saab 105G close support and trainer aircraft

Tacan or ADF
VOR/ILS (optional)
IFF
Dual flight instruments
Gyro sight, with depressed sight-line facility.

(3) 2 × UHF
Tacan
IFF
Twin gyro-platform.
Single flight instruments
Gyro sight head
BT9R ballistic computer and laser range-finder.

(4) 2 × UHF
Doppler with TANS computer
IFF
Twin gyro-platform
Air data computer
Single flight instruments
Roller map display
BT9 ballistic computer with laser range-finder.
Gyro sight head.

Standard equipment for these options is as follows:

Communications – Collins
IFF – Hazeltine
Twin gyro-platform – Sperry (UK)
Doppler – Decca
TANS and Roller map – Decca
Gyro sight – Ferranti
BT9R Ballistic computer – Saab
Laser range-finder – LME, Bofors, or Ferranti.
Air Data System – Elliott

In Service with: Royal Swedish Air Force – SK60A, B, and C versions. Austrian Air Force – 105XT, (OE) version

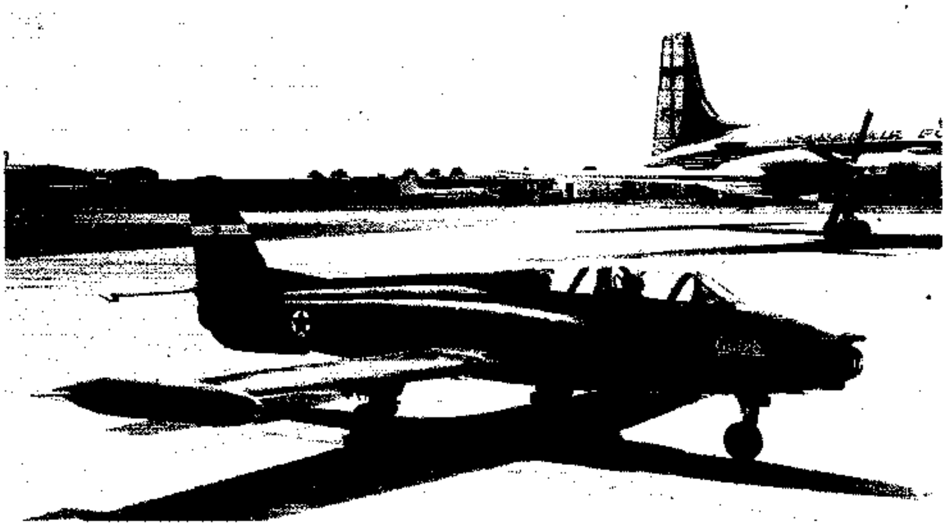
1579.302
HS 1182 HAWK
HAWKER SIDDELEY (UK)

Role(s): Two-seat multi-purpose strike/trainer aircraft. Designed for both basic and advanced training, with high subsonic performance and good low-speed handling characteristics. A close-support version can carry external stores on five pylons, the centre one of which (beneath the fuselage) may be replaced by a 30 mm gun
Power Plant: 1 × Rolls-Royce/Turbomeca RT 172-06 Adour un-reheated turbo-fan
Wing Span: 30 ft 10 in (9.40 m)
Length Overall: 33 ft 9½ in (11.96 m)
Max Take-Off Weight: 15,610 lb (7,080 kg)
Weapons: Centre-line attachment for 30 mm Aden gun and ammunition pack; two underwing points, each of 1,000 lb (454 kg) capacity; provision for two outer wing pylons of 1,000 lb (454 kg) capacity
Max Level Speed: 516 knots (1,102 km/h) at height
Typical Range: Ferry range approx 1,500 nm (2,780 km)
Under Development for: Royal Air Force. 175 ordered to enter service late 1976

Hawker Siddeley HS 1182 Hawk

8076.302
JASTREB
SOKO (YUGOSLAVIA)

Role(s): Single-seat light attack aircraft
Power Plant: 1 × 3,000 lb (1,360 kg) st, Rolls-Royce Bristol Viper 531 turbojet
Wing Span: 34 ft 8 in (10.56 m), 38 ft 4 in (11.68 m) with tip-tanks
Length Overall: 35 ft 1½ in (10.71 m)
Max Take-Off Weight: 10,010 lb (4,541 kg)
Installed Weapons: 3 × 0.50 in Colt-Browning machine-gun in nose (with 135 rpg)
Other Weapons: Has a total of 8 underwing weapons attachments.
2 inboard attachments can carry either:
2 × 550 lb (250 kg) bombs each.
2 × clusters of small bombs.
2 × 100 lb (45 kg) photo flares.
Other attachments can each carry:
1 × 57 mm or 127 mm rocket
Max Level Speed: 510 mph (820 kmh) at 19,680 (6,000 m) at AUW of 8,748 lb (3,968 kg)
Typical Range: 945 miles (1,520 km) at 29,520 ft (9,000 m) with tip-tanks full
In Service with: Yugoslav Air Force, Zambian Air Force



Two-seat Galeb trainer version of Soko Jastreb single-seat attack aircraft

1586.302
MFI-17
SAAB-SCANIA (SWEDEN)

Role(s): Two/three-seat light aircraft for forward area roles such as control (FAC), support, reconnaissance, observation, ground attack and training
Power Plant: 1 × Lycoming IO-360-AIB6, 200 hp fuel injection engine driving Hartzell constant-speed propeller
Wing span: 28 ft 6½ in (8.7 m)
Length Overall: 23 ft (7.0 m)
Max Take-Off Weight:
Normal – 2,095 lb (950 kg)
Restricted – 2,423 lb (1,100 kg)
Weapons: Up to 660 lbs (300 kg) of external loads can be carried on six underwing attachment points. Weapon options include:
4 × rocket launchers, each with 7 NATO 2.75 in HVA rockets.
4 × Bofors Bantam wire-guided anti-tank missiles.

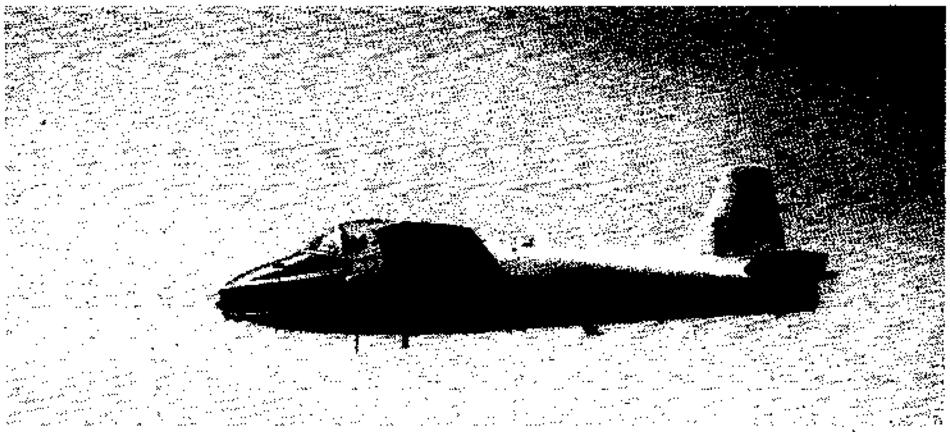
Saab-MFI 17 army co-operation and trainer aircraft

2 × GE mini-gun pods, 5.56 mm
6 × Bofors 135 mm rockets.
18 × Bofors 75 mm rockets.
4 × TOW anti-tank missiles
Max Level Speed: 141 knots (262 km/h)
Typical Range: 450 to 850 miles (725 to 1,370 km) depending upon flight profile and load

---

8077.302
P-2 KRAGUJ
SOKO (YUGOSLAVIA)
Role(s): Single-seat lightweight close-support aircraft
Power Plant: 1 × 340 hp Lycoming GSO-480-BIA6 piston-engine
Wing Span: 34 ft 11 in (10.64 m)
Length Overall: 26 ft 0¼ in (7.93 m)
Max Take-Off Weight: 3,580 lb (1,624 kg)
Installed Weapons: 1 × 7.7 mm machine-gun with 650 rpg in each wing
Other Weapons: 6 underwing attachments. 2 inner attachments each carry either:
1 × 220 lb (100 kg) bomb
Cluster of small bombs.
33 imp gal (150 litre) napalm tank.
12-round rocket pack.
The remaining 4 can each carry:
1 × 57 mm or 127 mm rocket.
Max Level Speed:
171 mph (275 kmh) at Sea Level
183 mph (295 kmh) at 5,000 ft (1,500 m)
Typical Range: 500 miles (800 km) with max fuel

8094.302
JET PROVOST T Mk 52
BAC (UK)
Role(s): 2-seat basic trainer and light attack aircraft
Power Plant: 1 × 2,500 lb (1,134 kg) st Rolls-Royce Bristol Viper 202 turbojet
Wing Span: 36 ft 11 in (11.25 m)
Length Overall: 32 ft 5 in (9.88 m)
Max Take-Off Weight: 7,400 lb (3,356 kg)
Installed Weapons: 2 × 0.303 in machine-guns in air intakes with 600 rounds per gun
Other Weapons: Wing attachments for:
24 × Sura Mk 3 rockets.
6 × 60 lb (27.2 kg) or 12 × 25 lb (11.3 kg) rockets.
8 × 25 lb (11.3 kg) or 2 × 100 lb (45.3 kg) bombs.
12 × 8 cm Oerlikon rockets.
Under fuselage pack of 2 × 0.50 in guns with 100 rounds per gun can also be carried
Max Level Speed: 410 mph (660 kmh) at 20,000 ft (6,096 m)
Typical Range: 700 miles (1,126 km)
In Service in: Iraq, Kuwait, South Yemen, Sri Lanka, Sudan, UK, and Venezuela

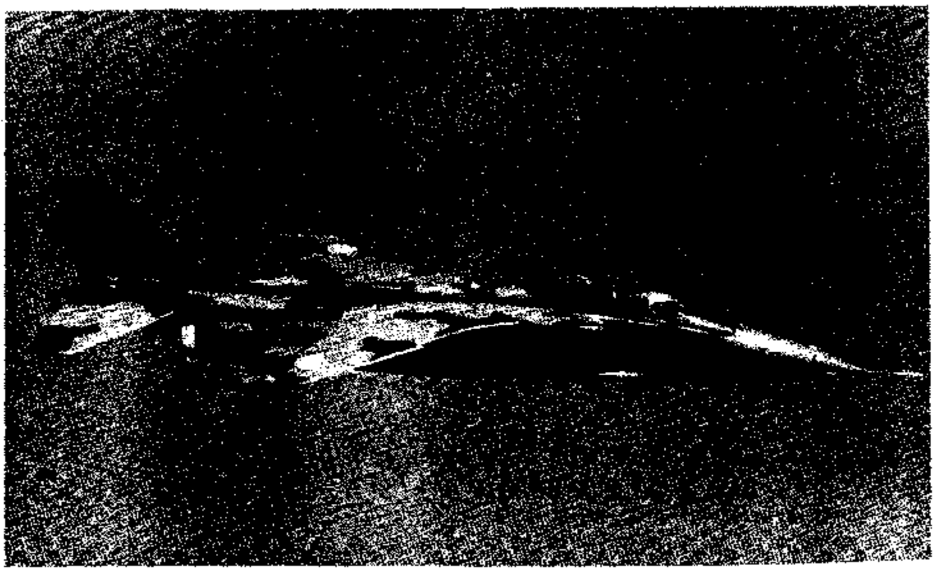


Provost Mk 5 of Royal Air Force

FIGHTER BOMBERS

1671.302
PUCARÁ IA-58
Argentine Military Aircraft Factory
Role(s): Multi-purpose, two-seat attack aircraft
Power Plant: 2 × 1021 ESHP Astazou XVIG turboprops
Wing Span: 47 ft 6 in (14.48 m)
Length Overall: 45 ft 7 in (13.90 m)
Max Take-Off Weight: 14,300 lb (6,846 kg)
Installed Armament:
4 × 7.62 mm machine guns
2 × 20 mm cannon
Other Weapons: Provision is made for a wide range of stores to a maximum combined load of 3,307 lbs (1,500 kg)
Max Level Speed: 281 knots (520 km/h) at 9,843 ft (3,000 m)
In Production for: Argentine Air Force

8006.302
JAGUAR
BAC/BREGUET (ANGLO-FRENCH)
Role(s): Single-seat tactical support aircraft
Power Plant: 2 × 6,950 lb (3,150 kg) st (with afterburning) Rolls-Royce/Turbomeca Adour turbofans
Wing Span: 27 ft 10¼ in (8.49 m)
Length Overall: 50 ft 11 in (15.52 m)
Max Take-Off Weight: 29,762 lb (13,500 kg)
Max Weapon Load: External weapons and stores 10,000 lb (4,500 kg)
Installed Weapons: 2 × 30 mm Aden cannon in lower fuselage aft of cockpit
Other Weapons:
5 weapon stations, 1 under fuselage and 4 under wings plus provision for 2 × Sidewinder AAM on wing tips.
Max loads are 2,000 lb (900 kg) on centre and inboard wing stations.
1,000 lb (450 kg) on outboard stations up to max total load of 10,000 lb (4,500 kg).
Typical Loads:
8 × 1,000 lb (450 kg) HE bombs.
3 × AS 37 ASM.
3 × 1,200 litre drop tanks.
6 × 1,000 lb (450 kg) HE bombs plus 4 × Matra type 155 68 mm rockets launchers.
2 × 1,000 lb (450 kg) bombs on centre station plus 2 × 1,200 litre drop tanks
Max Level Speed:
In initial form:
Mach 1.1 at sea level
Mach 1.7 at 36,000 ft (11,000 m)
Typical Range:
Attack radius, with external fuel:
Hi-lo-hi 1,025 miles (1,650 km).
Low altitude throughout 530 miles (850 km).
Attack radius, internal fuel only:
Hi-lo-hi 775 miles (1,250 km).
Low altitude throughout 405 miles (650 km)
In Service with: French and British Air Forces. Ordered for Ecuador and Oman

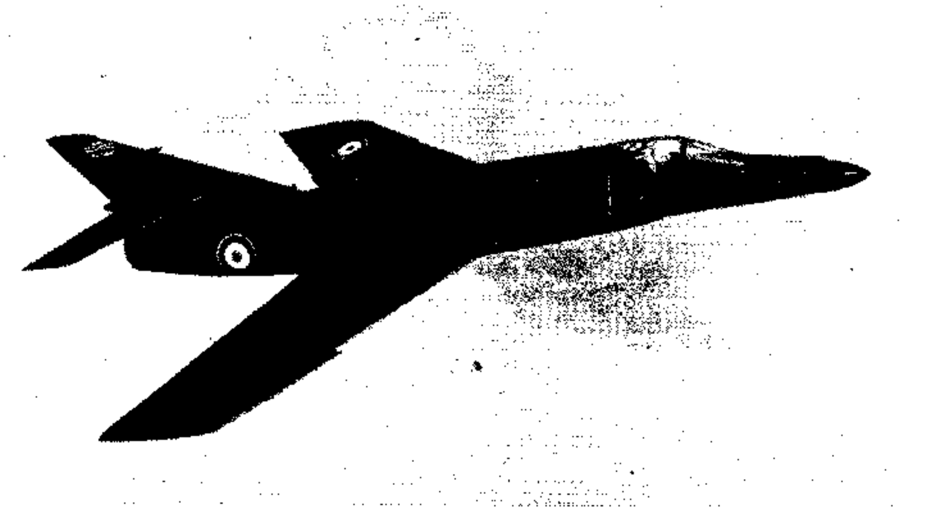


Anglo-French Jaguar

8018.302
ETENDARD IV-M
DASSAULT (FRANCE)
Role(s): Single-seat carrier-based interceptor and fighter-bomber
Power Plant: 1 × 9,700 lb (4,400 kg) st SNECMA Atar 8 turbojet
Wing Span: 31 ft 6 in (9.60 m)
Length Overall: 47 ft 3 in (14.40 m)
Max Take-Off Weight: 22,650 lb (10,273 kg)
Max Weapon Load: 3,000 lb (1,360 kg)
Installed Weapons: 1 or 2 × 30 mm cannon

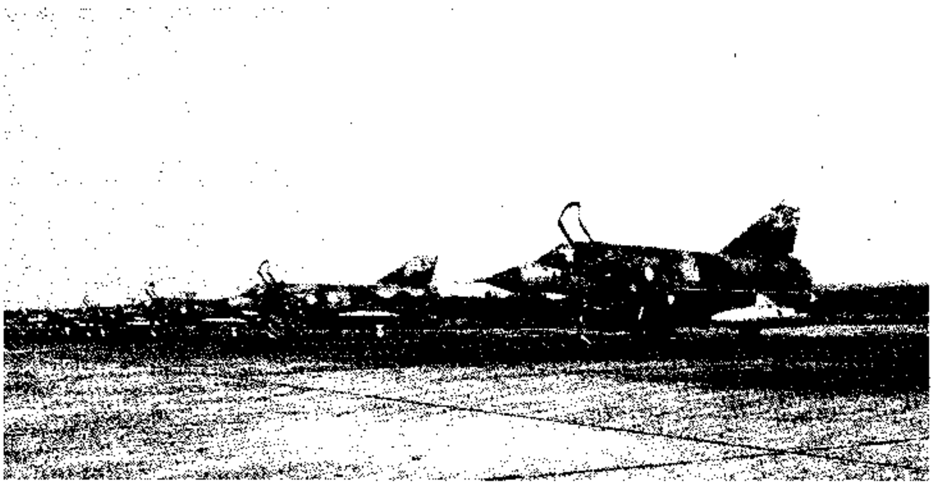
Other Weapons: Four under-wing attachments for up to 3,000 lb (1,360 kg) of rockets, bombs, Sidewinder air-to-air or Nord AS 30 air-to-surface missiles (or drop tanks)
Max Level Speed: Mach 1.02 at 36,000 ft (11,000 m)
Typical Range: 1,750 miles (2,816 km) with external tanks, at 510 mph (820 kmh)
In Service with: French Navy

Super Etendard
Dassault is developing for the French Fleet Air Arm an improved model of the Etendard IV, known as the Super Etendard. Similar in appearance to its predecessor, the new version will have a more powerful SNECMA 8K50 engine and a more sophisticated weapon system. The latter will include the Agave nose radar (**1672.353**) being developed by Thomson-CSF and Electronique Marcel Dassault, an inertial navigation system, and the use of new generation air-to-air missiles. Prototypes are planned for 1976 with deliveries to the French Navy starting in the Summer of 1977.



Super-Etendard being developed for French Fleet Air Arm

8020.302
MIRAGE IIIE
DASSAULT (FRANCE)
Role(s): Single-seat long-range fighter-bomber
Power Plant: 1 × 13,670 lb (6,200 kg) st (with reheat) SNECMA Atar 9C turbojet and, 1 × 3,307 lb (1,500 kg) st SEPR 844 rocket-engine
Wing Span: 27 ft 0 in (8.22 m)
Length Overall: 49 ft 3½ in (15.03 m)
Max Take-Off Weight: 29,760 lb (13,500 kg)
Installed Weapons: Provision for 2 × 30 mm DEFA cannon in fuselage, each with 125 rounds of ammunition
Other weapons: Normal interceptor armament comprises:
1 × MATRA R 530 air-to-air missile under fuselage.
2 × Sidewinder air-to-air missiles.
Ground attack armament consists normally of:
The 30 mm guns and 2 × 1,000 lb (453 kg) bombs or 1 × AS 30 air-to-surface missile under the fuselage and 1,000 lb (453 kg) bombs under the wings
Alternative underwing stores include:
JL-100 pods, each with 18 rockets, and 55 imp gallon (250 litre) fuel tanks
Max Level Speed: 870 mph (1,400 kmh) at max take-off weight and low altitude
Typical Range:
Combat radius at max take-off weight:
Low level throughout 305 miles (490 km).
High-low-high 398 miles (640 km).
High level throughout 472 miles (760 km)
In Service in: Argentine, Australia, Brazil, France, Lebanon, Libya, Pakistan, Saudi Arabia, South Africa, Spain, Switzerland, Venezuela, (in various versions)



Mirage IIIE

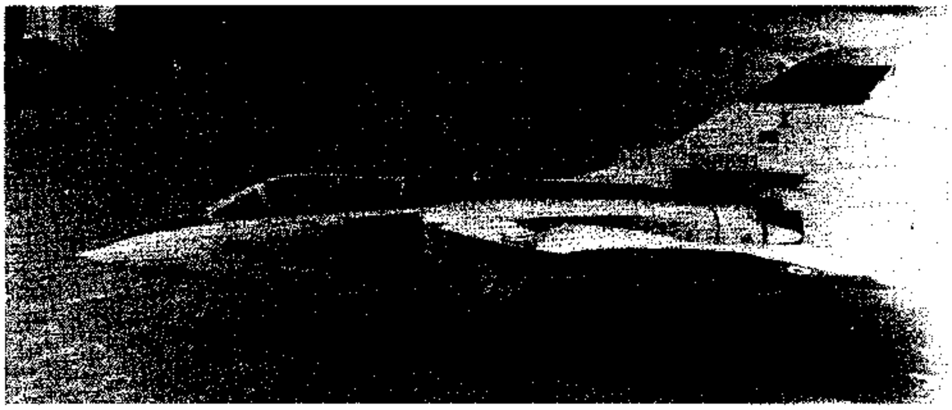
8022.302
MIRAGE 5
DASSAULT (FRANCE)
Role(s): Single-seat fighter-bomber
Power Plant: 1 × 13,670 lb (6,200 kg) st (with reheat) SNECMA Atar 9C turbojet
Wing Span: 27 ft 0 in (8.22 m)
Length Overall: 50 ft 10¼ in (15.50 m)
Max Take-Off Weight: 29,760 lb (13,500 kg)
Max Weapon Load: 8,820 lb (4,000 kg)
Installed Weapons: 2 × 30 mm cannon in fuselage
Other Weapons:
7 wing and fuselage attachment points can carry as a typical external weapon load:
2 × 1,000 lb (453 kg) bombs.
10 × 500 lb (226 kg) bombs.
2 × 250 lb (113 kg) bombs.
(As well as 2 external fuel tanks).
The Mirage 5 can also be flown as an interceptor with 2 × Sidewinder air-to-air missiles and also with external fuel
Max Level Speed: Mach 2.1 at 40,000 ft (12,192 m)
Ordered for: Belgian Air Force, Iraqi Air Force
In Service in: Abu Dhabi, Belgium, Colombia, France, Libya, Pakistan, Peru, Venezuela

Mirage 5 with a load of 14 bombs, and two external fuel tanks

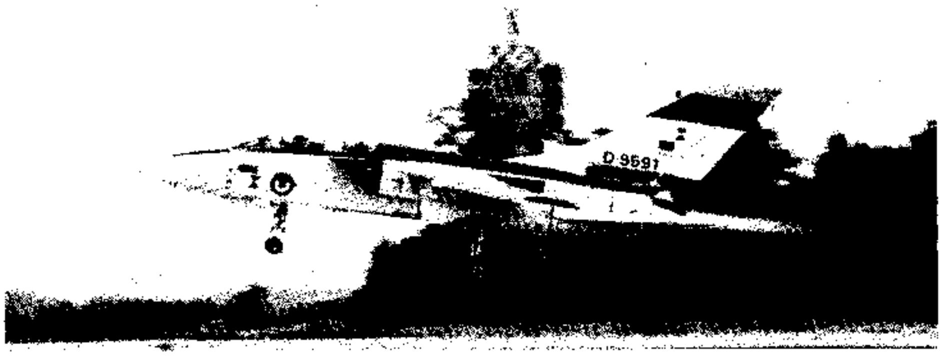
---

1581.302
PANAVIA 200 MRCA –
MULTI-ROLE COMBAT AIRCRAFT
PANAVIA (INTERNATIONAL – W. GERMANY, ITALY, UK)
Role(s): Two-seat multi-role aircraft for: close air support/battlefield interdictor; interdictor/strike; air superiority; naval role, reconnaissance
Wing Span: 28 ft 2½ in (8.6 m) swept
45 ft 7 in (13.9 m) maximum
Overall Length: 54 ft 10 in (16.7 m)
Max Take-Off Weight: 30,000 lb (13,607 kg) to 50,000 lb (22,680 kg) according to mission
Under Development for: British, German and Italian Air Forces
Systems Description: Although maximum commonality of systems and equipment has been a major design objective throughout the MRCA programme, there will be considerable variations as between roles and the three user

nations. Major systems common to aircraft for all three countries, which have been decided upon are a forward radar to be developed by Texas Instruments; Litef central digital computer; Ferranti inertial navigation system; Decca doppler radar; Marconi-Elliott autopilot; Smiths Industries Head-Up Display; Ferranti radar/map display; Marconi-Elliott TV/tabular data display; Honeywell air data computer. The nose radar is likely to appear in several versions to meet the requirements of specific missions and Marconi-Elliott Avionic Systems and Ferranti are collaborating in the development of a new radar for the British MRCA air defence role. There will be extensive co-production arrangements between concerns in the member countries. Much of the remaining avionics equipment will be selected largely on national considerations. Communications equipment will include UHF/VHF, and possibly HF in reconnaissance or longer range versions of MRCA. These requirements are likely to be met from home industries. Navigational equipment will include Tacan, which will be supplied by SEL for the German aircraft, and Marconi for British machines. The latter will have Cossor CILS 75/76 ILS receivers. The tactical landing aid for German and UK aircraft, respectively, is expected to be Setac and MADGE. IFF transponders are also likely to be provided by each nation's traditional supplier of this type of equipment.



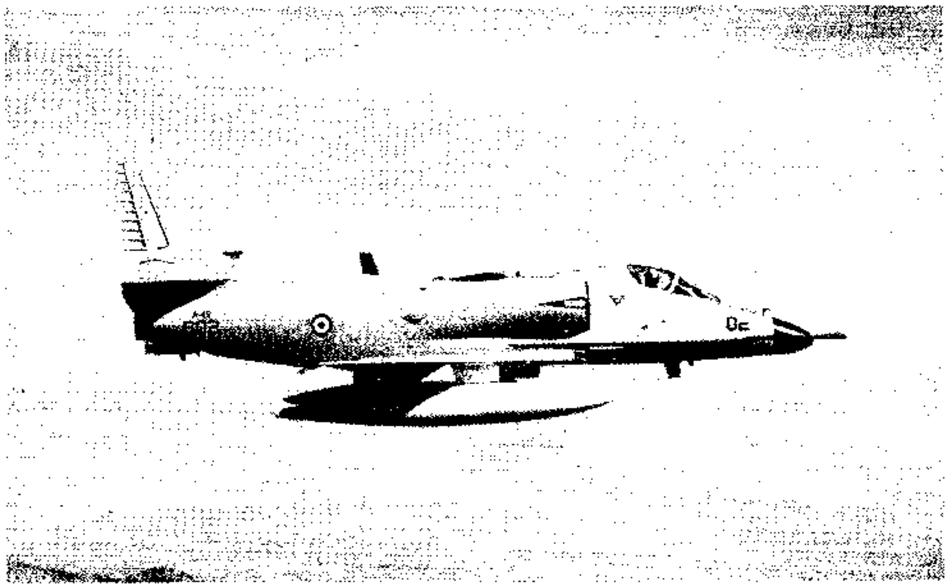
First prototype of MRCA



Panavia 200 Multi-Role Combat Aircraft

1414.302
SKYHAWK A-4M
McDONNELL-DOUGLAS (USA)
Role(s): Single-seat lightweight attack aircraft for land-based or carrier operations
Power Plant: 1 × Pratt & Whitney J52-P-408 11,200 lb (5,080 kg) turbojet engine
Wing Span: 27 ft 6 in (8.38 m)
Length Overall: 40 ft 3 in (12.27 m)
Max Take-Off Weight: 24,500 lb (10,206 kg)
Installed Weapons: 2 × 20 mm Mk 12 guns
Other Weapons:
Carried externally on five stations:
centre: max load 3,500 lb (1,588 kg).
inboard (2): max load 2,250 lb (1,020 kg).
outboard (2): max load 1,000 lb (450 kg).
External load can be made up of:
- HE bombs
- Rockets
- Flares
- ASM
- Sidewinder AAM
- Torpedoes
- Gun pods
- ECM equipment

Max Level Speed: 585 kt (1,085 km/hr)
Typical Range: 1,000 nm (1,853 km)
In Service with: (in different marks) US Navy, USMC, Royal Australian Navy, RNZAF, Israel AF, Argentine Navy, and Singapore



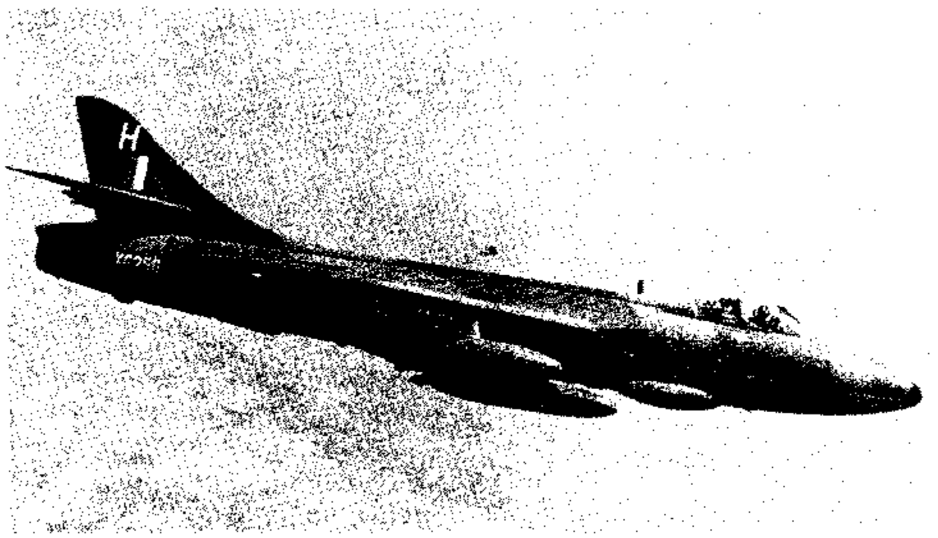
A-4B Skyhawk of the Singapore Air Defence Force

1670.302
A-10A
FAIRCHILD INDUSTRIES (USA)
Role(s): Single-seat close-support aircraft
Power Plant: 2 × 9,000 lb (4,080 kg) st General Electric TF34 turbofans
Wing Span: 54 ft 8 in (16.66 m)
Length Overall: 54 ft 8 in (16.66 m)
Max Take-Off Weight: 45,825 lb (20,786 kg)
Installed Weapons: 1 × GAU-8 multi-barrel forward-firing 30 mm gun in fuselage
Other Weapons: 10 underwing weapon pylons for the carriage of a wide range of stores including, bombs, gun-pods, AGM-65 Maverick missiles, flare or chaff dispensing pods
Max Level Speed: About 400 knots (740 km/h)
Under Development for: US Air Force

8029.302
G91R/3
FIAT (ITALY)
Role(s): Single-seat light tactical strike-reconnaissance fighter
Power Plant: 1 × 5,000 lb (2,270 kg) st Rolls-Royce Bristol Orpheus 803 turbojet
Wing Span: 28 ft 1 in (8.56 m)
Length Overall: 33 ft 9½ in (10.30 m)
Max Take-Off Weight: 12,125 lb (5,500 kg)
Installed Weapons: 2 × 30 mm cannon in sides of front fuselage
Other Weapons: 4 underwing attachments for up to 1,500 lb (860 kg) of bombs, Nord AS 20 missiles, air-to-ground rockets or 0.50 in machine gun pods
Max Level Speed: 650 mph (1,045 kmh) at 5,000 ft (1,500 m)
Typical Range: 400 miles (643 km) on internal fuel at 403 mph (649 kmh)
In Service with: German Air Force

8030.302
G91Y
FIAT (ITALY)
Role(s): Single-seat lightweight reconnaissance fighter-bomber
Power Plant: 2 × General Electric J85-GE-13A turbojet engines each 2,720 lb (1,235 kg) st dry, 4,080 lb (1,850 kg) st with afterburning
Wing Span: 29 ft 6½ in (9.01 m)
Length Overall: 38 ft 3½ in (11.67 m)
Max Take-Off Weight: 19,180 lb (8,700 kg)
Installed Weapons: 2 × 30 mm guns in nose

Other Weapons: 4 underwing attachments for 1,000 lb (453 kg) bombs, 750 lb (340 kg) napalm tanks, 7 × 2 in rocket packs, 28 × 2 in rocket packs or 4 × 5 in rocket containers
Max Level Speed: Mach 0.93 at sea-level
Typical Range: Combat radius 460 miles (740 km)
In Service with: Italian Air Force

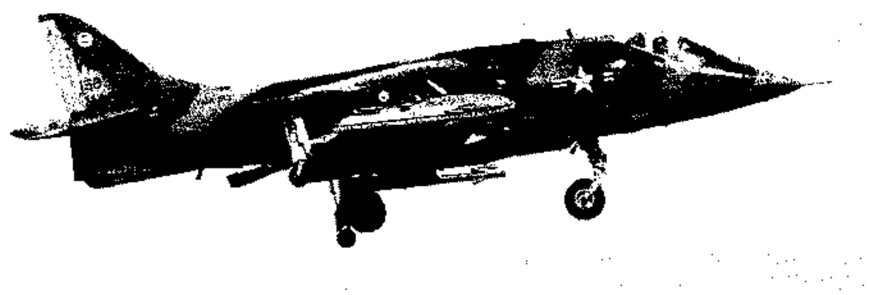


Hunter fighter-bomber with bombs and external fuel tanks

8037.302
HUNTER F (GA) Mk 9
HAWKER (UK)
Role(s): Single-seat fighter and 2 seat trainer
Power Plant: 1 × 10,000 lb (4,540 kg) st Rolls-Royce Avon 207 turbojet
Wing Span: 33 ft 8 in (10.26 m)
Length Overall: 45 ft 10½ in (13.98 m)
Max Take-Off Weight: 24,000 lb (10,885 kg)
Max Weapon Load: 7,400 lb (3,357 kg)
Installed Weapons: 4 × 30 mm Aden guns (150 rpg) in self-contained removable package in underside of fuselage nose
Other Weapons:
External stores that can be carried are.
On inboard wing pylons:
2 × 1,000 lb (454 kg) bombs.
2 × 500 lb (227 kg) bombs.
2 × carriers each with 2 25 lb (11 4 kg) practice bombs.
2 × clusters of 6 3 in rockets.
2 × containers, each with either 24 or 37 2 in folding-fin rockets.
(2 × drop tanks).
On outboard wing pylons:
(2 × drop tanks) or up to 24 × 3 in No. 1 Mk 5 RP's with 12 lb warheads.
The 100 gal drop tanks may be used as napalm bombs. Combinations of the above loads may be carried
Max Level Speed: Mach 0.92
Typical Range: 1,840 miles (2,965 km) with external tanks
In Service in: Abu Dhabi, Chile, India, Iraq, Jordan, Kuwait, Qatar, Lebanon, Oman, Peru, Rhodesia, Saudi Arabia, Singapore, Switzerland, UK. (Various versions)

8039.302
GNAT F Mk 1
HAWKER SIDDELEY (UK)
Role(s): Single-seat lightweight fighter or fighter-bomber
Power Plant: 1 × Bristol Siddeley Orpheus 701 (BOr2) turbojet engine 4,520 lb (2,050 kg) st
Wing Span: 22 ft 2 in (6.75 m)
Length Overall: 29 ft 9 in (9.06 m)
Max Take-Off Weight: Tactical version, max take-off weight with external tanks and armament 8,885 lb (4,020 kg)
Installed Weapons: 2 × 30 mm Aden cannon in the air intake fairings, 1 on each side of fuselage, with 115 rounds per gun
Other Weapons: Provision for underwing mounting of 2 × 500 lb (227 kg) bombs or 12 × 3 in (7.6 cm) rocket projectiles, etc
Max Level Speed: Mach 0 98
Typical Range: Radius of action 500 miles (805 km)
In Service with: Indian Air Force, Finnish Air Force

8040.302
HARRIER GR Mk 1
HAWKER SIDDELEY (UK)
Role(s): Single-seat V/STOL strike and reconnaissance aircraft
Power Plant: 1 × 19,200 lb (8,710 kg) st Rolls-Royce Bristol Pegasus 101 vectored-thrust turbofan
Wing Span: 25 ft 3 in (7.70 m)
Length Overall: 46 ft 4 in (14.12 m)
Max Take-Off Weight: VTOL approximately 16,000 lb (7,257 kg). STOL approximately 23,000 lb (10,433 kg)
Max Weapon Load: Max external load of 5,000 lb (2,270 kg)
Other Weapons: Combat load is carried on 4 underwing and 3 under-fuselage hard-points. The inboard wing points and the centre fuselage point are stressed for loads of up to 1,200 lb (544 kg) each, and the outboard underwing pair of loads of up to 650 lb (295 kg) each; the 2 outboard points under the fuselage can each carry a 30 mm gun pod and ammunition.
A typical combat load is:
2 × 30 mm Aden gun pods (interchangeable with under-fuselage strakes).
2 × Matra launchers each with 57 × 68 mm SNEB rockets.
2 × pairs of Lepus flares or two 100 imp gal (455 litre) drop-tanks under the wings.
1 × 1,000 lb (454 kg) bomb can be carried on central fuselage pylon in combination with gun pods
Max Level Speed: Mach 0.95 without combat load
Typical Range: Typical radius of action 500 miles (805 km)
In Service with: Royal Air Force, US Marine Corps. Ordered for Spanish Navy



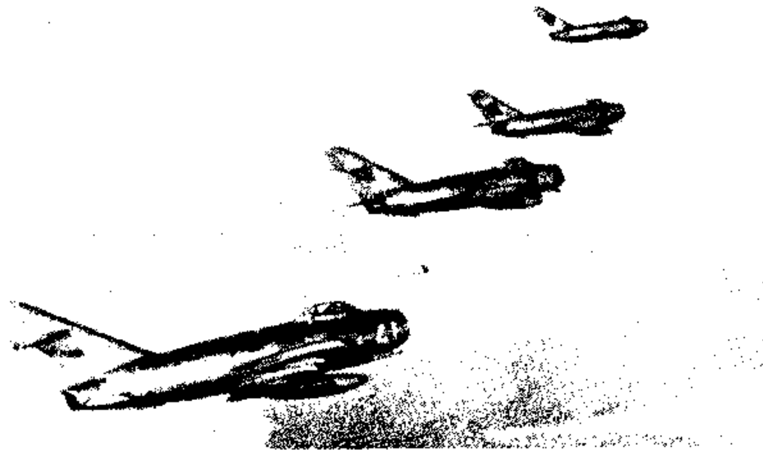
Harrier AV-8A of US Marine Corps

8044.302
HF-24 MARUT
HINDUSTAN (INDIA)
Role(s): Single-seat fighter
Power Plant: 2 × 4,850 lb (2,200 kg) st Bristol Siddeley Orpheus 703 turbojets (Mk I) or 6,600 lb (2,993 kg) st (with afterburning) Orpheus 703R (Mk IR)
Wing Span: 29 ft 6¼ in (9.00 m)
Length Overall: 52 ft 0¾ in (15 87 m)
Max Take-Off Weight: 24,250 lb (11,000 kg)
Installed Weapons: 4 × 30 mm Aden guns in nose, with about 120 rounds per gun, and retractable pack of 48 air-to-air rockets in lower fuselage aft of nose-wheel unit
Other Weapons: Attachments for 4 × 1,000 lb (453 kg) bombs, drop tanks and other stores under wings
Max Level Speed: Mach 1.02 attained at 40,000 ft (12,200 m)
In Service with: Indian Air Force

8055.302
MiG-15bis (NATO "FAGOT")
MIKOYAN/GUREVICH (USSR)
Role(s): Single-seat fighter bomber and 2-seat trainer
Power Plant: 1 × 5,950 lb (2,698 kg) st Klimov VK-1 turbojet
Wing Span: 33 ft 1¼ in (10.1 m)
Length Overall: 36 ft 4 in (11 1 m)
Max Take-Off Weight: 14,238 lb (6,464 kg)
Installed Weapons: 1 × 37 mm cannon with 40 rounds on starboard side of lower front fuselage. 2 × 23 mm NR 23 cannon on port side. Attachments for 1 100 lb (500 kg) of bombs
Max Level Speed: 668 mph (1,075 km/h) at sea

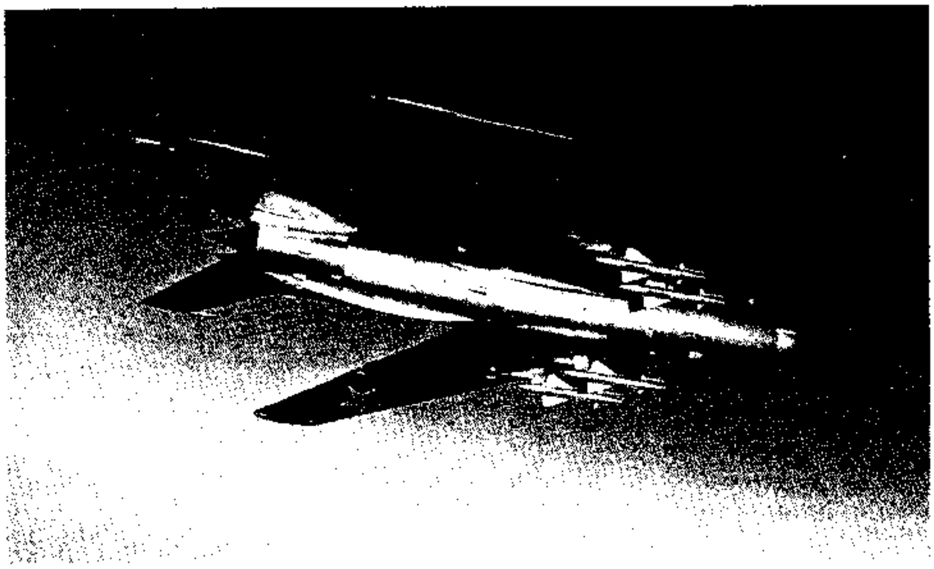
level
In Service with: Air Forces of Russia, Bulgaria, China, Czechoslovakia, East Germany, Egypt, Hungary, North Korea, Poland, Romania and Syria

8056.302
MiG-17 (NATO "FRESCO-C")
MIKOYAN/GUREVICH (USSR)
Role(s): Single-seat fighter
Power Plant: 1 × 6,990 lb (3,170 kg) st (with afterburning) Klimov VK-1A turbojet
Wing Span: 31 ft 0 in (9.45 m)
Length Overall: 36 ft 4 in (11.07 m)
Max Take-Off Weight: 12,500 lb (5,669 kg) (clean)
Installed Weapons: 3 × 23 mm NR-23 cannon
Other Weapons: 4 × 8-rocket pods or 2 × 550 lb (250 kg) bombs
Max Level Speed: Mach 0.975 at sea level
Typical Range: With external tanks and bombs 750 miles (1,207 km)
In Service with: Soviet Air Force, plus the Air Forces of Poland, Czechoslovakia, China, Afghanistan, Albania, Bulgaria, Cuba, Egypt, Hungary, Indonesia, Iraq, Morocco, North Korea, Romania and Syria



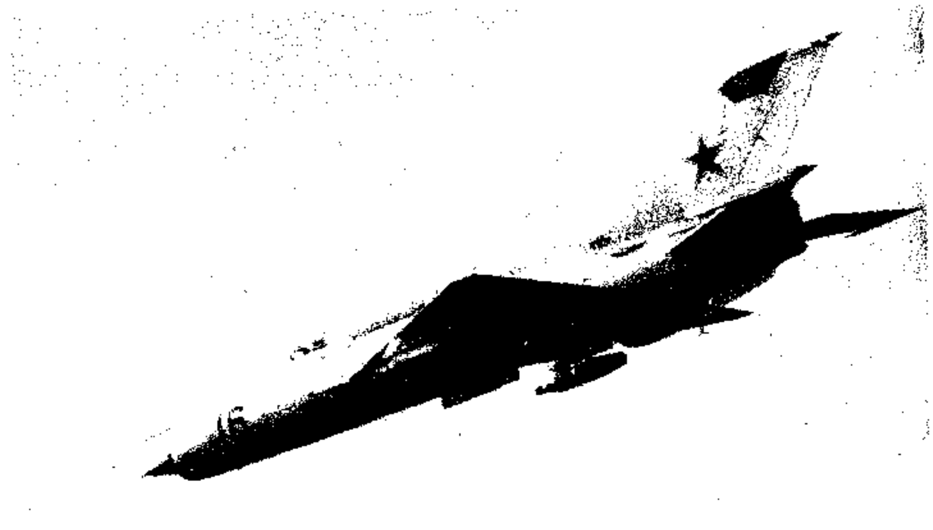
MiG-17 fighter with external fuel tanks

8057.302
MiG-19 (NATO "FARMER C")
MIKOYAN (USSR)
Role(s): Single-seat fighter
Power Plant: 2 × 8,820 lb (4,000 kg) st (with afterburning) Klimov VK-5 turbojets
Wing Span: 32 ft 0 in (9.75 m)
Length Overall: 37 ft 6 in (11.43 m)
Max Take-Off Weight: 19,840 lb (9,000 kg)
Installed Weapons: 3 × 30 mm cannon
Other Weapons: Underwing rocket pods, missiles etc
Max Level Speed: 850 mph (1,368 kmh) at 36,000 ft (11,000 m)
In Service with: Soviet Air Force, Chinese Air Force, Pakistan Air Force and several East European Air Forces



MiG-19 fighter armed with four Alkali missiles

8058.302
MiG-21 (NATO "FISHBED-C")
MIKOYAN (USSR)
Role(s): Single-seat fighter and 2-seat trainer
Power Plant: 1 × 12,500 lb (5,669 kg) st (with afterburning) TDR Mk R37F turbojet
Wing Span: 25 ft 0 in (7.60 m)
Length Overall: 55 ft 0 in (16.75 m)
Max Take-Off Weight: 16,700 lb (7,575 kg)
Installed Weapons: 1 or 2 × 30 mm cannon with 600 rpg
Other Weapons: Underwing attachments carry 2 × Atoll air-to-air missiles
Max Level Speed: Mach 2 (clean) at 36,000 ft (11,000 m). Mach 1.5 at 36,000 ft (11,000 m) with missiles and under-fuselage fuel tank
Typical Range: Combat radius (clean) 375 miles (600 m)
In Service in: Afghanistan, Bangladesh, Cuba, Czechoslovakia, Egypt, Finland, Germany (Dem Rep), Hungary, India, Indonesia, Iraq, Jugoslavia, Korea (N), Poland, Romania, Sudan, Syria, USSR, Vietnam (N)



MiG-21 fighter fitted with rocket pods

1851.302
MiG-23 (NATO "FLOGGER")
MIKOYAN (USSR)
Role(s): Air-superiority fighter. Two-seat tactical/trainer version also, probably with ground attack capability
Power Plant: 1 × turbojet with reheat giving estimated 20,000 lb (9,070 kg) st
Wing Span:
Maximum: 50 ft (15.25 m)
Swept 29 ft 6 in (9.00 m)
Length Overall: 57 ft (17.4 m)
Take-Off Weight: 28,000 lb (12,700 kg) estimated, single-seat version
Weapons:
1 × 23 mm cannon
4 × stores pylons for missiles or other weapons
Max Level Speed: Mach 2.3 at height
Typical Range: 600 miles (960 km)
In Service with: Soviet Air Force

8062.302
F-86F SABRE
NORTH AMERICAN (USA)
Role(s): Single-seat tactical fighter and fighter-bomber
Power Plant: 1 × 5,910 lb (2,680 kg) st General Electric J47-GE-27 turbojet
Wing Span: 39 ft 1 in (11.91 m)
Length Overall: 37 ft 6½ in (11.44 m)

Max Take-Off Weight: 20,610 lb (9,348 kg)
Installed Weapons: 6 × 0.50 in machine-guns
Other Weapons:
2 × Sidewinder missiles
2 × 1,000 lb (453 kg) bombs or 8 × rockets
Max Level Speed: 687 mph (1,105 kmh) at sea level
Typical Range: 925 miles (1,488 km) at 530 mph (853 kmh)
In Service with: Air Forces of Argentine, Burma, Nationalist China, Colombia, Ethiopia, Greece, Iran, Japan, South Korea, Norway, Pakistan, Peru, Philippines, Portugal, Saudi Arabia, Spain, Thailand, Turkey and Venezuela

8063.302
F-100D SUPER SABRE
NORTH AMERICAN (USA)
Role(s): Interceptor and fighter-bomber
Power Plant: 1 × 11,700 lb (5,307 kg) st (17,000 lb (7,711 kg) with afterburner) Pratt and Whitney J57-P-21A turbojet
Wing Span: 38 ft 9 in (11.81 m)
Length Overall: 54 ft 3 in (16.54 m)
Max Take-Off Weight: 34,832 lb (15,799 kg)
Installed Weapons: 4 × 20 mm cannon in fuselage
Other Weapons: 6 underwing pick-up points for bombs, rockets, air-to-air or air-to-surface missiles etc
Max Level Speed: Mach 1.3 at 36,000 ft (11,000 m)
Typical Range: With 2 external tanks 1,500 miles (2,414 km)
In Service with: US Air Force and NATO nations such as Denmark, Turkey and France, and with Nationalist China

8065.302
F-5E TIGER II
NORTHROP (USA)
Role(s): Single-seat lightweight fighter
Power Plant: 2 × 5,000 lb (2,268 kg) st (with afterburning) General Electric J85-GE-21 turbojets
Wing Span: 26 ft 8 in (8.12 m)
Length Overall: 48 ft 2 in (14.8 m)
Max Take-Off Weight: 24,083 lb (10,923 kg)
Installed Weapons: 2 × 20 mm guns in nose of fuselage
Other Weapons:
2 × Sidewinder missiles on wing-tip launchers.
5 pylons, 1 under fuselage and 2 under each wing, permit the carriage of a wide variety of other operational warloads.
1 × 2,000 lb (910 kg) or more bomb or high-rate-of-fire gunpack can be suspended from centre pylon.
Underwing loads can include.
4 × air-to-air missiles
Bombs
Air-to-surface rockets
Gun packs
Max Level Speed: Mach 1.6 at 36,000 ft (11,000 m)
Typical Range: Combat air patrol mission radius 780 miles (1,255 km); interdiction mission radius 620 miles (1,000 km), both with 3 × 275 gallon auxiliary tanks

F-5E Tiger II armed with Sidewinder

In Service with: Various models of the F-5 are used by the Forces of: Brazil, Canada, Ethiopia, Greece, Iran, Jordan, Korea (S), Libya, Morocco, Netherlands, Norway, Philippines, Saudi Arabia, Taiwan, Thailand, Turkey, USA, Vietnam (S)

8081.302
Su-7B (NATO "FITTER")
SUKHOI (USSR)
Role(s): Single-seat ground-attack fighter
Power Plant: 1 × 22,050 lb (10,001 kg) st (with afterburning) turbojet, believed to be TRD-31
Wing Span: 30 ft 0 in (9.15 m)
Length Overall: 56 ft 0 in (17.0 m)
Installed Weapons: 1 × 30 mm cannon in each wing-root leading edge
Other Weapons: Attachments for external stores, including rocket packs and bombs, under each wing
Max Level Speed: Mach 1.6 at 36,000 ft (11,000 m)
In Service in: Afghanistan, Czechoslovakia, Egypt, Germany (Dem Rep), Iraq, Korea (N), Poland, Syria, USSR

1406.302
MIRAGE 'MILAN'
DASSAULT (FRANCE)
Role(s): Single-seat tactical support aircraft
Power Plant: 1 × SNECMA Atar 9K50 15,875 lb (7,200 kg)
Wing Span: 26 ft 11 in (8.22 m)
Length Overall: 49 ft 3 in (15.03 m)
Max Take-Off Weight: 30,860 lb (14,000 kg)
Installed Weapons: 2 × 30 mm DEFA guns with 125 rpg
Other Weapons: 5 external weapon pylons for max load 9,240 lb (4,200 kg) made up of 250 kg, 450 kg and 1,000 kg bombs, Sidewinder AAM; 1,700 litre fuel tanks; rockets; AS 30 ASM
Max Level Speed: Mach 2
Typical Range: 250 nm (463 km)
Under Development: As a replacement for Mirage 5

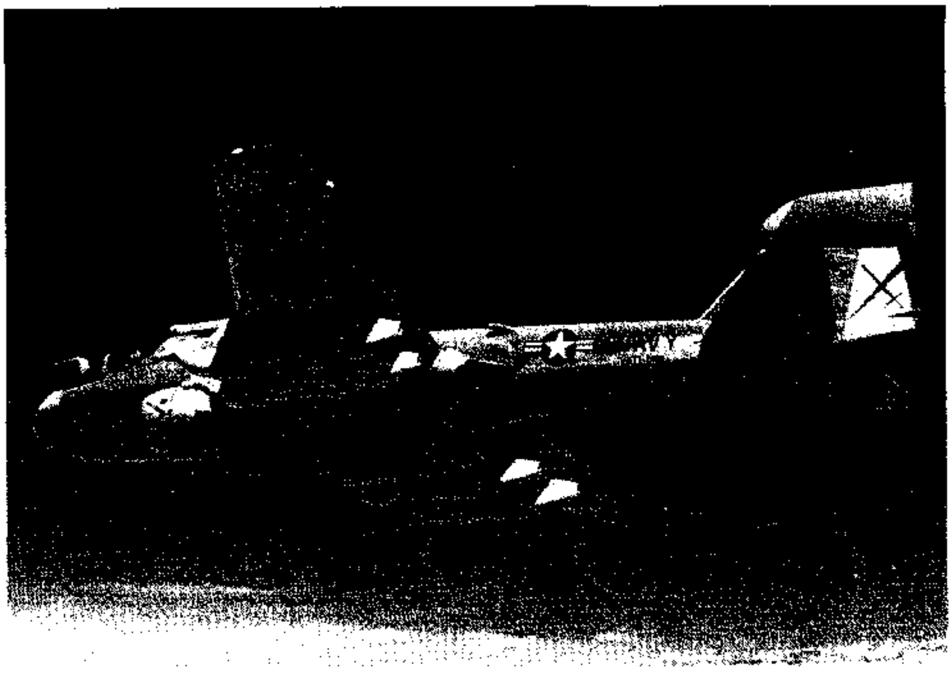
MEDIUM RANGE STRIKE/ INTERDICTION AIRCRAFT

8021.302
MIRAGE IV-A
DASSAULT (FRANCE)
Role(s): 2-seat supersonic strategic bomber
Power Plant: 2 × 15,400 lb (7,000 kg) st (with reheat) SNECMA Atar 9K turbojets
Wing Span: 38 ft 10½ in (11.85 m)
Length Overall: 77 ft 1 in (23.50 m)
Max Take-Off Weight: 69,665 lb (31,600 kg)
Other Weapons: 1 × nuclear weapon recessed into bottom of fuselage, or 16 × 1,000 lb (453 kg) bomb or Martel air-to-surface missiles under fuselage and wings
Max Level Speed: Mach 2.2 at 36,000 ft (11,000 m)
Typical Range: Operational radius of more than 1,000 miles (1,600 km)
In Service with: French Air Force

8028.302
CANBERRA B(I) Mk 8
ENGLISH ELECTRIC (UK)
Role(s): 2-seat night intruder and tactical bomber
Power Plant: 2 × 7,400 lb (3,357 kg) st Rolls-Royce Avon 109 turbojets
Wing Span: 63 ft 11½ in (19.50 m)
Length Overall: 65 ft 6 in (19.96 m)
Max Take-Off Weight: 54,950 lb (24,925 kg)
Other Weapons:
In bomber role can carry.
6 × 1,000 lb (453 kg) or 1 × 4,000 lb (1,814 kg) and
2 × 1,000 lb (453 kg) or 8 × 500 lb (226 kg) bombs internally, plus up to 2,000 lb of stores on underwing pylons.
In interdictor role.
A pack of 4 × 20 mm Hispano cannon is installed in rear of weapon bay, leaving room in forward part for 16 × 4.5 in flares or 3 × 1,000 lb (453 kg) bombs.
Can also carry Nord AS 30 air-to-surface missiles or nuclear weapons
Max Level Speed:
Mach 0.68 at sea level.
541 mph (871 kmh) at 40,000 ft (12,200 m) at 44,000 lb (19,760 kg) AUW
Typical Range: With max load, no reserves at 2,000 ft (600 m) with 10 min over target at full power 805 miles (1,295 km)
In Service with: (in various versions) the Air Forces of Argentina, Ecuador, Ethiopia, India, Peru, Rhodesia, South Africa, UK, Venezuela

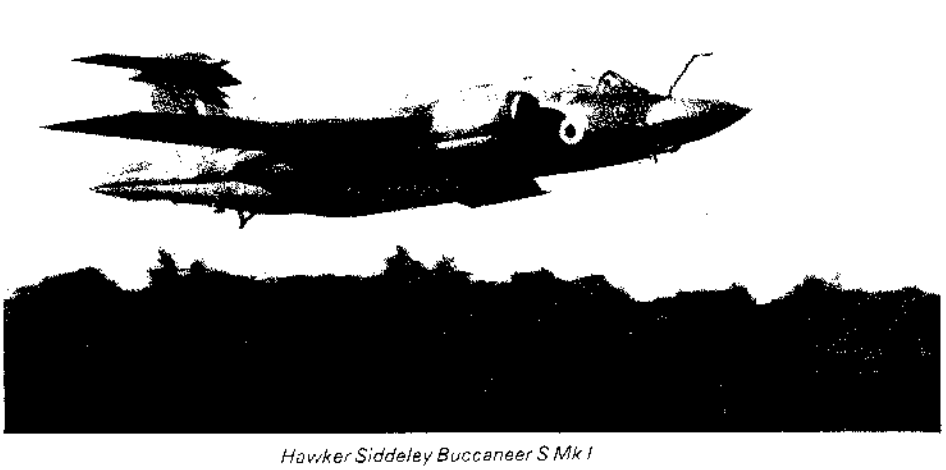
8032.302
F 111A
GENERAL DYNAMICS (USA)
Role(s): 2-seat tactical fighter
Power Plant: 2 × 12,500 lb (5,669 kg) st (21,000 lb (9,525 kg) with reheat) Pratt and Whitney TF30-P-3 turbofans
Wing Span: 63 ft 0 in (19.20 m) (spread) 31 ft 11½ in (9.74 m) (swept)
Length Overall: 72 ft 1⅓ in (21.98 m)
Max Take-Off Weight: 81,400 lb (36,922 kg)
Weapons: One M 61A1 20 mm gun or two 750 lb (340 kg) bombs in internal weapons bay; four fixed and four swivelling wing pylons for total external stores load of up to 25,000 lb (11,340 kg)
Max Level Speed: Mach 2.2 at 36,000 ft (11,000 m)
Typical Range: Tactical radius 1,600 miles (2,574 km) with 16,000 lb (7,257 kg) combat load
In Service with: US Air Force

8034.302
A-6A/E INTRUDER
GRUMMAN (USA)
Role(s): 2-seat carrier-based strike and reconnaissance aircraft
Power Plant: 2 × 9,300 lb (4,218 kg) st Pratt and Whitney J52-P-8A turbojets
Wing Span: 53 ft 0 in (16.15 m)
Length Overall: 54 ft 7 in (16.64 m)
Max Take-Off Weight: 60,626 lb (27,500 kg)
Max Weapon Load: 18,000 lb (8,165 kg)
Other Weapons: 5 weapon attachment points each have a 3,600 lb (1,633 kg) capacity. Typical weapon loads are:
30 × 500 lb (225 kg) bombs in clusters of three or
2 × Martin Bullpup missiles and
3 × 2,000 lb (907 kg) general purpose bombs
Max Level Speed: Mach 0.95 at sea level
Typical Range: Ferry range 3,225 miles (5,190 km)
In Service with: US Navy, US Marine Corps
Systems Description: The A-6E version of the Intruder is essentially the A-6A airframe and power plant with a completely new avionics installation. In early 1972 the USN awarded Grumman a contract to carry out a major retrofit programme to update A-6As now in service by fitting the A-6E avionics. The new avionics fit confers operational improvements and enhanced reliability. The principal differences between the A and E avionic specifications relate to the attack systems equipment. The E model has the Norden APQ-148 forward radar (Entry No. **1567.353**) which combines the functions of the APQ-92 and APQ-112 (Entries No. **1489.353** and **1490.353**) fitted in the A model. The new attack and navigation radar is associated with an IBM ASQ-133 digital computer which co-ordinates data to and from other aircraft systems, including inertial and doppler navigation systems, the automatic flight control system, electronic and other sensors, and weapon delivery sub-systems. A specially-developed interface unit supplied by Fairchild Camera and Instrument Corporation performs analogue-to-digital and digital-to-analogue conversions. A Conrac Armament Control Unit provides a single box system for management of the Intruder's weapons, and replaces several units needed on the A-6A. Conrac also provides the A-6E air data computer. The primary flight aid for navigation, approach and landing, and weapons delivery is a new multi-mode display system, AVA-1.
In addition to the basic A-6A and A-6E versions of the Intruder a number of specialised models have been produced. The A-6B was developed for surface-to-air missile suppression, using the USN Standard ARM; the A-6C carries electro-optical sensors to augment radar for target detection and recognition; and the KA-6D is a tanker version. More than 12 A-6Cs are to be equipped with improved Forward Looking Infra-Red Systems, AAS-28A



EA-6B intruder-attack aircraft with ECM payload

8038.302
BUCCANEER S Mk 2
HAWKER SIDDELEY (UK)
Role(s): 2-seat carrier-based low-level strike aircraft
Power Plant: 2 × 11,255 lb (5,105 kg) st Rolls-Royce RB 168 Spey Mk 101 turbofans
Wing Span: 42 ft 4 in (12.90 m)
Length Overall: 63 ft 5 in (19.33 m)
Weapons: Internal bomb-bay with rotating door accommodates a variety of weapons including:
4 × 1,000 lb (453 kg) nuclear bombs or 4 × 1,000 lb (453 kg) conventional bombs.
Four underwing pylons for Bullpup or Martel missiles.
4 × 1,000 lb (453 kg) bombs or packs of 2 in or 3 in rockets
Max Level Speed: Transonic at sea level
In Service with: Royal Navy, Royal Air Force, South African Air Force (similar version with rocket boost)

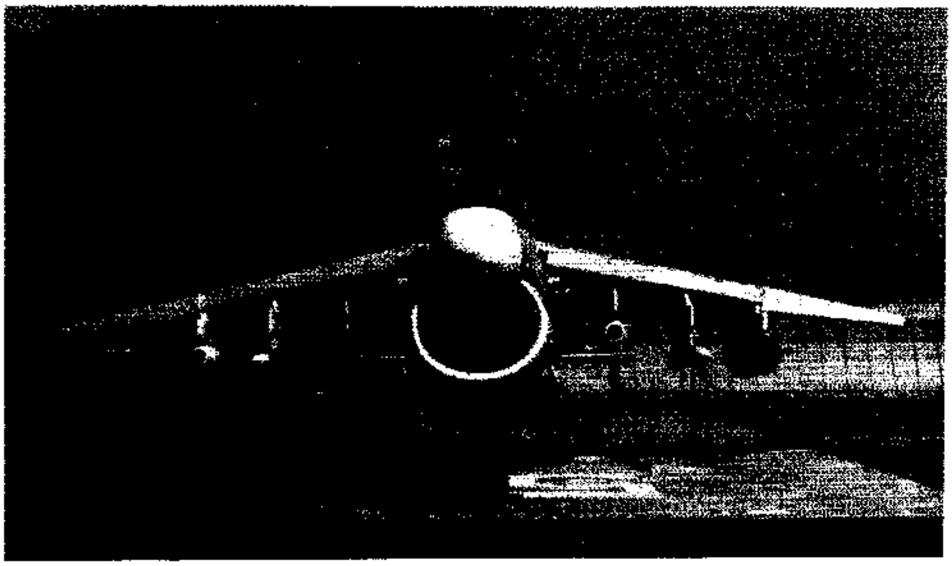


Hawker Siddeley Buccaneer S Mk I

8045.302
IL-28 (NATO "BEAGLE")
ILYUSHIN (USSR)
Role(s): 4-seat tactical bomber
Power Plant: 2 × 5,950 lb (2,698 kg) st Klimov VK-I turbojets
Wing Span: 64 ft 0 in (19.51 m)
Length Overall: 58 ft 0 in (17.68 m)
Max Take-Off Weight: 43,000 lb (19,504 kg)
Max Weapon Load: 4,500 lb (2,041 kg)
Installed Weapons: 2 × 30 mm cannon in nose; 2 × 23 mm cannon in tail turret
Other Weapons: A total of 4,500 lb (2,041 kg) of bombs
Max Level Speed: 580 mph (933 kmh) at 15,000 ft (4,572 m)
Typical Range: 1,500 miles (2,414 km) with max bomb load
In Service in: Algeria, China, Czechoslovakia, Egypt, Germany (Dem Rep), Hungary, Indonesia, Korea (N), Nigeria, Poland, Romania, Somalia, Syria, USSR, Vietnam (N), Yemen (N)

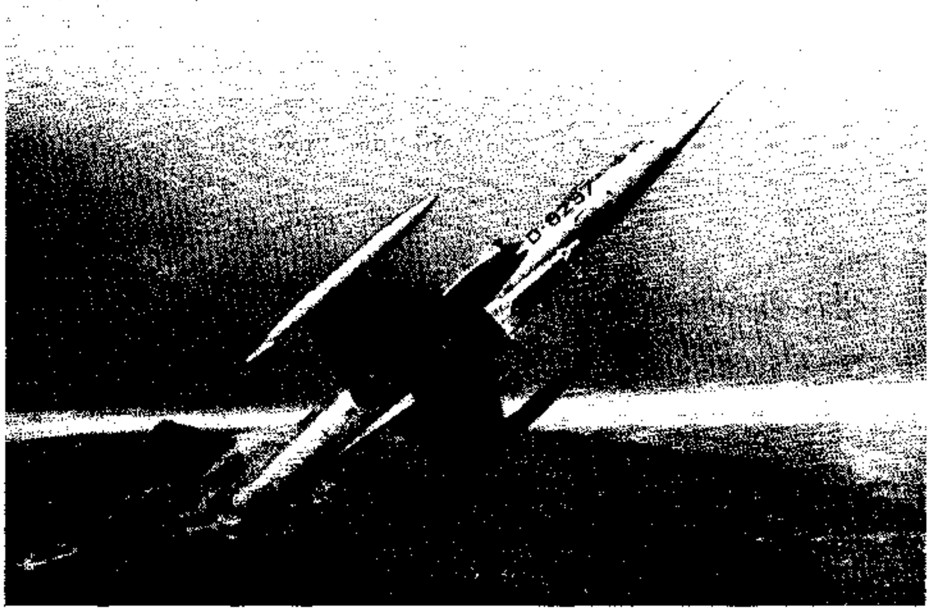
8049.302
A-7 CORSAIR II
LING-TEMCO-VOUGHT (USA)
Role(s): Single seat attack aircraft
Power Plant: 1 × 11,350 lb (5,150 kg) st Pratt and Whitney TF-30-P-6 turbofan
Wing Span: 38 ft 8¾ in (11.80 m)
Length Overall: 46 ft 1½ in (14.06 m)
Max Take-Off Weight: 32,500 lb (14,750 kg)
Max Weapon Load: 15,000 lb (6,800 kg)
Installed Weapons: 2 × 20 mm Mk 12 cannon in nose

Other Weapons: Typical weapon loads include:
24 × Mk 81 250 lb (113 kg) general-purpose bombs.
4 × Zuni rocket pods, 4 pods each containing 7 × 2.75 in rockets, and 4 pods each containing 19 × 2.75 in rockets.
1 × Shrike air-to-surface missile and 1 × Walleye glide bomb.
12 × Snakeye bombs.
4 × Bullpup A missiles and 2 × Shrike missiles.
2 × 2,000 lb (907 kg) bombs
Max Level Speed: 578 mph (930 kmh) at sea level
Typical Range: Radius of action 715 miles (1,150 km)
In Service with: US Navy, USAF



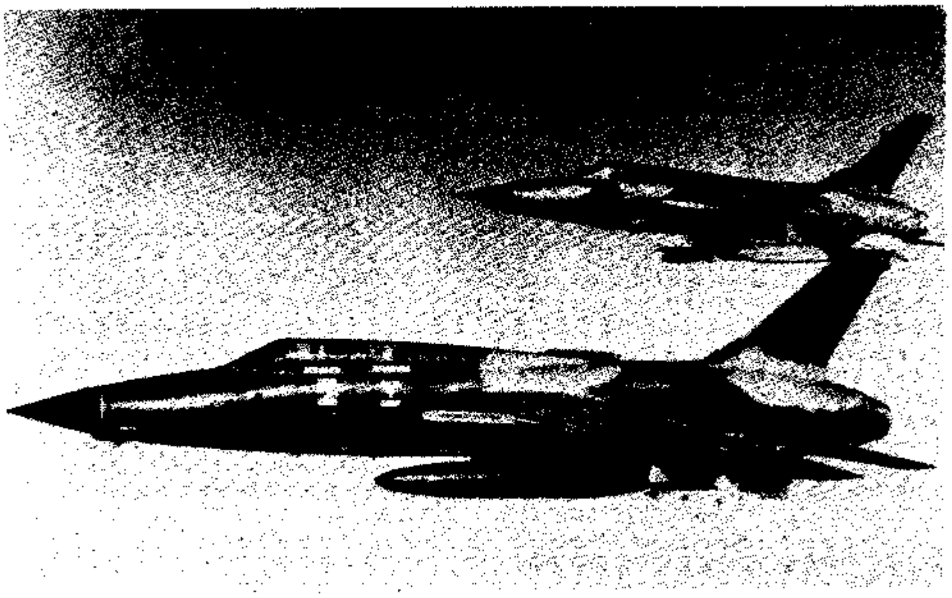
Corsair II with trials load which includes an instrumentation pod, Shrike anti-radar missiles, and camera pods

8051.302
F-104G STARFIGHTER
LOCKHEED (USA)
Role(s): Single-seat all-weather tactical strike and reconnaissance fighter
Power Plant: 1 × 15,800 lb (7,165 kg) st (with afterburning) General Electric J79-GE-11A turbojet
Wing Span: 21 ft 11 in (6.68 m)
Length Overall: 54 ft 9 in (16.69 m)
Max Take-Off Weight: 28,780 lb (13,054 kg)
Max Weapon Load: 4,800 lb (2,177 kg)
Other Weapons:
Bomb rack under fuselage for store weighing up to 2,000 lb (907 kg).
Underwing pylons can each carry a 1,000 lb (453 kg) store, fire bomb rocket pod, Sidewinder air-to-air missile, AGM-12B Bullpup air-to-surface missile or fuel tank.
Provision for 2 Sidewinders under fuselage and either a Sidewinder or fuel tank on each wingtip
Max Level Speed: Mach 2.2 at 36,000 ft (11,000 m)
Typical Range: Radius with max fuel 745 miles (1,200 km)
In Service with: Many NATO Air Forces, JASDF (similar version)



Royal Netherlands Air Force F-104 Starfighter with Sidewinders and wing tanks

8069.302
F-105D THUNDERCHIEF
REPUBLIC(USA)
Role(s): Single-seat long-range tactical fighter-bomber
Power Plant: 1 × 26,500 lb (12,030 kg) st (with afterburning) Pratt and Whitney J75-P-19W turbojet
Wing Span: 34 ft 11¼ in (10.65 m)
Length Overall: 67 ft 0¼ in (20.43 m)
Max Take-Off Weight: 52,546 lb (23,832 kg)
Installed Weapons: 1 × General Electric M-61 20 mm Vulcan automatic multi-barrel gun with 1,029 rounds
Other Weapons: Typical alternative loads are:
Nuclear store (plus 2 tanks of 650 and 450 gal).
4 × AGM-12 Bullpup missiles (plus 650 gal tank).
4 × Shrike + ECM pod.
2 × Standard ARM + ECM pod.
Nuclear weapon in bomb bay (plus 450 gal tanks).
2 × 3,000 lb (1,360 kg) bombs (plus 650 gal tank).
4 × Sidewinder missiles (plus 650 and 2,450 gal tanks).
9 × rocket packs.
9 × BLU-1/B fire-bombs or 9 × MLU-10/B mines or 16 × leaflet bombs, 750 lb (340 kg) bombs, or MC-1 toxic bombs

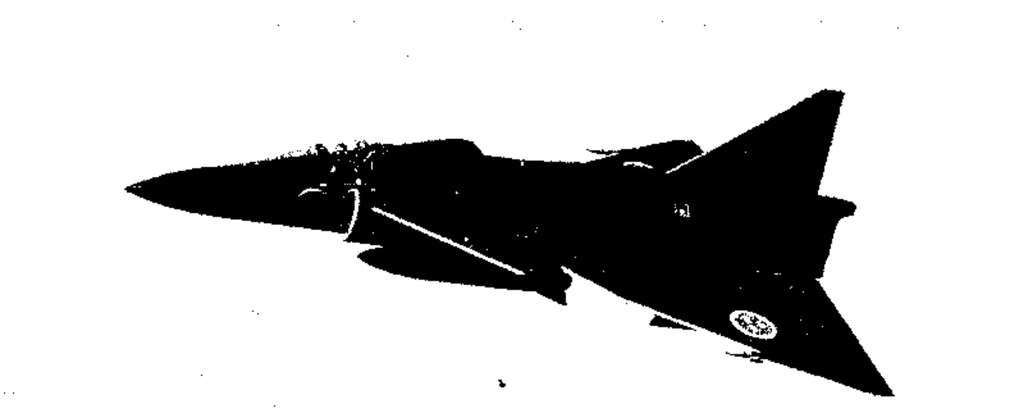


F-105F and F-105D Thunderchief aircraft

Max Level Speed:
Mach 1.11 at sea level.
Mach 2.1 above 36,000 ft (11,000 m)
Typical Range: With max fuel 2,070 miles (3,330 km)
In Service with: US Air Force

8072.302
AJ37 VIGGEN
SAAB (SWEDEN)
Role(s): Single-seat multi-mission combat aircraft
Power Plant: 1 × 26,450 lb (12,000 kg) st (with afterburning) Svenska Flygmotor RM8 (P and W JT8D-22) turbofan
Wing Span: 34 ft 9¼ in (10.60 m)
Length Overall: 53 ft 5¾ in (16.30 m)
Max Take-Off Weight: 35,275 lb (approx) (16,000 kg) with normal armament
Other Weapons: 3 attachments under fuselage

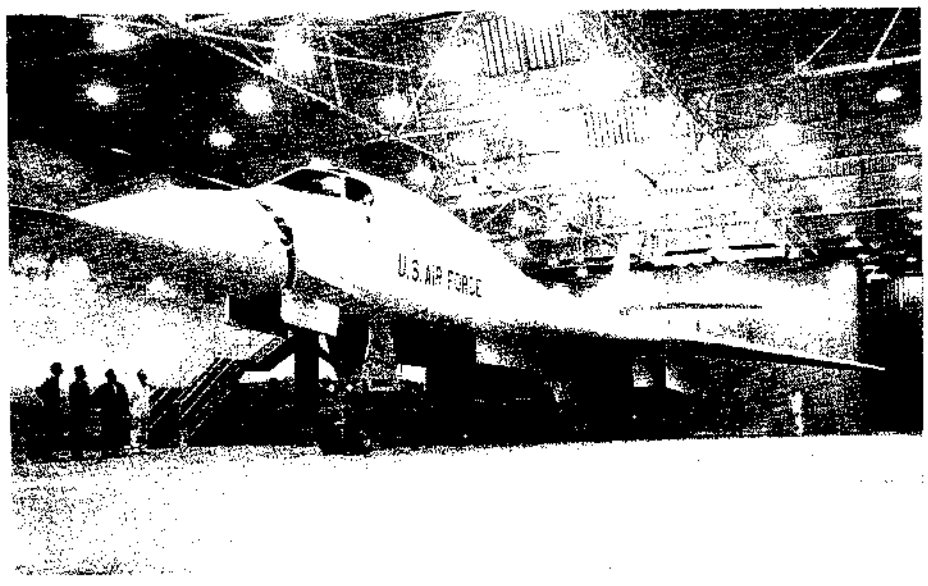
and 1 under each wing, for Rb 04 or Rb 05 air-to-surface missiles, plus alternative 30 mm gun packs, bombs, rockets or mines
Max Level Speed: (Above) Mach 2 at 36,000 ft (11,000 m)
In Service with: Swedish Air Force
Other Versions: The all-weather attack version (AJ37) went into service in 1971 and there are several operational squadrons. The two-seat trainer version (SK37) also is in service. Also in quantity production are two reconnaissance versions, the SH37 for combined maritime reconnaissance and attack and the SF37 for all-weather photo-reconnaissance. The latest version is the JA37 all weather fighter which is now in advanced development and test. Production of this version has been authorised and at least eight squadrons will be equipped, to replace Draken units from 1978 onward



Saab AJ37 Viggen

8095.302
B-57B CANBERRA
MARTIN (USA)
Role(s): 2 seat light tactical bomber
Power Plant: 2 × 7,200 lb (3,266 kg) st Wright J65-W 5 turbojets
Wing Span: 64 ft 0 in (19.5 m)
Length Overall: 65 ft 6 in (19.9 m)
Max Take-Off Weight: 55,000 lb (24,947 kg)
Installed Weapons: 8 × fixed forward-firing 0.50 in guns in nose
Other Weapons:
6,000 lb (2,721 kg) bomb load in rotary bomb-bay.
16 underwing points for rockets
Max Level Speed: 582 mph (937 kmh) at 40,000 ft (12,190 m)
Typical Range: 2,300 miles (3,700 m)
In Service in: USA, Pakistan, Taiwan.

STRATEGIC BOMBERS



Full-size B-1 bomber mock-up

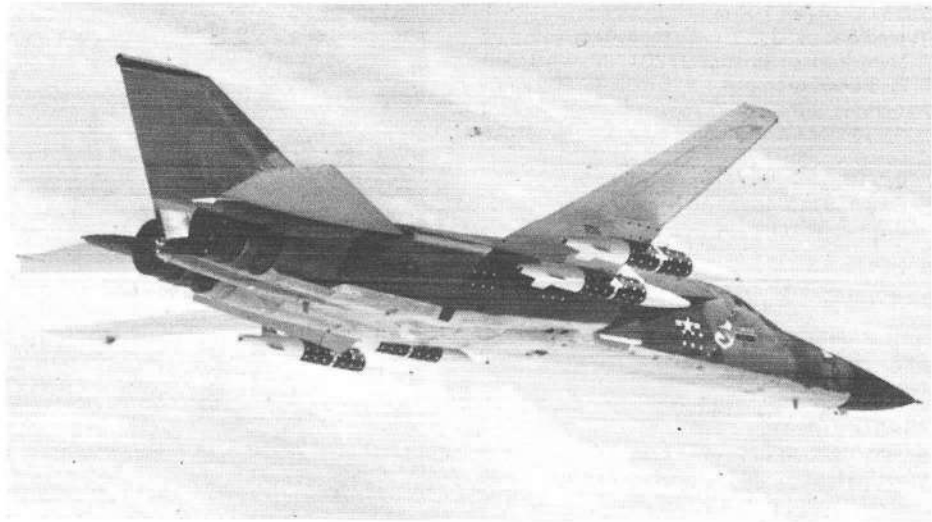
1582.302
B-1
NORTH AMERICAN ROCKWELL (USA)

Role(s): Long-range, low altitude penetrator strategic bomber
Crew: Normal – 4 (Pilot, Co-Pilot, two Systems Operators). Provisions for two instructors
Power Plant: 4 × 30,000 lb (13,600 kg) st class General Electric YF101-GE-100 turbofans with afterburner
Wing Span:
Wings forward 136.7 ft (41.6 m)
Wings swept 78.2 ft (23.8 m)
Length Overall: 150.2 ft (45.7 m)
Max Take-Off Weight: 398,800 lb (176,815 kg)
Weapons: 75,000 lb (34,000 kg) in three bays. Interchangeable mountings permit weapons mix: 24 SRAM (Short Range Attack Missiles), nuclear stores, conventional bombs
Max Level Speed:
Low-level penetration – high subsonic.
High altitude – above Mach 2.2
Typical Range: 6,100 miles (9,817 km) without refuelling
Under Development for: USAF as B-52 replacement
Systems Description:

In February 1972 Collins received contracts for almost $1.4 million for the development and production of the flight director computer, and an accident data recorder. The former will process data from navigation and approach radio systems, gyroscopes and other onboard sensors, and will display landing information to the flight crew. Displays will incorporate electronic display systems and vertical tape instruments.
A $62.4 million contract awarded to Boeing in April 1972 gives this concern responsibility for integration of all avionics hardware on the B-1.
In May, 1972 Boeing invited proposals from seven companies for the digital computer required – Singer General Precision Kearfott Division, Control Data Corporation, Univac, IBM, Texas Instruments, Honeywell, and General Electric. The Department of the Air Force, Headquarters Aeronautical Systems Division, has awarded an initial $2.5 million contract to Cutler-Hammer's AIL Division for Phase 1 of a two phase programme to develop the Radio Frequency Surveillance/Electronic Countermeasures subsystem (RFS/ECMS) for the B-1. The RFS/ECMS will provide the B-1 with the latest state-of-the-art electronic defences against hostile enemy radars. The objectives of the initial Phase 1 Programme are two fold: the completion of trade-off analysis to arrive at an optimum cost-effective subsystem configuration, and feasibility demonstrations of potentially high risk components prior to their selection for inclusion in the subsystem. The results of these efforts will reduce the cost risk and technical risk of the B-1 RFS/ECMS to acceptable levels prior to the initiation of the Phase 2 development and test programme.
AIL heads a team which includes Hallicrafters Company, and Sedco Systems, Inc, and will be responsible to the US Air Force for programme management and the overall technical configuration and performance of the RFS/ECMS. Hallicrafters, a major supplier of radar-jamming transmitters to the USAF, was selected by AIL for the new transmitter design. Sedco Systems, who will be responsible for the necessary antennas, has pioneered the development of sophisticated electronic countermeasures antennas for both the US Air Force and Navy. In addition to the overall technical and management responsibilities, AIL will be responsible for receiver and data processing design as well as for RFS/ECMS subsystem integration and test. The Phase 1 programme is a 10 month programme with the initiation of Phase 2 scheduled to commence about 45 days thereafter.
A Texas Instruments terrain following radar had been selected

8010.302
B-52H STRATOFORTRESS
BOEING(USA)
Role(s): Strategic heavy jet bomber
Power Plant: 8 × 17,000 (7,718 kg) st Pratt and Whitney TF33-P-3 turbofans
Wing Span: 185 ft 0 in (56.42 m)
Length Overall: 156 ft 0 in (47.55 m)
Max Take-Off Weight: 488,000 lb (221,350 kg)
Installed Weapons: 1 × M-61 20 mm gun in General Electric rear turret
Other Weapons: Normal offensive load comprises of 2 × AGM-29 Hound Dog missiles under wings and bombs in internal weapon-bay, or 20 × SRAM missiles. Provision for carrying ADM-20 Quail diversionary missiles
Max level speed: 660 mph (1,062 kmh) at 20,000 ft (6,096 m)
Typical Range: 12,500 miles (20,120 km)
In Service with: US Air Force

8033.302
FB-111A
GENERAL DYNAMICS (USA)
Role(s): 2-seat strategic bomber
Power Plant: 2 × Pratt and Whitney TF30-P-7 engines
Wing Span: Spread 70 ft 0 in (21.34 m), fully swept 33 ft 11 in (10.34 m)
Length Overall: 73 ft 6 in (22.40 m)
Other Weapons: Max load 50 × 750 lb (340 kg) bombs, of which two are carried in internal weapons bay and 48 in twin clusters of 3 on 8 underwing attachments. Full load carried with wings swept at 26°, reducing to 38 bombs (6 underwing attachments) at 54° of sweep, or 20 bombs at full sweep, or 4 × SRAM externally or plus 2 × SRAM in weapons bay
In Service with: US Air Force



FB-111 armed with SRAM

8043.302
VULCAN B Mk 2
HAWKER SIDDELEY (UK)
Role(s): 5-seat medium bomber
Power Plant: 4 × 20,000 lb (9,072 kg) st Rolls-Royce Bristol Olympus 301 turbojets
Wing Span: 111 ft 0 in (33.83 m)
Length Overall: 99 ft 11 in (30.45 m)
Max Take-Off Weight: Over 180,000 lb (81,646 kg)
Other Weapons:
Weapon load can include:
Hawker Siddeley Blue Steel air-to-surface missile.
Free fall nuclear weapons, or
21 × 1,000 lb (453 kg) high explosive bombs.
ECM and other defensive equipment in bulged tail-cone
Typical Tange: Combat radius:
At high and low altitude 1,725 miles (2,780 km).
At high altitude 2,300 miles (3,700 km).
With flight refuelling 2,875 miles (4,630 km)
In Service with: Royal Air Force

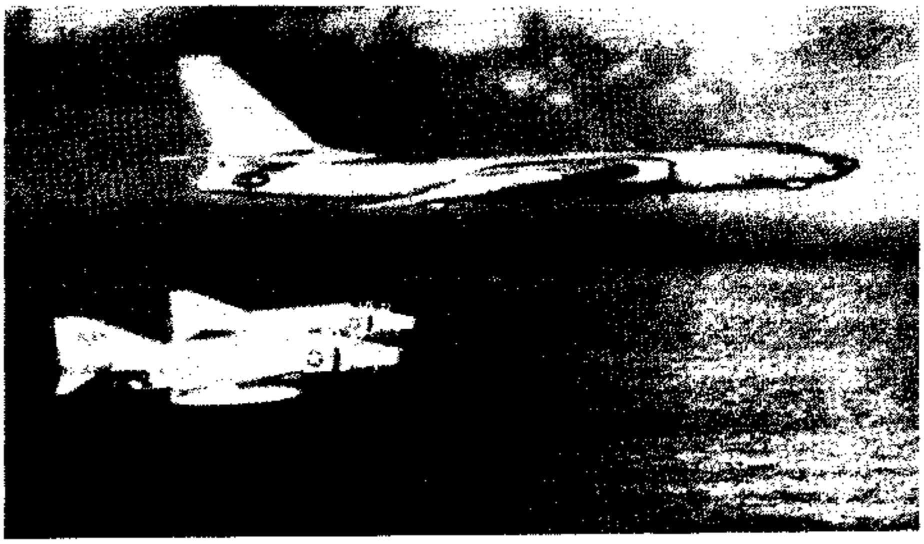
Vulcan B Mk 2

8060.302
Mya-4 (NATO "BISON")
MYASISHCHEV (USSR)
Role(s): 4-jet long-range reconnaissance bomber
Power Plant: 4 × 19,180 lb (8,700 kg) st Mikulin AM-3D turbojets
Wing Span: 170 ft 0 in (51.81 m)
Length Overall: 162 ft 0 in (49.37 m)
Max Take-Off Weight: 350,000 lb (158,757 kg)
Installed Weapons: Gun turrets in tail, above fuselage fore and aft of wing, and under fuselage fore and aft landing gear bays. (Thought to be equipped with 23 mm guns, 2 in each)
Other Weapons: Bomb load (normal) estimated at 9,000 lb (4,500 kg). Maximum load may be 19,800 lb (9,000 kg). Believed to be adapted to carry rocket-powered "stand off" type bomb with range of 50 miles (80 km)
Max Level Speed: 560 mph (900 kmh) at 36,000 ft (11,000 m)
Typical Range: 7,000 miles (11,265 km) at 520 mph (837 kmh) with 10,000 lb (4,535 kg) of bombs
In Service with: Soviet Air Force and Naval Air Force

1852.302
TUPOLEV V-g BOMBER (NATO "BACKFIRE")
TUPOLEV (USSR)
Role(s): Supersonic variable-gemoetry strategic bomber
Power Plant: Probably 2 × Kuznetsov NK-144 turbofans rated at 44,090 lb (20,000 kg) st (with reheat)
Max Take-Off Weight: 272,000 lb (123,350 kg) estimated
Max Level Speed: Mach 2.25 to 2.5 at height
Max Range: 6,000 miles (9,650 km) unrefuelled, at altitude
In Service with: Soviet Air Force

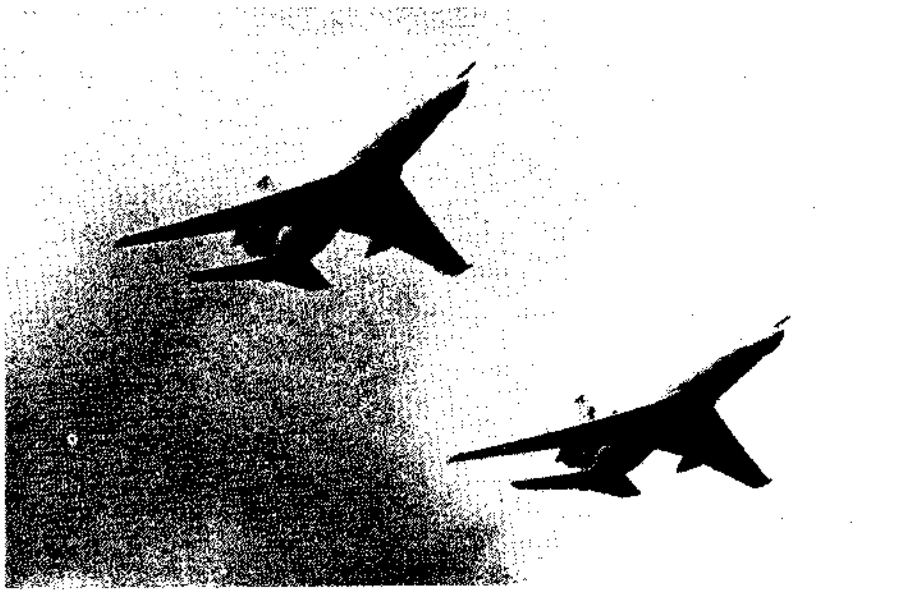
8084.302
Tu-16 (NATO "BADGER")
TUPOLEV (USSR)
Role(s): Medium bomber
Power Plant: 2 × 20,950 lb (9,500 kg) st Mikulin AM-3M turbojets
Wing Span: 110 ft 0 in (33.5 m) (estimated)
Length Overall: 120 ft 0 in (36.5 m) (estimated)
Max Take-Off Weight: 150,000 lb (68,000 kg) (estimated)
Max Weapon Load: Bomb-load up to 19,800 lb (9,000 kg) from bomb-bay
Installed Weapons:
Badger-A has 7 × 23 mm cannon in pairs in dorsal, ventral and tail turret and singly on starboard side of nose.
Badger-B is similar.
Badger-C has no nose cannon

Other Weapons:
Badger-A can carry up to 9 tons of bombs in bomb-bay.
Badger-B carries 2 × "Kennel" air-to-surface anti-shipping missiles under wing, instead of bombs.
Badger-C carries 1 × "Kipper" air-to-surface missile under the fuselage
Max Level Speed: 587 mph (945 kmh) at 35,000 ft (10,700 m)
Typical Range: 3,000 miles (4,800 km) with max bomb load. At 480 mph (770 kmh) with 6,000 lb (3,000 kg) bombs 3,975 miles (6,400 km)
In Service with:
All versions Soviet Air Force and Naval Air Force.
Badger-A Iraqi and Egyptian Air Forces.
Badger-B Indonesian Air Force.
Chinese Air Force



Tu-16 Badger escorted by USN F-4s

8086.302
Tu-22 (NATO "BLINDER")
TUPOLEV (USSR)
Role(s): Twin-jet supersonic bomber
Power Plant: 2 × unspecified turbojets with afterburners, dry rated at about 20,000 lb (9,071 kg) each
Wing Span: 80 ft 0 in (24.4 m)
Length Overall: 130 ft 0 in (39.6 m)
Mak Take-Off Weight: About 185,000 lb (83,914 kg)
Installed Weapons: 1 × gun in the radar-directed tail turret
Other Weapons: 1 × air-to-surface missile (NATO "Kitchen") carried internally by Blinder-A, and semi-submerged in underside of fuselage of Blinder-B
Max Level Speed: Mach 1.5 at 36,000 ft (11,000 m)
In Service with: Soviet Air Force and Naval Air Force



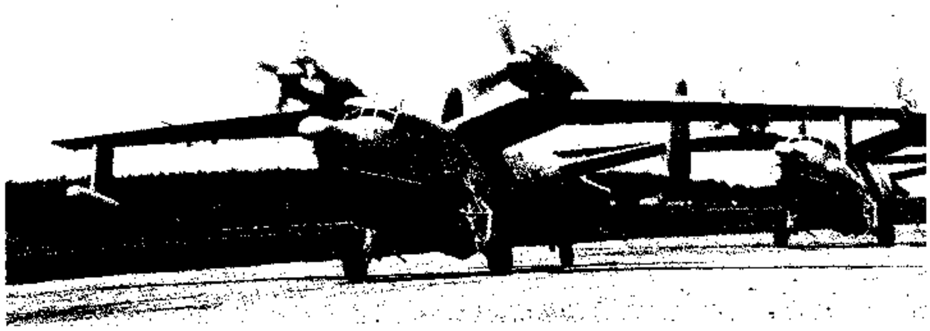
Tu-22 Blinder bombers

MARITIME AND ASW AIRCRAFT

8002.302
SHACKLETON MR Mk 3 PHASE 3
AVRO (UK)
Role(s): Long-range maritime-reconnaissance and ASR aircraft
Power Plant: 4 × 2,455 hp Rolls-Royce Griffon 57A piston-engines, and (RAF aircraft only) 2 × 2,500 lb (1,133 kg) st Rolls-Royce Bristol Viper 203 auxiliary turbojets
Wing Span: 119 ft 10 in (36.52 m)
Length Overall: 92 ft 6 in (28.19 m)
Max Take-Off Weight: 100,000 lb (45,360 kg)
Installed Weapons: 2 × 20 mm cannon in nose
Other Weapons: Bomb-bay carries a variety of anti-shipping weapons which include bombs, mines, depth charges, torpedoes, etc
Max Level Speed: 300 mph (483 kmh) at 12,000 ft (3,660 m)
Typical Range: At 200 mph (320 kmh) at 1,500 ft (460 m) 3,660 miles (5,890 km)
In Service with: South African Air Force

8008.302
Be-6 (NATO "MADGE")
BERIEV (USSR)
Role(s): Twin-engined reconnaissance and transport flying-boat
Power Plant: 2 × 2,000 hp ASh-73 radial engines
Wing Span: 108 ft 3¼ in (33 m)
Length Overall: 84 ft 0 in (25.6 m)
Max Take-Off Weight: 51,588 lb (23,400 kg)
Installed Weapons: Nose, dorsal and remotely-controlled tail gun-turrets containing 23 mm cannon
Other Weapons: Racks for bombs, mines, depth charges, torpedoes, etc, under wings, outboard of engines
Max Level Speed: 258 mph (415 kmh) at 7,875 ft (2,400 m)
Typical Range: 3,045 miles (4,900 km)
In Service with: Soviet Naval Air Force, Chinese Air Force

8009.302
Be-12 (NATO "MAIL")
BERIEV (USSR)
Role(s): Maritime reconnaissance amphibian
Power Plant: 2 × 4,000 ship Ivchenko AL-20D turboprops
Wing Span: 100 ft 0 in (30.5 m)
Length Overall: 100 ft 0 in (30.5 m)
Max Take-Off Weight: 65,000 lb (29,483 kg)
Other Weapons: In addition to the internal bomb-bay aft of the step, there is provision for one large or two small external stores pylons under each outer wing panel
In Service with: Soviet Naval Air Force

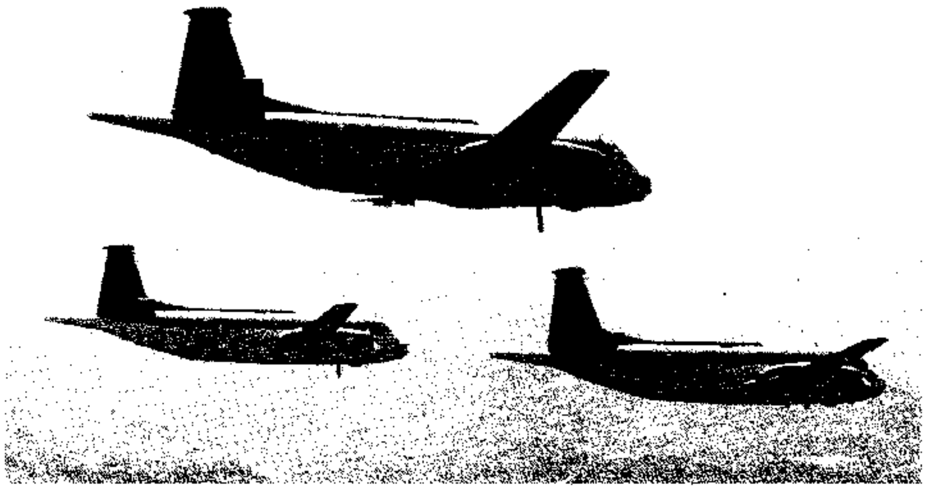


Be-12 Mail, maritime amphibian

1855.302
IL-38 (NATO "MAY")
ILYUSHIN (USSR)
Role(s): Anti-submarine/maritime patrol aircraft
Power Plant: 4 × Ivchenko A -20 turboprops of approx 4,250 ehp each
Wing Span: 122 ft 8½ in (37.4 m)
Length Overall: 129 ft 10 in (39.6 m)
Take-Off Weight: Approx 140,000 lb (63,500 kg) estimated
Max Cruising Speed: 347 knots (645 km/h) estimated
Max Range: 4,500 miles (7,250 km) estimated
In Service with: Soviet and Egyptian naval air forces

8011.302
Br 1050 ALIZE
BREGUET (FRANCE)
Role(s): 3-seat carrier-borne anti-submarine aircraft
Power Plant: 1 × 2,100 eshp Rolls-Royce Dart R Da 21 turbop
Wing Span: 51 ft 2 in (15.6 m)
Length Overall: 45 ft 6 in (13.86 m)
Max Take-Off Weight: 18,078 lb (8,200 kg)
Other Weapons:
Internal weapon bay for 3 × 353 lb (160 kg) depth charges or 1 × torpedo.
Racks under inner wings for 2 × 353 lb (160 kg) or 385 lb (175 kg) depth charges.
Racks under outer wings for 6 × 5 in rockets or 2 × Nord AS-12 air-to-surface missiles.
Sonobuoys in front of wheel housing
Max Level Speed: 292 mph (470 kmh) at 10,000 ft (3,048 m)
In Service with: French Navy, Indian Navy

8012.302
Br 1150 ATLANTIC
BREGUET (FRANCE)
Role(s): Long-range maritime reconnaissance aircraft
Power Plant: 2 × 6,105 eshp Hispano/Rolls-Royce Tyne R Ty 20 Mk 21 turboprops
Wing Span: 119 ft 1 in (36.30 m)
Length Overall: 104 ft 2 in (31.75 m)
Max Take-Off Weight: 95,900 lb (43,500 kg)
Other Weapons:: Main weapons carried in 30 ft (9 m) long bomb-bay in unpressurised lower fuselage. Weapons include:
All NATO standard bombs.
385 lb (157 kg) US or French depth charges.
HVAR rockets.
Homing torpedoes, including types such as the Mk 44 Brush or LX 4 with acoustic heads, or 4 × underwing air-to-surface missiles with nuclear or high explosive warheads
Max Level Speed: 380 mph (610 kmh) at high altitudes
Typical Range: 4,150 miles (7,700 km)
In Service with: French Navy, German Navy, Italian Navy and the Royal Netherlands Navy
Systems Description: Navigation of the Atlantic is performed in two modes, routine and tactical, the latter being concerned with 'on station' operations (ASW attack etc). Navigational aids include ADF, Tacan, VOR, Loran, doppler, air data computer and periscopic sextant. A Crouzet Type 61 navigation computer co-ordinates sensor inputs. Altitude and heading reference data are provided by a Sagem platform. There are two plotting tables with data projection facilities.



Br 1150 Atlantic ASW and maritime aircraft

Sensors fitted include a DRAA-2B search radar, APX-7 IFF interrogator, DHAX-1 MAD, ARAR-10B and ARAX-10B ECM, Mk 3B *Autolycus*, and *Julie* sonar equipment.
A more detailed description (Entry No. **1016.341**) appeared on pp 155-7 of JANE'S WEAPON SYSTEMS 1970-71

ATLANTIC Mk II
Development of an improved Mk II version of the Atlantic has been authorised for the French Navy, provisionally planned to enter service in 1982. In addition to enhanced ASW capability due to the use of a central digital computer to co-ordinate data from improved sonobuoys, new radar, MAD and an inertial navigation system, the Mk II version will provide wider facilities for the detection and engagement of surface targets. These include a new electronic warfare direction finder system, the new radar, and carriage of AS.12 wire-guided missiles, AS.37 anti-radiation Martel, and AM.39 air-to-surface Exocet anti-ship missile

---

8013.202
CP-107 (CL-28) ARGUS
CANADAIR (CANADA)
Role(s): Maritime reconnaissance aircraft
Power Plant: 4 × 3,700 hp Wright R-3350-EA-I Turbo-Compound piston-engines
Wing Span: 142 ft 3½ in (43.37 m)
Length Overall: 128 ft 9½ in (39.26 m)
Max Take-Off Weight: 148,000 lb (67,130 kg)
Other Weapons: 2 bomb bays, each capable of accommodating 4,000 lb (1,815 kg) of stores, including homing torpedoes. Provision for carrying 2 3,800 lb (1,725 kg) missiles under outer wings
Max Level Speed: 315 mph (507 kmh) at 20,000 ft (6,096 m)
Typical Range: 5,900 miles (9,495 km) at 223 mph (359 kmh)
In Service with: Canadian Armed Forces

8035.202
HU-16B ALBATROSS
GRUMMAN (USA)
Role(s): Anti-submarine amphibian
Power Plant: 2 × 1,425 hp Wright R-1820-76A engines
Wing Span: 96 ft 8 in (29.46 m)
Length Overall: 62 ft 10 in (19.18 m)
Max Take-Off Weight: 37,500 lb (17,010 kg)
Other Weapons: Provision for carrying depth charges
Max Level Speed: 236 mph (379 kmh) at sea level
Typical Range: With max fuel, 5% reserve, 30 min hold off 2,850 miles (4,587 km)
In Service in: Argentine, Brazil, Chine, Greece, Italy, Norway, Peru, Spain, Thailand and USA

8036.202
S-2E TRACKER
GRUMMAN (USA)
Role(s): 4-seat carrier-based anti-submarine attack aircraft
Power Plant: 2 × 1,525 hp Wright R-1820-82WA piston-engines
Wing Span: 72 ft 7 in (22.13 m)
Length Overall: 43 ft 6 in (13.26 m)
Max Take-Off Weight: 29,150 lb (13,222 kg)
Max Weapon Load: 4,810 lb (2,182 kg)
Weapons:
25 × echo-sounding depth charges in fuselage.
1 × Mk 101 or Mk 57 nuclear depth bomb or similar store in bomb bay.
32 × sonobuoys in nacelles.

Royal Australian Navy S-2 Tracker

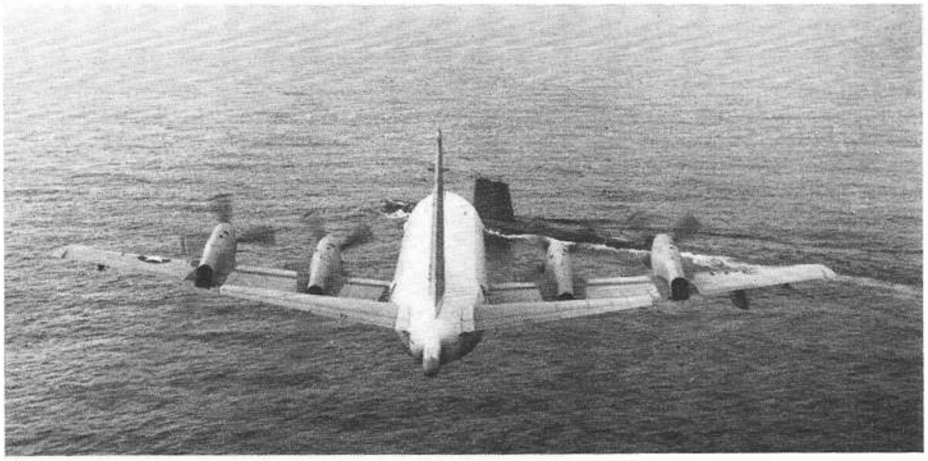
4 × float lights.
6 underwing pylons for 5 in rockets
Max Level Speed: Over 265 mph (426 kmh) at sea level with max take-off weight
Typical Range: Ferry range 1,300 miles (2,095 km)
In Service with: Argentine, Brazil, Chile, Canada, Italy, Japan, Netherlands, Taiwan, Uruguay, USA
Differing versions and designations apply to the aircraft used by the various countries
Systems Description: Navigation equipment carried includes the ASM-30 navigation computer display set, ASQ-80 co-ordinate data set, MF-1 compass system, APN-153 doppler, ADF, and Tacan, Search and detection equipment includes the APS-88A ASV search radar, ASR-3 condensation nuclei detector, ASQ-10A MAD, ARR-52A sonobuoy receiver, AQA-4 (System 2) *Jezebel* indicator, ASA-26B, *Julie* recorder, and UNH-6 tape recorder

8041.302
NIMROD MR Mk 1
HAWKER SIDDELEY (UK)
Role(s): Long-range anti-submarine aircraft
Power Plant: 4 × 11,500 lb (5,217 kg) st Rolls-Royce Spey Mk 250 turbofan
Wing Span: 114 ft 9½ in (35.00 m)
Length Overall: 126 ft 9 in (38.63 m)
Other Weapons: Ventral weapons bay, approximately 50 ft (15 m) long can accommodate full range of ASW weapons including bombs, mines, depth charges and torpedoes. Pylon beneath each wing can carry an 'AS 12' or 'Martel' air-to-surface missile
In Service with: Royal Air Force
Systems Description: Separate navigation systems are provided for routine and tactical navigation, but there are extensive interface arrangements between the two systems and each can serve as a back-up to the other. The two crew positions for navigation are located side-by-side, the tactical navigator acting as the attack co-ordinator during tactical operations.
Navigational equipment includes an Elliott E.3 inertial navigation system, Sperry gyrocompass, Decca doppler, Computing Devices Company wind computing and spherical data systems, AEI Mk I automatic variation computer, Tacan, ADF, Honeywell radio altimeter, air data computer, and Elliott and Ferranti display equipment. Special versions of the Smiths Industries SEP.6 autopilot and SFS.6 flight instrument systems are fitted.
Thomson-CSF ECM, MAD, *Autolycus*, sonar data receiving and processing equipment. Sensor data and navigation information are co-ordinated and processed by an Elliott MCS 920B digital computer.

Hawker Siddeley Nimrod MR Mk 1

It was announced in June 1971 that EMI is to develop an improved ASV radar for the Nimrod, and it was subsequently revealed that this was part of a major programme to provide a still more sophisticated avionics fit for the Nimrod. Other items include a new sono-buoy and complete aircraft sonics system, enhanced digital processing facilities, signal processing, and other improvements.
A more detailed description (Entry No. **1013.341**) appeared on pp 157-160 of JANE'S WEAPON SYSTEMS 1970-71.
Three special versions, designated R.Mk.1, are in use by the RAF for electronic reconnaissance

1402.302
ORION P-3
LOCKHEED (USA)
Role(s): Maritime Reconnaissance/anti-submarine aircraft, 12-man crew
Power Plant: 4 × Allison T56-A-14 4 910 eshp turboprop engines
Wing Span: 99 ft 8 in (30.37 m)
Length Overall: 116 ft 10 in (35.61 kg)
Max Take-Off Weight: 133,000 lb (60,325 kg)
Weapons: Carried internally and externally to max load 19,250 lb (8,730 kg) made up of
6 × 2,000 lb (907 kg- mines)
8 × Mk 57 depth bombs
8 × torpedoes
2 × Mk 101 nuclear depth bombs
plus sonobuoys, marine markets, etc
Max Level Speed: 413 kt (765 km/hr)
Typical Range: 3,000 nm (5,560 km)
In Service in: (in different marks) Australia, Iran, New Zealand, Norway, Spain, USA
System Description: Latest version of the Orion is the P-3C, in which the most significant difference from its predecessors (P-3A and B) was the development of a greatly improved electronics installation. This was described in detail on pages 162-4 of JANE'S WEAPON SYSTEMS 1970-71

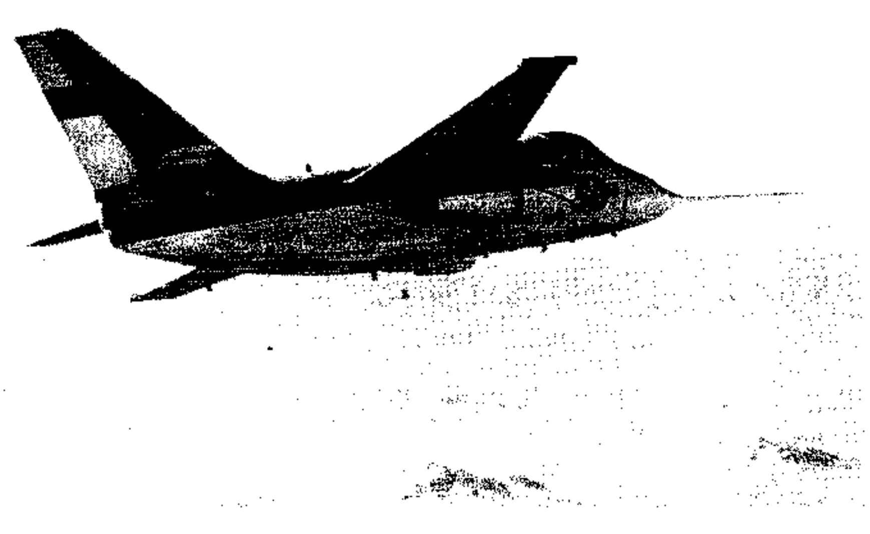


Lockheed P-3 Orion

8075.302
PS-1
SHIN MEIWA (JAPAN)
Role(s): 4-turboprop STOL maritime reconnaissance flying-boat
Power Plant: 4 × 2,850 shp General Electric T64-IHI-10 turboprops
Wing Span: 107 ft 7½ in (32.80 m)
Length Overall: 109 ft 11 in (39,400 kg)
Max Take-Off Weight: 86,862 lb (39,400 kg)
Max Weapon Load: 5,578 lb (2,530 kg)
Other Weapons:
2 underwing pods, between each pair of engine nacelles, each contain 2 × homing torpedoes.
6 × 5 in rockets on attachments under wing-tips.
4 × 330 lb (149 kg) anti-submarine bombs
Max Level Speed: 340 mph (547 kmh) at 5,000 ft (1,500 m)
Typical Range:
Normal range 1,347 miles (2,168 km)
Max range 2,948 miles (4,744 km)
In Service with: Japanese Maritime Self-Defence Force

1403.302
VIKING S-3A
LOCKHEED (USA)

Role(s): Carrier-based anti-submarine aircraft. Four-man crew
Power Plant: 2 × 9,000+ lb (4,080 kg) st General Electric TF-34-2 turbojets
Wing Span: 68 ft 8 in (20.92 m)
Length Overall: 53 ft 4 in (16.25 m)
Max Take-Off Weight: 41,000 lb (18,597 kg)
Other Weapons: Will include torpedoes, depth bombs, missiles, rockets, and mines
Max Level Speed: 495 mph (800 kmh)
Typical Range: 3,500 miles (5,630 km) – ferry range
In Production for: US Navy
Systems: The S 3A is the most recent American ASW aircraft programme to be undertaken, and this carrier-borne aircraft is equipped with the latest sensor and signal data processing systems and equipment. A full description appeared on pages 374 and 375 of JANE'S WEAPON SYSTEMS 1973-74. Projected introduction to operational service with the USN over the next few years will run at an annual rate of 45 aircraft per year



Lockheed S-3A Viking

EARLY WARNING AIRCRAFT

1304.302
E-3A AWACS – AIRBORNE WARNING AND CONTROL SYSTEM
BOEING (USA)

DESCRIPTION:
Originally planned and designed to fulfil both strategic and tactical airborne early warning and control functions for air defence and air superiority missions, the AWACS programme was changed in August 1973 to make it predominantly concerned with tactical roles only. At that time the US Secretary of Defence removed AWACS from the STRATEGIC CONUS Air Defence Forces and assigned it to the General Purpose Forces. Based on assessments made following prototype demonstrations in Europe in April 1973, and USN and US Army statements calling for the mutual support offered by AWACS in joint operations, it was considered that a more comprehensive and capable configuration of AWACS was needed to support General Purpose Forces. In November 1973 the USAF was authorised to continue the engineering development programme while accommodating the need to expand from the previously approved configuration. Procurement was planned on the basis of 12 AWACS per year from Fiscal Year 1975, successive annual batches incorporating enhancements as required and as available. The first batch has been defined as the basic AWACS plus a self-defence subsystem and a USAF satellite communications terminal. Funds were included to preserve options for the installation of additional improvement items in the second and third batches of aircraft for enhancement of Command, Control and Communications and survivability, a special IFF system and increased support to the other US Services. The final production decision on the first batch of 12 AWACS aircraft will be taken in December 1974. The tentative total procurement is 34 aircraft.
The aircraft employed is an adapted Boeing 707 and the systems were described on Page 375 of JANE'S WEAPON SYSTEMS 1973-74. Further details of the radar appear in this edition in Entry No. **1585.353**, in Section Three

AWACS evaluation and engineering development aircraft

1404.302
HAWKEYE E-2
GRUMMAN (USA)

Role(s): Naval airborne early warning aircraft
Power Plant: 2 × Allison T56 A 8 4,050 eshp turboprop engines
Wing Span: 80 ft 7 in (24.56 m)
Length Overall: 56 ft 4 in (17.17 m)
Maximum Take-Off Weight: 49,638 lb (22,515 kg)
Maximum Level Speed: 368 mph (953 kmh)
Typical Range: 1,905 miles (3,065 km) – ferry range
Systems Description: The E-2 Hawkeye series of aircraft exists in three versions, A, B and C. The E 2A has been in service for a number of years, and the E 2B differs principally in having more modern data processing facilities based on a Litton L-304 digital computer. US Navy E-2As are progressively being updated to E-2B standard. The E-2C, which is now in production, differs principally from the earlier versions in having an improved search radar. That in the E-2A and E 2B is the APS 96, and the E-2C has an APS 120 radar in improved form.
Operational functions of Hawkeye aircraft in support of naval forces are to patrol the extremes of land or fleet defence perimeters to detect air, sea or land threats, and those of strike and air traffic control, area surveillance, search and rescue guidance, and communications relay. To fulfil these roles the aircraft is equipped with ATDS, Airborne Tactical Data System, which consists of four basic elements the search radar, search computer, a larger digital computer for tracking and intercept control, and data links for the control of aircraft and communication with the overall Naval Tactical Data System (NTDS).
The search radar is housed in a 7.3 metre diameter radome mounted above the fuselage. The E 2B radome also has on its upper surface a small IFF antenna.
In the E-2C the APS-120 primary (search) and secondary (IFF) radars each have their own data extraction and signal processors, interfacing with the central processor. These are provided by the radar suppliers, General Electric and Hazeltine, respectively. Radar data and other information received via the data links is fed to the central processor, together with navigational data from the doppler/inertial, attitude and heading reference systems, and air data computer. Three display consoles are provided for the operators. The main display shows targets in PPI form or as synthetic video, with alpha-numeric and symbol labels. An auxiliary CRT unit is used for the presentation of tabular information selected by the operator.
The APS-96 radar used in the E-2A and E-2B versions operates in the P-band, with a coherent matched filter system and low PRF. To improve detection performance and MTI in the presence of clutter and ground returns overland, Grumman produced an improved version using the same transmitter chain but with a new receiver which incorporates clutter cancellation facilities.
This system was designated APS 111 and underwent a two-year test flight programme which ended in 1969. An improved version of this radar, the APS-120, is used in the E 2C, and it is used with an updated version of the APA-143 Rotodome antenna system provided by Dalmo Victor for other E-2 versions.
Present procurement plans call for the production of 23 E-2C aircraft over the next three years

1305.302
MOSS EARLY WARNING AIRCRAFT
TUPOLEV (USSR)

DESCRIPTION Moss is the NATO designation given to a version of the Tu 114 long-range passenger aircraft which has been converted for AWACS (Airborne Warning And Control System) operations.

The basic aircraft is a four-engined turboprop transport with a maximum take-off weight in that role of 171,000 kg. The service ceiling is 12,000 metres, and range 6,000 to 9,000 km, depending upon fuel and payloads. To adapt the Tu 114 for early warning roles, a configuration similar to that of the American E-2 Hawkeye has been employed, where a large circular radome is mounted above the rear part of the fuselage.

From the limited information available, little concerning the equipment or operation of Moss can be said with any certainty. The existence of the system was made public in 1968 in an official Soviet documentary film shown in the West

Airborne Early Warning aircraft "Moss"

1854.302
SHACKLETON AEW Mk 2
HAWKER SIDDELEY (UK)
Role(s): Airborne early warning aircraft
Power Plant: 4 × 2,455 hp Rolls-Royce Griffon 57A piston-engines
Wing Span: 119 ft 10 in (36.52 m)
Length Overall: 92 ft 6 in (28.19 m)
Max Take-Off Weight: 100,000 lb (45,360 kg)
Max Level Speed: 300 mph (483 km/h) at 12,000 ft (3,660 m)
Typical Range: 4,000 miles (6,440 km)
In Service with: Royal Air Force
Systems: Equipped with modernised and improved version of APS-20 search radar to provide Airborne Early Warning system facilities

RECONNAISSANCE AIRCRAFT

1667.302
SF37 and SH37 VIGGEN
SAAB-SCANIA (SWEDEN)

DESCRIPTION In the early part of 1973 it was announced that Saab-Scania had been awarded contracts by the Swedish Government for the development and production of reconnaissance versions of the Viggen (Entry No. **8072.302**) to replace the existing Saab S35E Draken and S32C Lansen aircraft currently used by the RSAF.

The reconnaissance aircraft now under development for future service consists of two Viggen versions:

(a) *SH37* for photo reconnaissance
(b) *SH37* for sea surveillance

Both versions will be equipped for all-weather operation, and both versions are developed from the same standard platform used for the AJ37 attack and SK37 trainer versions now in full production and service.

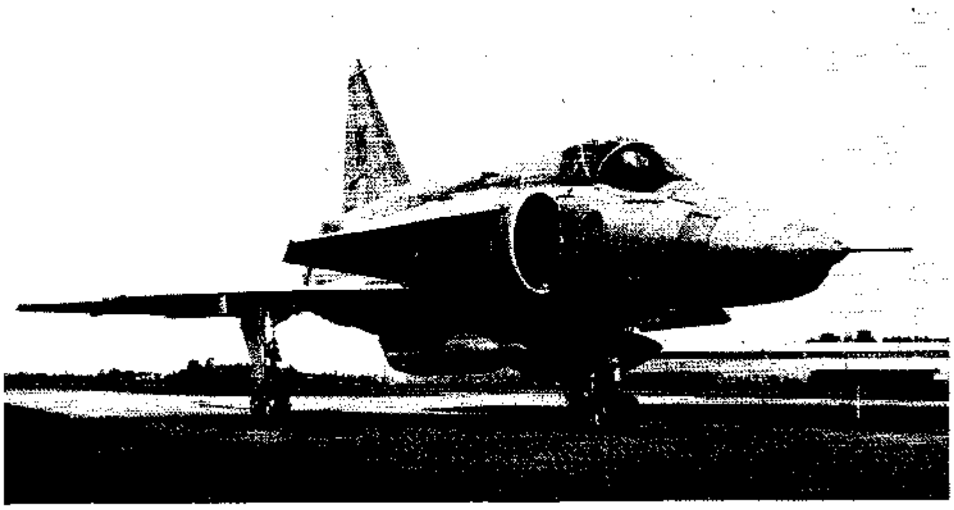
SH37

The primary mission of the SH37 is to survey, register and report activities in the neighbourhood of Sweden's territory, and it can also be used for attack missions. The reconnaissance equipment consists of surveillance radar, a camera for photographing the radar display, a long-distance camera, night photography equipment and various other registration systems including a data camera and a tape recorder.

SF37

The SF37 version is intended solely for reconnaissance missions. Its normal operational use will be over land. In the equipment are included cameras and other equipment permitting reconnaissance during daylight, dusk, darkness, at low and high altitudes and at long distances from the target. The systems configuration also makes possible detection of camouflaged targets and horizon-to-horizon (180°) photo coverage. To enable the pilot to aim the cameras correctly for high altitude and long-distance reconnaissance, the aircraft is equipped with a special optical sight. As in the SH37, the SF37 is fitted with data camera, tape recorder and other registration equipment. The data camera is an important aid in collecting and storing all information during the mission, and on the film are registered co-ordination figures, aircraft position, course, altitude, target location and other important data.

In contrast to earlier types of reconnaissance aircraft used in the Swedish Air Force (S29C, S32C and S35E), both Viggen reconnaissance versions will carry air-to-air missiles for self-defence. To reduce effectiveness of enemy action further, the aircraft will be equipped with active as well as passive counter-measures



The SF37 model of the two reconnaissance versions of the Saab Viggen

1405.302
MOHAWK OV-1
GRUMMAN (USA)
Role(s): Battlefield suveillance and reconnaissance aircraft
Power Plant: 2 × Lycoming T53-L-15, 1,100 eshp turboprops
Wing Span:
42 ft 0 in (12.80 m) OV-1A, C D.
48 ft 0 in (14.63 m) OV-1B
Length Overall: 41 ft 0 in (12.50 m)
Max Take-Off Weight:
15,031 lb (6,818 kg) OV-1A.
19,230 lb (8,722 kg) OV-1B, C
Max Level Speed:
308 mph (496 kmh) OV-1A, C
297 mph (478 kmh) OV-1B
Max Range (with external tanks):
1,410 miles (2,270 km) OV-1A
1,230 miles (1,980 km) OV-1B

1,155 miles (2,140 km) OV-1C
In Service with: US Army
Systems Description: The Mohawk is a multiple sensor aircraft for battlefield reconnaissance by both overflight and parallel surveillance. For the latter type of mission, a variety of sideways-looking sensors are employed. Both on-board recording of data, and real-time relay of information by data link to base stations are used. A detailed description of the Mohawk's sensor equipment appeared on page 377 of JANE'S WEAPON SYSTEMS 1973-74

US Army OV-1 Mohawk with Sideways Looking Radar

1409.302
RB-57F
GENERAL DYNAMICS (USA)
Role(s): High altitude reconnaissance – strategic and tactical
Power Plant: 2 × Pratt & Whitney 18,000 lb (8,165 kg) TF33-P-11 turbofan plus 2 × Pratt & Whitney 3,300 lb (1,500 kg) turbojets in underwing pods
Wing Span: 122 ft 5 in (37.32 m)
Length Overall: 69 ft 0 in (21.03 m)
Max Take-Off Weight: 50,000 lb (22,680 kg) estimated
Other Weapons: Active and passive reconnaissance sensors for intelligence gathering at the optical, infra-red and microwave frequencies
Max Level Speed: 450 kt (934 km/hr) class
In Service with: USAF

Special night reconnaissance and interdiction version of RB-57 used in Vietnam

1410.302
RA-5C
NORTH AMERICAN (USA)
Role(s): Two-seat, tactical reconnaissance from aircraft carriers
Power Plant: 2 × 17,900 lb (8,120 kg) GE J79-10 turbojet engine
Wing Span: 53 ft 0 in (16.15 m)
Length Overall: 76 ft 10 in (23.11 m)
Max Take-Off Weight: 80,000 lb (36,285 kg) approx
Other Weapons: Normal load multi-sensor reconnaissance pack. Attack capability retained. 4 × underwing weapon stations stressed for 3,000 lb (1,361 kg) each
Max Level Speed: Mach 2 approx
Typical Range: 1,500 nm (2,780 km)
In Service with: US Navy

1411.302
SR-71
LOCKHEED (USA)
Role(s): High altitude high speed strategic reconnaissance. Crew of 2
Power Plant: 2 × 32,500 lb (14,740 kg) Pratt & Whitney J58 turbojet engines
Wing Span: 55 ft 7 in (16.95 m)
Length Overall: 107 ft 5 in (32.74 m)
Other Weapons: Multi-sensor reconnaissance equipment with recorders for missions at high and low altitude and for tactical as well as strategic purposes. No offensive capability
Max Level Speed: Mach 3+ at 100,000 ft (30,500 m)
In Service with: Strategic Air Command 9th Strategic Reconnaissance Wing, USAF

Lockheed SR-71 high altitude reconnaissance aircraft

HELICOPTERS

8007.302
AH-1G HUEYCOBRA
BELL (USA)
Role(s): Armed helicopter
Power Plant: 1 × 1,100 shp (de-rated) Lycoming T53-L-13 shaft-turbine engine
Wing Span: 44 ft 0 in (13.41 m)
Length Overall: 53 ft 1¼ in (16.18 m)
Max Take-Off Weight: 9,500 lb (4,309 kg)
Installed Weapons: TAT 102 turret faired into the front fuselage undersurface houses a GAU2B/A Minigun 6-barrel 7.62 mm machine-gun, with 8,000 rounds. This will be fitted initially, but will be superseded later by the Emerson TAT-141 (XM28), mounting both the minigun (with 4,000 rounds) and an XM 120 40 mm grenade launcher with 300 rounds. Provision is made for alternative turret weapons including the M-61 (modified) 3-barrel version of the M-61 20 mm Vulcan gun, with 750 rounds
Other Weapons: 4 external stores attachments under the stub-wings will accommodate various loads including:
76 × 2.75 in rockets in 4 XM-159 packs.
2 × XM 18 minigun pods or
2 × pods each containing 3 TOW wire-guided missiles
Typical Range: A: 8,624 lb (3,912 kg) AUW 425 miles (684 km)
In Service with: US Army, US Marine Corps. Ordered for Iran and Spain
Development: Bell is engaged on a US Army contract calling for the modification of 101 AH-1G models to the AH-1Q TOW/Cobra configuration, in which the helicopter is equipped to

carry and launch 8 TOW anti-tank missiles. The XM-28 turret with a 7.62 mm minigun and a 40 mm grenade launcher is retained. Helmet sights will allow the crew to control the turret directly or provide target acquisition for the stabilised optics. The AH-1Q Hueycobra will carry 4,000 rounds of 7.62 mm, 300 rounds of 40 mm, eight TOW missiles, and fuel for over two hours. Another version is the AH-1J Sea Cobra used by the US Marines, and which in modified form is being supplied to Iran

The AH-1Q TOW/Cobra. Bell is modifying over 100 existing AH-IG HueyCobras to the TOW/Cobra configuration

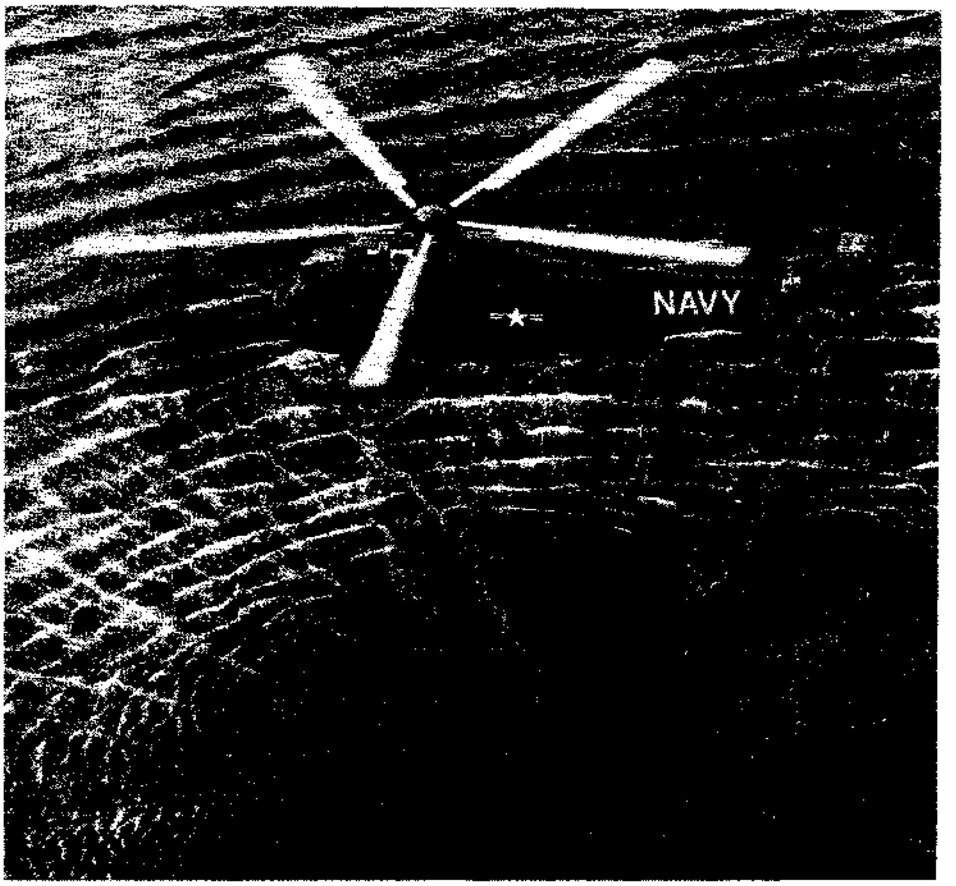
HH-2C SEASPRITE
KAMAN (USA)
Role(s): Armed search and rescue helicopter
Power Plant: 2 × 1,250 shp General Electric T58-GE-8B shaft-turbines
Rotor Diameter: 44 ft 0 in (13.41 m)
Length Overall: 52 ft 2 in (15.90 m)
Max Take-Off Weight: 12,840 lb (5,824 kg)
Installed Weapons: Chin-mounted Minigun turret, waist-mounted machine-guns
Max Level Speed: 156 mph (251 kmh) at sea level
Typical Range: 340 miles (545 km)
In Service with: US Navy

eg21853.302
Mi-24 (NATO "HIND")
MIL (USSR)
Role(s): Anti-tank and assault helicopter
Power Plant: 2 × Isotov TV2-117A turbo-shaft engines of 1500 shp
Rotor Diameter: 70 ft 3 in (22.0 m)
Length Overall:
83 ft 8 in (25.5 m) rotor turning
65 ft 6 in (19.96 m) fuselage
Max Weight: 26,500 lb (12,000 kg) estimated
Weapons: Total of four or six weapon stations on stub wings, including two launchers for Sagger A/T missile. Chin turret gun. 8-12 troops carried
Max Speed: 140 knots (260 km/h) estimated
Max Range: 260 nm (480 km) estimated

8047.302
Ka-25 (NATO "HORMONE")
KAMOV (USSR)
Role(s): Twin-turbine flying-crane helicopter
Power Plant: 2 × 900 shp Glushenkov shaft-turbine engines
Rotor Diameter: (Each) 51 ft 8 in (15.74 m)
Length Overall: 32 ft 3 in (9.83 m)
Max Take-Off Weight: 16,100 lb (7,300 kg)
Max Level Speed: 137 mph (220 kmh)
Typical Range: With standard fuel, with reserves, 250 miles (400 km). With max fuel, with reserves, 405 miles (650 km)
In Service with: Soviet Naval Air Force

8074.302
S-61B (H-3 SEA KING)
SIKORSKY (USA)
Role(s): Anti-submarine and transport helicopter
Power Plant: 2 × 1,400 shp General Electric T58-GE-10 shaft-turbine
Rotor Diameter: 62 ft 0 in (18.90 m)
Length Overall: 72 ft 8 in (22.15 m)
Max Take-Off Weight: 20,500 lb (9,300 kg)
Max Weapon Load: 840 lb (381 kg)
Other Weapons: 840 lb (381 kg) of homing torpedoes, depth charges, etc
Max Level Speed: 166 mph (267 kmh) at 20,500 (9,300 kg) AUW
Typical Range: With max fuel, 10% reserve, 625 miles (1,005 km)
In Service with: US Navy, Spanish Navy, Brazilian Navy, Royal Canadian Navy, Italian Navy and the Japanese Maritime Self-Defence Force



US Navy SH-3D, Sikorsky S-61 helicopter

1588.302
SA.330 PUMA
SNIAS / WESTLAND (FRANCE / UK)
Role(s): Tactical utility helicopter
Power Plant: 2 × Turbomeca Turmo III C4 turbines of 1,320 hp each
Rotor Diameter: 49 ft 3 in (15.00 m)
Length Overall: 59 ft 7 in (18.18 m)
Max Take-Off Weight: 14,110 lb (6,400 kg)
Max Level Speed: 151 knots (278 km / h)
Max Range: 340 nm (625 km)
In Service in: France, Portugal, South Africa, UK, Zaire

SA.330 Puma helicopter in RAF service

1668.302
SA.341 GAZELLE
WESTLAND / AÉROSPATIALE (UK / FRANCE)
Role(s): Light tactical utility helicopter
Power Plant: 1 × Turbomeca Astazou 3 gas turbine of 530 shp
Rotor Diameter: 34 ft 6 in (10.5 m)
Length Overall: 39 ft 2 in (11.9 m)
Max Take-Off Weight: 3,750 lb (1,700 kg)
Max Speed: 167 knots (310 km / h)
In Service or Ordered for: French Army, British Army, RN, RAF, and Yugoslavian Air Force

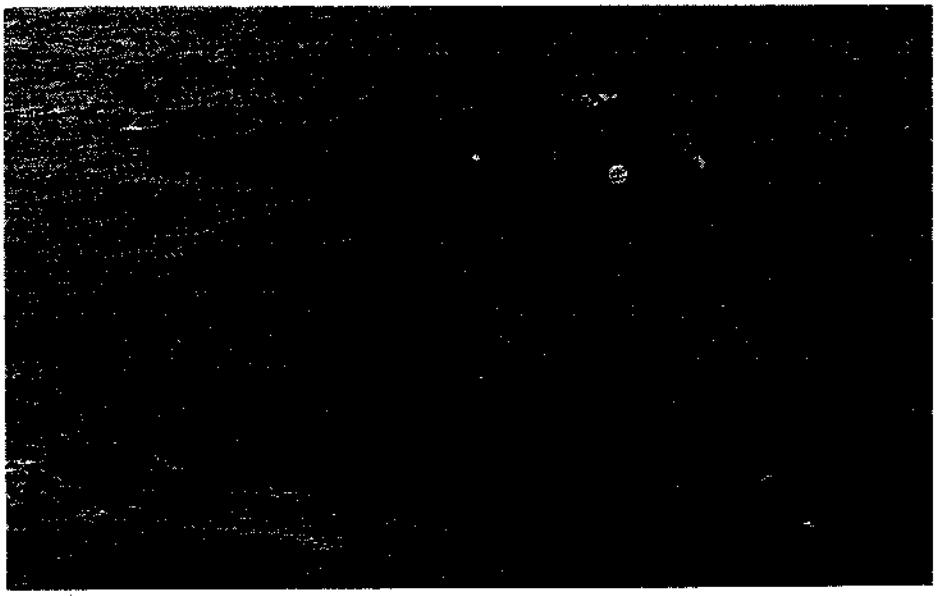
SA.341 Gazelle helicopter in British Army colours

8078.302
SE 3160 ALOUETTE III
SUD-AVIATION (FRANCE)
Role(s): General-purpose, armed reconnaissance and anti-tank helicopter
Power Plant: 1 × 870 shp (derated to 550 shp) Turbomeca Artouste IIIB shaft-turbine engine
Rotor Diameter: 36 ft 1 in (11.0 m)
Lenfth Overall:
42 ft 0¾ in (12.82 m) rotor turning
33 ft 4½ in (10.17 m) blades folded
Max Take-Off Weight: 4,630 lb (2,100 kg)
Other Weapons: Wide range of alternative armament includes:
AS 11 and AS 12 wire-guided missiles with gyro-stabilised sight.
Quick-firing 20 mm cannon.
Side mounted 7.62 mm machine gun.
2 × pods each containing 18 or 36 rockets.
An ASW version of the Alouette III fitted with MAD and carrying a Mk 44 homing torpedo is under development
Max Level Speed: 131 mph (210 kmh) at sea level
Typical Range:
Range with 1,800 lb (820 kg) payload at Sea Level 62 miles (100 km).
Range with 1,400 lb (635 kg) payload at Sea Level 186 miles (300 km).
Range with max fuel at Sea Level 342 miles (550 km).
Range at best altitude 385 miles (620 km)

8079.302
SA 321G SUPER FRELON
SUD-AVIATION (FRANCE)
Role(s): Naval anti-submarine helicopter
Power Plant: 3 × 1,500 shp Turbomeca Turmo IIIC3 shaft-turbines
Rotor Diameter: 62 ft 0 in (18.90 m)
Length Overall:
75 ft 6⅞ in (23.02 m) rotor turning.
65 ft 10¾ in (20.08 m) fuselage length including tail rotor.
56 ft 0 in (17.07 m) naval version blades and tail folded
Max Take-Off Weight: 26,455 lb (12,000 kg)
Other Weapons: Anti-submarine attack weapons in naval version
Max Level Speed: 158 mph (255 kmh) at sea level
Typical Range: At Sea Level 572 miles (920 kmh)
In Service with: French Navy

8088.302
SEA KING
WESTLAND (UK)
Role(s): Anti-submarine and general-purpose helicopter
Power Plant: 2 × 1,500 shp Rolls-Royce Gnome H 1400 shaft-turbines
Rotor Diameter: 62 ft 0 in (18.90 m)
Length Overall: 47 ft 3 in (14.40 m) rotors and tail pylon folded
Max Take-Off Weight: 20,500 lb (9,300 kg)
Other Weapons: Up to 4 torpedoes or bombs and / or depth charges
Max Level Speed: 161 mph (259 kmh)
Typical Range: With standard fuel 690 miles (1,110 km)
In Service with: The Royal Navy, Belgian Air Force, West German Navy, Indian Navy, Norwegian Air Force, Pakistan Air Force, Royal Australian Air Force
Systems Description: The Westland Sea King helicopter performs a variety of naval operational roles. The principal functions are ASW, SAR (search and rescue), air to surface strike, cargo, casualty evacuation and personnel carrying. The Westland version of the Sea King is claimed to be unique in that its standard of

equipment enables it to be used as a platform for tactical control and co-ordination of submarine search and attack operation involving both surface and airborne units. A full description of the Sea King's systems appeared on page 380 of JANE'S WEAPONS SYSTEMS 1973-74

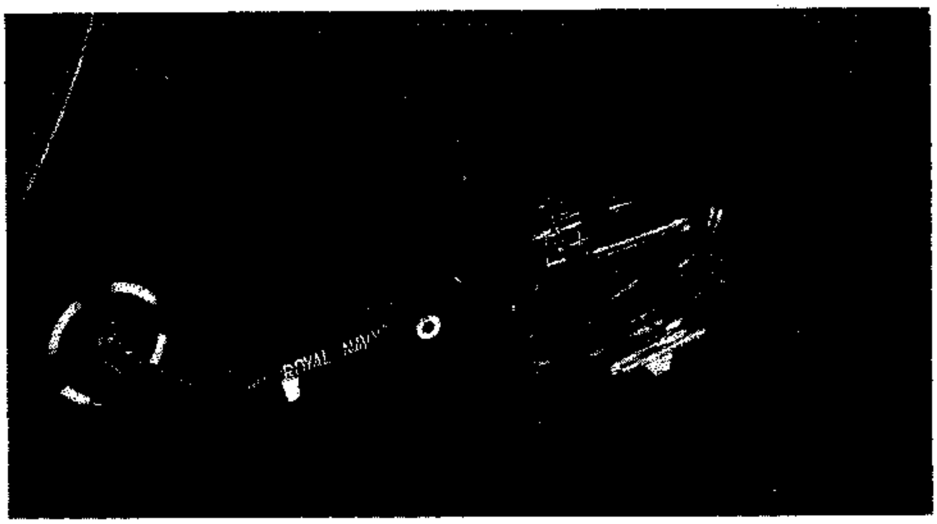


Westland Sea King of the German Navy during SAR trials

8089.302
WESSEX HAS Mk 3
WESTLAND (UK)
Role(s): 4-seat anti-submarine helicopter
Power Plant: 1 × 1,600 shp flat-rated Gazelle NGa 22 Mk 165 shaft-turbine engine
Rotor Diameter: 56 ft 0 in (17.07 m)
Length Overall: 65 ft 9 in (20.03 m)
Other Weapons: Anti-submarine strike weapons
In Service with: Royal Navy, Royal Australian Navy (similar version)

1587.302
WG-13 LYNX
WESTLAND (UK)
Role(s): Anti-submarine, surface strike, training, general purpose
Power Plant: 2 × Rolls-Royce BS 360-07-26 three-shaft, free turbine engines, of 900 shp rating
Rotor Diameter: 42 ft (12.80 m)
Length Overall:
49 ft 9 in (15.16 m) rotor turning
41 ft 10¾ in (12.77 m) rotor folded
Max Take-Off Weight:
8,000 lb (3,630 kg) general purpose version.
8,550 lb (3,879 kg) naval version
Weapons: A variety of weapon options are possible, depending upon role:
2 × Mk 44 torpedoes.
Internal and external fixed weapons.
AS 12 or SS 11 missiles.
CL.834 anti-ship missile (under development)
Max Level Speed: 160 knots (294 km/h) – general purpose version
Typical Range: 440 nm (810 km) – general purpose version
In Production for: French and British Services
Army Variant: The fuselage of the Army variant has been designed for maximum weapon system flexibility whilst still retaining high speed and performance. Radio, navigational and auto-pilot facilities are available to meet particular operational requirements. These include UHF/VHF radio, IFF equipment, doppler navigation system, tactical map display, Decca Mk 19 and radio altimeter. The duplex flight stabiliser and auto-pilot are designed on a modular basis to give optional auto-pilot capabilities ranging from datum holding, indicated airspeed, barometric height and heading to automatic turns on to preselected headings, automatic transition to the hover and hover control.
Role equipment is available to meet troop transport (10 troops), freight carriage, rescue and casualty evacuation (3 stretchers) roles. A full weapon load can be carried for a highly flexible weapon response. Armament installations can include 2 × 7.62 mm G.P.N.G.s, 2 × 7.62 mini-guns and a pintal mounted 20 mm cannon which can be mounted in the doorways on quick release fasteners allowing rapid interchange of armament.
For anti-tank missions either SS11 or Hawkswing missiles can be carried. Avimo Ferranti or APX stabilised sighting systems are available for use in conjunction with the missiles. The Hawkswing missile can be fired and controlled while the helicopter is undertaking evasive manoeuvres. Facilities are available for carrying

WG-13 Lynx helicopter in the British Army configuration



WG-13 Naval Lynx carrying AS.12 air-to-surface missiles two bomb racks with a total complement of up to eight light stores.

Naval Variant: With a similar fuselage assembly to the army variant, and employing the same dynamic components, the naval variant has been designed as a powerful extension of small ships' weapon systems. The naval variant has a high energy absorption tricycle undercarriage designed specially to enable it to operate from small ships in rough conditions. The same wide range of radio, navigational and auto-pilot facilities are available as on the army version but with further augmentation by a Ferranti Sea Spray nose radar installation. The Lynx helicopter will form an integral part of small ship armament and is so designed to provide a complete weapon system in ASW or ASV roles and also provide the other miscellaneous requirements such as SAR and ship to ship communication.

An integrated weapon system is provided for anti-submarine warfare. Two homing torpedoes or two depth charges as alternative weapons can be carried, mounted one on each side of the cabin. Two light series bomb racks are also carried, one under each wheel sponson with a total complement of six light series stores. Provisions are made for the carriage and dropping of sonar buoys and MAD classification system can be deployed. Dunking sonar can be installed as an alternative fit.

The Lynx is also designed as a search and strike system against surface targets. The new BAC CL 834, Skua, light-weight missile will be installed on the Royal Navy Lynx helicopters to provide long-range defence for frigates against missile carrying fast patrol boats, hydrofoils and hovercraft. The operational range will enable CL 834 to strike long before any defensive missile on the parent ship itself could successfully engage the target, and the general performance of this important new defensive system will far outstrip that of existing missile equipped naval helicopters. For the French naval version of the Lynx four AS 12 wire guided missiles will be fitted. With these missiles a stabilised APX B34 sight will be provided for surveillance and missile control

1412.302
KIOWA OH-58A
BELL (USA)

Role(s): 2-seat light tactical armed observation helicopter
Power Plant: 1 × Allison T63-A-700 270 shp shaft turbine engine
Rotor Diameter: 33 ft 4 in (10.14 m)
Length Overall: 41 ft (12.5 m)
Max Take-Off Weight: 3,000 lb (1,361 kg)
Other Weapons: XM134 7.62 mm minigun or XM 8,440 mm grenade launcher or 2.75 in rocket pod; XM170E1 sighting system
Max Level Speed: 115 kt (213 km/h)
Typical Range: 300 nm (556 km)
In Service with: (in different marks) US Navy, US Army, Brazil AF, Israeli AF

1398.302
LAMPS HELICOPTER

DESCRIPTION LAMPS (Light Airborne Multi-Purpose System) is the designation of a US Navy programme calling for a ship-borne helicopter system to perform anti-submarine and missile defence functions with search and rescue, and a wide variety of other missions as secondary roles.

Three Marks of LAMPS have been nominated, as follows: Mk I is the current operational system which originated in 1970 with the Kaman Aerospace Corporation response to a $2-million contract for the conversion of a number of Kaman H-2 Seasprite helicopters for the new role. These aircraft were designated SH-2D and during 1972 twelve of these helicopters were deployed aboard USN Belknap Class guided missile frigates and escorts of the DE 1052 Knox class. A similar quantity followed in 1973. In the same year a further improved version, the SH-2F entered service and this version now represents the standard LAMPS Mk I configuration. Virtually all H-2 and SH-2D helicopters will be brought up to this standard and more than 50 have already been converted.

The Mk II was to have differed principally in the use of advanced electronics and sensor equipment, and two YSH-2E helicopters were assigned as test vehicles for this programme. Non-availability of the advanced equipment in production quantities led to the cancellation of the Mk II effort as a production programme and the data and experience acquired was transferred to the Mk III programme.

The Mk III programme is geared to a much slower pace and at the time of closing for press

Kaman SH-2D LAMPS helicopter

neither a systems integration contractor nor an airframe prime contractor had been selected. The Mk I LAMPS thus represents the definitive system for the foreseeable future.

A modified Canadian Marconi Company small boat radar is fitted in a 'chin' radome to provide ASV facilities, and this is based on the solid state LN 66 set. This is a 10 kW, X-band radar, designed for good sub-clutter visibility. 25 cm or 18 cm diameter displays are available. The ASQ-10 magnetic anomally detector used on the Orion P-3C maritime aircraft is fitted to the LAMPS helicopter in a cable-towed form and designated ASQ-81. Fifteen sonobuoys, SSQ-41 or SSQ-47 types, can be carried internally and an ARR-52 sonobuoy receiver is installed for the retrieval of data from them after they have been dropped.

Other avionics include the APN-182 doppler navigator, ASN-50 attitude and heading reference system, APN-171 radio altimeter, two ARC-159 UHF radios, and an AYK-2 navigation computer, AKT-22 data link set, ALR-54 countermeasures receiver, Tacan, IFF, and ADF

SUBMARINES

SUBMARINES CARRYING STRATEGIC MISSILES (6601.402)

Category (JWS) Name/Class/Type	Years Completed	No. in Class	Displacement (Full Load) tons	Type and No. of Missiles	Other Weapons
CHINA (PEOPLE'S REPUBLIC OF)					
G class: Ballistic missile type submarine	1964	1	2,350 surface 2,800 submerged	3 x *Sark* launching tubes (no evidence of missiles)	Torpedo tubes: 6 x 21 in (533 mm)
FRANCE					
Le Redoutable class: Nuclear powered ballistic missile submarines	1971–78	5	7,500 surface 9,000 submerged	16 x tubes for MSBS Type ICBMs	Torpedo tubes: 4 (18 torpedoes)
Gymnote: Experimental missile submarine	1966	1	3,000 surface 3,250 submerged	4 x tubes for MSBS Type ICBMs

SECTION THREE – EQUIPMENT

ORDNANCE

ELECTRONIC AND OPTICAL EQUIPMENT

ARMY ORDNANCE

INTRODUCTION

This section of the book is devoted to descriptions of those heavier weapons with which the land forces are equipped, and which have not already been described in Section One under the various weapon system headings.

There is such a wide variety of these weapons and so many overlapping uses to which they can be put that the selection of entries for this section presents many problems. A further complication is that most of the heavier guns are highly durable pieces of equipment, and many of them continue in service – often in countries other than those in which they were manufactured – for many years after the cessation of manufacture. To present anything like a reasonable picture of the range of weapons in service, therefore, it is necessary to go far beyond the list of weapons regarded as current by those who are developing and making such weapons. Moreover, it is not always easy to be sure whether or not a particular weapon should still be regarded as current; and sufficient detail to warrant an entry is more easily obtained from some sources than it is from others. It is important for the reader to understand, therefore, that the list of weapons in this section is not exhaustive on the one hand, and that on the other hand, some of the weapons included in it may no longer be in service anywhere.

Subject to these reservations, the following notes indicate the scope of the section.

1. *Classes of weapons (not necessarily mutually exclusive)*
   Field Guns
   Howitzers
   Tank Guns
   Anti-tank guns
   Anti-aircraft guns
   Recoilless weapons
   Cannon
   Unguided artillery rockets (in separate sub-section)
   Mortars (in separate sub-section)
   Man-portable anti tank weapons (in separate sub-section)
2. *Sizes of weapons*
   Generally only weapons of calibre 20 mm and above are included. An exception is made in favour of including some smaller weapons when used in multiple mountings.
3. *Other criteria and methods of arrangement*
   To be included a weapon must be (a) believed to be in service with active or reserve formations of at least one country – not necessarily its country of origin – or (b) in development and expected to enter service at some future date; or (c) in current development or production and on offer for sale to suitable customers; or (d) no longer in service but convenient as a reference for its derivatives.

A weapon satisfying these criteria and in service – even if only in reserve – in its country of origin is listed under that country.

A weapon no longer in service in its country of origin but satisfying the criteria for two or more other countries is entered under its country of origin.

A weapon which is in service in only one country but satisfying the criteria is entered under that country even though it may not be the country of origin. The same treatment is given to a weapon which is put to a special use in only one country.

A weapon or weapon variant being *developed* in only one country but not yet in service is listed under that country.

A weapon *developed* by more than one country as a collaborative venture is entered under the "International" heading. Weapons manufactured under licence or copied in a country other than the country of origin are generally entered under both country headings.

ALBANIA

2012.103
ALBANIAN ORDNANCE

Albania has no indigenous armaments industry of any consequence, and thus relies on imported weapons for the equipment of her armed forces. Within the confines of a small national budget, even though defence expenditure takes a larger share of the GNP than it does in most countries, there is little money available for weapon imports.

Much of the equipment and almost all the heavy weapons of the Albanian Army therefore date from before Albania's withdrawal from the Warsaw Pact group of countries. Little has been received from the Chinese People's Republic, with which Albania is now aligned; and, so far as is known, all artillery and related weapons are of Russian origin.

Most of these weapons are of Second World War or very early post-war date, because they are no longer in service with active formations in their country of origin, some brief details are given in the following entries. Weapons in service with the Albanian forces and described elsewhere in this book are listed below.

152 mm gun-howitzer M-37 (**2886.103**)
152 mm field howitzer M-43 (**2885.103**)
122 mm howitzer M-38 (**5520.103**)
85 mm AA gun M-44 (**5580.103**)
76 mm anti-tank gun M-42 (**5516.103**)
57 mm AA gun M-50 (**5514.103**)
37 mm AA gun M-38/39 (**2887.103**)
14.5 mm (quad-mounted) AA MG (**5582.103**)
160 mm mortar M-43 (**5568.103**)
120 mm mortar M-43 (**5567.103**)
82 mm mortar M-37 (**5566.103**)

2014.103
76 mm SP ANTI-TANK GUN SU-76

DESCRIPTION:

This self-propelled anti-tank gun equips the infantry brigades of the Albanian Army. Designed in Russia at the end of the Second World War, it is believed to be no longer in service in that country. It comprises a high-velocity 76.2 mm gun mounted on a lengthened T70 light tank chassis.

CHARACTERISTICS:
Gun:
Calibre: 76.2 mm
Barrel length: 42 calibres
MV: 662 m/sec (ATk)
Vehicle:
Crew: 4
Weight: 11.2 t
Engines: 2 × 85 bhp Otto
Road speed/range: 45 km/h/230 km
Length: 5.1 m
Width: 2.73 m
Height: 2.3 m
Ground pressure: 0.6 kg/cm²

STATUS:
In service.

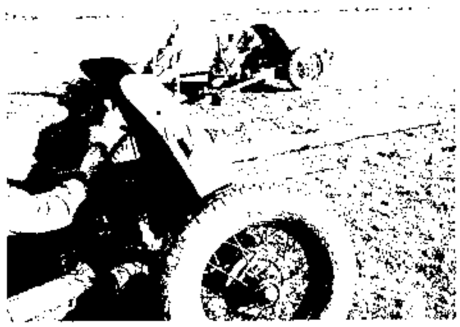
2013.103
45 mm ANTI-TANK GUN M-37

DESCRIPTION:

Deployed in active formations of the Albanian defence forces, this is a Second World War weapon of the Russian Army which is no longer used in its country of origin.

CHARACTERISTICS:
Calibre: 45 mm
Barrel length: 46 calibres
Elevation: −8° to +25°
Traverse: 60°
Weight in firing order: 510 kg
Shell weight: 1.43 kg
MV: 760 m/sec
Range: 8,900 m
Rate of fire: 30 rounds/min
Penetration: 60 mm at 500 m and 90°

STATUS:
In service, but presumably obsolescent.



M-37 45 mm anti-tank Gun

AUSTRIA

2015.103
AUSTRIAN ORDNANCE

Austria's central European location and slow disengagement from the post-war occupying powers are among the reasons why the Austrian Army is equipped with weapons obtained from Czechoslovakia as well as from NATO and neutral countries. The Czechoslovakian link is also an historical one: much of the artillery of the Austro-Hungarian Empire was made at the Skoda works.

Most current Austrian weapons appropriate to this section are described elsewhere in this book. They are:

Czechoslovakia
85 mm anti tank gun M 52 (**5588.103**)
130 mm Praga multiple RL (**2024.103**)
Sweden
40 mm L/70 AA gun (**5528.103**)
Switzerland
35 mm AA cannon system M-65 (**2374.131**)
20 mm AA cannon M-58 (**5587.103**)
UK (made under licence in Austria)
81 mm mortar L16A1 (**5563.103**)

USA
155 mm field gun M-2 (**5506.103**)
155 mm field howitzer M-1 (**5510.103**)
105 mm field howitzer M-2 (**5511.103**)
105 mm SP howitzer M-109 (**5570.103**)
Twin 40 mm L/60 SP AA gun M-42 (**5526.103**)
106 mm recoilless rifle M40A1 (**5584.103** but see also **2023.103** below)
107 mm mortar M-30 (**5565.103**)
81 mm mortar M-1/M-29 (**5564.103**)
USSR (made in Austria)
120 mm mortar M-43 (Austrian designation M 60) (**5567.103**)

2022.103
102 mm FIELD HOWITZER 18/40
DESCRIPTION:
Now relegated to reserve formations only this is a Second World War weapon of German origin. It is a hybrid construction comprising the Rheinmetall/Krupp gun from the earlier M18M field howitzer mounted on the carriage of the Rheinmetall 75 mm M40 anti-tank gun.
CHARACTERISTICS:
Calibre: 104.9 mm
Barrel length: 28 calibres
Elevation: $-5°$ to $+45°$
Traverse: 60°
Weight in firing order: 1,800 kg
Shell weight: 14.8 kg
MV: 540 m/sec
Maximum range: 12,325 m
STATUS:
Used in Austrian and German Armies during the Second World War. Now found only in Austrian Army reserve units.
MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1, Germany

2023.103
106 mm RECOILLESS RIFLE M40A1 (TOWED)
DESCRIPTION:
The M40A1 recoilless rifle is in service with the Austrian Army in two forms. One of these is as a vehicle mounted weapon – as it is in its US Army applications (**5584.103**), the other is as a towed weapon on an Austrian-designed two-wheeled carriage. This carriage is notable for having two stable firing positions, the barrel being 0.26 m higher in one position than it is in the other.
CHARACTERISTICS
Rifle:
Calibre: 106 mm
Barrel length: 3.4 m
Elevation: $-17°$ to $+65°$
Traverse: 360°
Weight in firing order: 113.9 kg (rifle only)
Weight of shell: 7.71 kg
MV: 503 m/sec
Maximum range: 6,900 m
Rate of fire: 5 rounds/min
Carriage:
Weight: 170 kg
Breadth: 1.41 m
Height: 0.93 m or 0.67 m
STATUS:
In service with the Austrian Army

BELGIUM

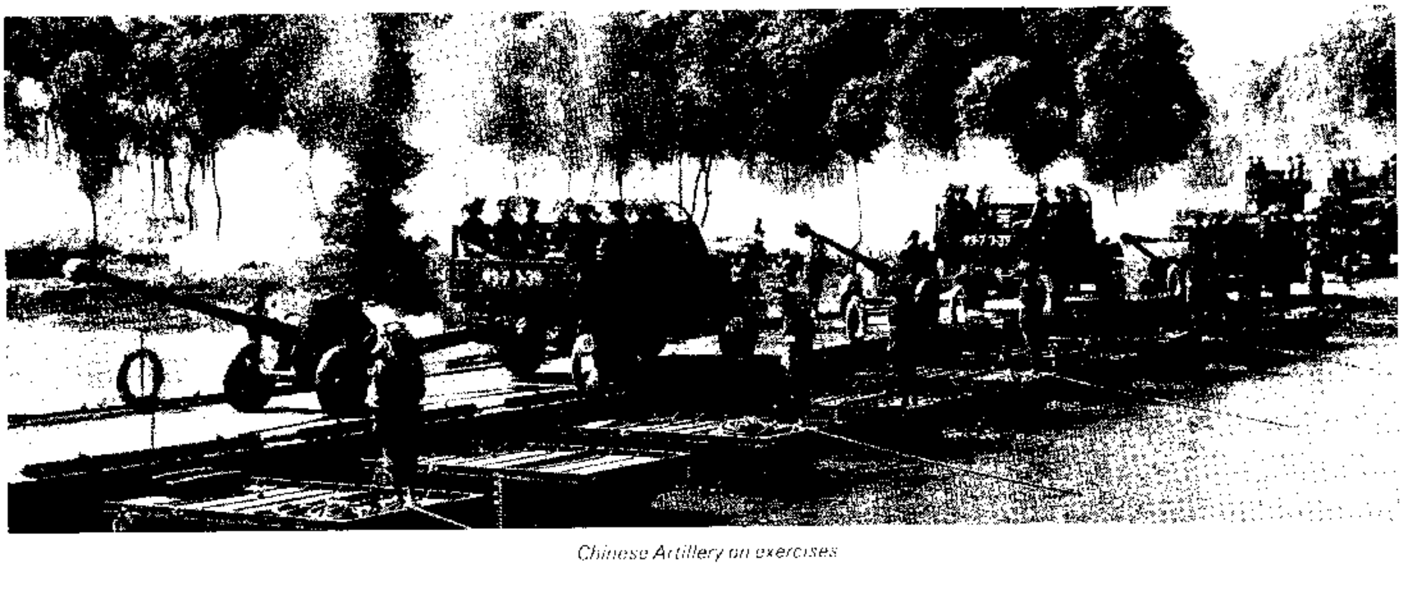
2491.103
90 mm MECAR LIGHT GUN
DESCRIPTION
The Mecar 90 mm light gun system is designed primarily for anti-tank defence and has been developed over a number of years. It can fire various types of ammunition including HEAT, canister, fragmentation and smoke; in addition there is a training round. It is of light construction and can be fitted to a variety of vehicles (e.g. the Commando armoured car **5066.102**), on its own wheels, or in a fixed position. If required a muzzle brake can be fitted. Characteristics of two versions are given below.

CHARACTERISTICS:	CAN-90L	CAN-90H
Overall length:	3.13 m	3.25 m
Overall height:	.35 m	.40 m
Overall width:	.29 m	.45 m
Barrel length:	.29 m	.29 m
Weight:	285 kg	416 kg
Calibre:	90 mm	90 mm
Length of gas chamber:	368 mm	368 mm
Chamber volume:	2,560 cc	2,560 cc
Maximum gas pressure:	1,200 kg/cm²	1,200 kg/cm²
Working pressure:	700/800 kg/cm²	700/800 kg/cm²
Minimum recoil:	400 mm	400 mm
Recoil speed:	10.2 m/sec	7.8 m/sec

AMMUNITION:
Tracer Projectile 90 mm (HEAT-CAN-90): Length 635 mm, projectile weight 2.28 kg, complete round weight 3.54 kg, fuse – impact point-detonating, maximum operational range 1,000 m, maximum range at 12° elevation 3,500 m, armour penetration 350 mm, concrete penetration 1.2 m, launch velocity 633 m/sec, arming distance 18 m.
Tracer Projectile 90 mm (Fragmentation): Length 528 mm, weight of complete round 5.21 kg, projectile weight 4.10 kg, fuse – point-detonating, max range when launched at 20° 4,200 m, maximum effective radius 50 m, launch velocity 338 m/sec, arming distance 40 m.
Tracer Projectile 90 mm (Smoke): Length 528 mm, projectile weight 4.10 kg, max range when launched at 20° 4,200 m, width of smoke screen 40 m, launch velocity 338 m/sec. Arming distance 40 m. **Canister Projectile**: Length 373 mm, weight complete 5.95 kg, operational range 300 m, contains 1,120 spheres weighing 3.6 gm.
MANUFACTURER:
Mecar SA, 6522 Petit-Roeulx-lez-Nivelles, Belgium.

CHINA (PEOPLE'S REPUBLIC)

5529.103
CHINESE ORDNANCE
DESCRIPTION:
Most Chinese Army ordnance is of Russian design. Some was supplied by the USSR before the two countries became estranged, but substantial quantities of various Russian-designed weapons have been manufactured in China. Among the entries below are all those weapons which are known to be, or to have been, manufactured in this way, but there may well be others.
Also in service with the Chinese forces are some



Chinese Artillery on exercises

ex-Japanese guns of World War II vintage. One which is known to be in service and to have been made in China is entered below – but again there may be others.

Finally there are two recoilless rifles in service with the Chinese Army which are based on an American design.

The Chinese have no long history or experience of gunnery, except what they have learned from the Russians, and it may be expected that their tactical use and methods of fire control will be very similar to those of the Soviet Army.

2168.103
130 mm FIELD GUN

DESCRIPTION:

It has been reported that the Russian M-1946 130 mm field gun (**5554.103**) is being built in China. The Russian design of this weapon was based on the 130 mm naval gun and two slightly different versions are in service with the Red Army and elsewhere. Available details of the Russian weapons are given in the entries for that country; no differences between the Russian and Chinese versions are known.

STATUS:

Uncertain. It has been reported that some Chinese-built weapons have been supplied to Pakistan.

2169.103
76 mm LIGHT FIELD GUN TYPE 54

DESCRIPTION:

The Type 54 76 mm light field gun is the Chinese version of the Russian M.1942 (ZIS-3) weapon (**5516.103**). In the USSR this weapon is probably obsolescent although it is still widely deployed in other countries. No differences between the Russian and Chinese version are known; and available details will be found among the entries for the USSR.

STATUS:

In service with Chinese forces. Supplied by China to several countries including Cambodia, Tanzania and North Vietnam.

5531.103
Ex-JAPANESE 75 mm MOUNTAIN GUN TYPE 94

DESCRIPTION:

This gun continues in service as it is the only true mountain gun possessed by the Chinese. It breaks into eight pack loads for transport and is meant to be carried by mules. It has a much better performance than the 70 mm howitzer, and is in pack gun.

CHARACTERISTICS:

Overall weight: 544 kg
Barrel length: 20.8 calibres
Maximum range: 8,320 m
Elevation: $+45°$ to $-10°$
Traverse: 40° (on carriage)
Ammunition: Semi-fixed QF. Complete round weighs 7.2 kg
Shell: HE, Shrapnel, APHE, HE/AT, Smoke WP
MV: 385 m/s
Penetration: APHE 58 mm/1,000 m/0°
HE/AT, 85 mm/0°

STATUS:

In service. The gun has been seen in North Vietnam.

2170.103
75 mm RECOILLESS RIFLES TYPES 52 & 56

DESCRIPTION:

Two 75 mm recoilless rifles are known to be in service with the Chinese forces. Both are based on the American M-20 weapon of the same calibre (**2561.103**), details of which will be found among the entries for the USA.

It is understood that the Chinese Type 52 weapon is a modified version of the M-20, and that the Type 56 incorporates additional modifications, but no details of these changes are known.

STATUS:

In service. Some are reported to have been supplied to North Vietnam.

2171.103
57 mm ANTI-TANK GUN TYPE 55

DESCRIPTION:

The Type 55 57 mm anti-tank gun is a Chinese copy of the Russian M.1943 (ZIS-2) gun (**5515.103**). Although still widely deployed in Warsaw Pact countries, the weapon should probably be regarded as obsolescent so far as USSR forces are concerned. No differences between the Russian and Chinese versions are known: available data will be found among the entries for the USSR.

STATUS:

In service.

2172.103
37 mm LIGHT ANTI-AIRCRAFT GUN TYPE 55

DESCRIPTION:

The Type 55 37 mm LAA gun is a copy of the Russian M.1939 weapon (**2887.103**) made in China. Now allocated only to reserve formations in the USSR the gun is still in service with active formations elsewhere. All available details will be found among the USSR entries.

STATUS:

In service with Chinese forces. Some have been supplied to Cambodia, Laos, North Vietnam, Pakistan and Tanzania.

CZECHOSLOVAKIA

2306.103
152 mm HOWITZER M-18/46

DESCRIPTION:

The Czech M-18/46 152 mm howitzer is a modification of the German 150 mm M-18 medium howitzer of which a large number remained in Czechoslovakia at the end of the Second World War. The modifications carried out involved reboring the guns, to accept the Russian 152 mm howitzer round, and fitting a double-baffle muzzle brake and a new shield.

CHARACTERISTICS:

Calibre: 152 mm
Barrel Length: 4.875 m
Elevation: 0° to $+45°$
Traverse: 60° (total)
Firing Weight: 5,512 kg
Shell Weights: HE 39.9 kg, Semi-AP 51.1 kg
MV: HE 508 m/s, Semi-AP 432 m/s
Maximum Range: 12.4 km (HE)
Armour Penetration: 82 mm at 1 km (Semi-AP)
Crew: 7

STATUS:

Reserve forces only.

MANUFACTURER:

Modified by Skoda Works, Pilsen.

2307.103
105 mm HOWITZER M-18/49

DESCRIPTION:

One of several variants of the Rheinmetall/Krupp 105 mm light field howitzer designed in the 1920s (see entry **2190.103** for variants still in service in Norway and Yugoslavia) the Czech M-18/49 is a modification of the M-18/40 (which itself was the M-18 mounted on the German PAK.40 carriage), the modification involving replacing the spoked wheels and solid tyres of the carriage by more modern solid wheels with rubber tyres.

CHARACTERISTICS:

Calibre: 105 mm
Barrel Length: 3,308 mm (including muzzle brake)
Elevation: $-5°$ to $+42°$
Traverse: 60° (total)
Firing Weight: 1,750 kg
Shell Weight: (HE) 14.8 kg
MV: 540 m/s
Maximum Range: 12.32 km
Rate of Fire: 6-8 rounds/min
Crew: 8

STATUS:

Reserve forces only.

2308.103
100 mm FIELD ANTI-TANK GUN M-1955

DESCRIPTION:

The Czech 100 mm Field Anti-Tank Gun M-1955 is also known as the 100 mm Field Gun M-53 and is the equivalent of the Russian 100 mm field gun (**5518.103**) – firing the same ammunition and having similar performance.

CHARACTERISTICS:

Calibre: 100 mm
Barrel Length: 6,431 mm (including muzzle brake)
Elevation: $-5°$ to $+40°$
Traverse: 60° (total)
Firing Weight: 3,400 kg
Shell Weight: APHE 15.9 kg; HE 15.7 kg; HEAT not known
MV: APHE 1,000 m/s; HE 900 m/s; HEAT 800 m/s
Maximum Range: 21 km (HE)
Rate of Fire: 8 rounds/min

Armour Penetration: 185 mm at 1,000 m (APHE)
Crew: 8

STATUS:
Service.

MANUFACTURER:
Skoda Works, Pilsen.

2309.103
85 mm FIELD GUN M-52
DESCRIPTION:
Similar in appearance and performance to the Russian D-44 gun (**5517.103**) and firing the same ammunition, the Czech 85 mm M-52 weapon was designed and manufactured entirely in Czechoslovakia.
CHARACTERISTICS:
Calibre: 85 mm
Barrel Length: 5,070 mm (including muzzle brake)
Elevation: $-6°$ to $+38°$
Traverse: 60° (total)
Firing Weight: 2,095 kg
Shell Weight: HE 9.5 kg; APHE 9.3 kg; HVAP 5.0 kg
MV: HE 805 m/s; APHE 820 m/s; HVAP 1,070 m/s
Maximum Range: 16.16 km (HE)
Rate of Fire: 20 rounds/min
Armour Penetration: 123 mm at 1,000 m
Crew: 7

STATUS:
In service in Czechoslovakia and East Germany.
MANUFACTURER:
Škoda Works, Pilsen.

2310.103
82 mm RECOILLESS ANTI-TANK RIFLES
DESCRIPTION:
Two 82 mm recoilless rifles are in service with Czech forces, one being a much more powerful weapon than the other. The lighter one, the T-21, fires a 3-5 kg projectile with a muzzle velocity of 250 m/sec and has an effective range of only 450 m. Characteristics of the larger M-59 weapon (which has a minor variant known as the M-59A) are given below: it should be noted that this weapon (but not the T-21) is fitted with a 12.7 mm spotting rifle.
CHARACTERISTICS (M-59/59A):
Calibre: 82 mm
Elevation: $-13°$ to $+25°$
Traverse: 360° at 0° elevation; 60° at 25° elevation
Firing Weight: 366 kg
Shell Weight: 6 kg (HE or HEAT projectile)
MV: HE 565 m/s; HEAT 745 m/s
Maximum Range: 7.6 km
Rate of Fire: 6 rounds/min
Armour Penetration: 250 mm (HEAT)
Crew: 5

M-59A Recoilless anti-tank rifle

STATUS:
In service in Czechoslovakia and Egypt.

MANUFACTURER:
Skoda Works, Pilsen.

2311.103
57 mm ANTI-AIRCRAFT GUN
DESCRIPTION:
A 57 mm anti-aircraft gun was developed in Czechoslovakia and put into production. The Russian S-60 57 mm weapon (**5514.103**) was, however, preferred to it because it was lighter and had a higher muzzle velocity. As a result only a small quantity of the Czechoslovakian weapon was produced, most of which appear to have been exported – either directly or indirectly.

STATUS:
Believed not to be used in Warsaw Pact forces. Supplied to Cuba, Guinea and Mali.

2312.103
QUAD-MOUNTED 12.7 mm AA MACHINE GUN M-53
DESCRIPTION:
No longer in service with Warsaw Pact forces but still in use elsewhere, the M-53 quad-mounting comprises four Russian-designed M1938/46 DSLK 12.7 mm heavy machine-guns on a mounting designed and built in Czechoslovakia but generally similar to that used, for example, for 14.5 mm machine-guns in the Russian ZPU-4 weapon (**5582.103**).
CHARACTERISTICS:
Calibre: 4 × 12.7 mm
Barrel length: 1,069 mm
Elevation: $-7°$ to $+90°$
Traverse: 360°
Firing Weight: 628 kg
Projectile Weight: 49.5 kg
MV: 840 m/s
Maximum Range: 6,500 m horizontal; 5,500 m vertical
Rate of Fire: (per barrel) 550-600 rounds/min cyclic; 80 rounds/min practical
Armour Penetration: 20 mm at 500 m (API round)
Crew: 6
STATUS:
No longer in Warsaw Pact service, but known to be used in Cuba and believed to have been supplied to North Vietnam.

2029.103
TWIN 30 mm ANTI-AIRCRAFT CANNON M-53/59
DESCRIPTION:
Two versions of this twin AA mounting are in service in Czechoslovakia. The M-53 is an open mounting on a light four-wheel trailer; the other, M-59, is a partially-enclosed mounting (giving some protection to the gunner's body) installed on an armoured version of the Praga 6 × 6 V3S truck.
CHARACTERISTICS (M-53):
Calibre: 2 × 30 mm
Barrel Length: 2,429 mm
Elevation: $-10°$ to 90°
Traverse: 360°
Firing Weight: 2,000 kg
Shell Weight: HE or API projectile 0.45 kg; Complete round 0.9 kg
MV: 1,000 m/s
Maximum Range: 10,000 m horizontal; 7,000 m vertical but effective only 2,000 m
Rate of Fire: 450-500 rounds/min (cyclic); 100 rounds/min
Armour Penetration: 60 mm at 500 m
Crew: 4
STATUS:
Both versions are in service with divisional anti-aircraft regiments of the Czechoslovakian Army. The SP version is also used by the anti-aircraft companies of the armoured regiments.

FINLAND

2037.103
122 mm FIELD GUN M-60
DESCRIPTION:
This is a powerful weapon of Finnish design. It is mounted on a four-wheel carriage, the wheels of which are driven by an hydraulic motor.
CHARACTERISTICS:
Calibre: 122 mm
Barrel length: Apparently about 50 calibres
Elevation: $-5°$ to $+50°$
Traverse: 90° or 360° with supplementary equipment.
Weight in firing order: 9,500 kg
Weight of shell: 25 kg
MV: 950 m/sec
Range: 25 km
Trail: split

STATUS:
In service in the Finnish Army. Principal employment of this weapon is in the artillery battalion of the armoured brigade.
MANUFACTURER:
Tampella Ab, Finland.

2039.103
105 mm LIGHT FIELD HOWITZERS M-61/37 AND M-37/10
DESCRIPTION:
These are two hybrid howitzers in service with the Finnish Army. The M-61/37 has been constructed by mounting a new 105 mm Tampella gun on the carriage of the earlier 105 mm Tampella LFH. A similar hybrid was constructed at the same time by mounting the gun of the Tampella LFH on the carriage of the Russian 122 mm LFH M-10 to make the LFH M-37/10.
The 122 mm LFH M-10/50 together with several others of similar age, is now used only in a static role in forts or coast defences. Details of the more modern hybrid howitzer are given below.
CHARACTERISTICS:
Calibre: 105 mm
Elevation: 6° to 45°
Traverse: 53°
Weight in firing order: 1,800 kg
Weight of shell: 14.9 kg
MV: 600 m/sec
Range: 13.4 km
Rate of fire: 7 rounds/min
Trail: split
STATUS:
In service as brigade artillery in Finnish infantry brigades.
MANUFACTURERS
Tampella Ab, Finland.

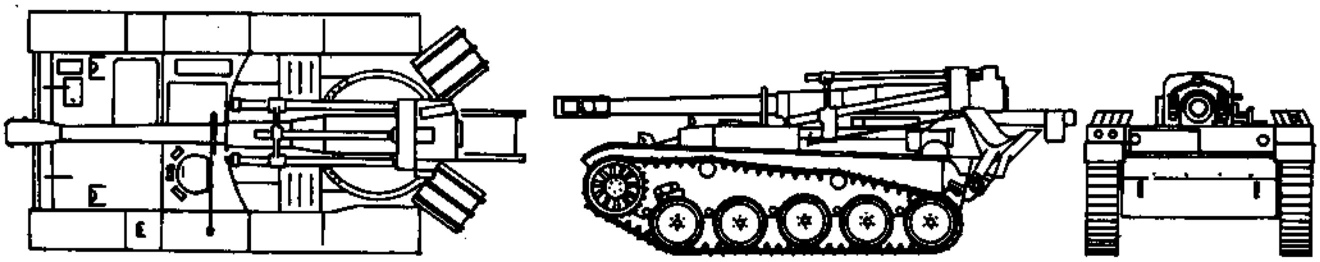
2041.103
95 mm RECOILLESS ANTI-TANK GUN M-58
DESCRIPTION:
This is the only heavy recoilless weapon known to be in service in the Finnish Army. It is mounted on a two-wheel trailer for towing and the wheels remain in position for firing. Reported characteristics make it appear superior in performance to the American 106 mm weapon (**5584.103**) and not far short of that of the British 120 mm Wombat (**2476.103**).
CHARACTERISTICS:
Calibre: 95 mm
Barrel length: 3.2 m
Weight in firing order: 140 kg
Weight of shell: 10.1 kg
MV: 615 m/sec
Anti-tank range: 1,000 m
Penetration: 300 mm
Rate of fire: 6-8 rounds/min
STATUS:
In service in heavy weapon companies of infantry battalions.

2571.103
ROCKET-ASSISTED PROJECTILES
It has been reported that rocket-assisted projectile developments are in hand in Finland.
So far as is known, these projectiles have not been put into service in Finland: but it is believed that some have been supplied to other countries.
No details are known.

FRANCE

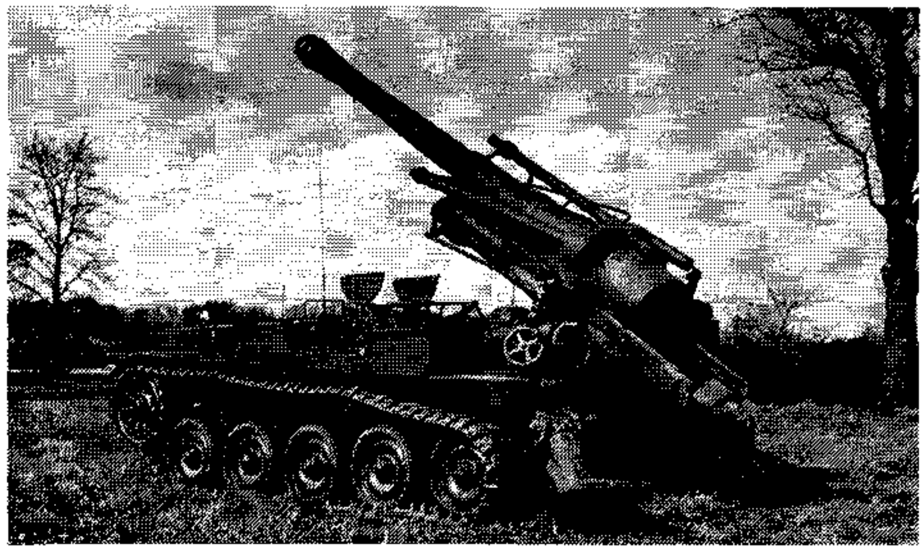
5536.103
155 mm SP HOWITZER Mk F3
DESCRIPTION:
This howitzer provides the general fire support for the mechanised divisions of the French Army, and uses one more variant of the AMX 13 tank chassis. The gun is of French design and manufacture, but will accept both US and French ammunition. The driver and one gunner ride with the gun, the remainder of the 8 man crew being transported in a second vehicle, lorry or APC/AMX 13.
Ammunition is carried in the second vehicle which also transports the crew.

CHARACTERISTICS:
Overall length: 6.22 m
Width: 2.75 m
Height: 2.20 m
All-up weight: 17,000 kg
Barrel length: 33 calibres
Maximum range: 20 km
Elevation: 0° to +67°
Horsepower: 270
Speeds: max 60 km/h (average 40 km/h)
Ammunition: BL about 10 charges
Shell: HE, smoke, illuminating, hollow base shell. Average weight 43 kg
MV: 647 m/s
Rate of fire: max 4 rounds/min (average 1 round/min)
Crew: 8



155 mm SP

STATUS:
In service in French Army. Supplied also to Argentina, Venezuela and two other countries.
MANUFACTURER:
Creusot-Loire, (Groupes Marine Schneider), 15, rue Pasquier, 75383-Paris, France.



155 mm SP Howitzer Mk F.3

5541.103
AMX 13 VCA TRACKED ACCOMPANYING VEHICLE FOR THE 155 mm SP GUN

DESCRIPTION:
The tracked accompanying vehicle (VCA) is part of the team for the 155 mm Mk F3 SP gun. It is an AMX 13 chassis with the APC superstructure and carries the gun team or ammunition. It also tows the ARE trailer with extra ammunition. It carries a 12.7 mm machine gun in a cupola.
CHARACTERISTICS:
Overall length: 5.80 m
Width: 2.80 m
Height: 2.40 m
Overall weight (laden): 15,700 kg. 8 men and 25-155 mm rounds

2 Tons ARE Ammunition Trailer
This small vehicle is towed behind the accompanying vehicle of the 155-mm SP Gun. It is a two-wheeled trailer without suspension and with a hand-brake on each wheel.
CHARACTERISTICS:
Trailer weight (laden): 2,200 kg
length: 3.85 m
width: 2.18 m
height: 1.48 m
wheel base: 1.87 m
Vehicle plus trailer:
overall length: 9.55 m
max road speed: 60 km/h
cross country: 15-20 km/h
STATUS:
In service with the French Army.
MANUFACTURER:
Creusot-Loire (Groupes Marine Schneider) 15, rue Pasquier 75383-Paris, France.

5574.103
155 GCT SP GUN

DESCRIPTION:
The 155 mm self-propelled gun mounted on an AMX 30 chassis is designed to give indirect fire support to units of the battle corps. The main operational requirements forming the basis of the specification for equipment were:

- mobility similar to that of a battle tank,
- quick reaction time to engage targets in all directions, at short or long range in conditions of very mobile warfare,
- instantaneous high fire power, in range as well as in rate of fire with up-to-date ammunition,
- protection of crew and ammunition in unsafe area or NBC environment.

The resulting weapon system is a self-propelled gun with a weight and a mobility similar to those of the AMX 30 battle tank. Its main armament is a 155 mm/40 calibre gun, with a range of approximately 24 km with 155 mm hollow base shells. Gun loading is automatic and allows for a high rate of fire.
The gun's fire control system establishes firing parameters quickly and with a very low risk of error. The hydraulically controlled turret permits full weapon traverse and elevation from −5° to +66°.
Secondary armament is a 7.62 mm MG.
Four men make up the crew, their functions being:

- 1 gun commander: responsible for outside communications and co-ordination of the crew work,
- 1 gunner: in charge of fire control and turret traverse and elevation
- 1 loader: prepares charges and selects types of shells
- 1 driver: not in action during firing sequences.

The gun commander and the gunner can exchange their functions in the turret and the driver can replace the loader. Also the gun can fight with only a 2 men crew, without noticeable decrease of its capability.
Ammunition reloading of the 155 GCT/AMX 30 takes 2 or 3 men.

155 GCT

CHARACTERISTICS:
Weights and dimensions:
- **total weight in running order:** 37 t
- **total weight in combat order:** 41 t
  of which ammunition represents: 2.5 t
- **overall length, gun forward:** 10.4 m
- **gun to the rear:** 9.5 m
- **overall width:** 3.1 m
- **height to turret roof:** 3.0 m
- **overall height (without machine-gun):** 3.17 m
- **ground clearance:** 0.43 m

Mobility:
- **maximum road speed:** 60 km/h
- **cross country mobility:** identical to that of AMX 30 tank
- **fording:** 2.20 m
- **range of action on road at 40 km/h average speed:** 450 km

Main Gun Performance:
The gun is a 155 mm/40 calibre weapon with a vertical wedge breech block, hydraulically operated but with provision for emergency manual operation. The gun is equipped with a gas exhaust device.
Muzzle velocity: 155 mm M1e ammunition 760 m/sec; 155 mm hollow base shell
Range: M/e ammunition 21,300 m; hollow base ammunition 23,500 m
Loading: Automatic, hydraulically operated
Rate of fire: Up to 8 rounds/min automatic. Emergency manual rate 1-2 rounds/min
Recoil: 950 mm
Train: +360°: 0.01° to 10°/sec
Elevation: −5° to +66°: 0.01° to 5°/sec
Shell weight: 43.2 kg, for hollow base shell, of which 8.355 kg is RDX – tolite explosive. Other types of 155 mm shell can be fired.
Ammunition in the turret is 42 shells and 42 slow bags arranged in 7 racks of 6 shells and 7

racks of 6 bags. In addition, 40 quick charges 1 are housed in a fixed container in the turret basket.

Re-supplying involves loading shells and bags into the cells which are visible when the rear door is opened. Firing can go on during re-supplying operations.

The time required for re-supplying the gun completely is one half-hour with 3 men or 20 minutes with 4 men.

STATUS:

Pre-production and trials. Series production of the 155 GCT/AMX 30 is planned for 1976.

In association with Krauss-Maffei AG, Munich, GIAT have also developed the 155 GCT/LEOPARD – comprising a specially-adapted Leopard tank chassis and the 155 GCT gun and turret assembly. See entry **2572.103.**

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT) 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

5542.103

105-mm TANK GUN CN-105-F1

DESCRIPTION:

This gun is the main armament of the AMX-30 tank (**5018.102**). It is a conventional high performance AFV gun. A semi-combustible cartridge case is under development.

CHARACTERISTICS:

Barrel length: 56 calibres with no muzzle brake.
Recoil length: 480 mm
Recoil stress: 20/25 tons
Ammunition: QF fixed
Shell: HEAT, HE, Smoke (weights 11-12 kg)
MV: 1,000 m/s
Accuracy: Better than 1.5 mil
Penetration: 360 mm/0°, 150 mm/65°

STATUS:

In service with the French Army. This gun is also being used as the basis of a modernisation of the American M47 (Patton) tank (**5046.102**) now under development in France.

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

2148.103

TANK TURRET TYPE F1-12

DESCRIPTION:

Generally similar to the earlier FL-10 turret (**2149.103** which, with its 75 mm gun has been supplied for use in AFVs in France and many other countries, the FL-12 turret mounts a 105 mm rifled gun (**2147.103**) and is suitable for tank installation either in new production or retrospectively.

Main features of the turret are stable and accurate positioning resulting from the use of a large diameter ball-bearing ring; hydraulic laying (360° in 12-13 seconds) controlled by commander or gunner; emergency hand laying; eight observation periscopes for commander and gunner; dual magnification sight for commander and X7-5 sight for the gunner. Most standard tank communication equipment can be fitted and there is provision for mounting smoke-pot launchers, searchlights or a laser rangefinder.

The main gun features semi-automatic loading with external case ejection (see **2149.103**). Rate of fire is about 12 rounds/min: there are 12 ready rounds and 5-7 other rounds stored in the turret. Secondary armament of a 7.5 mm or 7.62 mm MG can be mounted.

Turret crew is two men (commander and gunner) and weight without crew or ammunition 4,300 kg.

STATUS:

Production. Some hundreds of turrets have been produced and are in service in several countries.

MANUFACTURER:

Fives Lille-Cail, Départment Armement, 7, rue Montalivet, 75-Paris 8e, France.

2147.103

105 mm TANK GUN D1504

DESCRIPTION:

This gun is the main armament of the AMX-13 tank (**5020.102**) in the version fitted with the FL-12 turret (**2148.103**) but it can also be used in the same turret for retrospective fitting to other AFVs.

CHARACTERISTICS:

Barrel length: 44 calibres
Recoil length: 368 mm
Recoil force: 800 m/s
MV: HEAT shell: 800 m/s HEAP shell: 700 m/s
Penetration: HEAT shell: 360 mm/0°

STATUS:

In production and in service with the armies of several countries outside France.

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

2149.103

TANK TURRET TYPE FL-10

DESCRIPTION:

This turret was the standard fitment to the AMX-13 tank (**5020.102**) when this was armed with the 75 mm 61.5 calibre gun type 50. Although no longer in production, this variant of the AMX-13 with its FL-10 turret is still in service in many parts of the world.

The design of the FL-10 is essentially the same as that of the FL-12 (**2148.103**) which was derived from it by replacing the 75 mm gun by a 105 mm weapon and altering the ammunition storage arrangements. Both are 'oscillating' turrets – which means that the complete gun turret and basket assemblies remain in a fixed relationship to each other, being supported on two trunnions by a support structure which is attached to the turret ring. The whole oscillating structure can thus be elevated or depressed relative to the support structure, and the combined structures can be rotated in azimuth.

The fixed position of the gun makes it possible to incorporate a recoil-operated automatic loader while still retaining a reasonably low profile and with the gun mounted relatively high in the turret. The incorporation of the automatic loader, in turn, means that the turret crew need only comprise commander and gunner. The reloader is mounted in the turret bustle and contains two revolving cylinders, each containing six rounds of ammunition, mounted on either side of the recoil path of the breech. Spent cases are ejected through a hole in the back of the bustle. The loader arrangement makes it possible to achieve a high rate of fire for twelve rounds: the cylinders must then be replenished through hatches in the turret roof; one crew member must dismount to do this.

STATUS:

In service outside France. No longer in production.

MANUFACTURER:

Fives Lille-Cail, Départment Armement, 7, rue Montalivet, 75-Paris 8e, France.

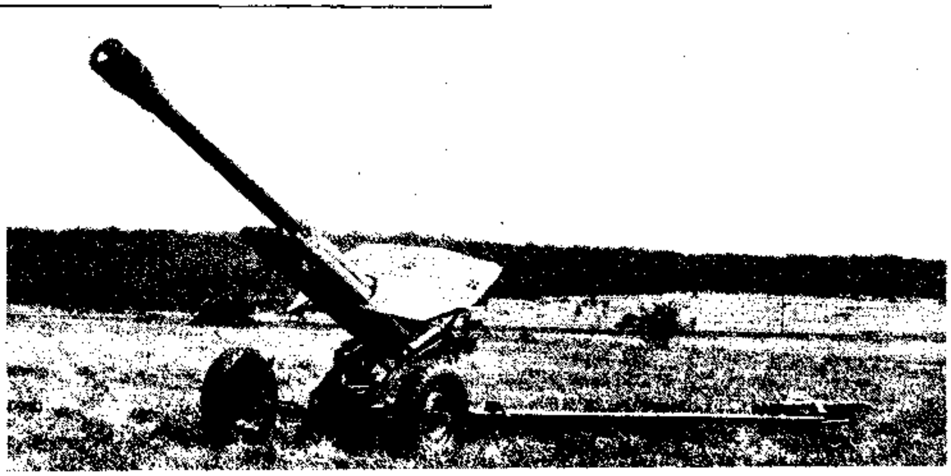
5552.103

105 mm LIGHT GUN

DESCRIPTION:

This gun is a rugged and light weapon for general-purpose use on the battlefield. Suitable for direct and indirect support and for use against tanks it can be air-dropped or transported by helicopter. French or American 105 mm ammunition can be used.

The gun can be towed either folded, for transport in L. of C. zone, or unfolded when travelling in an advanced combat zone. Opening the trails automatically positions the gun on the firing platform.



105 mm Light Gun

CHARACTERISTICS:

Total weight: 1,200 kg
Barrel length: 30 calibres
Vertical field: —5° to +70°
Traverse: 45°
Height of line of fire: 0.8 m
Length (folded): 5.12 m
Width (folded): 1.77 m
Height: (folded): 1.18 m
Max range: 15,000 m (French 105 mm Mk 63 hollow base shell). 11,000 m (American 105 mm HEM 1 shell)

STATUS:

Demonstration prototype.

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

2582.103
105 mm HOWITZER M-50

DESCRIPTION:

One of the older weapons still in service with the French Army and with the armies of some former French colonies, the M-50 howitzer was developed between 1946 and 1952 and went into service in 1955. Production ceased in 1960.

CHARACTERISTICS:
Calibre: 105 mm
Weight travelling: 2,922 kg
Length travelling: 6,004 mm
Width travelling: 1,981 mm
Height travelling: 1,706 mm
Elevation: $-5°$ to $+70°$
Traverse: 360°
MV: 580 m/sec
Range: 14,500 m
Rate of Fire: 6 rounds/min

STATUS:

In service in France, Cameroun, Guinea, Israel, Ivory Coast, Morocco

5538.103
105 mm SP HOWITZER AMX 105B

DESCRIPTION:

The B model of the 105 mm howitzer is a more modern version of the A model (**5537.103**). The obvious difference is in the turret, which not only provides all-round traverse but also lowers the silhouette. Less obvious is the improved gun with longer barrel.

CHARACTERISTICS:
Overall length: 5.20 m
Height: 2.7 m
Width: 2.5 m
Laden weight: 17,000 kg
Ammunition: 80 rounds
Range: 15,000 m

Characteristics are otherwise similar to those of the AMX 105A howitzer (**5537.103**) described below.

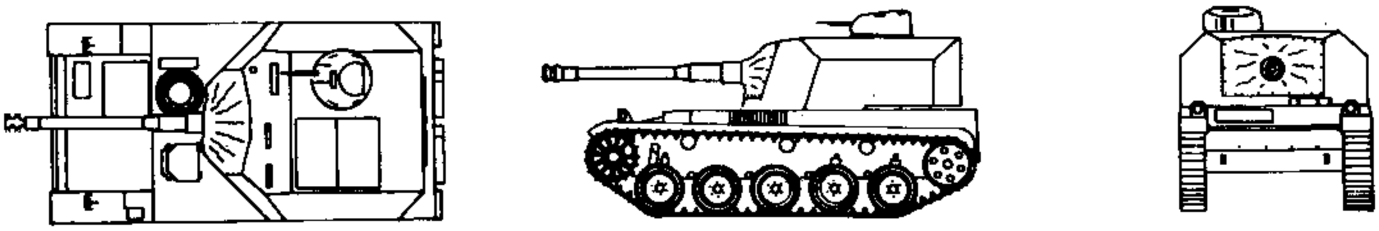
105 mm SP Howitzer AMX 105 A

STATUS:

So far this SP howitzer is not yet in service but a pre-production quantity has been made and some are believed to have been sold to Switzerland.

MANUFACTURER:

Creusot-Loire (Groupes Marine Schneider), 15, rue Pasquier, 75383-Paris, France.



105 mm SP AMX 105B

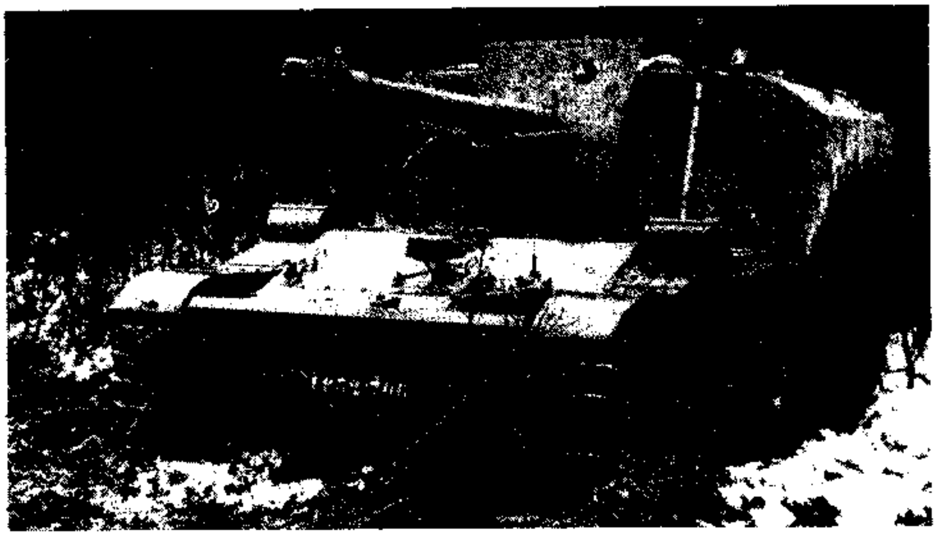
5537.103
105 mm SP Howitzer AMX 105 A

DESCRIPTION:

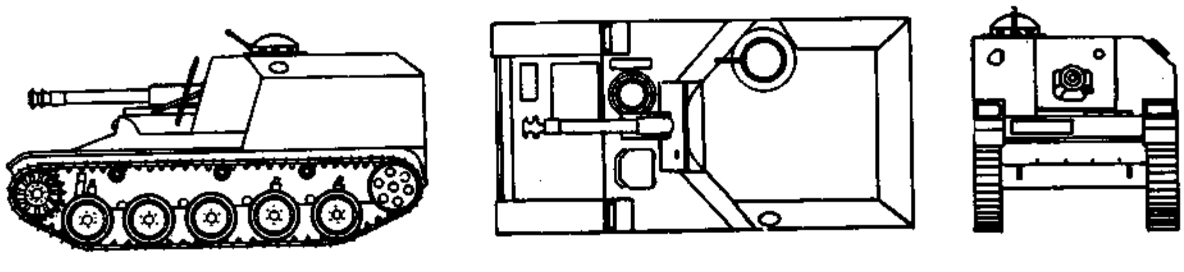
The SP 105 mm is the basic artillery weapon for close fire support in the French Army. There is now very little towed artillery in service, and the AMX 105 A is the equipment of most field regiments. This model is now fairly old having been in service since 1952. Its chief drawback is, of course, the fixed gun casemate which limits traverse. The amount of ammunition which can be carried is also fairly restricted, though better than some more modern designs. and it is destined to be steadily replaced by the model B.

The gun fires both US and French ammunition, and there are two lengths of barrel. The French Army uses a barrel 23 calibres long, but the Netherlands army has a 30 calibre length. It is not known what precise difference this makes to the performance of the gun.

CHARACTERISTICS
Overall length: 6.40 m
Height: 2.70 m
Width: 2.65 m
Overall weight: 16,500 kg
Barrel length: 30 or 23 calibres



105 mm SP Howitzer AMX 105A



Maximum range: 11,500 m with US M1 ammunition. 15,000 m with French Mk 63 ammunition
Elevation: −4°30′ to +70°
Traverse: 20°
Horsepower: 270
Speeds: Max 60 km/h (average 40 km/h)

Ammunition: US M1 or French Mk 63 105 mm 56 rounds carried in vehicle
Shell: Semi fixed cartridge HE, Smoke, Illuminating
MV: 230 m/s to 586 m/s (8 charges)
STATUS:
In service with the French Army.

COUNTRIES SUPPLIED:
Netherlands.

MANUFACTURERS:
Groupement Industriel des Armements Terrestres (GIAT) 10, Place Georges Clémenceau, 92211-Saint Cloud, France

5543.103
90-mm AFV GUN CN-90-FI

This gun is widely used in the small AFVs in the French army, particularly those in the weight range up to 10 tons. It is also installed in the modernised M 24 Chaffee tank, and in this mount great accuracy is claimed for it. Its most interesting feature is that it is unusual in firing fin-stabilised ammunition. This is necessary in order to retain the best penetration for the HEAT rounds.

A modernised version of the gun (F3) is fitted to the AMX-13 tank (**5020.102**), and fires at a higher MV.

CHARACTERISTICS:

Barrel length	**F1:**	33 calibres less muzzle brake
	F3:	51 calibres
Recoil length	**F1:**	580 mm
	F2:	300 mm
	F3:	340 mm
Recoil stress	**F1:**	3.5 tons
	F2:	9 tons
	F3:	4.5 tons
MV	**F1:**	750 m/s
	F3:	950 m/s

Ammunition: OF fixed HEAT HE, Smoke. All fin stabilised
Shell weights: HEAT 3.65 kg, HE 5.27 kg, Smoke 5.40 kg
Penetration: 320 mm/0°, 120 mm/65°
Accuracy: Better than 2 m.

STATUS:
Operational in French Army. F1 gun is operational in 6 other armies. F3 in one other army.

MANUFACTURER:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau 92211-Saint-Cloud, France.

5539.103
SP TWIN 30 mm AA GUNS (AMX D.C.A. 30)

This SP AA vehicle is fairly typical of the type which appears in many of the NATO armies for defence against low flying aircraft. The 30 mm guns are the Hispano-Suiza type 831 L which are also mounted on ships for the same purpose: the turret is the SAMM S401A.

This vehicle carries its own fire control radar ("Oeil Noir") mounted on the back of the turret on a retractable mounting. The vehicle is therefore a completely self-contained fire unit, although it would obviously be connected to an early warning system operated from some distance away. The radar "locks-on" to a target, and the guns follow it, the necessary lead angles being calculated by the on-board computer. There are optical sights for emergency use.

The design was developed in 1960, and the first production model appeared in 1964. Mounted on a lightweight version of the AMX chassis it has been in service with the French Army since 1965.

An improved version has now been developed using the AMX 30 chassis thus giving the weapon system wider operational scope and greater mobility. In particular the AMX-30 mounting has the advantages of a larger supply of ammunition and – thanks to the AMX-30 power supply arrangements – the ability to function when the vehicle is at rest without running the main engine or making special power supply arrangements.

CHARACTERISTICS:

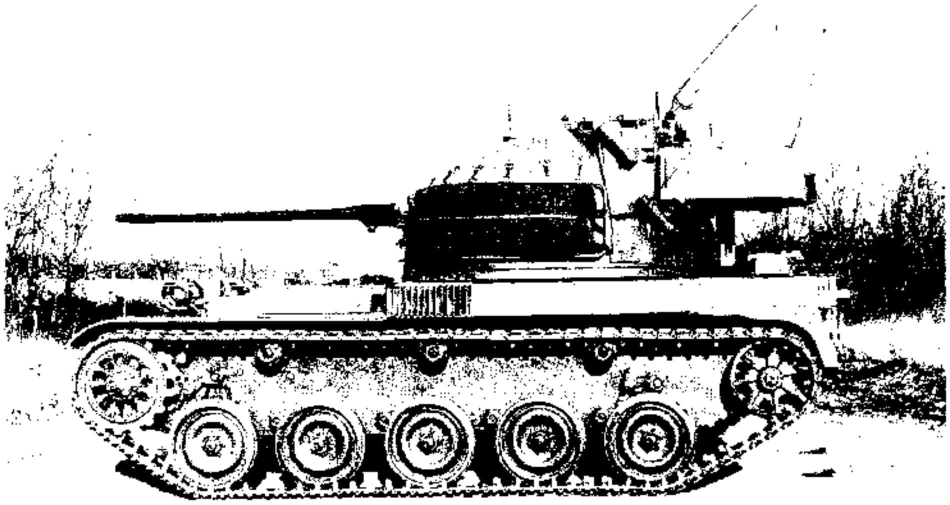
	AMX 13 Version	AMX 30 Version
Overall length:	5.40 m	6.80 m
Width:	2.50 m	3.10 m
Height:	3.00 m	3.00 m
Horsepower:	270	680
Speed-max:	60 km/h	65 km/h
Ammunition:	HS 831 L	HS 831 L

See the entry for Rarden cannon for full details of HS 831 L rounds (**5504.103**)

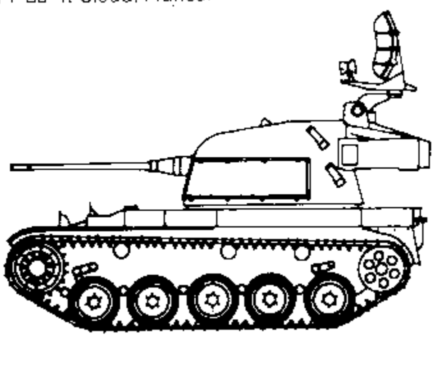
STATUS:
In service.

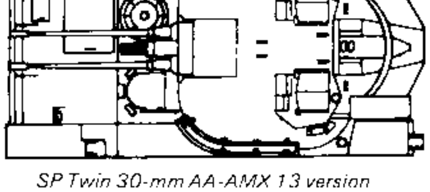
MANUFACTURER:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

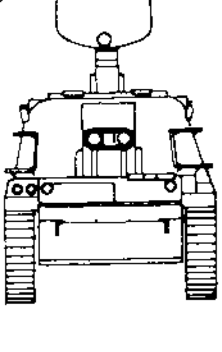
SP Twin 30-mm AA – AMX-13 version with radar



SP Twin 30 mm AA on AMX 30 chassis







SP Twin 30-mm AA-AMX 13 version

5544.103
SAMM 8.530 AA TURRET

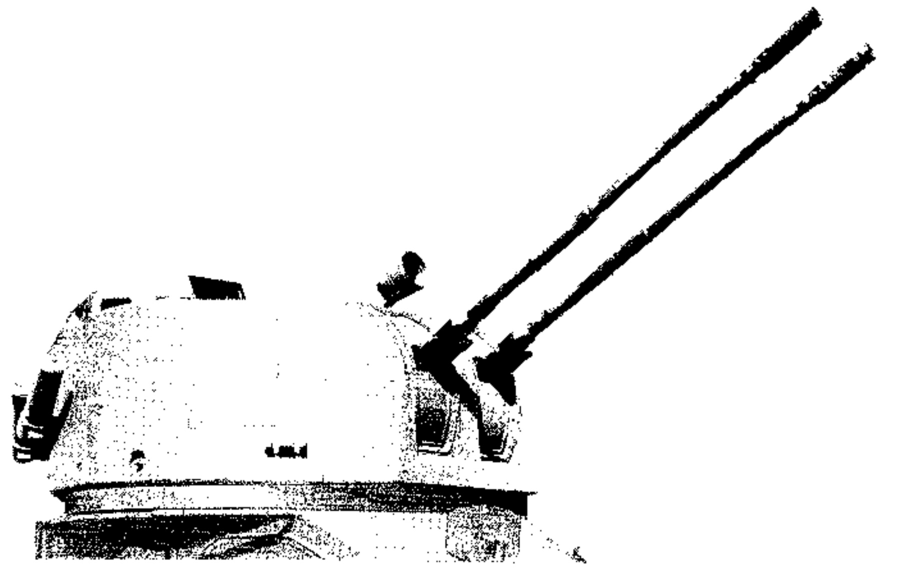
The SAMM S.530 turret is a light, simple equipment intended to be fitted to any small AFV to provide a special purpose gun mounting. It carries two 20 mm guns and the primary role of these is attacking low flying aircraft. A secondary role is for ground targets, particularly those encountered in guerrilla warfare.

The turret and turret basket carry most of the mechanical, hydraulic and electrical equipments for laying and firing the guns. The main ammunition stowage is also in the basket. The elevating mass of the guns carries the ammunition feed.

Sighting is optical, and there are two systems: the first is the AA sight which is carried in an armoured cupola on top of the turret roof. The second is an APX episcope used for ground targets.

The crew consists of a commander and gunner. The commander acquires the targets through his episcopes, controls the gunner, and operates the radio. The gunner lays and fires the guns in both roles.

In the photograph the turret is mounted on an AML Panhard chassis (**5021.102**) but can be adapted to any other chassis of similar type or used as an AA turret in a static installation.



SAMM S.530 Turret

CHARACTERISTICS
Total weight of turret (including crew): 1.720 kg
Armour: 7 mm
Elevation: $-10°$ to $+70°$
Elevation speed: 40°/s
Traverse: 360°
Traversing speed: 80°/s
Guns: AME 621 20 mm (**5589.103**)
Ammunition: The standard for each type of gun
Ammunition stowage: 300 rounds for each gun in the turret basket

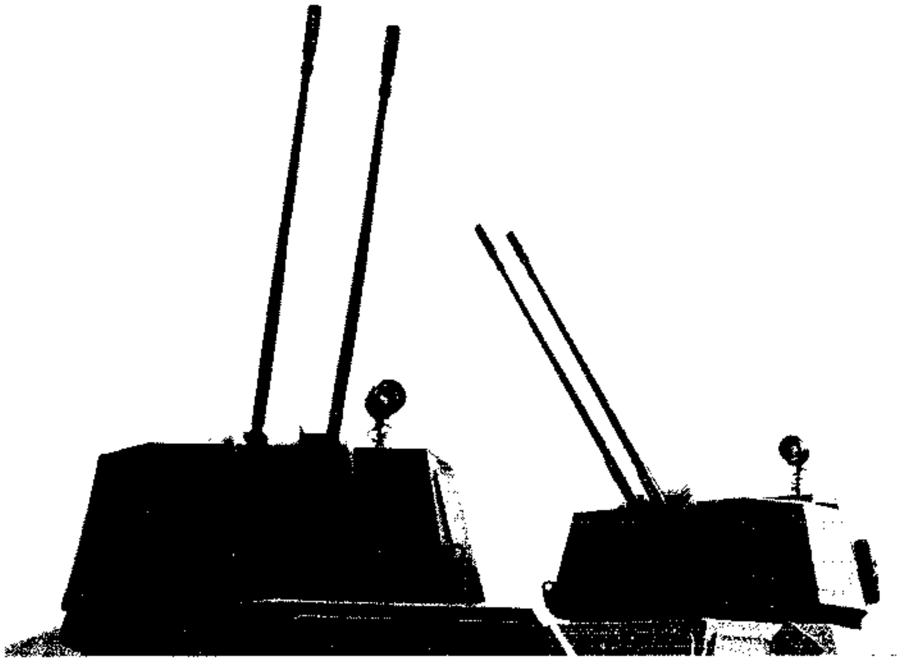
STATUS
Series production.
MANUFACTURER:
Société D'Applications des Machines Motrices (SAMM), 224, Quai de Stalingrad, 92130-Issy Les Moulineaux.

2150.103
20 mm AA TURRET TG 522 F1

DESCRIPTION:
This is a twin-gun anti-aircraft turret suitable for mounting on light or medium armoured vehicles. The gun can also be brought to bear on surface targets.

The turret is of the rotating casemate type and is operated by two men. It is equipped with a hydraulic "speed" aiming control system, optical gunsights and shell feed systems which together permit smooth tracking and continuous engagement of moving targets. Provision is made for the installation of radio and any one of a variety of fire control systems.

CHARACTERISTICS:
Weight: 1.800 kg in firing order
Armament: Two 20 mm guns CN-MIT-20F1 (**5599.103**)
Rate of fire: 700 rounds/min per gun
MV: 1 040 m/sec (HE)
Effective range: 1.300 m (HE)
Ammunition capacity: HE: 240 rounds per gun. AP: (Optional) 40 rounds per gun
Training limits: 360°
Elevation limits: $-8°$ to $+75°$
Training speed: Min 80°/sec
Max 0.8°/sec
Observation devices: Episcope/sight-tube and episcopes



TG 522 FI AA turrets

FIRE CONTROL OPTIONS:
1. AA firing: sight/gunsight M348. Surface: episcope/sight-tube M250/1
2. AA and surface firing: episcope/sight-tube M411.
3. AA firing: CSEE sight correction unit Uranus. Emergency AA and surface firing: episcope/sight-tube M411.
4. AA firing: TV tracking and correction system. Emergency AA and surface firing: episcope/sight-tube M411

STATUS:
Prototype stage
MANUFACTURER:
Société D'Applications des Machines Motrices (SAMM), 224, Quai de Stalingrad, 92130-Issy Les Moulineaux.

5589.103
20 mm GUN M621

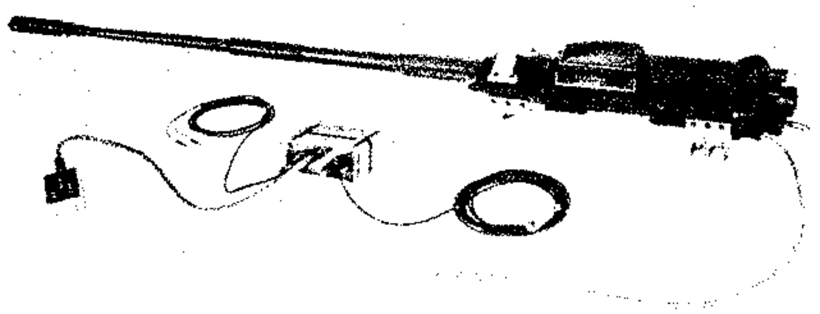
DESCRIPTION:
This is an electrically operated rapid fire gun designed for use with electrically-primed US and French ammunition. A variety of ammunition feed systems are available: and these, together with the light compact construction of the weapon and low recoil stresses make it suitable for installation in helicopters and light aircraft as well as in a variety of military vehicles. For airborne applications see entry **1275.303**.

Single shots or bursts can be fired and the rate of fire can be selected from the alternatives of 300 or 740 rounds per minute. An optional burst-limiting device is also available.

Three feed systems are available. The standard flat feed mechanism is of simple construction and takes up little room. Left hand or right hand versions are available, the links being ejected from the side opposite to the feed. A rather more elaborate mechanism using, for the most part, the same components as the flat feed mechanism, provides for the ejection of links on the same side as the feed. Finally there is a selective feed mechanism which accepts two ammunition feed belts and enables the gunner to choose from two different types of ammunition. The first two systems can be used with a built-in generator which supplies the power required to operate the weapon, thus making it independent of external power supplies.

CHARACTERISTICS:
Weight: (Gun plus cradle) 58 kg
Length: (Gun plus cradle) 2,207 mm
Width: (Gun plus cradle) 202 mm
Height: (Gun plus cradle) 245 mm

Rate of fire: 300 or 740 rounds/min
Muzzle velocity: 980 to 1,030 m/sec
MANUFACTURER:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.



M621 gun

2583.103
20 mm M621 CANNON FOR TRUCK MOUNTING
DESCRIPTION:
This weapon arrangement consists basically of the 20 mm M621 cannon (**5589.103**) associated with a new type of combined mounting and feed system which enables it to be mounted as an independent self-contained system on unarmoured vehicles or small naval craft.

In this arrangement the gun is fed from the left with ammunition which is drawn from a cylindrical ammunition container surrounding the vertical shaft which carries the trunnions on which the gun is mounted. The ammunition box thus pivots with the gun in azimuth and the feed does not interfere with the field of fire.

CHARACTERISTICS:
Generally as in Entry **5589.103**

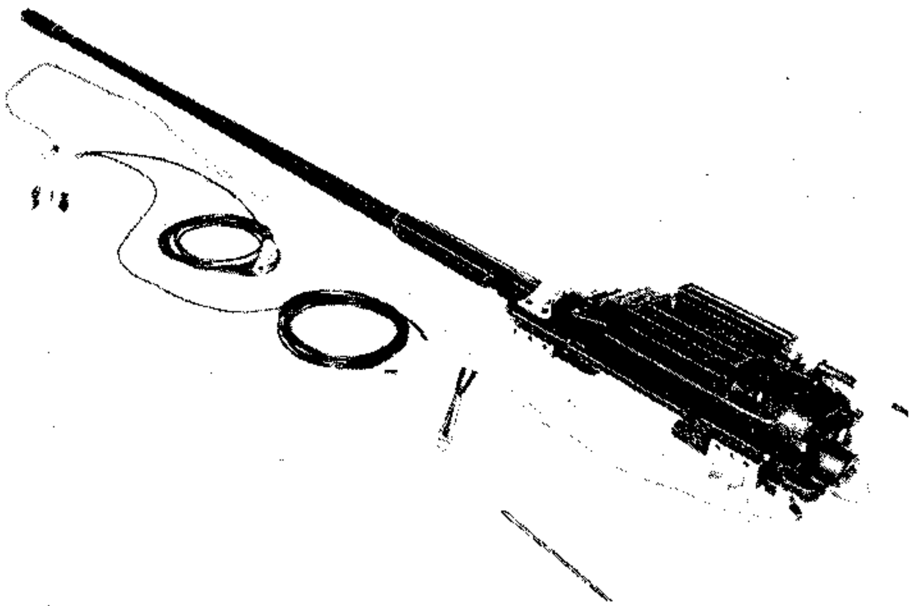
Elevation: —10° to +50°
Traverse: 360°
Rounds in magazine: 150
Total weight: 220 kg with 150 rounds

MANUFACTURERS:
The mounting was designed by Etablissements d'Etudes et de Fabrication de Bourges (EFBA) and is made by the Manufacture National d'Armes de Tulle (MAT) under the auspices of GIAT.

5599.103
20 mm GUN MODEL F2 (M693)
DESCRIPTION:
Derived from the M621 20 mm gun (**5589.103**) the M693 is an electrically operated weapon that is designed to fire all cartridges with the mechanical priming of the Hispano HS820 family – whereas the M621 is designed to fire electrically-primed ammunition.

A dual feed ammunition supply system is standard for the weapon, giving the gunner a choice of two types of ammunition. For example, the choice could be between the HS820 HE ammunition and the type 693 sub-calibre high-velocity AP ammunition. This choice, coupled with the range of HS ammunition available makes the weapon extremely versatile in this sense without impairing the versatility that it inherits from the M621.

CHARACTERISTICS:
Calibre: 20 mm
Muzzle velocity: HS820 ammunition about 1,030 m/sec. 693 sub-calibre ammunition about 1,300 m/sec.
Rate of fire: 740 rounds/min.
Type of fire: Single round; limited burst; continuous burst.
Power requirement: 24 V dc 6-7 A.
Dimensions: With cradle:
Length 2,695 mm
Height 266 mm
Width 205 mm
Cradle adds 30 mm to height.
Weight: Basic gun 70.5 kg. Cradle 10.5 kg. Control box 1.25 kg



M693 gun

STATUS:
Using so much of the technology and so many of the components of the M621 gun, the M693 was developed and put into production quickly.

The gun is installed on the T20-13 cupola of the AMX 13 VTT vehicle (**5010.102**) and on the TH 20 turret of the AMX 10P vehicle (**5009.102**). It is also being considered for installation on the T20-13 cupola of the AML/VTT vehicle (**5022.102**) for two types of anti-aircraft installation and for installation in helicopters.

MANUFACTURER:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

GERMANY (FEDERAL REPUBLIC)

5575.103
GERMAN ARTILLERY—GENERAL
In addition to the weapons listed here, reference may be made to the following entries in other parts of this book.

Self-propelled Anti-tank Gun, Kanone JPZ 4-5 (**5019.102**). 90 mm gun in turretless mounting on essentially the same chassis as the Rakete GW launcher and the Marder APC. Rheinmetall high-velocity gun.

20 mm Twin-Gun Anti-Aircraft System (**2182.131**). One application of the Rheinmetall 20 mm gun

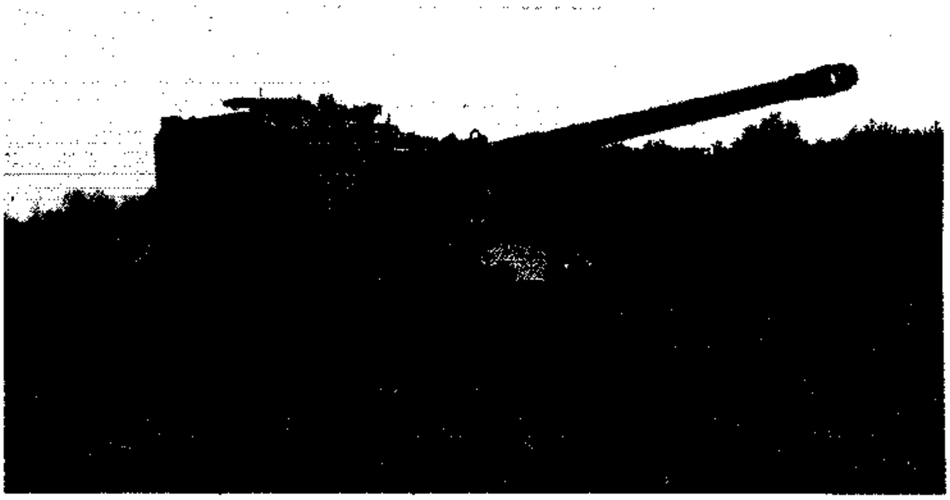
MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1 Germany.

2572.103
155 mm GCT LEOPARD SP GUN
DESCRIPTION:
The 155 mm GCT Leopard is the German version of the SP weapon system, the French (and original) version of which is the 155 GCT mounted on the AMX-30 chassis (**5574.103**).

The German version is the result of a cooperative operation by GIAT – who have been responsible for the French weapon system – and Krauss-Maffei, designers and manufacturers of the Leopard tank.

In essence the weapon system consists of the turret of the French version mounted on a specially adapted Leopard tank chassis. Apart from the chassis difference there are believed to be no differences of consequence between the two weapon systems and the reader is invited to consult entry **5674.103**, earlier in this section, where he will find all available details of the weapon proper. The advantage of having a Leopard system, however, is that it will be a logistically more suitable weapon for the numerous armies which are already equipped with Leopard tanks.

MANUFACTURERS:
Gun and Turret: GIAT, 10 Place Georges Clémenceau, 92211 Saint-Cloud, France.
Leopard Chassis and System Integration: Krauss-Maffei AG, 8, München 50, Federal German Republic.



155 GCT Leopard SP Gun

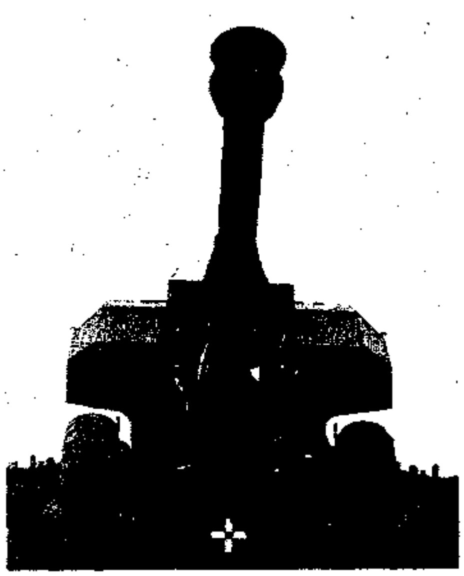
2192.103
155 mm SP HOWITZER M-109G
DESCRIPTION:
This weapon is a German modification of the American M-109 howitzer (**5508.103**). Significant modifications include a vertical sliding breech-block, semi-fixed ammunition and improved sights.
CHARACTERISTICS:
Calibre: 155 m
Barrel length: 23 calibres
Elevation: $-5°$ to $+75°$
Traverse: 360°
MV: 686 m/s
Weight of shell: (HE) 43.18 kg
Range: 18,100 m
Dimensions: Length 6.95 m; width 5.06 m; height 3.0 m
Total weight: 24.6 t
Engine: Otto 420 bhp (max)
Road speed: 56 km/h
Cruising range: 350 km
Crew: 6

STATUS:
In service in the Bundeswehr.

MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1, Germany.

2179.103
155 mm FIELD HOWITZER FH155(L)
DESCRIPTION:
A modernisation programme on the American 155 mm and 105 mm field howitzers has been carried out by Rheinmetall. The updated version of the larger weapon, the FH155 (L) has been equipped with a new barrel with breech ring, breech and muzzle brake, and new sighting and fire control systems have been provided.

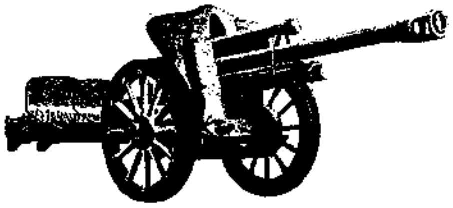
The general characteristics of the weapon can be found in the entry dealing with the original American version (**5510.103**). The introduction of the modifications referred to above is considered to have considerably extended the life of the gun.
STATUS:
In service.
MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1, Germany.



155 mm Field Howitzer after modification

5576.103
105 mm LIGHT FIELD HOWITZER
DESCRIPTION:
A modified version of the American 105 mm M.101 Howitzer (**5511.103**) this gun has a longer barrel with a muzzle brake and a new type of sight.
CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 35.5 calibres
Weight in firing order: 2.5 t
MV: 600 m/sec
Range: 14.1 km
Trail: Spread
Other characteristics believed similar to M.101.
MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1, Germany.

2190.103
105 mm LIGHT FIELD HOWITZER M-18/18M/39
DESCRIPTION:
Designed in the late 1920s the M-18 105 mm light field howitzer first went into service with the German Army in 1935. In its original form it was made by Rheinmetall; subsequently Rheinmetall and Krupp jointly brought out an improved version, the 18M. The M39 was made by Krupp and a quantity was to have been delivered to the Netherlands; but the Second World War intervened and the guns were appropriated instead by the German Army and mounted on M-18 carriages to become the M18/39.
CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 28 calibres
Elevation: $-5°$ to $+42°$
Traverse: 56°
Firing weight: M-18 and M-39: 1,915-1,985 kg; M-18M: 2,040 kg
Shell weight: 14.8 kg
MV: M-18 and M-39: 470 m/sec; M-18M 540 m/sec
Range: M-18 and M-39: 10,675 m; M-18M: 12,325 m.



105 mm Light Field Howitzer M-18

STATUS:
Apart from the German Army these weapons were supplied to Finland, Hungary, Norway, Spain and Sweden. Today, however, there are only a few M-18Ms in Yugoslavia and some M-39s in Norway.

MANUFACTURERS:
Rheinmetall and Krupp.

2191.103
NEW HIGH-PERFORMANCE GUNS

Rheinmetall GmbH is understood to be working on a range of new high-performance guns and ammunition.

Gun calibres are believed to be 105 mm, 110 mm, 120 mm and 155 mm. Some of these developments are joint projects; the 110 mm development (**2197.103**) for the Leopard II tank (**5015.102**) and the 155 mm FH 70 and SP 70 developments (**2195.103**) and (**2196.103**) being examples. In addition to these, however it is understood that there is a project for a 105 mm smooth bore gun firing fin-stabilised rounds with a very high muzzle velocity and a very high degree of accuracy. Another project, believed to be further advanced, concerns a high-pressure smooth bore 120 mm gun also firing fin-stabilised rounds.

Rheinmetall is certainly doing a lot of work on fin-stabilised rounds, some of which can be used over remarkably long ranges: one unconfirmed report has suggested that 70 km is feasible.

Finally, mention should be made of SPEAR—a gun-launched, fin stabilised, unguided anti tank rocket of about 60 mm calibre which can cover the first 1,000 metres in one second.

STATUS

Mainly development.

MANUFACTURER:

Rheinmetall GmbH, 4 Düsseldorf 1, Ulmenstrasse 125, Germany.

2180.103
90 mm ANTI-TANK GUN WITH AUXILIARY PROPULSION

DESCRIPTION:

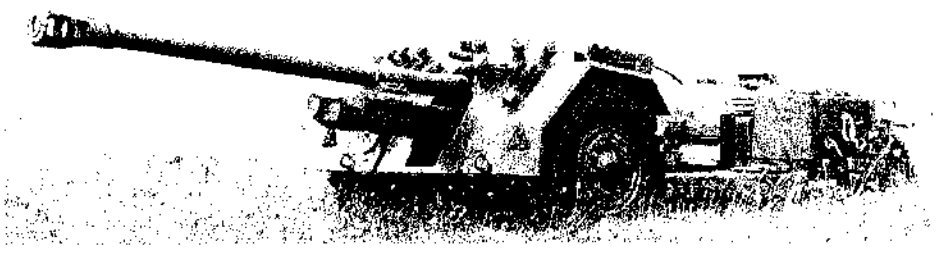
This weapon arrangement is designed to give a high-precision 90 mm anti-tank gun sufficient mobility to enable it to change its position under battlefield conditions without either the increase in silhouette that results from mounting the weapon on a tracked chassis or the cost of providing armoured protection for a commander, gunner and driver all with a clear view ahead.

STATUS:

Experimental.

MANUFACTURER:

Rheinmetall GmbH, 4 Düsseldorf 1, Germany.



90 mm SP Anti-tank gun with auxiliary propulsion unit

5600.103
20 mm RAPID-FIRE GUN Mk 20 Rh 202

DESCRIPTION

The Rheinmetall Mk 20 Rh 202 rapid-fire gun is designed for use with the 20 mm ammunition with disintegrating belt now in service with the army of the Federal German Republic.

The gun has a normal rate of fire of between 800 and 1,000 rounds per minute which can be reduced to about 600 rounds per minute if desired. The gun is gas operated and has a rigid breech block: a noteworthy feature is that the breech is locked symmetrically by two locking pieces so that the forces are absorbed centrally. Recoil forces are reduced by the use of a muzzle brake and by firing each round before the recoil travel from the previous round is complete. The ammunition feed is gas operated and does not depend on the movement of the belt and weapon.

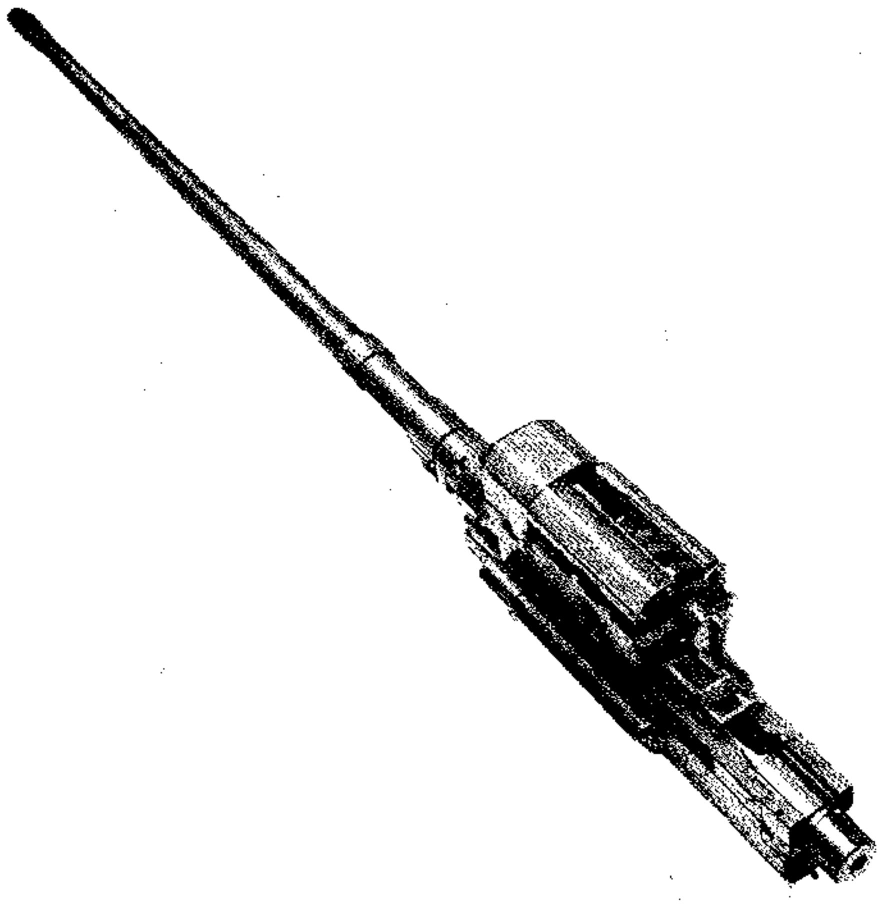
Two different belt feed mechanisms are available. In one (Type 2) two standard cartridge belts can be introduced in parallel simultaneously from above and the operational belt can be selected by a simple lever control. In the other (Type 3) a single standard cartridge belt is used but can be introduced from the left, from the right or from above without the necessity of making any mechanical changes.

The gun has been designed to operate satisfactorily under the most arduous physical conditions including temperatures below −54°C and exposure to water and heavy contamination.

All these characteristics make the gun suitable for use in a variety of different applications and several different mounts have been devised, including naval and airborne mounts. Particularly noteworthy here are the twin mountings that form the basis of the Twin-Gun Anti-Aircraft System (**2182.131**) and a one man turret system designed by Rheinmetall primarily for use on M113 armoured personnel carriers (**5016.102**).

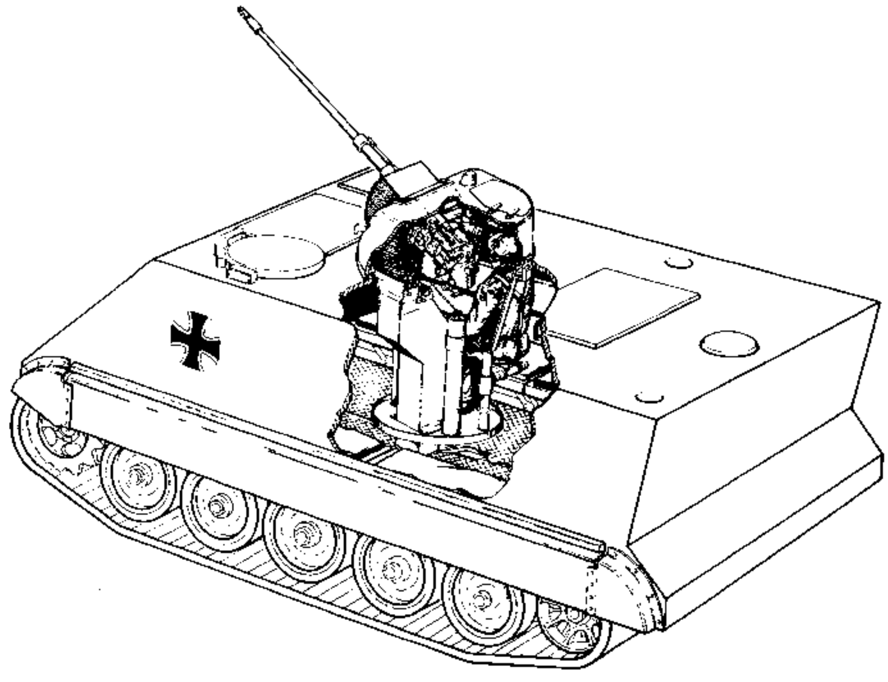
STATUS:

In service. The gun is the primary armament of the new Spähpanzer 8x8 ARV (**5115.102**) now in production for the German Army.



Rheinmetall Rh 202 gun

MANUFACTURER:
Rheinmetall GmbH, 4 Düsseldorf 1, Ulmenstrasse 125, Germany.



One-man turret for the Rh 202 gun

INTERNATIONAL

2195.103
155 mm TOWED HOWITZER FH70
DESCRIPTION:
FH70 – standing for "Field Howitzer of the Seventies" is one of two 155 mm artillery weapons which are being jointly developed by organisations in Britain, Germany and Italy.
An extremely versatile weapon, it is designed to fire all the standard 155 mm munitions in service in NATO and in addition it has to fire a special shell to a range in excess of 30 km – compared with some 24 km for a conventional shell. It is understood that the special shell chosen is a sub-calibre fin-stabilised round with a range capability in excess of 45 km.
The FH70, in addition to its ammunition versatility has several other interesting features. One is the inclusion of a detachable auxiliary power unit, mounted on the front of the carriage together with its fuel supply. This unit can be used for self-propulsion but also provides power for a multiplicity of operations in connecting and disconnecting the gun and its towing vehicle, for steering the small trail wheels and for raising the main wheels when the sole plate has been lowered. Provision is made for carrying out these tasks manually if the APU fails.
Another important feature is the assisted loading device which is actuated during the barrel run-out, and positions the shell in the mouth of the chamber for manual ramming. It is operable up to the maximum elevation angle of 70°.
CHARACTERISTICS:
Calibre: 155 mm
Barrel length: about 40 calibres
Elevation: –5.5° to +70°
Traverse: 55°
Weight: without shield and APU, 8.8t approx
Projectile weight: 43.5 kg (standard HE)
Ammunition: HE, smoke, illuminating, mine-dispensing, rocket-assisted
MV: 827 m/sec
Range: conventional round 24 km; sub-calibre and rocket-assisted projectiles at least 30 km
Rate of fire: normal 6 rounds/min; burst 3 rounds/15-20 sec
APU weight: 1.6 t approx
SP range: about 20 km
DEVELOPMENT AND MANUFACTURER:
Originally an Anglo-German project, the FH70 became a tri-nation operation when Italy joined as an equal partner in 1970 – by which time the first prototype firing trials had started. British and German government establishments have joint co-ordinating responsibilities at the government level; at the industrial level Vickers Ltd have overall co-ordination responsibility and particular responsibility for the carriage. Rheinmetall GmbH have particular responsibility for the elevating mass. Other German firms involved are Faun-Werke (APU), Leitz-Wetzler (sights) and Möller (telescope); in Britain the Royal Ordnance Factories and the Royal Armament Research and Development Establishment are involved in projectile and charge system work. Italian firms will enter at the production stage and are expected to include OTO Melara, SIGME and SNIA Viscosa.
Development is expected to be completed in 1975.

2196.103
155 mm SP HOWITZER SP70
DESCRIPTION:
SP70 is the second tri-nation ordnance project for the equipment of West European armies in the late 1970s. It is being developed on a programme which has a later time scale than the FH70 project and less information is available concerning its ultimate design and performance.
It is known, however, that while the new weapon will fire the same ammunition as the FH70 it will use a different gun which will be turret-mounted.
Probable work-sharing arrangements appear to be that Germany will undertake responsibility for the chassis and engine (Rheinmetall and Porsche) while the UK and Italy share the armament and turret and jointly produce the ammunition. The gun is likely to go to Italy where OTO Melara's upgunning of the M-109 (see **2193.103**) is probably relevant. The British contributor is understood to be ROF, Leeds.

2197.103
110 mm TANK GUN L10
DESCRIPTION:
This gun is being developed for the Leopard II tank (**5015.102**).
Very little information has so far been released concerning this project; but it is understood that the gun and ammunition are being developed jointly by the Royal Armament Research and Development Establishment (RARDE) in the UK and Rheinmetall GmbH, with a target specification which includes a muzzle velocity of around 1,800 m/sec with a terminal velocity at 2 km distance well in excess of 1,000 m/sec. It is believed that the gun will have a light steel barrel.
Ammunition development is understood to be shared between the two principals, the UK developing HEAP and HEAT spin-stabilised rounds while Rheinmetall develops a sub-calibre fin-stabilised discarded sabot round.
STATUS:
Development – as part of Leopard II development.

ISRAEL

2312.103
155 mm M-68 HOWITZER
DESCRIPTION:
This is built in Israel. It has a four-wheeled carriage with no shield. When travelling, the barrel is traversed 180° so that it is over the trails. The barrel has a single-baffle muzzle brake. The weapon is similar in appearance to the Finnish 122 mm gun M-60.
CHARACTERISTICS:
Calibre: 155 mm
Length of barrel: 33 calibres
Total Weight Travelling: 9,500 kg
Range: 20,000 m
Elevation: –3° to +52°
Traverse: 90°
Ammunition: HE wt 43.7 kg
STATUS:
In service.
SUPPLIER:
Soltam Limited, Israel

2319.103
155 mm M-68 SELF-PROPELLED GUN/HOWITZER (L-33)
DESCRIPTION:
This is basically a Sherman chassis rebuilt with a superstructure mounting the 155 mm M-68 gun/howitzer. The vehicle is fitted with a pneumatic lifting - loading system which, combined with the semi-automatic breech mechanism, enables the weapon to achieve a high rate of fire. The modifications to the Sherman chassis are quite extensive and include the fitting of a new engine. The L-33 was extensively used during the 1973 campaign.

CHARACTERISTICS:
Calibre: 155 mm
Length of Barrel: 33 calibres
Length Overall: 8.47 m
Width Overall: 3.50 m
Height Overall: 3.25 m
Total Weight: 41,500 kg (loaded)
Range: 21,500 m
Elevation: −3° to +52°
Traverse: 60° (total)
Speed: 36 km/h

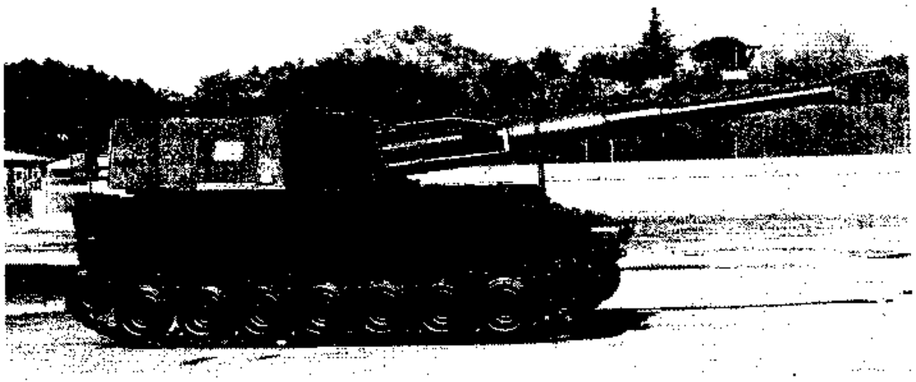
155 mm SP HOWITZER (M-109) (MODIFIED)
DESCRIPTION:
OTO Melara have developed and successfully tested a modified version of the M-109 155 mm SP howitzer (**5508.103**). This howitzer already exists in two modified forms—one of which is little different from the original (the Swiss M-109U **2298.103**) while the other (German M-109G **2192.103**) is more heavily modified. The Italian modification would seem to be the most substantial of all: the gun is a higher-performance weapon with a longer barrel.
Among the characteristics of the new weapon are the ability to fire existing M101 and M107 ammunition to a range of some 22 km and the new FH70 ammunition (**2195.103**) to a range of some 24 km. The development indeed looks much like a preliminary stage in the development of the new SP70 self-propelled howitzer (**2196.103**).

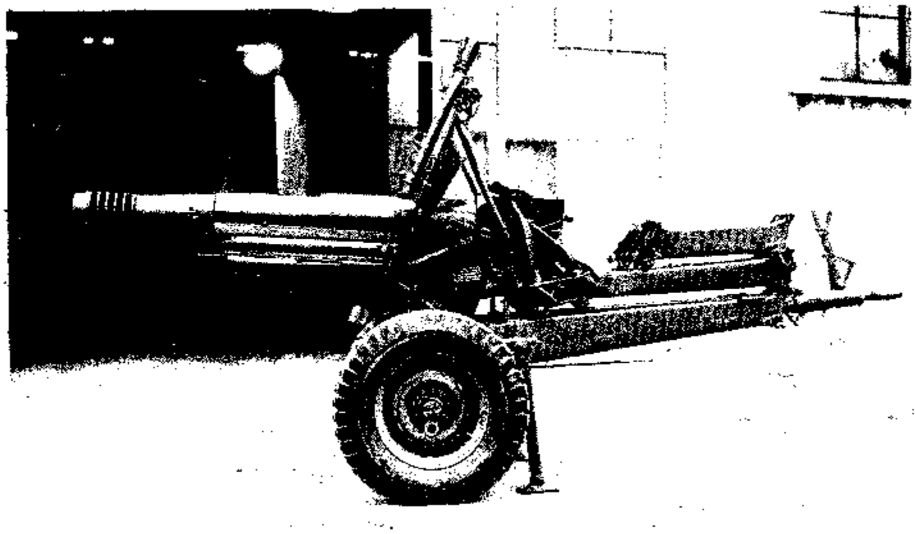


Italian modified version of M-109 SP howitzer

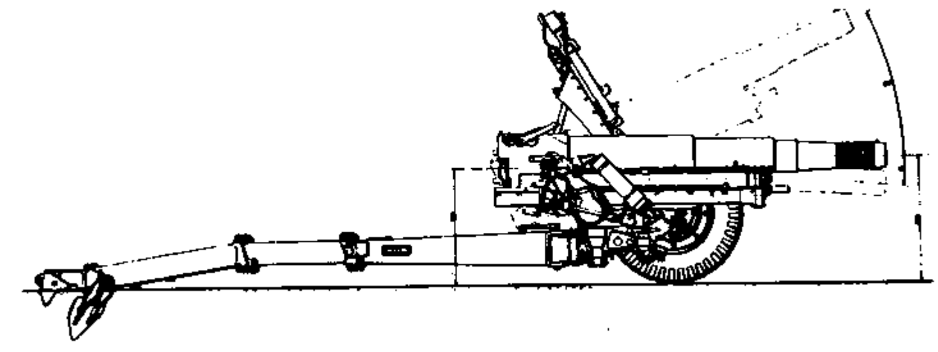
STATUS:
Demonstration prototype.

MANUFACTURER:
OTO Melara SpA, Via Valdilecchi 15 – 19100 La Spezia, Italy.

5501.103
105/14 MODEL 56 PACK HOWITZER
DESCRIPTION:
The Model 56 Pack Howitzer was designed with the intention of providing one weapon of sufficient versatility to cover the operational roles normally performed by several different types. At the same time the gun had to conform to the widest possible standardisation in materials and ammunition.
Design work started in 1950, the first prototype was produced in 1956, and the first gun was in service with the Italian Army in 1957. The gun has been outstandingly successful, and so far 1,417 have been ordered of which 1,365 have been delivered.
Essentially it is a light weight pack howitzer capable of rapid and easy dismantling into small parts, and equally rapid re-assembly. It is pre-eminently a highly portable equipment, and is unique in the modern world in that it can be man-packed, although only for short distances as the heaviest load is 122 kg
It can be transported in the following ways.
Mule train (breaks down into 11 mule loads)
Man pack
Parachute
Helicopter
Aircraft
In addition it can be, and usually is, towed by a vehicle or animal. In the British Army the towing vehicle is a ¾ ton long wheelbase Land Rover, but any similar sized vehicle is adequate.
It was not, however, designed for extensive high-speed towing over rough country; for this purpose a more robust weapon is desirable; and this is one reason why the Model 56 is to be replaced in British Army service by the new 105 mm Light Gun (**5505.103**). Another reason is the relatively short range of the Italian weapon – a necessary result of achieving the prime objective of high mobility in all kinds of difficult terrain.
The howitzer is widely used throughout the world, and one factor which has assisted in this is the ammunition. The ammunition is the US M1 system which is a NATO standard and is easily procured in practically all the western nations. Whilst this may not be the most advanced ammunition system which can now be manufactured, it is more than adequate for a light field piece such as this. Inevitably the range is slightly degraded by the short barrel, but the loss is very small and worth the price for the mobility achieved.
The howitzer has a secondary role as an anti-tank gun. For this the profile is lowered by moving the wheels forward, and laying the legs out flat. Not only is stability increased by this, but the gun is also easier to conceal; however, the howitzer is primarily intended as a close support weapon, and anti-tank actions would only be undertaken in emergencies.
The long, cranked legs of the split trail are unusual, and have to be folded for travel. A five-baffle muzzle brake is fitted to reduce the recoil as far as possible, and a small shield protects the crew.



105 mm Pack Howitzer with trail legs folded



105 mm Pack Howitzer in the Anti-Tank Role

CHARACTERISTICS:
Overall length: 5 3 m
Width: 1.51 m
Height: 1.92 m (max), 1.55 m (min)
Barrel length: 14 calibres
Total weight: 1,290 kg. Breaks down into 11 loads, the heaviest being 122 kg
Range:– **Max**10.575 m
Elevation: −5° to +65°
Traverse: 36°
Ammunition: US M1 System. Shell weight 14.9 kg

COUNTRIES SUPPLIED:
Argentina, Australia, Belgium, Canada, Chile, France, Federal German Republic, India, Italy, Malaysia, Nigeria, New Zealand, Pakistan, Rhodesia, Spain, United Kingdom, Zambia.

PENDING:
Saudi Arabia.

STATUS:
In production.

MANUFACTURER:

105 mm Pack Howitzer in the Field Role

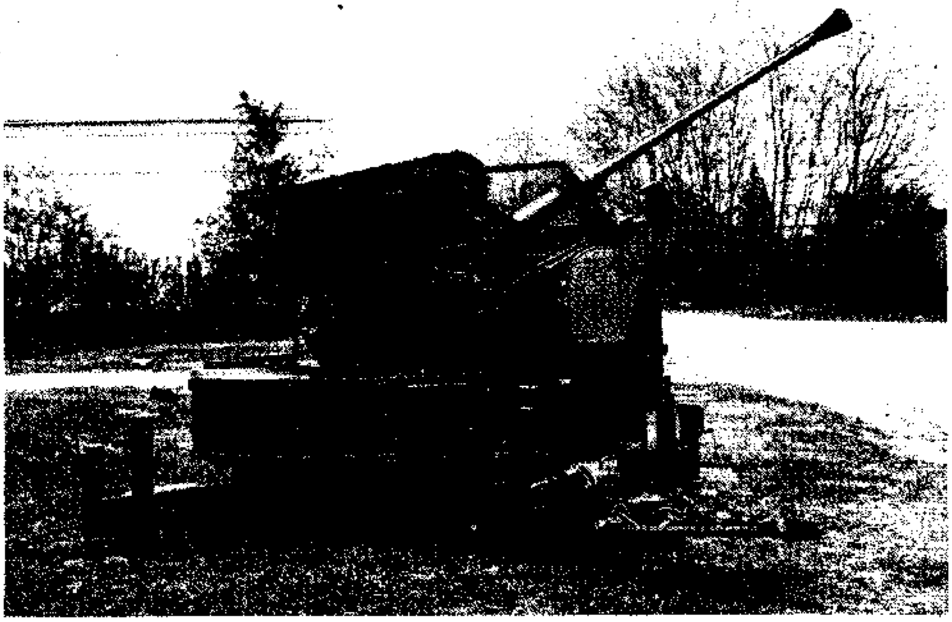
2603.103
40 mm BREDA/BOFORS LAA FIELD MOUNTINGS

DESCRIPTION:
Breda Meccanica Bresciana make a range of light anti-aircraft field gun-mountings, based on the Bofors 40 mm L/70 gun, which is similar to the range of single gun-mountings made for naval use (**2557.203**).

Illustrated here is the version with the 144-round Breda automatic feeder; others are that with the 32-round AL.100 feeder and the basic manually loaded version.

MANUFACTURER:
Breda Meccanica Bresciana, Via Lunga 2, 25100-Brescia, Italy.

Breda / Bofors LAA mobile field mounting



Bofors 40 mm L/ 70 AA gun in Breda mounting with 144-round feed

JAPAN

2585.103
106 mm SP RECOILLESS RIFLE TYPE 60

DESCRIPTION:
The type 60 SPRR was the first post-war Japanese armoured fighting vehicle and entered service in 1960/61. It is designed primarily for the anti-tank role, and is similar in concept to the M-50 Ontos (**2763.103** - 1973/74) which has recently been phased out of service with the United States Marine Corps. The 106 mm rifles fitted are known as the Type 60 and are basically the American 106 mm M-40A1 (**5584.103**) built in Japan. Production of this vehicle has been completed.

CHARACTERISTICS:
Crew: 3
Weight: 8.02 t
Size: Length 4 3m. Width 2.23m. Height 1.38m
Road speed/range: 48 km/hr/130 km
Main Armament: 2 × 106 mm recoilless rifles
Method of ranging: 1 × 12.7 mm ranging machine gun
Rate of fire: 6 rounds a minute
Max Effective anti-tank range: 1,100 m
Elevation/depression: −5° to +10° (normal)
−15° to +25° (when mount is raised)
Ammunition: Fixed HE and HEAT rounds
Turret rotation limits: 10° left and right (normal)
30° left and right (mount raised)
Engine: Komatsu 6 cylinder air-cooled diesel, 120 HP/2,400 rpm
Agility: Ground pressure .63 kg/cm^2. Max step 53 m. Max trench 1.78 m.
Max gradient: 67%. Ground clearance .35 m
Water crossing ability: Fords to a depth of .8 m
NBC system: nil
Night fighting aids: nil

STATUS:
In service with the JSDF.

SOUTH AFRICA

2586.103
SOUTH AFRICAN ORDNANCE
DESCRIPTION:

Full details of South African artillery developments are not available; but it is known that they have undertaken a considerable amount of work in refurbishing and modifying older weapons and it is believed that they have developed at least one major piece of ordnance – a 90 mm Field Gun.

Ammunition for South African artillery is believed now to be made entirely within the Union.

SP 25-pounder (Sexton) gun in service with the South African Army

SPAIN

2030.103
SPANISH ORDNANCE

Most of the heavy weapons used by the Spanish Army are of American origin and they include many of the American weapons which are currently operational in US and other NATO armies. For anti-aircraft operations there is possibly greater reliance on AA guns than is common elsewhere in Western European countries, although there is one battalion equipped with Hawk missiles. Guns, too, are relied upon heavily for anti-tank purposes.

Apart from these American weapons the only other imported gun is believed to be the Italian pack howitzer (**5501.103**); although, since the guns in service in Spain appear to have a modified muzzle brake, it may be that they have been either made or modified in Spain. Spain has its own armaments industry and has for many years made both field and naval guns for its armed forces. In the following entries there are descriptions of one old and one modern gun, both of which are in service in Spain and believed to be of Spanish design. There is also a description of a family of Spanish artillery rockets.

2031.103
105 mm LIGHT HOWITZER
DESCRIPTION:

This is a general-purpose field howitzer of robust and conventional construction. Date of entry into service is not known, but it seems likely that it was designed in the 1950s. Maker not known but almost certainly Spanish.

CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 26 calibres
Elevation: $-5°$ to $+45°$
Traverse: 50°
Weight: in firing order 1,950 kg
MV: 443 m/sec
Range: 9,400 m
Trail: Spread

STATUS:
In service in Spain.

2032.103
75 mm LIGHT FIELD GUN
DESCRIPTION:

This is a horse-drawn weapon of unknown but probably Spanish, presumably pre-1939, design. It features a box trail, a simple gunshield and large spoked wheels. With a total weight of only a little over 750 kg it is evidently easily manoeuvred in difficult terrain and has a useful range – although its accuracy may not be very great.

CHARACTERISTICS:
Calibre: 75 mm
Barrel length: 22 calibres
Elevation: 0° to 40°
Traverse: 7°
Weight in firing order: 764 kg
MV: 480 m/sec
Range: 10,500 m
Trail: box

STATUS:
In service in Spain.

SWEDEN

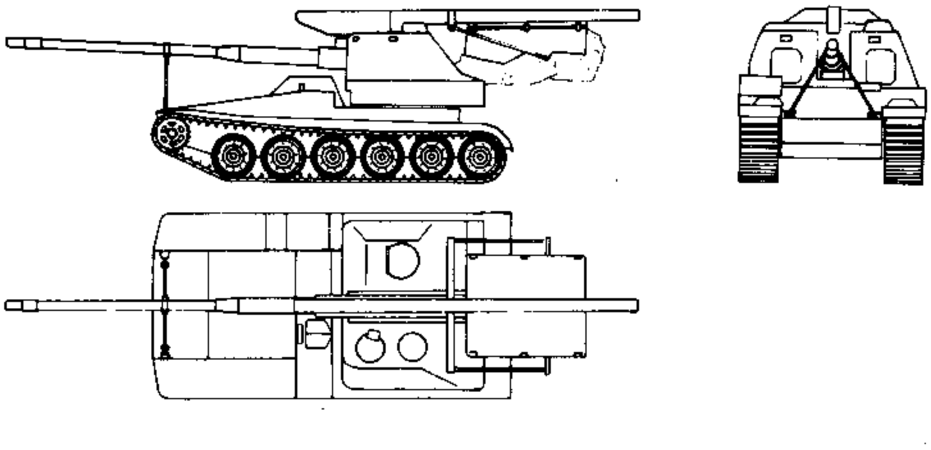
5527.103
155 mm SP AUTOMATIC GUN L/50 (VK 155 L/50)
DESCRIPTION:

The design of this very interesting gun began in the early 1950s prompted by the Swedish Army Staff. The intention was to produce a long range SP Gun with a high rate of fire. The first prototype was ready in 1960, production started in 1966, and was completed in 1968.

The L/50 is a fully automatic SP field gun on a tracked chassis. It is unique in that it loads each round automatically from a magazine, utilising the force of recoil to do so.

A four man crew is sufficient to operate the gun; the gun commander and gun layer being in the left cabin, the loader in the right hand one, and the driver in the hull.

The two cabins are protected from NBC attack, and contain enough room for three more men.



Normal elevating and traversing is by hand wheel, but an electric motor raises and lowers the gun to and from the loading position.

The loading arrangements consist of a tray beneath a magazine behind the breech. This tray carries the round to the breech, where it is then rammed. Both the tray and the rammer are activated by springs which are cocked by recoil. The loading tray is supplied by two feeding trays, again spring operated. The magazine holds 14 rounds in 7 drop compartments. The two rounds in each compartment drop onto the feed tray by gravity. The 14 rounds can be loaded in a clip in less than two minutes. Before loading, the type of fuse and the charge required for the action are chosen, thus avoiding having to change ammunition in the magazine.

The rate of fire is very high, maximum being 15 rounds per minute.

The chassis is supported on six large road wheels, with the track returning along their top. The sprocket is at the front. Suspension is hydropneumatic and is locked for firing.

There are two engines, a diesel and a gas turbine. The diesel drives an hydraulic pump, and the sprockets are connected to an hydraulic motor whose output varies differentially to each sprocket for steering. When only the gas turbine is driving, steering is effected by clutches and brakes.

STATUS:
In service since 1966.

Width: 3.3 m
Height: 3.25 m
Total weight: 51,000 kg
Range—max: 25,000 m with conventional ammunition
Elevation: $-3°$ to $+40°$
Traverse: 30°
Ammunition: Fixed. Weight of complete round. 85 kg. The existence of an RAP round has been reported, but no details are known.
Shell: HE. Weight 48 kg
MV: 865 m/s to 600 m/s
Engines: C.I. engine RR K 60 2-stroke Gas Turbine: Boeing 502-10 MA
Horsepower: C.I. engine: 240 SAE. Gas turbine 300 SAE

2331.103
155 mm F MEDIUM HOWITZER

DESCRIPTION:
This weapon is a version of the French 155 mm howitzer (**5536.103**) made under licence in Sweden in a slightly modified form. So far as is known, these modifications relate only to speeding up the unlimbering drill and improving the traverse mechanism.

CHARACTERISTICS:
Calibre: 155 mm
Barrel length: 23 calibres
Elevation: $-4°$ to $+69°$
Traverse: 82°
Weight in combat order: 8-15 t
Weight of shell: 43.75 kg
MV: 650 m/sec
Range: 17,700 metres
Rate of fire: 4-6 rounds/min
Trail: split, 4 wheels

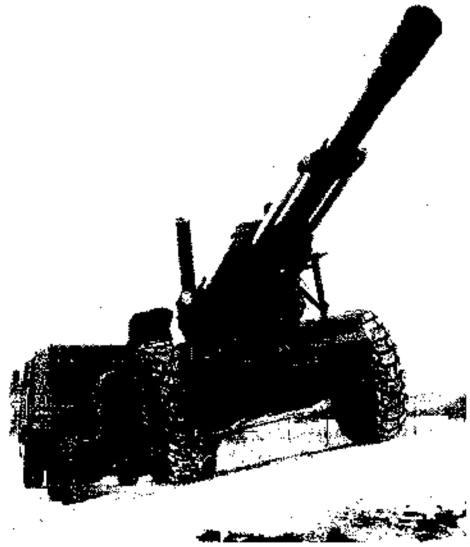
2332.103
155 mm FIELD HOWITZER 77

DESCRIPTION
The 155 mm Field Howitzer 77 is a new field artillery piece, with auxiliary engine, developed by AB Bofors on a contract from the Swedish Defence Authorities.

The Swedish Army – like many other armies – has a great number of guns from World War II days. FH 77 is intended to form the nucleus of the new generation of weapons in the Swedish field artillery. The nature of Swedish terrain and climate make good cross-country mobility an important consideration in the design of a new weapon; and the Swedish tactical philosophy demands that any such piece of ordnance have a high rate of fire. Financial consideration ruled out the development of a tracked weapon to meet the first requirement; instead, it was decided to develop a towed weapon with auxiliary propulsion. In doing this, and in meeting the rate of fire requirement Bofors have made extensive use of their experience of hydraulic systems and have produced (not for the first time – consider the S-tank) a system of considerable interest and ingenuity – the most noteworthy feature in this instance being perhaps the use of the auxiliary engine as a source of power for the various hydraulic systems.

The auxiliary engine drives the gun's two big wheels via an hydraulic transmission. When driving in rough terrain this drive is utilised to increase the cross country mobility of the equipment: the auxiliary engine is started and the tractive force of the wheels is controlled by the driver of the towing vehicle, with the aid of a special co-ordinating system. Trials hitherto carried out show that the gun driver in co-ordination with the towing vehicle gives the combination very good cross-country mobility. The howitzer can also move

FH 77 in firing position



FH 77 under its own power

FH 77 on tow

separately, by means of the auxiliary drive. It is steered with two control levers, one for each driving wheel.

In order to attain the high rate of fire stipulated – 3 rounds in 10 seconds – hydraulics are utilized for ramming the ammunition.

Hydraulics are also utilized for aiming the weapon in elevation and traverse, and to raise and lower the supporting wheels on the carriage trails.

For the deployment of the howitzer, the auxiliary drive and the hydraulics for the supporting wheels are used to disengage the howitzer from the towing vehicle, spread the trails and seat the trail spades in the ground. They are also used in the opposite way when leaving a position. The weapon can thus be made ready for firing and moved out of its firing position very rapidly; at the same time the work for the gun crew becomes very easy. This, in turn, increases the ability of the weapon to maintain combat activities for long periods of time.

The auxiliary drive is also used to turn the weapon – to direct the fire to different zones. This too can be accomplished very rapidly, with little effort on the part of the gun crew.

Extensive studies and trials relating to ammunition supply for the weapon have also been carried out. On one of its carriage trails, the howitzer has an electrically operated hoisting crane, whereby the heavy shells can be moved from the ammunition store to a loading tray on the weapon. Manual handling of the shells is thereby avoided and a high rate of fire can be obtained even if the gun crew is reduced or the crew members are tired.

Having regard to existing supplies of ammunition in Sweden, the choice of calibre lay between 105 mm and 155 mm. Because it was thought necessary to use a highly effective individual round, the larger calibre was chosen; and in order to increase the effect extensive development work on a new shell has been carried out by Bofors. This shell will be made of a type of steel that has not been used previously, and which gives better fragmentation properties than earlier types. Furthermore, the shell will be filled with hexotol, a high explosive with a more powerful effect than TNT.

In addition to the high-explosive shell, development of which has now been completed, smoke and illuminating shells are being developed.

Characteristics:

Calibre: 155 mm
Range: 22 km
Weight of projectile: 43 kg (with fuze)
Rate of fire: 3 rounds in 10 seconds
Traverse: – 30°
Elevation: –3° to +50°
Weight: 11 tons
Engine: Type: Volvo B20B Output DIN 74 kw at 92 rps.
Max. speed when towed: 70 km/h
Max. speed when self-propelled: 8 km/h

Status:

FH 77 is in the prototype-testing stage. Three prototypes, with ammunition and sights, are with the Swedish Army, for user trials, approval tests etc.

The three prototypes have been provided with three different types of sight. One of them has a conventional mechanical sight, one has a newly developed mechanical sight and one has an automatic electronic sight.

Manufacturer:

AB Bofors, Bofors, Sweden.

2335.103

105 mm LIGHT FIELD HOWITZER 4140

Description:

Remarkable at the time of its introduction for the use of a four-part trail permitting unlimited traverse, this is the current modern 105 mm howitzer of the Swedish Army. It has replaced the older weapons (**2334.103** 1973-74).

Characteristics:

Calibre: 105 mm
Barrel length: 28 calibres
Elevation: –5° to +65°
Traverse: 360°
Weight in combat order: 2.6 t
Weight of shell: 14.5 kg
MV: 620 m/sec
Range: 14,600 m
Rate of fire: 25 rounds/min

Manufacturer:

AB Bofors, Bofors, Sweden.

2343.103

105 mm TANK GUN L74

Description:

Main armament of the Swedish (Bofors) Strv 103 tank (**5003.102**) this gun is similar to the Vickers L7A family of guns, used on the Centurion and many other tanks, but has a longer barrel. It is fitted with a bore evacuator but has no muzzle brake.

Characteristics

Full details of performance have not been disclosed and the following list summarises the available data.

Calibre: 105 mm
Barrel length: 62 calibres
Elevation: (as mounted) –11° to +11° with tank chassis
Traverse: (as mounted) nil relative to tank chassis
Ammunition: HEP, APDS or Smoke
Projectile weight: 6.5 kg
Recoil: 270 mm
Loading: automatic
Rate of fire: 15-20 rounds/min

Muzzle velocity is among the undisclosed characteristics but is more than 1,500 m/sec with APDS

Status:

In service in Sweden.

2587.103

90 mm TANK GUN – BOFORS KV 90 S 73

Description:

This 90 mm Bofors gun is of the low pressure type: the peak pressure is only 17,000 psi – thus offering the advantages of lower weight and smaller recoil loads over conventional guns. The gun fires fin-stabilised shells, also developed by Bofors. The HEAT round utilises a piezo-electric fuse in order to reach a full-calibre sensitivity and is capable of penetrating all NATO targets. The HE round has a mechanical impact fuse and is used for anti-personnel missions. Maximum effective range is 2,000 m. The gun is the primary armament of the Ikv 91 Tank Destroyer (**5063.102**).

Characteristics:

Calibre: 90 mm
Length of barrel: 54 calibres
Ammunition: HEAT round has a m/v of 825 m/sec, complete round weighs 10.7 kg and projectile weighs 4.5 kg.

HE round has a m/v of 600 m/sec; complete round weighs 12.2 kg and projectile weighs 6.7 kg.

Manufacturer:

AB Bofors, S-690 20 Bofors, Sweden.

2339.103

75 mm COASTAL DEFENCE GUN

Description:

These weapons are mounted in fortified emplacements on the Swedish coast. The coastal artillery system for the protection of Sweden's long coastline is in fact under the control of the Royal Swedish Navy; in addition to the 75 mm gun described below, the defence system includes static and mobile batteries with 105 mm, 120 mm, 152 mm and 210 mm guns and with Rb-08 (**2372.121**) and Rb-52 (SS-11 **2139.111**) missiles, there being 20 batteries in all.

Characteristics:

Calibre: 75 mm
Barrel length: 60 calibres
MV: 840 m/sec

Range: 12,000 m
Rate of fire: 25 rounds/min

STATUS:
In service.

MANUFACTURERS:
AB Bofors, Bofors, Sweden.

2336.103
57 mm ANTI-AIRCRAFT GUN M54

DESCRIPTION:
This is a quick-firing anti-aircraft gun which, like the 40 mm L/70 (**5528.103**) is in service with anti-aircraft artillery battalions of the Swedish Army.

CHARACTERISTICS:
Calibre: 57 mm
Barrel length: 60 calibres
Elevation: −5° to +90°
Traverse: 360°
Weight in combat order: 8.1 t
Weight of shell: 2.6 kg
MV: 920 m/sec
Range: maximum: 14.5 km. Effective against aircraft 4,000 m
Rate of fire: 120 rounds/min

STATUS:
In service.

2337.103
40 mm ANTI-AIRCRAFT GUN L/60

DESCRIPTION:
Forerunner of the widely used L/70 weapon (**5528.103**) the Bofors L/60 is still in service in Sweden and elsewhere – as indeed is its naval counterpart.

CHARACTERISTICS:
Calibre: 40 mm
Barrel length: 60 calibres
Elevation: −5° to +90°
Traverse: 360°
Weight in combat order: 1.73 t
Weight of shell: 0.96 kg
MV: 850 m/sec
Range: maximum: 8,700 m; effective against air targets: 1,200 m
Rate of fire: 120 rounds/min
Penetration: (in anti-tank role) 55 mm at 500 m and 90°

STATUS:
In service with territorial forces but obsolescent. No longer in production.

5528.103
40 mm AUTOMATIC GUN L/70

DESCRIPTION:
The Bofors 40 mm light anti-aircraft gun is one of the best known and most widely used pieces of ordnance in the world. In many languages the name of Bofors is automatically synonymous with the 40 mm gun. It has been in service since about 1937.

The L/70 is a later variant of the original design, and the first prototype appeared in 1947. The first production models were delivered in 1951 and the latest version is still being manufactured. Over 5,000 equipments have been made, of which 1,000 are in naval mountings.

The gun is self-loading, feeding from clips of ammunition placed by the crew into guideways above the breech. A cyclic rate of fire of 300 rounds per minute can be achieved, together with very high rates of traverse and elevation.

In the ground version the gun has its own power unit on the carriage, and can generate independently of any power supply. Fire control data is fed in by cable from an external radar set which can be up to 500 m away. Gun layers are not required when the weapon is being automatically controlled.

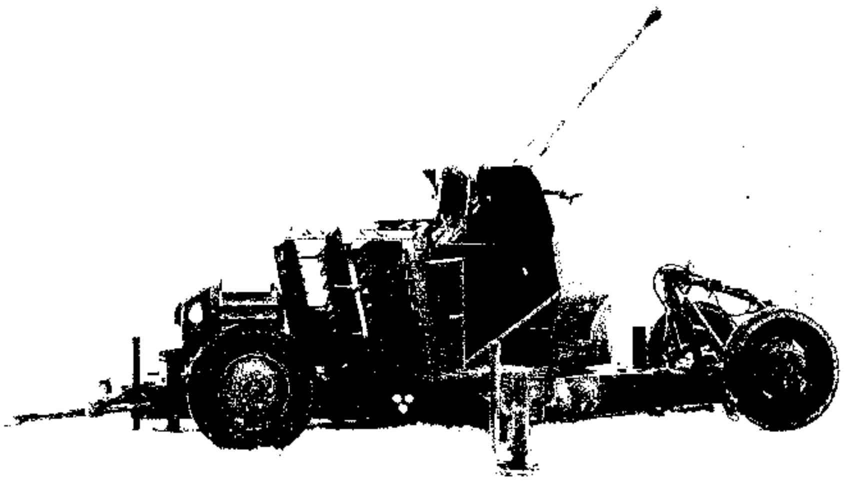
The gun can also be provided with an integrated optronic fire control equipment called BOFI (**2378.151**), the combination constituting a weapon system which can be rapidly deployed.

Mobility is good, the four wheeled carriage accepting cross country movement well. The entire equipment is air portable without extensive preparation, and can also be parachuted.

The crew is normally six, of which four are loaders and ammunition numbers.

The ammunition is normally HE, with a point detonating fuse of great reliability. The HE round also has a self destruction timer which operates at 8.5 sec (+2 sec) after firing. But since this gun is often used against surface targets a full-calibre armour piercing round and an APCBC-T round have been evolved.

A recent development is a pre-fragmented shell for use with a newly-developed proximity fuse. This ammunition is superior to the earlier types in its effects against aircraft and particularly missiles.



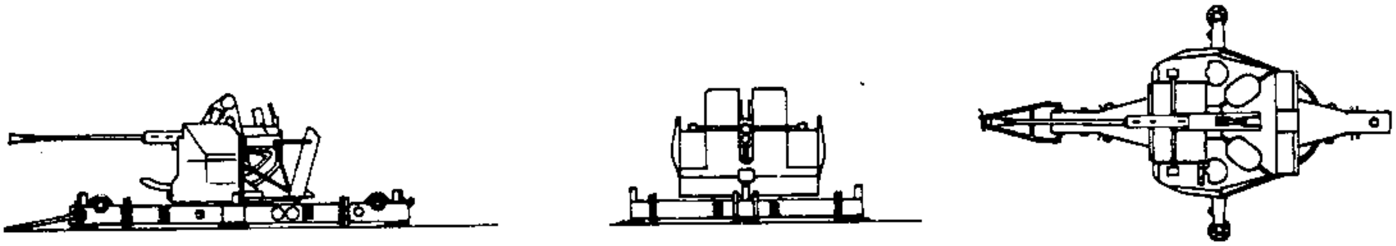
40-mm L/70 AA gun with integral power unit

STATUS:
In production.

COUNTRIES SUPPLIED:
Up to 20 different nations supplied so far. Typical users are NATO countries, India and Sweden.

CHARACTERISTICS:
Overall length: 6.32 m
Width: 2.25 m
Height: 2.35 m
Barrel length: 70 calibres
Total weight: 5,150 kg
Tactical range: 4,000 m
Elevation: −5° to +90°
Traverse: 360°
Ammunition: See text
MV: 1,000 m/s

MANUFACTURER:
AB Bofors Ordnance Division, Box 500, S-690 20, Bofors, Sweden.



40-mm L/70

2338.103
20 mm ANTI-AIRCRAFT CANNON M40-70

DESCRIPTION:
This light anti-aircraft weapon is used by brigade anti-aircraft units in the Swedish Army. It is mounted on a two wheel trailer for towing; but for firing it is supported on a three-part trail with the wheels raised.

CHARACTERISTICS:
Calibre: 20 mm
Barrel length: 70 calibres
Elevation: −5° to +35°
Traverse: 360°
Weight combat order: 500 kg
Weight of projectile: 0.145 kg
MV: 815 m/sec
Range: maximum: 7,500 m; effective against air targets: 1,600 m
Rate of fire: 360 rounds/min

STATUS:
The M40 70 weapon is the latest in a series of improvements on a basic weapon design extending back to before the Second World War and is the version which is currently in service.

2333.103
90 mm RECOILLESS ANTI-TANK RIFLE 1110
DESCRIPTION:
This weapon is employed either mounted on a light wheeled vehicle or on a two-wheel trailer towed by a tractor. In the latter version the weapon is mounted on a turntable to which the wheels are attached and which serves as an arm rest for the gunner who fires from a kneeling position. With this arrangement the available traverse, as measured in the horizontal plane, varies with the elevation angle since the turntable tilts when the weapon is elevated.
CHARACTERISTICS:
Calibre: 90 mm
Barrel length: 3.7 m
Elevation: −10° to +15°
Traverse: 75-115° according to elevation
Weight in combat order: 260 kg as a trailer
Weight of shell: 3.1 kg
MV: 715 m/sec
Effective range: 900 m
Penetration: 380 mm at 90°
Rate of fire: 6 rounds/min

STATUS:
In service.

SWITZERLAND

2998.103
155 mm SP MEDIUM HOWITZER M-109U
DESCRIPTION:
So far as is known this Swiss version of the American M-109 SP howitzer differs little from the original (see entry **5508.103**). It is believed that the differences are mainly electrical – necessitated by national practice
CHARACTERISTICS:
Designation: Panzerhaubitze 66 (PzHb 66)
All-up weight: 23.5 t
Crew: 8
Gun calibre: 155 mm
Barrel length: 23 calibres
Range: 15-18 km
Rate of fire: 5-6 rounds/min
Rounds carried: 28
Secondary armament: 12.7 mm AA MG
STATUS:
In service, replacing 105 mm LFH (**2387.103**) in mechanised divisions. 145-150 deployed.

2389.103
150 mm MEDIUM HOWITZER M-42

DESCRIPTION:
This is an early Bofors-designed weapon made under licence in Switzerland and still in service there in small numbers.
CHARACTERISTICS:
Calibre: 150 mm
Barrel length: 28 calibres
Elevation: −5° to +65°
Traverse: 45°
Weight in firing order: 6.5 t
Weight of shell: 42 kg
MV: 580 m/sec
Range: 15 km
Trail: spread
Rate of fire: 5 rounds/min
STATUS:
In service in artillery regiments and artillery battalions of mechanised divisions.

2387.103
105 mm LIGHT HOWITZER M-46
DESCRIPTION:
This is a Bofors-designed weapon manufactured under licence in Switzerland and believed now to be in service only in that country.
CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 22 calibres
Elevation: −0° to +65°
Traverse: 60°
Weight in firing order: 1,850 kg
Weight of shell: 15.15 kg
MV: 490 m/sec
Range: 10 km
Trail: spread
STATUS:
In service in the divisional artillery of the Swiss Army. Some 800 of these howitzers and the M-35 medium guns (**2388.103**) are believed to be operational in Switzerland. It is being replaced in mechanised divisions by the M-109U 155 mm SP medium howitzer (**2998.103**).

2388.103
105 mm MEDIUM GUN M-35
DESCRIPTION:
This is an old weapon of Bofors design which was made under licence in Switzerland where a few are still in service.

CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 42 calibres
Elevation: −3° to +45°
Traverse: 60°
Weight in firing order: 3,840 kg
Shell weight: about 15 kg
MV: 750-800 m/sec depending on ammunition used
Range: 17.5 - 21 km depending on ammunition used
Trail: spread
Rate of fire: 5 rounds/min

STATUS:
In service in the artillery battalions of mechanised divisions and in artillery support regiments. Some 800 of these guns and the M-35 howitzers (**2387.103**) are believed to be operational in Switzerland.

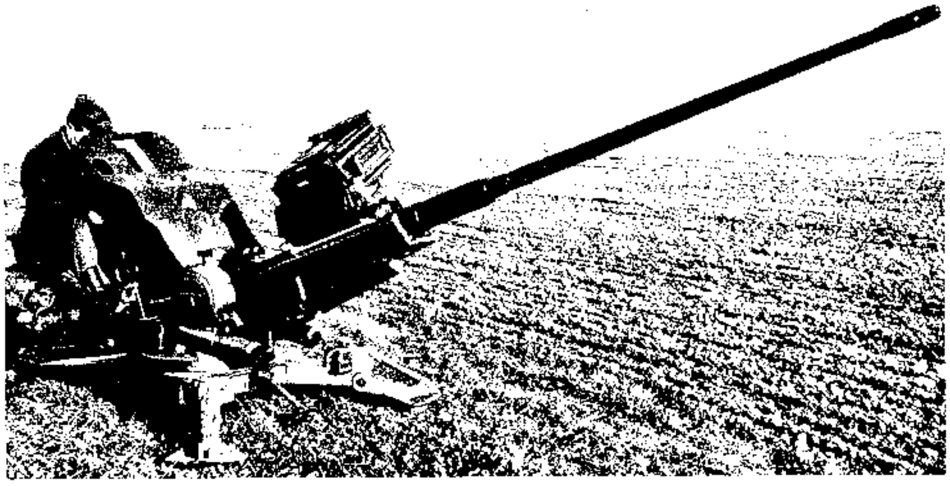
2393.103
90 mm ANTI-TANK GUNS M-50/57
DESCRIPTION:
Two 90 mm anti-tank guns are in service with the Swiss armed forces. Performances are not greatly different: but the M-57 has a longer effective range and is generally of more streamlined construction.

CHARACTERISTICS (M-57):
Calibre: 90 mm
Weight in firing order: 550 kg
Weight of shell: 3.15 kg (hollow charge)
MV: 600 m/sec
Effective anti-tank range: 800-1,000 m
Trail: spread
Penetration: 250 mm at 60° with hollow shell

STATUS:
Both weapons are in service with heavy companies of the fusilier battalions.

2380.103
30 mm ANTI-AIRCRAFT MOUNTING TYPE 661
DESCRIPTION:
This is a mobile anti-aircraft weapon system designed to be transported on a two-wheel trailer and capable of rapid deployment in the field.
The complete mounting comprises a type 831-SL M 30 mm Oerlikon cannon (**2379.103**), a type P36 Galileo mechanical fire control computer, sights for air and ground targets and hydraulic drives for elevation and traverse. The gun is arranged for feeding with linkless ammunition in clips.
Rate of fire is 650 rounds/min and the ammunition feed box contains 40 ready rounds. All-up weight is 1,500 kg.

MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.

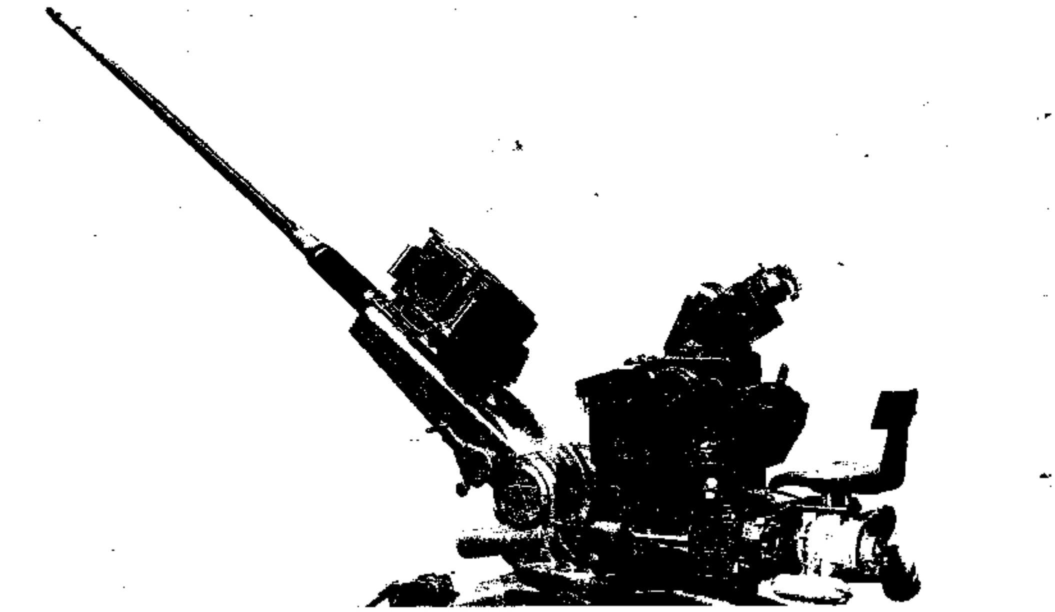


Type 661 30 mm Automatic Cannon

2342.103
34 mm ANTI-AIRCRAFT GUN M-38
DESCRIPTION:
This light and mobile gun is deployed together with smaller weapons, for the defence of airfields and hydro-electric installations against attack by low-flying aircraft. It is mounted on a four-wheel trailer and can be bought into action rapidly.

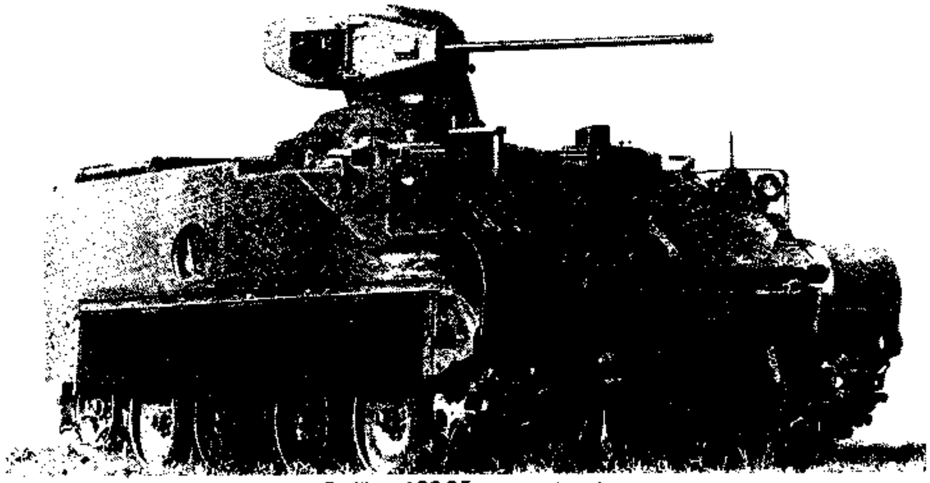
CHARACTERISTICS:
Calibre: 34 mm
Barrel length: about 60 calibres
Traverse: 360°
Weight in firing order: 2.8 t
Weight of shell: 720 gm
MV: 900 m/sec
Range: maximum 12 km
effective AA 3 km
Rate of fire: 250-270 rounds/min
STATUS:
In service as noted above.
MANUFACTURER:
Berner Waffenfabrik.

2379.103
30 mm AUTOMATIC CANNON TYPE 831 SLM
DESCRIPTION:
Cannon type 831 SLM is a derivative of the Hispano (now Oerlikon) type 831A; one major difference being that the latter fires a 420 g projectile whereas the 831 SLM fires a 360 g projectile. Other characteristics are:
Rate of fire: 650 rounds/min
MV: 1,080 m/sec
Ammunition feed: 1. linkless with clips (5 rounds per clip, 8 clips per box). 2. belt with either left-hand or right-hand feeders
MANUFACTURER:
Machine Tool Works Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.



Type 831 30 mm Automatic Cannon

5586.103
OERLIKON 25 mm APC GUN TURRET
DESCRIPTION:
Oerlikon have developed a 25 mm gun turret which can be fitted into any type of armoured personnel carrier. The turret is equipped with an overhead mounting, is operated by one man and can be supplied either manually controlled or electrically controlled and stabilised, so that firing while on the move is possible. The turret characteristics are suitable for engaging aircraft, armoured vehicles or infantry, and versatility is increased by the possibility of a quick changeover from HE to AP ammunition. For night firing there is a built-in infra-red aiming periscope with 4-power magnification. The turret is equipped with the newly developed Oerlikon KBA 25 mm dual purpose automatic gun which has the following characteristics.
CHARACTERISTICS:
Calibre: 25 mm
Rate of fire: Selectable from single shot to 250 rds/min, max rate 750 rds/min
MV: 1,100 m/sec
Tactical range: 2,000 m
Weight of gun: 95 kg



Oerlikon APC 25 mm gun turret

Ammunition supply: 120 and 80 rds in two containers. Dual feed for AA/infantry and AP ammunition selectable without any delay in time
Weight of turret: Total, including 200 rds: manually controlled, 960 kg; electrical controlled and stabilised, 1,055 kg
MANUFACTURER:
Machine Tool Works, Oerlikon-Bührle Ltd, Zürich, Switzerland.

5587.103
20 mm AA GUN TYPE 10 ILa/5TG
DESCRIPTION:
The 10 ILa/5TG 20 mm anti-aircraft mounting is a high-performance weapon of modern design. Manually operated it is suitable not only for anti-aircraft engagements but also for ground-to-ground fire. By reducing all oscillating masses to a minimum and designing all parts as simply as possible, a very high rate of fire has been achieved. The mounting features high aiming speed, quick changeover from travel position to fire position (less than one minute) and low weight and ease of dismantling. Furthermore even the heaviest parts of the mounting can be carried by only two men.
CHARACTERISTICS:
Calibre: 20 mm
MV: 1,100-1,200 m/sec

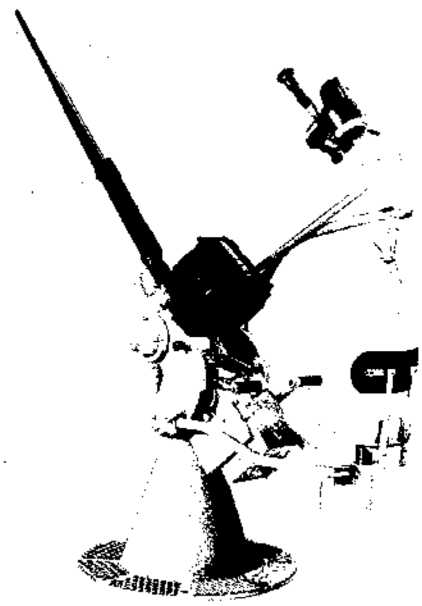
Oerlikon 20 mm AA gun

Rate of fire: 1,000 rds/min
Weight of mounting: 544 kg in travel position, 383 kg in firing position

Ammunition feed: Drum magazine containing 50 rounds
Tactical range: Up to 2,000 m

MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Zürich, Switzerland.

2381.103
20 mm AUTOMATIC CANNON TYPE 804
DESCRIPTION:
One of the most widely used 20 mm weapons, this Hispano cannon is no longer in production but is included here because it is still extensively used.
CHARACTERISTICS:
Calibre: 20 mm
Barrel length: 70 calibres
Weight: Gun without feed, 41.6 kg
Projectile weight: 120 gm
MV: 835 m/sec
Rate of fire: Up to 800 rounds/min
Recoil thrust: max 474 kg
Range: typically 1,500 m against aircraft
MANUFACTURER:
Formerly manufactured by Hispano-Suiza in Switzerland (and under licence in other countries).



20 mm Type 804 cannon on A41B mounting

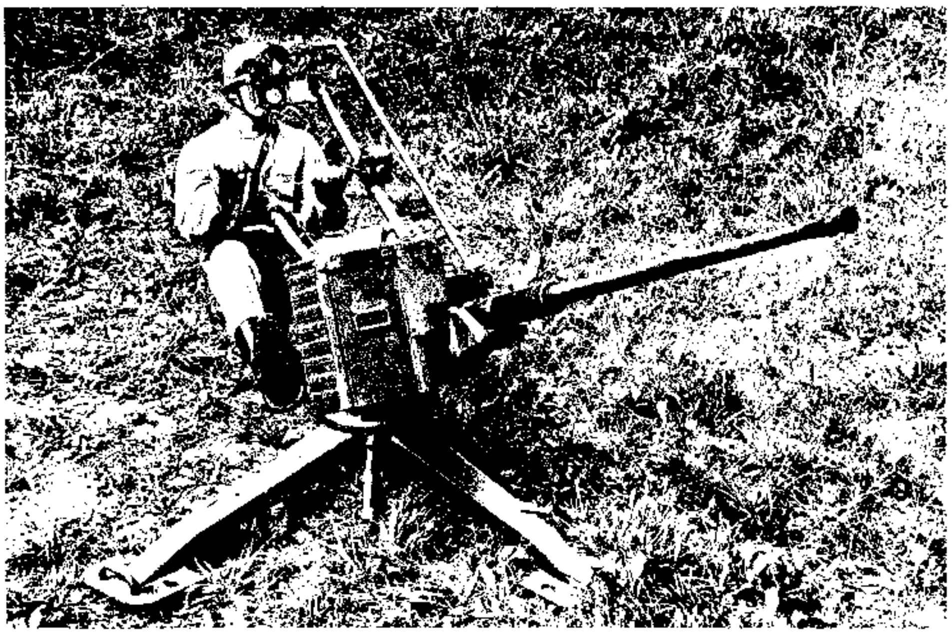
2382.103
20 mm AUTOMATIC CANNON TYPE HO 820 SL
DESCRIPTION:
This weapon is the successor to the Oerlikon 20 mm cannon type 804 (**2381.103**). Principal differences between the two weapons are the greater barrel length and the higher muzzle velocity of the later weapon.

CHARACTERISTICS:
Calibre: 20 mm
Barrel length: 105 calibres
Projectile weight: 120 g
MV: 1,050 m/sec
Rate of fire: 1,000 rounds/min
Range: typically 1,500 m against aircraft
Ammunition feed:
1. Drum magazines: 50 rounds per magazine
2. Stick magazines: 10 rounds per magazine
3. Belt feed: left-hand, right-hand or dual

STATUS:
In service – mainly in APC turrets.

MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.

2383.103
SINGLE 20 mm MOUNTING TYPE 639-B
DESCRIPTION:
This is the smallest and simplest of several mobile field mountings for the Oerlikon 20 mm cannon type HO 820 SL (**2382.103**). It is mounted on a two-wheel trailer for travelling but is quickly deployed.
CHARACTERISTICS
Gun: 20 mm type HO 820 SL
Elevation: manual
Traverse: by gunner's body
Sight: Delta-Reflex
Ammunition: 50 rounds in drum magazine or 75 rounds in belt
All-up weight: 495 kg on trailer
MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.



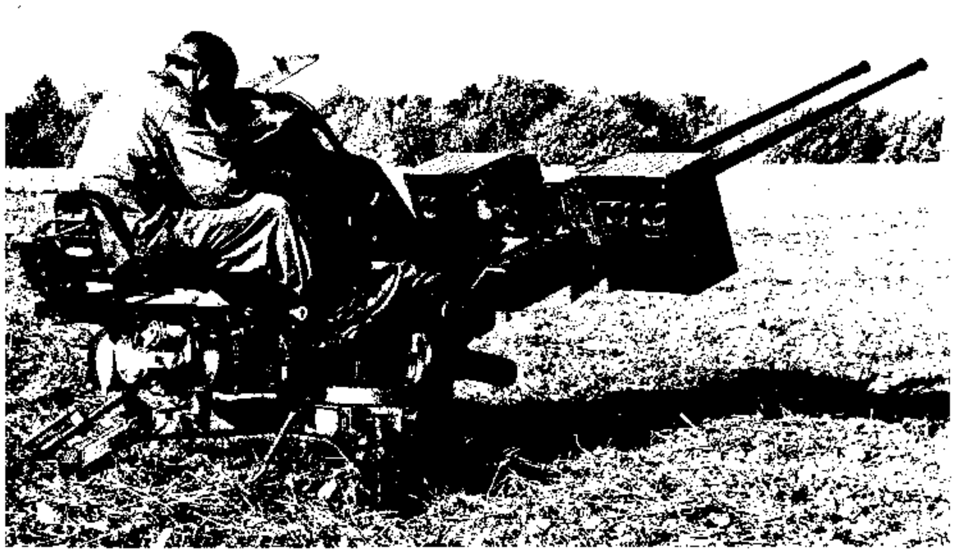
20 mm Type 639B single mounting

2384.103
TWIN MOUNTING 20 mm TYPE 666

DESCRIPTION:
Based on the Oerlikon 20 mm cannon type HO 820 SL (**2382.103**), this mounting is otherwise similar in many respects to the 30 mm cannon mounting type 661 (**2380.103**). Specifically, the mounting is equipped with the same sights, fire control computer and hydraulic drives. Like the other field mountings for this gun it travels on a two-wheel trailer.

CHARACTERISTICS:
Guns: 20 mm type HO 820 SL
Rate of fire: 2,000 rounds/min total
Ammunition feed: belt feed of 120 rounds per gun
All-up weight: 1,500 kg on trailer

MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.



20 mm Type 666 twin mounting

THE UNITED KINGDOM

5546.103
BL- 5.5 in GUN
DESCRIPTION:

The 5.5-in gun was a contemporary of the 25 pounder and was immensely popular with the Royal Artillery. It saw a great deal of service in the 1939-45 war and established a very good reputation for accuracy and lethality. It is now in service with reserve units but will shortly be phased out even from these.

It achieves a maximum range of 18,100 yards with an 80 lb shell and was used mainly in support of armoured regiments. It was also eminently suitable for counter-battery tasks. In its early days the gun had a 100 lb shell; however it was later decided to enlarge the cavity and reduce the amount of metal in the shell body: thus, the 80 lb shell was produced with a considerably higher explosive content and increased lethality.

The gun is towed by a 10-ton Leyland tractor which gives it a surprisingly good mobility. It has a very reasonable cross-country performance and can be brought into and out of action by its 10 man detachment in 3 to 5 minutes.

The split trail not only allows the detachment to load the heavy shell with ease, but also gives the gun an excellent top traverse of 30 degrees right and left. The gun also incorporates an ingenious quick loading device which enables the detachment to swing it down to a loading angle and return it to its original elevation after loading, with minimum effort and maximum speed.

The gun was not designed to have a high angle capability and is thus able to employ two compression type balancing gears mounted vertically on either side of the elevating mass.

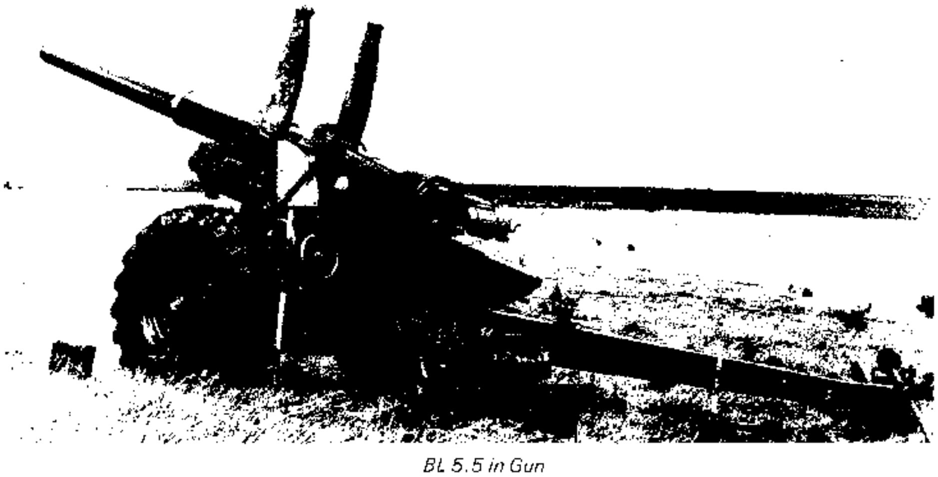
The breech of the gun combines a modified Welin breech screw with the famous Asbury mechanism. The latter was introduced in 1916. The system gives excellent strength and reliability, and although the ammunition is of the separate loading, bag charge variety, the gun has a fairly high rate of fire.

STATUS:

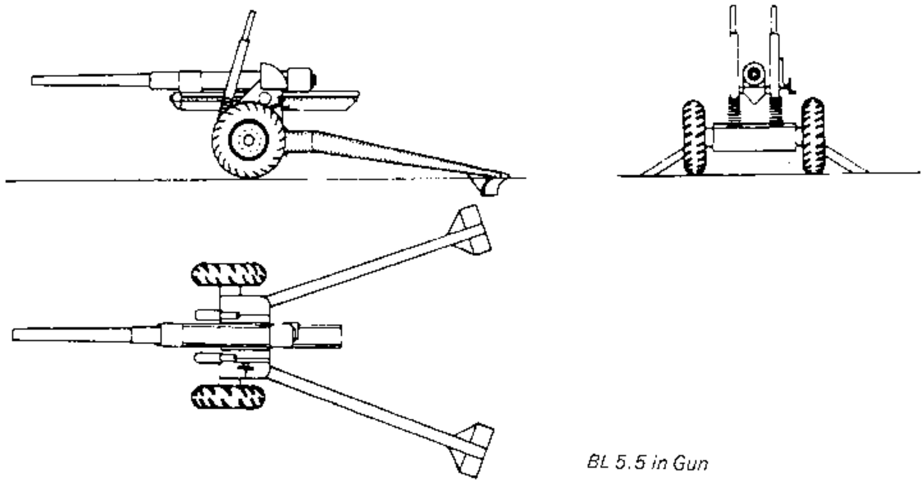
Reserve units of the British Army. Believed still to be in service in Burma, India, Malaysia, New Zealand, Oman, Pakistan and South Africa.

CHARACTERISTICS:

Overall length: 7.5 m
Width: 2.54 m
Height: 2.6 m
Barrel length: 4.17 m
Calibre: 5.5 in (140 mm)
Total weight: 6,184 kg
Range – max: 16,500 m
Elevation: 45°
Traverse: 60°
MV: Charge 1: 290 m/s. Charge 2: 594 m/s
Ammunition: Separate loading, bag charge
Shell: HE wt 36.4 kg, Smoke, Illuminating



BL 5.5 in Gun



BL 5.5 in Gun

2453.103
120 mm TANK GUN L11A3
DESCRIPTION:

Main armament of the Chieftain tank (**5006.102**), this gun is one of the most powerful tank weapons in current operational service and is said to be the only one capable of outranging the Russian 115 mm tank guns (but see entries **2191.103** and **2197.103**).

Separate ammunition is used, the bagged charges being fully combustible. The gun, as mounted in the Chieftain, is fully stabilised in azimuth and elevation so as to permit accurate firing while on the move; to prevent gunnery errors resulting from differential heating or cooling on opposite sides of the barrel a thermal jacket is fitted. A bore evacuator is also fitted.

CHARACTERISTICS:
Calibre: 120 mm
Barrel length: 55 calibres
Elevation: (in Chieftain) −10° to +20°
MV: APDS: 1,370 m/sec HESH: 670 m/sec
Range: (effective maximum) APDS: 3,000 m; HESH: 8,000 m
Rate of fire: 7 rounds/min
Projectile weight: 17 kg
Recoil distance: 356 mm

STATUS:
In service.

2451.103
105 mm TANK GUNS L7A1 and L7A2

DESCRIPTION:
These two guns were introduced sequentially into British Army service in the Centurion tank (**5004.102**) as successive replacements for the 20-pounder gun with which that tank was first equipped. The L7A1 gun is also used on the American M60A1 tank (**5024.102**) and a modified version built under licence in Switzerland is used on the Pz61 tank (**5031.102**). The 105 mm L74 gun used on the Swedish S-tank (**5003.102** and **2343.103**) is similar, but has a longer barrel and is modified for automatic loading.

CHARACTERISTICS:
Reliable detailed information is in short supply. The following data gives some indication of the capabilities of the two weapons.
Calibre: 105 mm
Barrel length: 51 calibres
Elevation: (on Centurion) −10° to +18°
Projectile weight: 11.3 kg
MV: about 1,470 m/sec with APDS
about 730 m/sec with MESH
Recoil: Approx 280 mm
Rate of fire: 9-10 rounds/min (Centurion)

STATUS:
L7A1 in service in Mk 10 Centurions and in some upgunned earlier marks. L7A2 is in service with Mk 13 Centurions.

2452.103
105 mm TANK GUN L7A3

DESCRIPTION:
Successor to the L7A1 and L7A2 guns (**2451.103**) this 105 mm gun is used on the Vickers Mark 3 tank (**5057.102**), the Leopard tank (**5015.102**) and the Japanese ST-B tank (**5073.102**).

CHARACTERISTICS.
Calibre: 105 mm
Barrel length: 51 calibres
Elevation: (in Vickers MBT) −7° to +20°
Weight of projectile: 11.3 kg
MV: 1,470-1,480 m/sec with APDS;
730 m/sec with HESH
Range: maximum: 36,750 m. Effective: 1,800 m APDS; 5,500 m HESH
Rate of fire: 9-10 rounds/min

STATUS:
In service.

5503.103
105 mm SP GUN ABBOT

DESCRIPTION:
Abbot is a compact and highly mobile SP gun. Its 218 bhp Rolls-Royce K60 engine gives it a speed of 48 km/h and an operating range of 370 km. It swims using its flotation screen, and can be prepared for the water in a very short time. Though smaller than its contemporaries its speed, mobility, high rate of fire and highly lethal ammunition make it highly effective. In spite of the comparatively small crew compartment 40 rounds of ammunition are carried on the gun and a further 200 can be carried in its accompanying Stalwart limber vehicle.

Firing the British-designed 15 kg alloy shel the gun is reported to have a range of 17 km. Barrel life is believed to be at least 10,000 rounds.

The gun detachment consists of 3 gun numbers and a driver on the gun and two ammunition numbers on the limber vehicle.

Optional equipment includes a 7.62 mm commander's machine gun which is mounted on a pintle on the turret.

STATUS:
The Abbot, FV.433 is currently in service with the British Army.

The sole manufacturers of the vehicle, Vickers Limited, have developed a less sophisticated version of the Abbot, FV.433, by removing some of the trimmings from it, e.g. power traverse and power ramming, and allied with value engineering have produced a less expensive basic vehicle named the Vickers Abbot which nevertheless has lost nothing in performance or battle-worthiness. At the option of the purchaser, any of the trimmings can be replaced at the manufacturing stage, and within limits, at a later stage.

MANUFACTURER
Vickers Ltd. Armament Division, Elswick Works, Newcastle-upon-Tyne, NE99 1CP. England

5505.103
105 mm LIGHT GUN

Description:

The 105-mm Light Gun is a close support weapon which has been designed to provide the range, mobility and firepower required in limited war conditions from the Arctic to the Tropics.

The gun fires a 15 kg shell with a range of 17,500 metres. On its wheels it can be towed at a high speed, yet be in action within one minute of arriving at the gun position. The elevating mass can be removed to give two light helicopter loads, and the gun reassembled with simple tools in less than 30 minutes.

Its low silhouette and fast all round traverse give it an effective anti-tank performance using a HESH shell. Also, the gun can be linked to the FACE fire control system (**2415.153**).

The gun is fitted with an efficient muzzle brake which does not cause crew discomfort and for cleaning purposes is readily removable. The barrel is of totally new design, being of thin-walled auto-frettaged construction in high yield steel. Barrel wear is negligible so that muzzle velocity should vary very little during the life of the gun.

A vertical sliding block, hand operated breech mechanism of advanced design is actuated by a lever mounted at the top, affording smooth breech opening at all elevations and permitting easy removal of the breech block for cleaning.

The hydro pneumatic recoil system has a separate recuperator and the buffer is fitted with cut-off gear to reduce the recoil length from 45 in to 20 in at full elevation.

A recoil pit is not necessary.

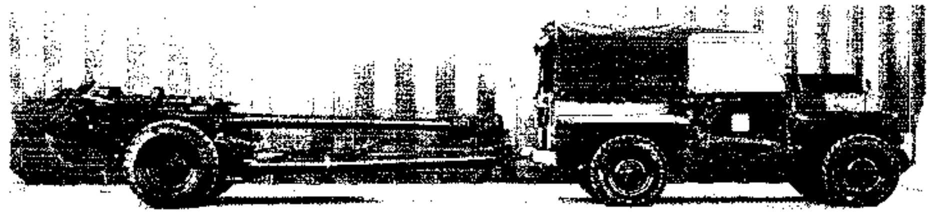
The recoil system is mounted in a light weight fabricated cradle, which carries the elevating arc and a simple helical compression spring balancing gear.

The saddle is a light weight fabrication, on which the elevating mass is carried. It provides a top traverse of 100 mils left and right.

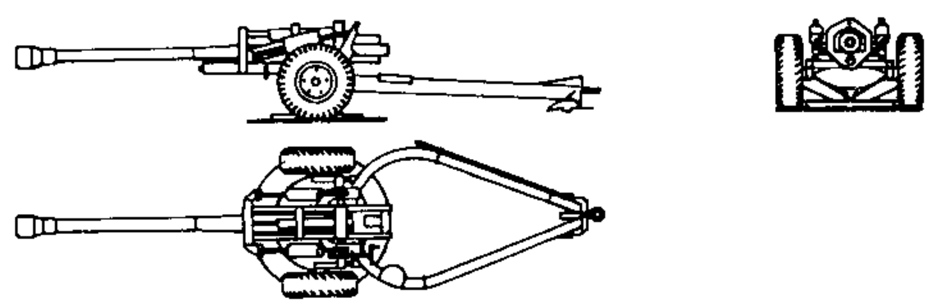
The direct and indirect sighting system and controls are operated by the layer whilst seated and all controls including the firing lever are immediately accessible to him from this position.

A direct fire telescopic sight, incorporating a moving illuminated graticule which is adjustable in both the X and Y axes to allow for target movement and range, is fitted.

105 mm Light Gun, firing attitude



105 mm Light Gun, towing attitude



105 mm Light Gun

Two knobs on the sight carrier set the angle of sight and tangent elevation for indirect fire and their values appear in two windows. The gun is then elevated until two pointers are matched in a third window.

This advanced sighting system is provided with Trilux nuclear light sources, illuminating all scales and graticules, therefore eliminating the use of any batteries on the equipment.

The trail is fabricated in high strength stainless steel and is bow shaped to enable the breech operator and loader to remain within the trail and maintain a high rate of fire at all elevations. The shape also allows the platform to be conveniently stowed within the trail during travelling.

The platform is a circular light weight fabrication with a toothed rim which gives a firm base and permanent gun stability even under the most adverse ground conditions.

The tyres run on the outer edge of the platform which is connected to the underside of the gun by two links. This arrangement ensures stability when firing and ease of traverse. The links are also used as front gun stays when the equipment is in the forward area towing attitude.

AMMUNITION:

Charge System.

The charge system is developed to give very long barrel life together with good accuracy. It consists of a five charge cartridge with range overlaps from the minimum range of 2,500 m to a maximum of 17,500 m.

HE Shell:

The standard HE shell is of forged steel, but to meet the requirements for increased lethality against troops in the open a shell with a body of spheroidal graphite cast iron is under development.

US 105 mm Ammunition:

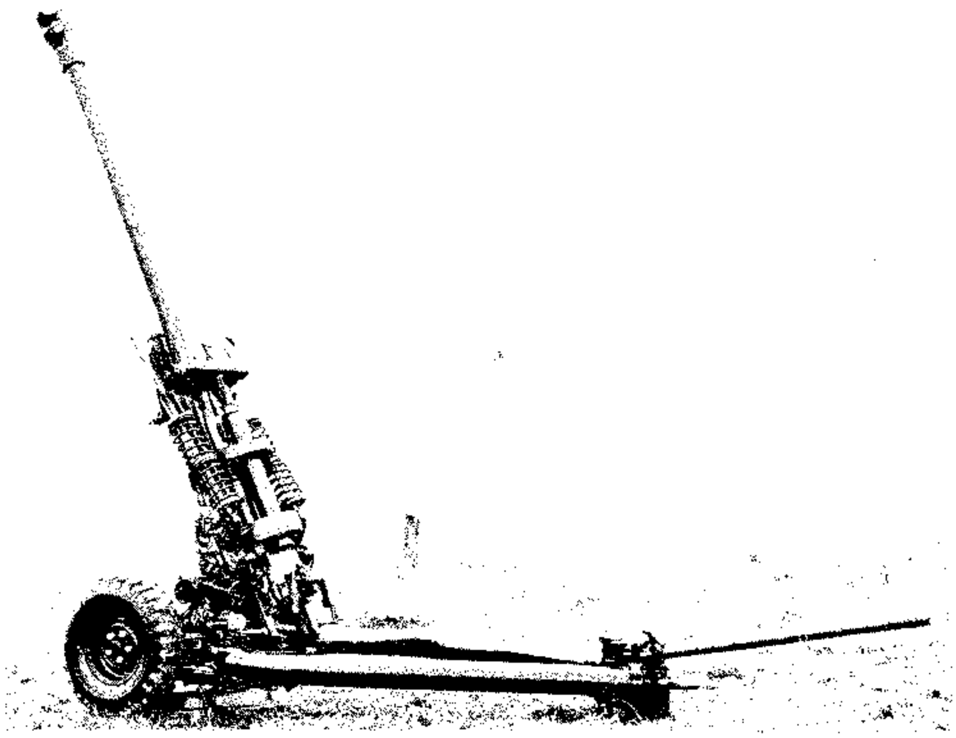
US 105 mm ammunition, including the pre-World War 2 Mk 1 ammunition can be fired by using a completely interchangeable percussion fired ordnance.

STATUS:

Now entering British Army service.

MANUFACTURER

Director of Sales (Army), Ministry of Defence, St. Christopher House, Southwark Street, London S.E.1.



105 mm Light Gun, firing attitude

2489.103
3.7-INCH AA GUN

DESCRIPTION:

Developed just before World War II this was the mainstay of the British HAA artillery during the major part of that war and was sometimes used, in its mobile versions, as an anti-tank weapon. Three marks of the gun were produced – varying mainly in the design of the tube jacket – and there were four mounts differing in the associated sighting, loading and running equipment. A substantial number of these guns were installed on fixed sites (or temporarily fixed "mattress" sites during the "Diver" operation against German V.1 weapons) for the air defence of Britain.

The highest mark of this gun in service was the Mark 3: the 3.7-inch Mark 6 was not basically a 3.7-inch weapon – it was a 4.5-inch HAA gun lined down to fire 3.7-inch shells in an attempt to deal with high-flying aircraft out of normal 3.7-inch range.

CHARACTERISTICS:

Calibre: 94 mm
Weight (travelling): 9,200 kg
Elevation: –5° to +90°
Traverse: 360°
Range: 18,800 m horizontal, 12,000 m vertical – but effective vertical range about 9,000 m
Rate of fire: 20 rounds/min with No 11 mechanical fuse-setter (MFS) and a good crew
Ammunition: HE, AP or shrapnel
MV: 792 m/s (HE)
Penetration: 117 mm at 30° and 914 m

STATUS:

No longer in British service. Believed still used by Burma, Egypt, India and Malaysia.

5502.103
25 POUNDER GUN

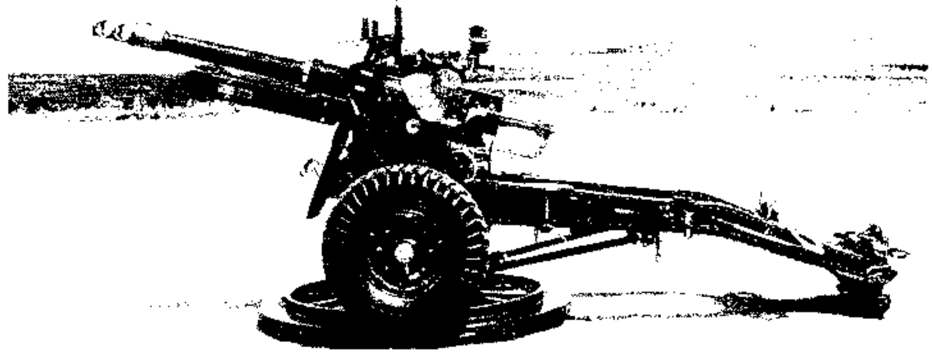
DESCRIPTION:

This well-known and well-used gun is no longer in service with the Field Force units of the Royal Artillery, but some survive in Reserve units and the weapon appears in the equipment schedules of armies all over the world. First designed in 1935, the 25-pounder was a development of the 18-pounder which had equipped the British Army of World War I, and by 1940 it had replaced its predecessor only to repeat history by fighting through another World War. The last significant modification was incorporated in 1943, since when the gun has been virtually unchanged.

It is a sturdy, simple and rather heavy equipment, with a reasonable range and the ability to fire in the upper register, although the higher angles of elevation require some preparation to the gun pit if they are to be achieved. A shield is fitted, although this was removed on some air-portable versions. One drawback throughout the life of the 25-pounder was its weight, and a satisfactory airborne version was never achieved. For the same reason a powerful towing vehicle is required. The cross country mobility of any towed gun is usually in doubt, and the 25-pounder was no better than most. Curiously, a satisfactory self-propelled version never emerged, probably because a special chassis was not produced and the pressures of war or the economies of post war could allow nothing other than a roughly modified tank as a carriage. The gun served nearly all its life as a towed equipment, in the British Army generally pulled by a 3 ton lorry.

The ammunition is semi-fixed, allowing a range of charges, and a wide variety of shell was produced. The North African campaign gave rise to an anti-tank round, and to reduce the recoil from this round a double baffle muzzle brake was fitted, and has remained on all subsequent production guns.

When the gun is brought into action a circular platform is lowered from its travelling position (suspended beneath the trail) and the wheels of the gun are pulled back onto it as shown in the photograph. The platform is secured to the trail by two tie-rods which are hinged for folding into the travelling position. The platform digs into the ground and takes much of the firing load off the spade which is fitted with a 'shoe' to prevent it digging into the ground. Thus the spade and box trail may easily be lifted by one man and the gun swung round on its platform to give very swift traverse through 360 degrees.



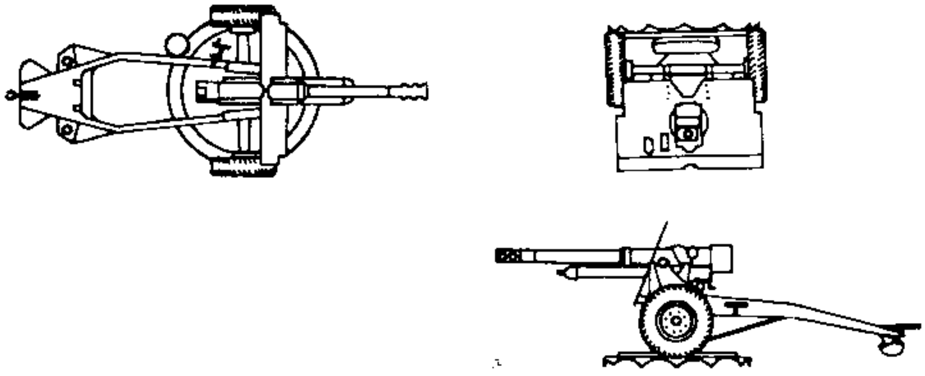
25 Pounder Gun on No. 9 Platform

CHARACTERISTICS:

Overall length: 4.65 m
Width: 2.13 m
Height: 1.69 m
Barrel length: 2.48 m
Calibre: 88 mm
Total weight: 1,741 kg
Range – max: 12,252 m
Elevation: 45°
Traverse: 45° on carriage
MV: Charge 1: 198 m/s, Charge 2: 533 m/s
Ammunition: Semi-fixed

Shell: HE weight for all shell, 11.3 kg, Smoke, Target Indication, Illuminating, APDS, Carrier (i.e. chemical, etc)
STATUS:
Reserve units.

COUNTRIES SUPPLIED:
Commonwealth, Portugal. Most countries of the Middle and Far East.



25-pdr

2486.103
17-POUNDER ANTI-TANK GUN

DESCRIPTION:
No longer in British Army service but still used in several countries, the 17-pounder (76 mm) anti-tank gun was developed in 1940/41 and entered service in 1942. Some early models were mounted on a 25-pounder (**5502.103**) carriage and there were various SP versions. Basic data of the Mark 1 version are given below: the weapon has a distinctive low-silhouette carriage and scalloped-top gunshield and is fitted with a double-baffle muzzle brake.

CHARACTERISTICS:
Calibre: 76.2 mm
Weight (travelling): 3,040 kg
Width (travelling): 2,255 mm
Length (travelling): 7,540 mm
Height (travelling): 1,676 mm
Elevation: $-6°$ to $+16.5°$
Traverse: 60° total
MV: 950 m/s standard
Range: 10,520 m
Rate of fire: 20 rounds/min
Penetration (APDS): 222 mm at 1,000 m

STATUS:
Believed still in service in Burma, Egypt, Israel, Pakistan and South Africa.

2487.103
6-POUNDER ANTI-TANK GUN

DESCRIPTION:
Developed around the outbreak of the Second World War as a replacement for the 2-pounder ant.-tank gun, the 6-pounder (57 mm) was used both as a tank gun and in an anti-tank role.
The design was also taken up by the USA where it was produced as the M-1 57 mm gun. Some vehicle mounted versions were also produced.
CHARACTERISTICS:
Calibre: 57 mm
Weight (travelling): 1,224 kg
Length (travelling): 4,724 mm
Width (travelling): 1,889 mm
Height (travelling): 1,280 mm
Elevation: $-5°$ to $+15°$
Traverse: 90° total
MV: 900 m/s standard
Range: 8,990 m
Rate of fire: 20 rounds/min
Penetration: 118 mm at 475 m

EMPLOYMENT:
No longer in British or US Army service but still in service in many countries, some of which have the American M-1 weapon.

2455.103
40 mm LIGHT ANTI-AIRCRAFT GUN

DESCRIPTION:
This British version of the L/70 Bofors 40 mm AA gun (**5528.103**) is, despite the introduction of light guided weapons, still extensively used in the British armed forces. Mounted on a high-speed four-wheel trailer it can be brought into action quickly and equally quickly taken out again. Mainly used for the protection of airfields and other military installations, it can also be used effectively against ground targets.
CHARACTERISTICS:
Calibre: 40 mm
Barrel length: 70 calibres
Elevation: $-5°$ to $+90°$
Traverse: 360°
Weight in combat order: 4.5 t
Weight of projectile: 0.96 kg
MV: 1,000 m/sec
Range: effective AA: 4,100 m; effective ground 4,600 m
Rate of fire: 250 rounds/min
Crew: 2 gun-layers; two ammunition numbers on the gun
Ammunition: HE tracer with percussion and self-destroying fuse
Ready rounds: 16 in magazine plus 48 in racks
STATUS:
In service. Currently being replaced in some places by the Rapier missile system (**2424.131**).

5504.103
RARDEN 30 CANNON

DESCRIPTION:
The Rarden 30 mm automatic cannon has been developed to meet a need for a versatile weapon which, with suitable ammunition can perform a variety of roles.
For the British service it is mounted in the Fox armoured car (**5064.102**) and the Scimitar derivative of the Scorpion light tank (**5040.102**). It is also suitable for mounting as secondary armament in a main battle tank or in small naval craft or helicopters.
The cannon is primarily a compact single shot self-loading weapon, but it is also capable of firing automatically at a rate of approx 120 rounds per minute. The full load is 6 rounds, 5 in the feed way and 1 in the chamber. The clips of three rounds will fully load the weapon. Careful assessment indicates that this is more than enough for a successful engagement of typical light armour targets. Additional rounds could not be used in the short span of an air engagement. The gun is normally loaded by the gunner. If a loader is available, continuous aimed fire is possible.
Hand cocking, by rotating a small handle, is required only at the start of action. The breech is held open on firing the last round and closed by pressing a catch after reloading the magazine.
The gun fires with the breech locked by operating an electric switch. Only the solenoid and firing hammer move, giving immediate response, with minimum disturbance of the lay of the gun. Mechanical firing is also available.
All recoils and other operations take place within a closed casing. The spent cartridge cases are ejected forward out of the turret, reducing toxicity hazards to the minimum and dispensing with the need for bulky ventilation machinery an

important feature when considering a weapon to operate from armoured vehicles in radioactive areas.

As the rounds are fed in from the rear, the gun need protrude only nine inches into the turret. Access to the feeding and breech mechanism is nevertheless excellent. The top part of the casing can be removed completely in seconds without tools, conveniently carrying with it all the feed mechanism for maintenance and inspection. The breech mechanism is then fully revealed and the recoil system can be examined. A jammed round can be cleared by lifting open the top and reaching inside the casing.

As the whole mechanism is enclosed, there is no difficulty in operating in dirty and wet conditions.

AMMUNITION:

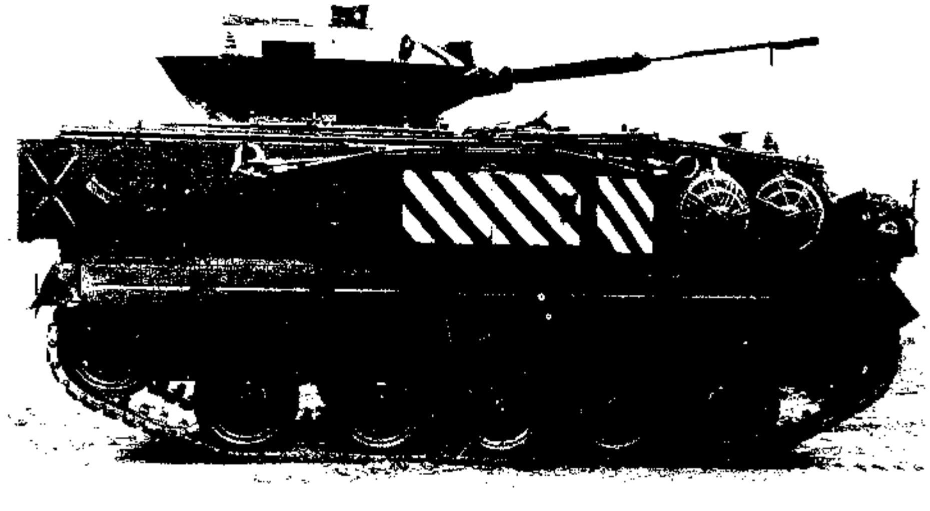
To achieve the outstanding performance of the Rarden 30 against armour an Armour Piercing Discarding Sabot (APDS) round has been developed by the Royal Armament Research and Development Establishment.

For other roles standard Hispano Suiza 831 L ammunition is available. The gun was deliberately designed to take this existing family to ensure that quick development of the system was not delayed by any problems of ammunition development.

For the Rarden 30, although all HS 831 L rounds can be fired, tracered ammunition is considered essential, to enable the aim of each round to be corrected.

CHARACTERISTICS

Overall length: 2.80 m
Inboard length when mounted: 230 mm
Weight: 100 kg
Trunnion loading: 1,360 kg
Ammunition: HS 831 L ammunition, HE, AP, Practice, RARDE APDS
Weight of complete round: 870 gm (HS 831) 780 gm (RARDE APDS)



Rarden 30 mounted in Fox turret on FV 432

SINGLE 20 mm PEDESTAL MOUNTING TYPE A41 B FOR LAND ROVER

DESCRIPTION:

Derived from the A41 naval mounting for the HS 804 20 mm cannon, the A41 B is the second of two single pedestal mountings developed for mobile operations in Land Rover vehicles. This model differs from the first, A41A, mainly in the provision of a seat for the gunner and in the control and sighting arrangements.

The gun is mounted on a conical pedestal and is controlled in elevation by two horizontal handgrips located above the rear of the gun cradle. The trigger rotates round the axis of the left handgrip. Traverse is achieved by leg action by the gunner: the seat is adjustable to enable him to traverse the gun comfortably. An unusual feature of the mounting is the displacement of the sight from the gun cradle: this is done to enable the gunner to use the sight comfortably at all elevation angles, the sight line being maintained parallel to the gun line by means of a mechanical linkage.

Although designed primarily for installation on a Land Rover, the weapon can obviously be installed readily on any larger open vehicle.

A41 B 20 mm pedestal mounting on Land Rover

CHARACTERISTICS (Type A41 B):
Cannon: HS 804/70 20 mm
MV: 835 m/sec
Rate of fire: max 800 rounds/min
Weight of cannon: 41.6 kg without feed mechanism
Feed mechanism: 60-round drum magazine. Empty weight 12.5 kg
Weight of mounting: 188 kg
Elevation arc: −10° to +50°
Traverse: unlimited

STATUS:
Production.

British Manufacture and Research Company Ltd, Springfield Road, Grantham, Lincs, England

2476.103
MOBAT RECOILLESS ANTI-TANK GUN

DESCRIPTION:

Now largely superseded by the Wombat (**2477.103**), this is a second generation battalion anti-tank gun. Of rugged construction, the gun can be towed on its two wheel trailer over rough country but is nevertheless readily manoeuvrable by its three-man crew. A 7.62 mm Bren LMG is mounted on the left-hand side of the barrel, the gunner's sight being mounted on the right. The gun fires off its wheels, being steadied by a short trail, and the mounting permits full 360 deg traverse.

CHARACTERISTICS:
Designation: 120 mm BAT L4
Calibre: 120 mm
Barrel length: Approx 3.2 m
Combat weight: 764 kg
Projectile weight: 12.84 kg
MV: 462 m/sec
Effective range: Approx 820 m
Crew: 3

STATUS:
Obsolescent.

2477.103
WOMBAT RECOILLESS ANTI-TANK GUN

DESCRIPTION:

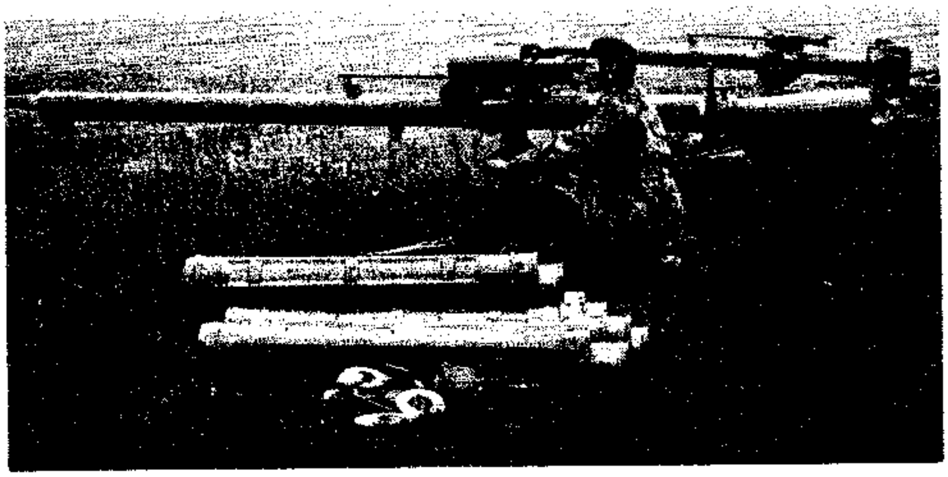
This 120 mm recoilless anti-tank weapon is the latest of its kind in service with the British Army. Significantly lighter than its predecessor, the Mobat (**2476.103**), it is designed to be fired from or transported by wheeled or tracked vehicles, the light two-wheel carriage of the portee version being intended solely for manoeuvring into or out of a firing position and not for cross-country towing. Other changes from Mobat include a new optical battle sight and a powerful 12.7 mm (Remington) spotting rifle which enables moving targets to be engaged up to 1,000 metres and stationary targets up to 1,450 metres.

CHARACTERISTICS:

Designation: 120 mm BAT L6
Calibre: 120 mm
Barrel length: 3.86 m
Combat weight: (Portee version) 295 kg
Projectile Weight: 12.84 kg
MV: 462 m/sec
Effective range: 1,000-1,500 m

STATUS:

In service.



Wombat. The weapon in the foreground is fitted with the S330 Crew-served Sight made by Rank Precision Industries

THE UNITED STATES OF AMERICA

5523.103
8 inch SP HOWITZER. M-110

DESCRIPTION:

The M-110 was introduced in 1962 as a replacement for the M.55. Design work was begun in 1957 by the Pacific Car and Foundry Company and the first models were delivered to units in 1962. The M-110 shares the same chassis as the M-107 175 mm gun, only the barrels being different. Both versions came into service together. The design was intended to improve the mobility of the M-55 and in particular, to reduce the weight.

The M110 chassis is comparatively small and very low. The flat deck is not much above the level of the road wheels. The track runs on five large road wheels with the drive sprocket in the front. There is no separate idler, the track returning around the rear road-wheel, and no return rollers.

The engine is in the front of the chassis, on the right, and the driver beside it. Ground clearance is good, and the whole design quite neat. It is a departure from the M-55 in that no attempt is made to armour the fighting compartment. The crew service the gun completely in the open on the flat top deck.

The suspension is novel as it involves a single hydraulic cylinder to each wheel which combines the functions of spring and shock-absorber. It can also be locked solid when the gun is firing. Hydraulic power is used to operate the other functions required, notably the traverse and elevation, loading and ramming, and lowering and raising the large spade. An hydraulic derrick hoists the shells from ground level to the breech.

Mobility is the same as with the 175 mm gun, but the M-110 has more range. The crew is also similar, a total of 13 men of whom 5 travel in the gun vehicle, the remainder in a separate load-carrier.

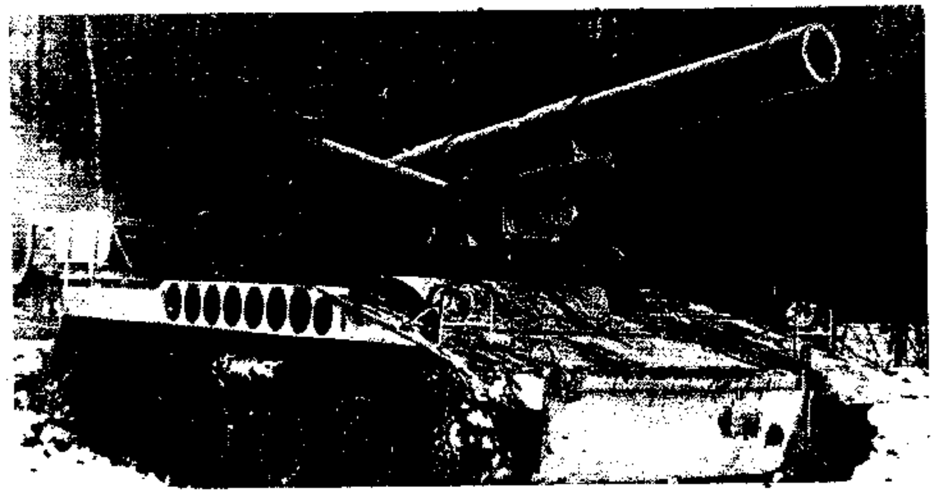
M-110 is employed as a general artillery support weapon, and is assigned down to divisions. In the divisional artillery it is found in single batteries of 4 guns. At Corps or above it is employed in battalions of three batteries, each of four howitzers.

CHARACTERISTICS:

Overall length: 7.48 m
Width: 3.14 m
Height (firing): 6.4 m
Height (travelling): 2.6 m
Total weight: 26,308 kg
Range – max: 16,800 m
Elevation: 2° to 65°
Traverse: 30°
Ammunition: Separate loading
Shell: HE, Nuclear
MV: 594 m/s
Sustained rate of fire: 1 round in 2 minutes
Speed (cross country): 14 km/h
Speed (roads): 54 km/h
Crew: 13

STATUS:

In service since 1962. Supplied also to Belgium, Iran, the Netherlands, South Korea, the United Kingdom and West Germany.



8 inch Howitzer M.110 moving through woods in Germany (US Army Photograph)

203 mm SP

5549.103
8-INCH TOWED HOWITZER M.115

DESCRIPTION:

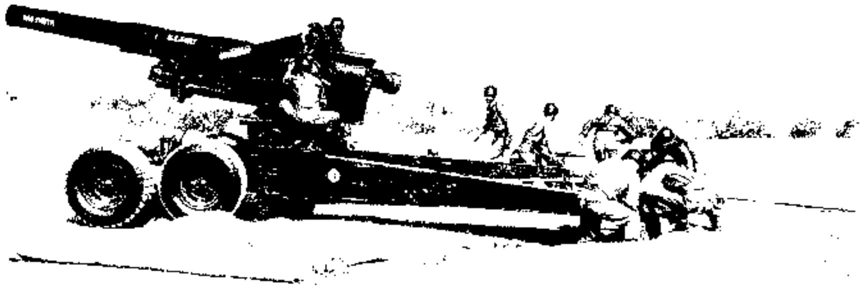
This howitzer is the towed counterpart to the M.110. The details of the performance of the howitzers are identical, and they are intended to be employed in the same manner. The M.115 is not in service in large numbers, although many are in reserve in the USA. The design is now fairly old, going back to the early 1950s.

CHARACTERISTICS:

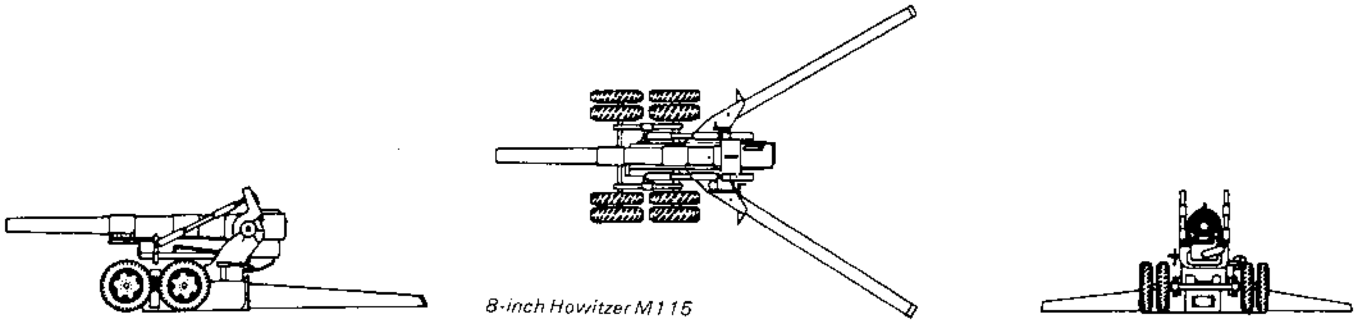
Total weight: 12,400 kg

Elevation: 2° to +65°
Traverse: 60°
All gun performance details as for M.110

STATUS:
Obsolescent. US reserve forces.
COUNTRIES SUPPLIED:
NATO countries plus India, Jordan and Spain.

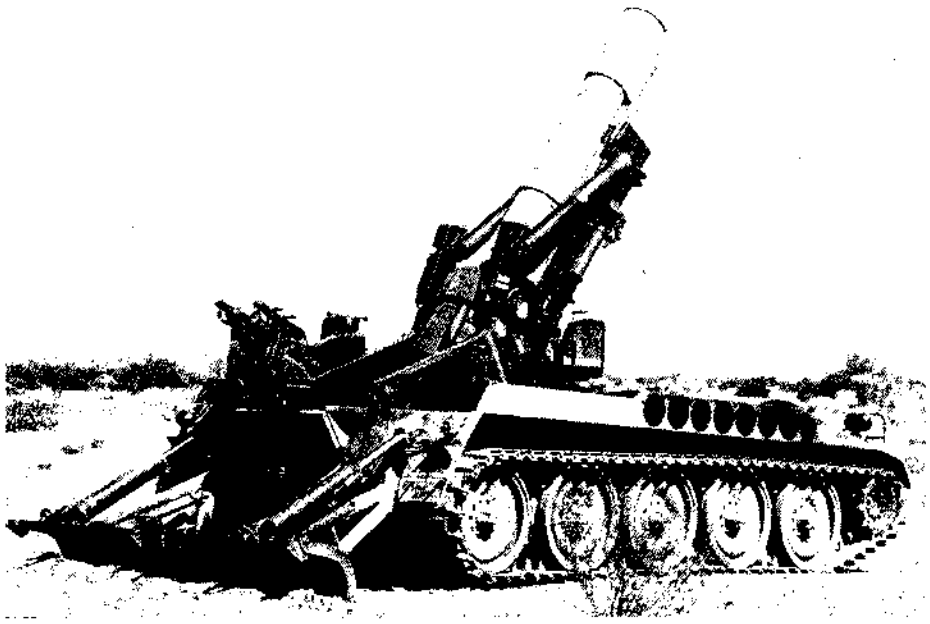


Emplacing an M.115 howitzer on a training range (US Army photograph)



8-inch Howitzer M115

5573.103
8-INCH SP HOWITZER M110E2
DESCRIPTION:
This howitzer is an improved version of the M110 (**5523.103**) and is currently being developed by the US Army Weapons Command as a follow-on system for the M110 8-inch howitzer (**5523.103**) and the M-107 175 mm gun (**5524.103**). Development began in December, 1919.
In most respects the weapon is believed to be similar to the M.110—the most obvious difference being the increase of some 2.4 metres in barrel length—and the weight has been given as something over 28,000 kg which is about 2,000 kg more than the earlier weapon. The carriage is understood to be the same as that of the M-107.
No performance details have been released, but evidently the range may be expected to be greater than the 16.8 km given for the M110. Ammunition will be HE, incendiary, nuclear, ICM (improved conventional munitions) and dual-purpose.
STATUS:
Engineering tests. It is believed that early deployment is intended.



M 110E2 8-inch SP Howitzer
(US Army photograph)

5524.103
175 mm SP GUN, M-107
DESCRIPTION:
The M-107 is one of the excellent and formidable family of heavy guns and howitzers which provide general artillery support to the field army. This particular gun was developed by Watervliet Arsenal, New York, and the general specification called for a weapon with a range and effect greater than that of the 155 mm gun. The resulting M107 has the same chassis, mounting and components

175 mm SPG Gun, in service with British Army, being driven into an action position as the 8 inch howitzer, the only difference being the very long barrel.

This long barrel, together with a fairly large propellant charge, gives the projectile a high muzzle velocity, and great range. The barrel life is probably quite short, but this is not known, and in any case guns of this size do not generally undertake prolonged shoots. For firing, the spades at the rear of the chassis are lowered hydraulically, and dug into the ground. The actual firing mechanism is actuated by a long lanyard.

M107 is surprisingly mobile for its size, although a ground pressure of 13.5 lb/in^2 (0.95 kg/cm^2) makes it essential for the route to be examined before the gun moves off a prepared surface. It can be dismantled and carried in large cargo aircraft, but obviously could not come into action as soon as it was landed. When travelling under its own power, it has a crew of five. The full section is thirteen men, and the remaining eight travel in a separate M 548 tracked vehicle.

Only HE rounds are fired, and loading, ramming and breech closing are hydraulically performed, as are elevating and traversing.

CHARACTERISTICS:
Overall length: 11.30 m
Width: 3.14 m
Height: 3.47 m
Total weight: 28,165 kg
Range—max: 32,700 m
Elevation: +2° to +65°
Traverse: 30° left and right
Ammunition: Separate loading, bagged charge
Shell: HE only. Weight 66.6 kg
MV: 914 m/s
Crew: 13 (5 on the M.107 and 8 in an accompanying vehicle)
Cruising range: 725 km
Speed—max: 54 km/h

STATUS:
In service since 1962.

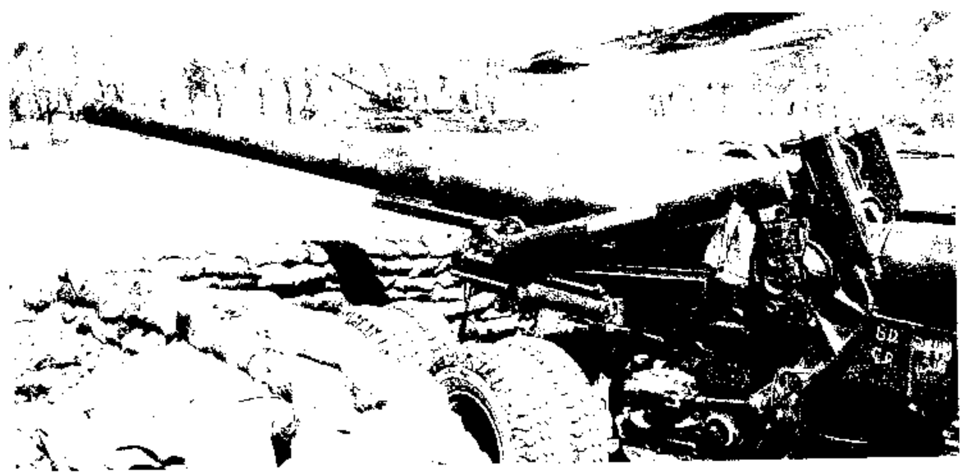
5506.103
155 mm GUN M2

The 155 mm Gun is an elderly weapon, having first been introduced in the late 1930s as a replacement for a 155 mm which the US Army had taken from the French in 1917. It is a good and sound design and virtually no major modification has ever been necessary to the original model.

The long range and heavy projectile make the 155 an extremely effective gun and it continues to serve in the inventory of many armies. The SP version has increased the life-span of the gun by many years, but battlefield mobility is not an outstanding virtue of the towed 155. The carriage is the same as for the 8 inch Howitzer. It is transported on four dual wheels on a bogie, and the trail is a wide-angled twin leg variety.



155 mm M.2 guns in action

CHARACTERISTICS:
Overall weight: 13,645 kg
Barrel length: 7.02 m
Elevation: −2° to +63°
Traverse: 60°
Ammunition: Separate loading. Not interchangeable with the 155 mm howitzer. Complete round weighs 56.6 kg
Shell: HE, weight 43.1 kg, Smoke WP, Chemical. There is also a two wheeled limber.

STATUS:
In service.

5510.103
155 mm HOWITZER M.114A1

DESCRIPTION:

The M.114A1 Howitzer provides general supporting fire and it is normally assigned to the Divisional Artillery of Infantry Divisions and Corps artillery battalions. It is not a new design, but is robust and sturdy with a good performance for its size and weight. It was developed by the Rock Island Arsenal and so far about 6,000 have been made. Many have been transferred to NATO and other allies through the Military Assistance and Sales Programme.

For firing, the carriage is jacked up until the wheels clear the ground, and the jack shares the firing stresses with the trails and spades.

For moving, the howitzer is normally towed by a 5 ton truck or high-speed tractor.

There are several variations of this howitzer, all having the same general characteristics.

A version with auxiliary propulsion, known as the M-123A1 is illustrated here. The howitzer is driven by an internal combustion engine mounted on the trail. The drive is transmitted to the large dished plates on the outside of the wheel hubs. A speed of 4.5 mph (6 km/h) is claimed.

Similar attempts at low-speed self-propulsion have been tried by other armies, but generally the power output of the engine is insufficient to drive the gun on any but smooth level surfaces. The system shown in this photograph drives by hydraulics, and is said to give the howitzer good cross-country mobility. It is unique in that it drives the main wheels of the carriage.

COUNTRIES SUPPLIED:

NATO and others under the Military Assistance Programme.

CHARACTERISTICS:

Overall length: 7.30 m
Width (trails spread): 5.7 m
Width (trails closed): 2.4 m
Height (firing): 4.5 m
Height (travelling): 1.8 m
Range—max: 14,600 m
Elevation: $-2°$ to $+63°$
Traverse: 48.7°
Ammunition: Separate loading
Shell: HE, weight 43 kg, Illuminating, Chemical, Nuclear
MV: 564 m/s
Maximum towed speed (cross country): 16 km/h
Maximum towed speded (roads): 48 km/h
Crew: 11

155-mm Howitzer M.114A1

5571.103
155 mm LIGHTWEIGHT HOWITZER XM198

DESCRIPTION:

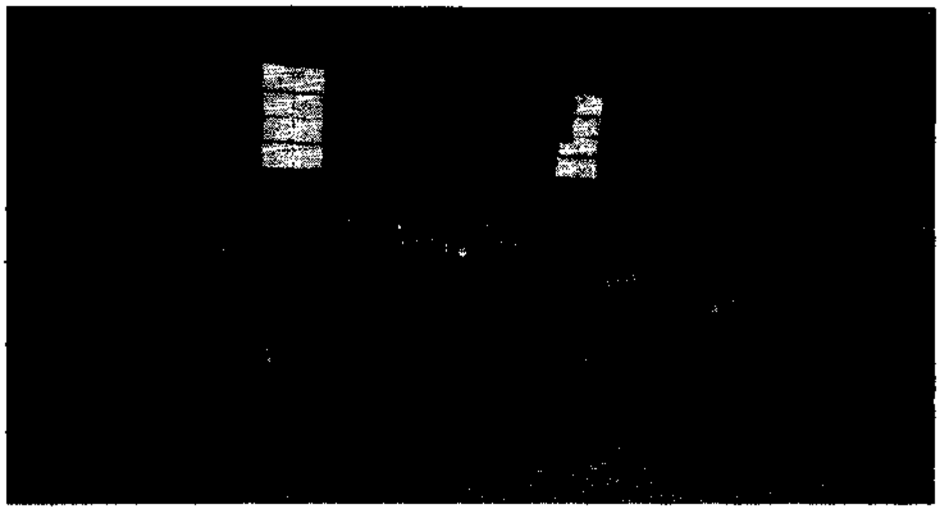
This howitzer is currently under development and is scheduled to replace the M.114A1 towed howitzer in the mid-1970s.

Lighter and with a greater range capability than the M114A1, the XM198 is said also to be more reliable. It will be employed to provide general support field artillery fire for infantry and airborne divisions during the post-1974 period, with both nuclear and non-nuclear munitions. It will also be employed in air-mobile operations using the CH-47C helicopter and the US Army light tactical transport systems as prime movers.

No performance details have yet been released for publication. It has been said that the gun will weigh not more than 6,600 kg – but since this appears to be rather more than the weight of the M114A1 it is either a deliberate exaggeration or a mistake. The main mechanical features can be seen in the accompanying illustrations.

STATUS:

Design work on the XM198 began in 1968 and engineering development started in 1970. As already noted, operational deployment is planned for the mid-1970s.



XM198 155 mm howitzer in stowed position. Note the platform secured by the trails
(US Army Photograph)

XM198 155 mm howitzer in firing position
(US Army Photograph)

5550.103
155 mm SP HOWITZER M.44

DESCRIPTION:

This howitzer is very similar to the M.52, the only real differences being in the gun and fighting compartment. The hull and chassis are identical to M.52, but the total weight has gone up, and so the automotive performance has decreased. The top of the fighting compartment is open, and normally covered by a canvas tilt, so that there is no overhead protection for the crew, nor any capability to keep out gas or nuclear attack.

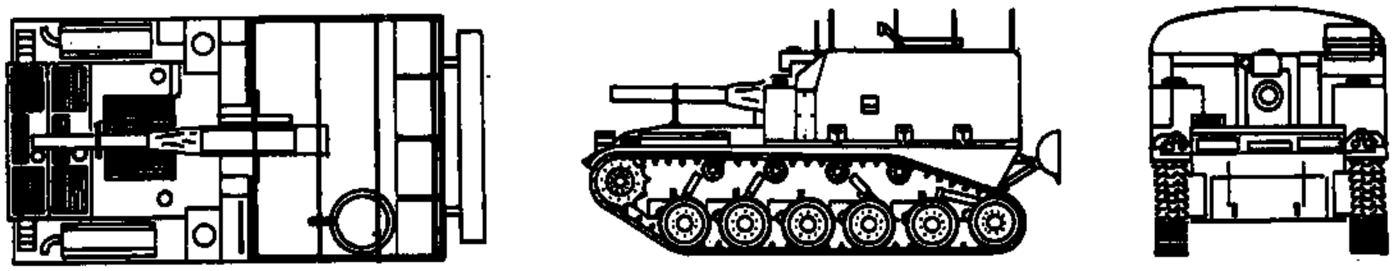
A large spade is carried at the rear. The cruising range is low, and few rounds of ammunition can be carried. The design is similar in age to the M.52, and like that gun it is now no longer in first line service in the US Army.

CHARACTERISTICS:

Overall length: 6.09 m
Width: 3.3 m
Height: 3.1 m
Total weight: 28,550 kg
Range—max: 14,600 m
Elevation: $-5°$ to $+60°$
Ammunition: US 155 mm Howitzer
Shell: HE, Smoke, Chemical
Ammunition stowage: 24 rounds
Cruising range: 120 km
Speed—max: 56 km/h

STATUS:

US Army Reserve. First line service in some NATO countries.



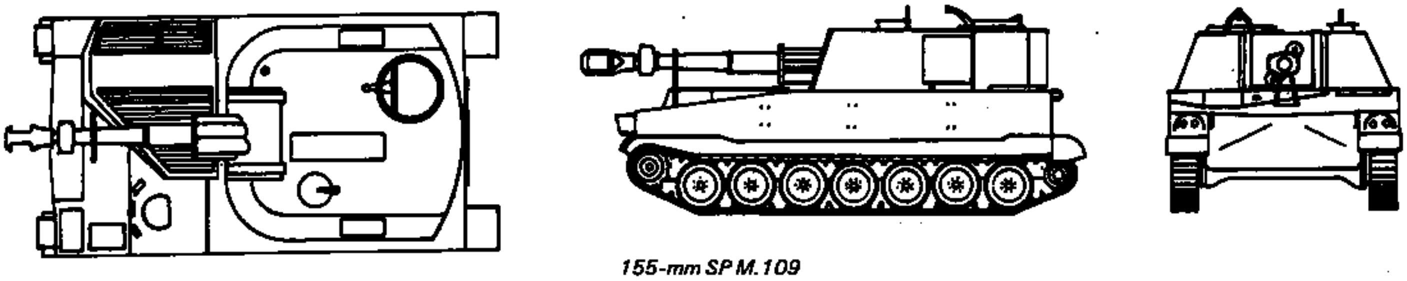
155-mm SP Howitzer M 44

5508.103
155 mm SP HOWITZER M.109

DESCRIPTION:

In all outward respects, apart from the size of the barrel, the M.109 is identical with the M.108. The chassis and power plant are the same and the only change to the hull lies in the gun mounting in the front of the turret. Naturally it is heavier than M.108. Despite its weight the gun is air-transportable in the C-124 and C-133 freight aircraft.

M.109 is used to provide general fire support and reinforcing fire to armoured and mechanised divisions, and is also available to other formations. It is the smallest gun in the US service to fire a nuclear shell. Ground mobility is roughly similar to M.108 although the cruising range is reduced somewhat. The vehicle floats in the same way.



155-mm SP M.109

Some 2,000 M.109s have been produced so far.

CHARACTERISTICS:
All leading dimensions are identical with M.108.
Total weight: 23,795 kg
Range: 14,600 m
Elevation and traverse as for M.108
Maximum speed: 55 km/h
Cruising range: 350 km
Ammunition: HE, Canister, Chemical, Nuclear. Typical shell weight 43 kg
Sustained rate of fire: 45 r.p.hr.

STATUS:
In service.

COUNTRIES SUPPLIED:
Austria, Belgium, Canada, Denmark, Federal German Republic, Iran, Israel, Italy, Libya, the Netherlands, Norway, Spain, Switzerland and the United Kingdom.

M 109. 155 mm SP Howitzer (US Army Photograph)

5570.103
155 mm SP HOWITZER M.109A1
DESCRIPTION:
The M109A1 is a retrofit modification to the basic M109 SP howitzer (**5508.103**). It was initiated by the US Army Material Command in 1966 who recommended testing modifications – including a longer barrel and a larger charge – which would extend the range of the weapon from 14,600 m to 18,000 m.

Development, by the Allison Division of General Motors Corporation, Cleveland, Ohio, began in 1967; and the modified weapon was classified Standard A in October, 1970. The barrel length increase is from 3.7 m to 6.1 m and the propellant has been improved. All M.109s are to be converted to the new M.109A1 standard.

Modifications began during Fiscal Year 1971 and the A1 version became operational in Fiscal Year 1972.

M109A1 155 mm SP Howitzer (US Army Photograph)

2833.103
152 mm TANK GUN XM162
DESCRIPTION:
Main armament of the M60A2 main battle tank (**5025.102**) and one of three gun-launchers capable of launching the Shillelagh anti-tank missile (**2809.111**) as well as being able to fire a conventional shell, this gun was caught up in the development troubles which afflicted both the missile and its incorporation in the M60 tank.

Although it seems that the gun-launcher, when ultimately deployed in the M60A2 tank, functioned satisfactorily within the limits of its specifications, the inability of such a gun to fire a kinetic energy round is a severe limitation in tank applications: it means that most anti-tank operations have to be conducted using the missile – which tends to defeat the object of having a dual-purpose weapon. In this connection it is interesting to note that the French ACRA gun-launched missile project (**2071.111**), although in many respects different from the Shillelagh project, has also been shelved.

The M60A2 tank is now in service in small numbers – and indeed it was never envisaged that the numbers would be large, since the tank was intended only as a stopgap pending the introduction of the ill-fated MBT-70 (**5029.102**). The bulk of the Shillelagh gun-launchers currently in service is made up of those mounted on the 1,662 Sheridan tanks (**5030.102**). The Sheridan gun-launcher is the XM-81 which is very much like the XM162 and suffers from the same drawbacks as a conventional gun – a short barrel, with consequent low MV suitable only for shaped-charge projectiles (and hence lack of variety because the Shillelagh warhead is similar), and an inconveniently large bore.

In the Sheridan vehicle the 152 mm round is unpopular with crews because the recoil forces are very large in relation to the size of the vehicle. This is less of a problem in the M60A2 tank; also it is said that the XM162 gun is easier to set up and maintain and more reliable than the earlier weapon.

For the MBT-70 a different gun-launcher, the XM150, was developed. This had a longer barrel and could fire both medium velocity HE projectiles and high-velocity APFSDS rounds. For the MBT-70 successor, however, a conventional tank gun has been specified.

5511.103
105 mm TOWED HOWITZER M.101A1
DESCRIPTION:
The M.101A1 is the standard general purpose close support light artillery weapon of the US Army. It is now obsolescent and being replaced by more modern SP equipments, or the lighter and improved M.102 towed howitzer. The design dates back to the years immediately after World War 2, and production ceased at Rock Island Arsenal in 1953. By that time 10,202 had been produced and issued. Since then the howitzer has been employed in many armies all over the world. It is simple, reliable and rather heavy.

The design follows conventional patterns, and there is little that is remarkable in it. It will probably remain in the reserve units of the US Army for some years, and continue in first line service elsewhere in the world. It was designed to fire the M.1 ammunition system, and very large stocks of this remain.

105 mm Howitzer M101A1 in action in South Vietnam (US Army Photograph)

CHARACTERISTICS:
Overall length: 6.00 m
Width: 2.1 m
Height: 1.65 m
Total weight: 2,220 kg
Range—max: 11,000 m
Elevation: −5° to +665°
Traverse: 45°
Ammunition: Semi-fixed, M.1 system
Shell: HE, HEAT, Illuminating, Chemical
MV: 473 m/s
Crew: 8

STATUS:
In service. Obsolescent.

105-mm Howitzer M101A1

5556.103
105 mm HOWITZER WITH AUXILIARY PROPULSION (MAJOR-MINOR WHEELS)

DESCRIPTION:

This version of the 105 mm M101 howitzer has been designed on a US Army contract to establish the applicability of the "major-minor" wheel concept to artillery and other military apparatus.

The purpose of the major-minor wheel arrangement is to combine the advantages of tracked and wheeled transport mechanisms and produce a system that is suitable for all kinds of terrain. As can be seen from the accompanying illustration the major-minor wheel arrangement comprises three small wheels disposed symmetrically around a central axle. The drive to these wheels is so arranged that when travelling on a hard surface the small wheels in contact with the surface are driven so that the whole system functions like a normal wheeled vehicle – except that skid steering is used. Should the ground surface be too soft for this form of drive to be effective, however, the small wheels can be braked and the drive transferred to the central axle. When this happens the whole three-wheel assembly rotates and the vehicle "walks" forward.

The drive mechanisms for the three minor wheels are identical so that it does not matter which pair of wheels is in contact with the ground when the drive is transferred back to the minor wheels. Low pressure tyres are used to ensure good traction in all forms of terrain.

DEVELOPMENT:

Developed by the Lockheed Aircraft Service Company under contract to the US Army Weapons Command.

STATUS:

Trials.

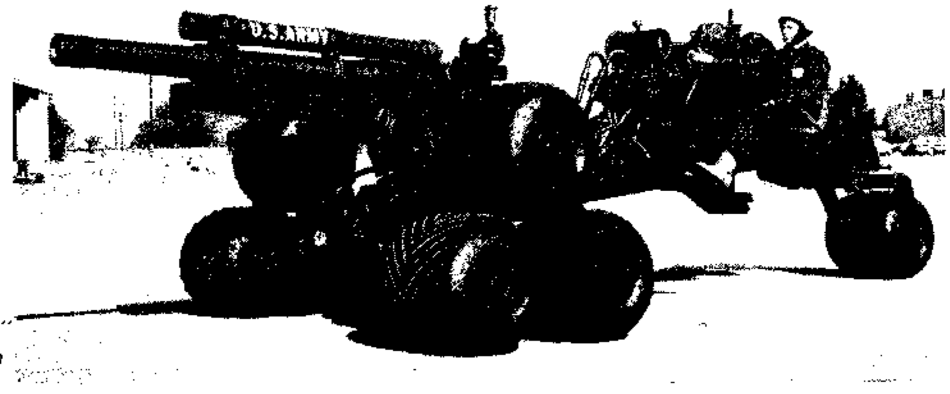
105 mm howitzer with auxiliary propulsion system operating in the "major wheel" mode in difficult terrain



M.101 105 mm Howitzer with "major-minor wheels" auxiliary propulsion

5512.103
105 mm HOWITZER M.102

DESCRIPTION:

The M.102 light towed howitzer, calibre 105 mm system is an airdroppable, direct-support artillery weapon for airborne and air-mobile divisions. It weighs 3,200 pounds (1,470 kg) is transportable in the Caribou fixed-wing plane and the Chinook helicopter and may be carried by sling under the Choctaw helicopter. The M.102 combines the features of the top and bottom carriage into one box-girder type structure shaped like a wishbone. This design allows 360 degree on-carriage traverse, minus five degrees to plus 75 degrees quadrant elevation and low silhouette. The low trunnion height and structural stiffness inherent in the box-trail type of construction assure stability far superior to that in other towed

105 mm Howitzer M.102

weapons. A variable type recoil mechanism uses its mass to provide lower trunnion reaction. Recoil varies from 50 inches at low quadrant elevations to 26 inches at higher quadrant elevations. This reduces trunnion reactions to acceptable limits and eliminates the need for a recoil pit. The M102 can fire all the current standard ammunition as well as a new family of cartridges. With the new ammunition it has a low range of 1,000 metres in the upper register and a high range of 15,000 metres. This compares with 2,000 minimum and 11,000 maximum of the current M.101A1 and its ammunition.

CHARACTERISTICS:
Overall length: 6.69 m
Width: 1.92 m
Height: 1.60 m
Total weight: 1,470 kg
Range—max: 11,500 m
Elevation: −5° to +75°
Traverse: 360° on platform
Ammunition: US M.1 system
Shell: HE, HEAT, Chemical, Illuminating, Anti-personnel flechettes
Sustained rate of fire: 3 rounds/minute
Crew: 8

STATUS:
In service.

COUNTRIES SUPPLIED:
Apart from the USA only Cambodia and South Vietnam are believed to have this weapon.

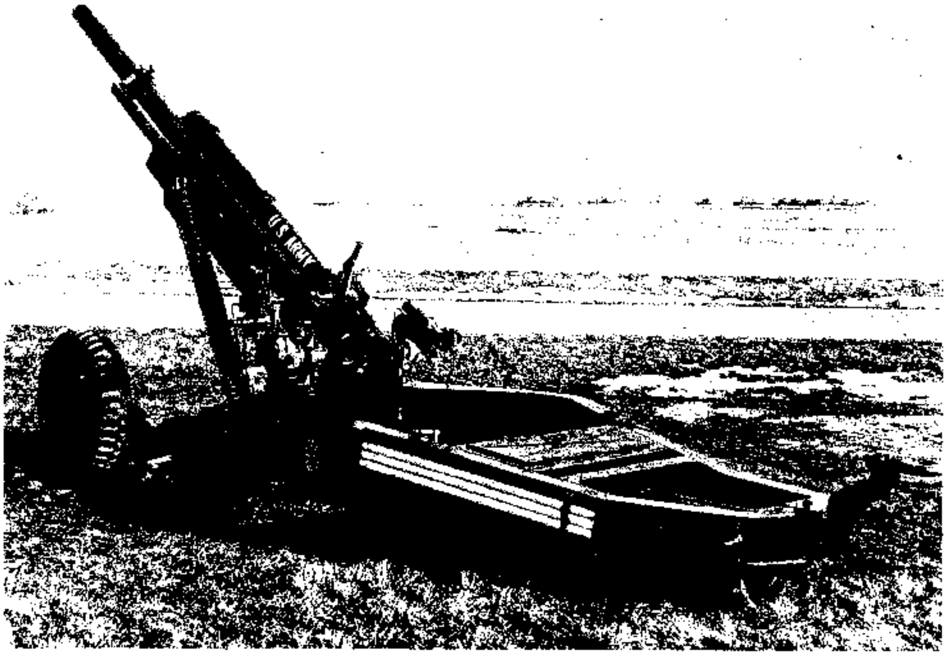
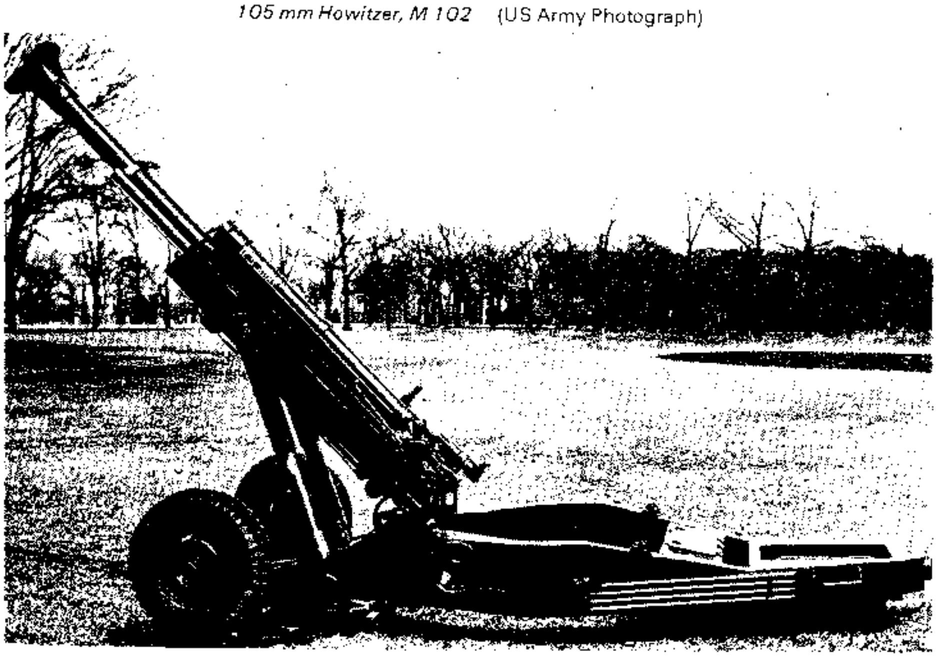
Department of Defense, The Pentagon, Washington, 25, DC.

M 102 Howitzer together with its ammunition, being carried into battle area by a CH-47 Chinook helicopter



105 mm Howitzer, M 102 (US Army Photograph)



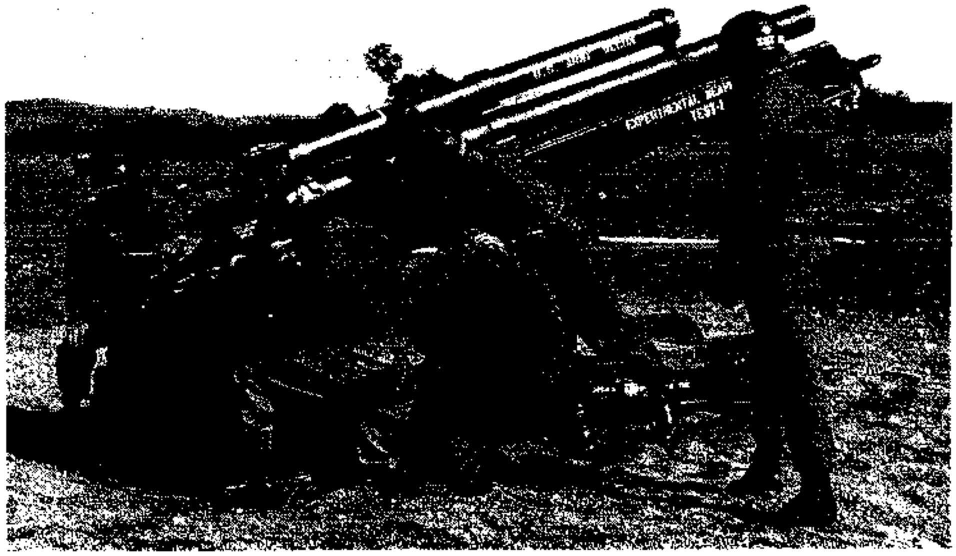
Modified version of the M102—1966 production model (US Army Photograph)

5572.103
105 mm FIELD ARTILLERY DIRECT SUPPORT WEAPON SYSTEM XM 204

DESCRIPTION:
This interesting new howitzer is being developed to provide the US Army with a cheap reliable weapon that is helicopter-transportable and has a range performance superior to that of the M101A1 weapon.

Novel feature of the design is the incorporation of a "soft recoil" mechanism, the principle of which is roughly illustrated in the accompanying diagrams. It is said that this technique results in very low recoil forces; and because of this it is possible to do without firing trails and ground anchors. As a further consequence of this and as can be seen from the accompanying picture, the introduction of a novel method of traversing the weapon has been made possible.

CHARACTERISTICS:
Weight: 2,027 kg
Length: 5.28 m
Width: 1.98 m
Height: 1.37 m at 0° QE
Elevation range: −5° to +75°
Traversing range: 360°
Emplacement time: 30 sec



Military potential testing of the XM204 soft recoil howitzer (US Army Photograph)

DEVELOPMENT:

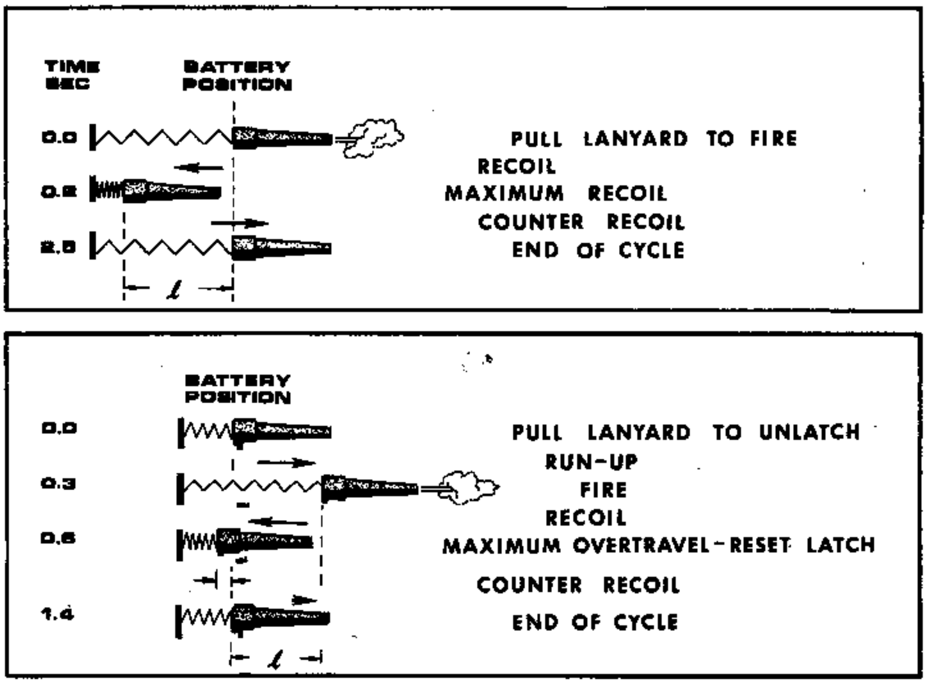
Design work on the XM204 began in 1968. The soft recoil concept is considerably older than this, however, and is believed to date back to 1957.

An advanced development (AD) model has been produced and extensively and successfully tested. It is illustrated here.

Rock Island Arsenal is responsible for carriage and recoil mechanism development, overall system integration and engineering support for system tests. Frankford Arsenal is responsible for developing the fire control equipment, Watervliet Arsenal for the development of the cannon and Picatinny Arsenal for developing the XM200 charge. The gun is expected to replace the M101A1 and M102 (**5512.103**) weapons.

RAP ROUND:

It has been reported that the XM204 gun is the one for which the 105 mm RAP round now in development is destined (see entry **2834.103**).



Principle of soft recoil process. Top picture shows the sequence of events for a conventional system. Bottom picture shows the sequence for soft recoil

105 mm SP HOWITZER M52 and M52A1

DESCRIPTION:

This howitzer is no longer in first line service in the US Army, but quite large numbers were made and many are now with the US reserve army, or in service in NATO. The design dates from the early 1950s, and was replaced by the M.108 in the mid-60s. The 105 mm gun is of a slightly different pattern from that in the M.108 and of a marginally lower performance. The vehicle is larger and heavier than the SP howitzers now in service, and it has a noticeably smaller range of operation on the fuel carried. The M52A1 has a fuel injection engine.

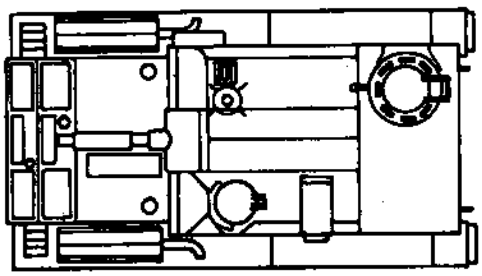
CHARACTERISTICS:

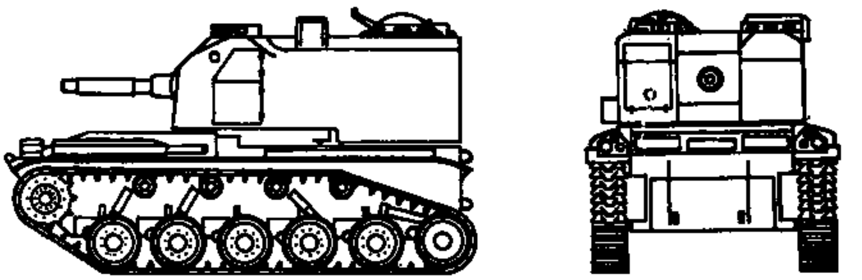
Overall length: 5.80 m
Width: 3.3 m
Height: 3.1 m
Total weight: 24,040 kg
Range—max: 11,200 m
Elevation: −9° to +60°
Ammunition: US M.1 105 mm series
Ammunition stowage: 102 rounds
Crew: 5
Cruising range: 150 km
Speed—max: 56 km/h

STATUS:

In service with some countries in NATO, with the Reserve Army in USA.

M52 105 mm self-propelled howitzer





105-mm SP Howitzer M52

5509.103

105 mm SP HOWITZER M.108

DESCRIPTION:

Initial development was by the Allison division of General Motors with the object of replacing the M.52 by a lighter and more mobile SP howitzer. The M108 has been in service since 1964 with the US Army, and has been sold to several NATO countries. It is a fairly large vehicle, and its size has the advantage that the crew have plenty of space in which to work the gun, and a useful ammunition load can be stowed inside.

The hull and turret are made from aluminium armour, and the vehicle floats with the aid of inflated flotation bags and wash screens which are carried inside. Water speed using the tracks for propulsion is 4 mph (7 km/h).

CHARACTERISTICS:
Overall length: 6.09 m
Width: 3.14 m
Height: 3.04 m
Total weight (gross): 22,452 kg
Range: 12,000 m
Traverse: 360°
Ammunition: HE, Chemical
Sustained rate of fire: 3 r.p.m.
Crew: 7 men
Secondary armament: .5 in MG

STATUS:
In first line service.

COUNTRIES SUPPLIED:
Belgium, Brazil and Spain.

105 mm TANK GUN M-68

The 105 mm tank gun M-68 is fitted to the M-60 MBT (in mount M-116) and M-60A1 MBT (in mount M-140).

It is basically the British 105 mm gun (**2451.103**) built under licence in the United States. The breech block is of the sliding wedge, drop block type and opens on counter-recoil. The firing mechanism is electric. Estimated life of the barrel is 200/300 rounds.

CHARACTERISTICS:
Calibre: 105 mm
Weight of barrel: 753 kg
Elevation: −10° to +19°
Ammunition:
APDS-T m/v 1470 m/s proj. wt 5.9 kg
HEP-T m/v 730 m/s proj. wt 9.8 kg
HEAT-T m/v 1170 m/s proj. wt 10.9 kg
WP-T
TP-T
Canister
Rate of fire: 6-9 rounds/min
Range: 2,500 m
Accuracy: Figures quoted in public state that the 105 mm gun has the following chances of a first round hit against a stationary tank:-
85% at 1000m
40% at 2000m
25% at 2500m

STATUS:
In production and service.

2855.103
90 mm TANK GUN M.36

DESCRIPTION:
The 90 mm tank gun M-36 when used with mount M 78 is fitted to the M-47 tank. It has a vertical sliding breech block. Estimated life of the barrel is 700 rounds.

CHARACTERISTICS:
Calibre: 90 mm
Barrel length: 4.495 m
Barrel weight: 793 kg
Elevation: −5° to +19°
Ammunition: AP-T m/v 914 m/s
APC-T
HVAP and HVAP-DS-T
HE & HE-T m/v 731 m/s
HEAT MARKER WP etc.

STATUS:
In service.

2832.103
90 mm TANK GUN M-41

DESCRIPTION:
The 90 mm cannon M-41 in mount M-87 is the main armament of the M-48 tank (**5056.102**). The gun is in widespread service with NATO, SEATO and other countries. It has been used in the India-Pakistan war, Vietnam and by Israeli and Jordanian forces in the Middle East. Although many M-48s have been refitted with 105 mm guns, the 90 mm gun is still an effective weapon.

CHARACTERISTICS:
Calibre: 90 mm
Length in calibres: 48
Barrel length: 4.91 m

Barrel weight: 717 kg
Elevation: −9° to +19°
Ammunition:
HE & HE-T, m/v 731 m/s
WP m/v 731 m/s
AP-T m/v 930 m/s
HVAP m/v 1235 m/s
HVAP-PS m/v 1249 m/s
HEAT m/v 854 m/s
Canister
Rate of Fire: 8-9 rounds per minute
Range: 17,900 m
4,800 m practical
2,000 m effective
STATUS:
In service.

5526.103
ANTI AIRCRAFT SP GUN, TWIN 40 mm. M.42
DESCRIPTION:
The M 42 is an SP light anti-aircraft gun mounting twin L/60 Bofors guns on a fully tracked chassis, under armour. It is used in the forward areas of the battlefield to provide defence against low-level air attacks. Development began in 1951, and the weapon was in service in 1953. The short development time resulted from the pressures of the Korean War.

The gun mounting is an open-topped cylinder which rotates by power or by hand. The crew feed the clips of ammunition onto the guns by hand, and the maximum cyclic rate of fire is 240 rounds per minute. There are three separate sighting systems, but as no radar is carried on the vehicle its effectiveness is limited to the targets which the gunner can see visually. There is a computing sight, which calculates lead.

M 42 is elderly, rather heavy, and limited in range.

The protection which it offers its crew is less than is considered necessary in modern war, and the fire control system appears weak. It is rapidly being replaced by Vulcan and Chapparal.

CHARACTERISTICS:
Overall length: 6.35 m
Width: 3.20 m
Height: 2.84 m
Total weight: 22,452 kg
Range—max: 8,200 m
Elevation: −5° to +87°
Ammunition: As for Bofors L/70
Speed—max: 72 km/h
Cruising range: 160 km
STATUS:
In service.
COUNTRIES SUPPLIED:
Federal German Republic and some other NATO nations.

2834.103
ROCKET-ASSISTED PROJECTILES (RAP)
DESCRIPTION:
In common with many European countries, the United States is devoting a lot of effort to the development of rocket-assisted projectiles for tube artillery.

In general, these developments relate to unguided projectiles, although some attention has been given to laser guidance systems for such rounds. A difficulty in developing the rocket-assisted rounds has been that of achieving sufficient accuracy; and a laser guidance technique would obviously assist in overcoming this difficulty. On the other hand the greatly increased cost of the guided over the unguided round makes it desirable to explore the possibilities of unguided rounds thoroughly before abandoning them in favour of guided missiles. Results so far appear to be encouraging.

A further difficulty is the loss of payload resulting from the incorporation of a rocket motor in the projectile. In parallel with the development of the RAP rounds, therefore, there is also a programme aimed at increasing the effectiveness of the reduced payload by the use of new materials and processes in the construction of the warheads.

The rocket motors in the projectiles must be designed to withstand very large stresses. Mean accelerations in guns currently in service are typically about 5,000 g for a 105 mm howitzer and about 20,000 g for a high-velocity tank gun, with 30-40,000 g in sight for the next generation of the latter. RAP rounds for field artillery may thus have to withstand chamber pressures in the order of 3,000 kg/cm^2 acceleration in the order of 18,000 g and rotation rates up to 17,000 rev/min.

Two RAP rounds, the 105 mm M548 and the 155 mm M549 are currently at the operational stage; following them are 203 mm and 175 mm projectiles and there may be others. Practical development and operational considerations suggest that such rounds should be in the range of calibres extending from 40 mm to 203 mm or thereabouts.

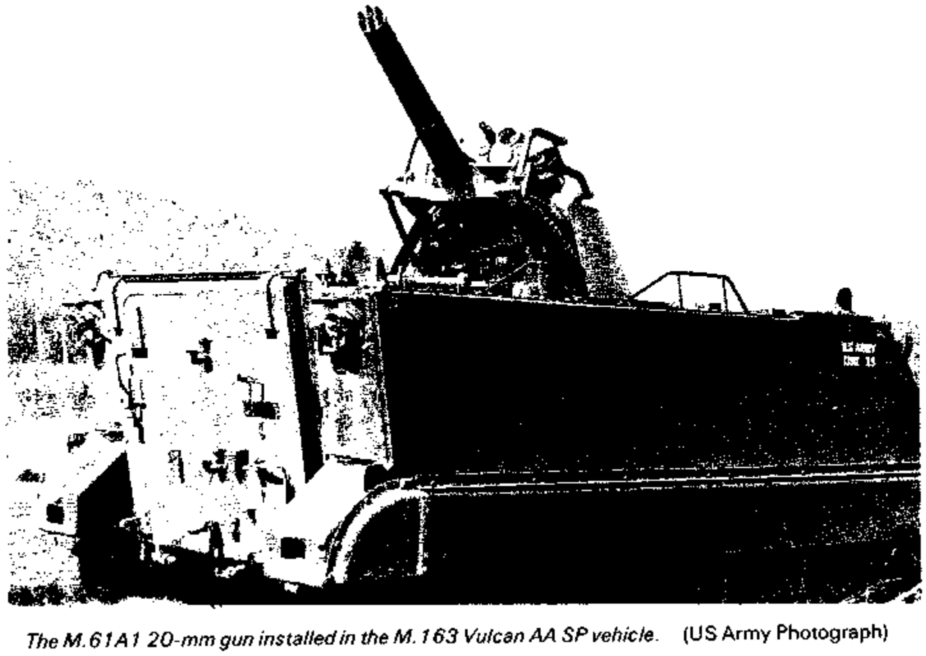
DEVELOPMENT:
RAP projects are controlled by (and much of the work is done at) Picatinny Arsenal, Dover, N.J., whose Solid Rocket Propulsion Laboratory is at the technical centre of this project family.

5547.103
M61A1 20 mm VULCAN AA GUN
DESCRIPTION:
The M61A1 is an externally powered, six barrel gun capable of firing 6,000 rounds per minute. This gun is the result of more than twenty years of continuous experiment and evolution.

The six barrels and their breeches and loading mechanism rotate as one unit. Ammunition is fed in to the loading slot from a linkless belt through which it is pushed by electric or hydraulic motors. In the gun the rounds are fed into each barrel by a cam action and fired and the empty case ejected without the barrels pausing in their circular motion. The advantage of this method is that very high rates of fire can be achieved for the whole system without each barrel having to fire at more than the normal rate for weapons of this calibre. Thus the weapon has a long life by reducing barrel erosion and heat generation.

The pattern of fire can be altered by changing the angular dispersion of the barrels, thus enabling some control over hit chance.

When used as an aircraft gun the Vulcan is used at its highest rates of fire, namely 4,000 and 6,000 per minute. In the air defence role, moun-



The M.61A1 20-mm gun installed in the M.163 Vulcan AA SP vehicle. (US Army Photograph) ted in the M 163 AA vehicle the rates of fire are 1,000 and 3,000. Electrically initiated ammunition is used, which requires an external power source for the gun.

The gun has been in service in one or other of its various forms since 1956.

CHARACTERISTICS:

Length of gun and breech: 1.85 m
Weight of bare gun: 115 kg
Weight of gun system complete with motors, and linkless feed system and 1,100 rounds: 1,306 kg
MV: 1,030 m/s
Average recoil force:
At 1,000 r.p.m. 272 kg
At 3,000 r.p.m. 816 kg
At 4,000 r.p.m. 1,206 kg
At 6,000 r.p.m. 1,730 kg
Barrel life: 20,000 rounds
Gun life: 145,000 rounds
Power requirements:
Firing circuit: 250-300 volts d.c. 0.5 amp
Clearing cam: 28 volts d.c. 28 amps

2859.103

30 mm CHAIN GUN

DESCRIPTION:

The Hughes Chain Gun is a single-barrel externally powered weapon having a rotating bolt mechanism driven by a simple and reliable chain drive. All-up weight of the gun is less than 100 lbs (45 kg) and rates of fire from 100 to 1000 rounds/minute are achievable. The ammunition feed is also of simple design and the complete weapon is expected to be very competitive in price.

Ammunition cased in brass, steel or aluminium can be fired with equal facility and the simple cycle of the gun permits safe use of the open bolt arrangement without the need for chargers, declutching feeders or other special devices.

Initially designed for helicopter use, the gun is now being proposed for a variety of AFV and similar applications.

CHARACTERISTICS:

Calibre: 30 mm
Barrel Length: Typically 35 calibres
Length overall: Typically 1.5 m
Weight: Typically 39 kg
Number of Parts: 97
Ammunition: XM552/639

STATUS:

Prototype firing began in April 1973 as part of an extensive and continuing development programme. The manufacturers state that production models could be phased in with all current US AFV schedules.

MANUFACTURER:

Hughes Helicopters and Ordnance Systems, Culver City, California 90230, USA.

2856.103

20 mm CANNON, M-197, PINTLE-MOUNTED

DESCRIPTION:

The M-197 cannon is a lightweight 3-barrel version of the M-61 Vulcan gun (**5547.103**) and is used in various airborne applications. Using a pintle mount and a hanging-loop ammunition container the gun can readily be used in vehicle applications.

CHARACTERISTICS:

Calibre: 3 × 20 mm
Rate of Fire: 350/700 rounds/min
Ammunition: M-50 Series
Ammunition Capacity: 500 rounds
System Weight: 191 kg excluding ammunition
Ammunition Weight: 157 kg
Power Requirement: 28 V DC, 100 A

2588.103

106 mm RECOILLESS RIFLE M40A2

DESCRIPTION:

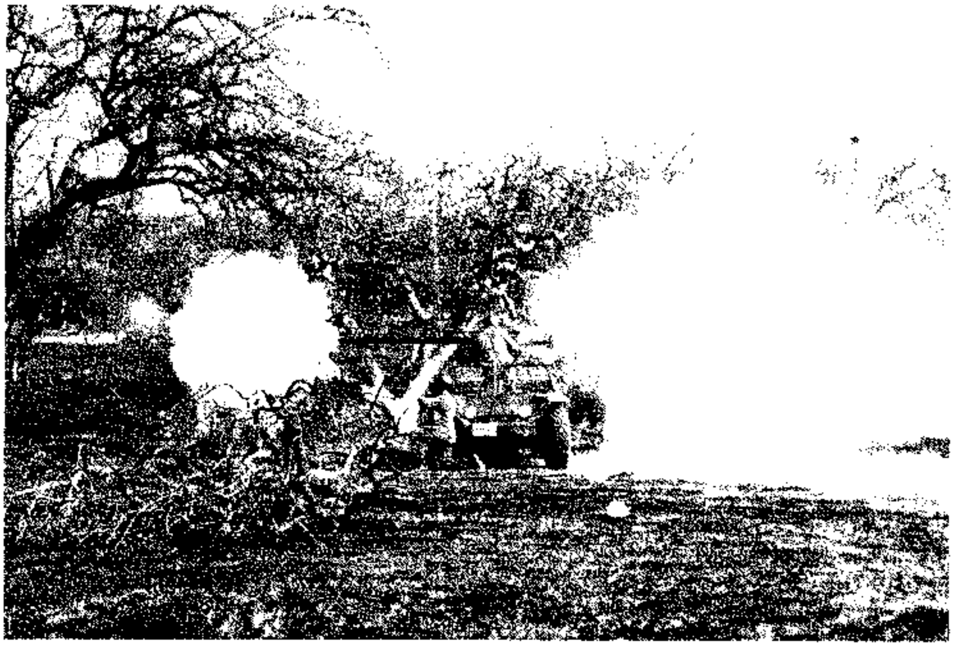
This is a crew-served, rifled recoilless weapon designed primarily for the anti-tank role. It can be fired from its wheeled-tripod mount or from a vehicle.

CHARACTERISTICS:

Calibre: 106 mm
Barrel length: 3.4 m
Elevation: −17° to +65°
Traverse: 360° if dismounted. Otherwise dependent on vehicle
Weight: 220 kg (weapon only) 236 kg (loaded)
Muzzle Velocity: 503 m/sec (HEAT round)
Range: 2,745 m maximum (HEAT round) Maximum effective 1,097 m
Rate of Fire: 1 round/min manually loaded
Ammunition: HEAT, HEP-T
Rifling: 36 grooves, 1 turn in 212 cm
Sighting: Spotting rifle with telescopic sight
Crew: 4

STATUS

Service.



Firing a 106 mm RR from a FMC XR311 vehicle

2561.103

75 mm RECOILLESS RIFLE M-20

DESCRIPTION:

No longer in United States Army service but still in use all over the world and much copied, the M20 75 mm RR is a breech-loading portable weapon designed to be fired from a MG tripod mount. Design started in March 1944 and the weapon was first produced by the Miller Printing Machinery Company of Pittsburgh in 1945.

CHARACTERISTICS:

Calibre: 75 mm
Weight: 5.2 kg excluding mount
Length: 2,073 mm on US MG mount
MV: 426 m/s
Range: 6,565 m
Rate of fire: 10 rounds/min
Ammunition: HE, HEAT, HEP, WP
Penetration: 91 mm at 0°

STATUS:

In service in many countries of Europe, the Middle East and the Far East.

2725.103
MINIATURE NUCLEAR WARHEADS

DESCRIPTION:

A range of small nuclear warheads for use with tactical surface-to-surface or air-to-surface weapons has been developed in the USA. Details of dimensions are not known, but the warheads are intended for use with conventional artillery and with missile systems. Prior to the development of these warheads, the smallest-calibre gun known to be capable of firing nuclear ammunition was the M-109 155 mm SP howitzer (**5508.103**); and since the yield of the new warheads is believed to be not more than a tenth of that of the earlier ammunition it would be reasonable to assume that nuclear ammunition could now be made available for weapons of 105 mm or perhaps even smaller calibre. The warheads would also be suitable for use with unguided artillery rocket systems or as multiple warheads with guided missiles such as Lance (**2682.111** and see also entry **2838.111**).

Yield of the warheads has been variously reported as 50 tons or 100 tons and it is said that the weapons would be "clean" – i.e. there would be no radioactive fission products of the explosion itself.

Concern has been expressed regarding the desirability of introducing such potent warheads into operational use in association with comparatively minor weapons. An earlier American nuclear weapon, the Davy Crockett mortar which had a range of about 8 km, was withdrawn from service because of the difficulty of deriving adequate control and fail-safe procedures for a weapon which must of necessity be used so far forward operationally; and similar arguments could be applied to the new warheads if they are to be used in ammunition for medium-range artillery. On the other hand their use as sub warheads for a large missile would appear not to be open to the same criticism.

STATUS:

Development. Reports of the 13th meeting of the NATO Nuclear Planning Group in 1973 suggested a possible deployment date of 1978.

THE UNION OF SOVIET SOCIALIST REPUBLICS

5513.103
GENERAL

The employment of mass artillery fire has always been a feature of Russian military operations, and at the end of World War II the proportion of artillerymen in the Soviet Army had risen to as high a figure as 35 per cent. Since then it has come down to 25 per cent, but this still represents an unusually heavy concentration of gunners when compared with Western Armies. Soviet artillery weapons are well designed and manufactured, with the chief design emphasis on range and terminal effects. Conventional surface-to-surface artillery is largely towed, which is somewhat different from the great emphasis which Western Armies are placing on self-propelled artillery capable of fast cross-country and amphibious movement.

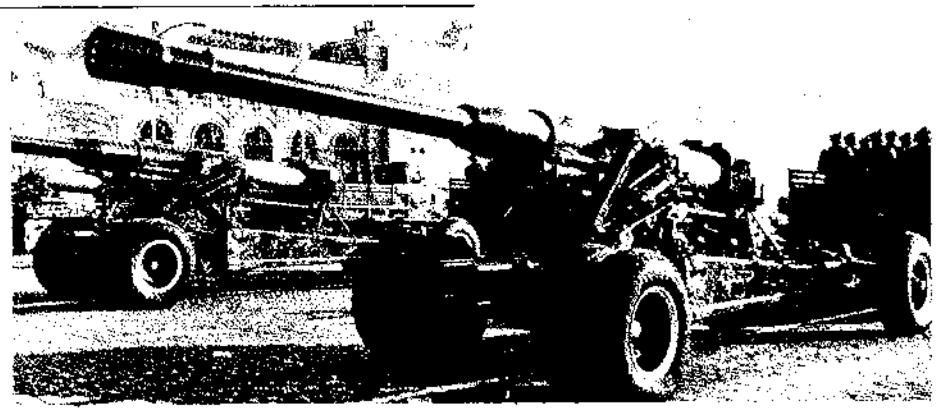
Almost all Soviet artillery equipment, with the possible exception of the highly sophisticated missiles, is supplied to the satellite countries. Thus, that which appears in a Soviet division may be taken as appearing in a similar type of satellite division. Some minor modifications are occasionally made by the secondary user, particularly the Czechs.

Although Soviet artillery is frequently seen, detailed information is often hard to come by.

5540.103
203 mm GUN HOWITZER M.55

DESCRIPTION:

This is the largest conventional gun in service in the Soviet Army. Its calibre is identical with the US 8-inch, and it is presumably employed in the same way. It would seem to fire a lighter shell. It is known that it fires nuclear shells, and to a greater range than any other gun except the US 280 mm. The precise deployment of the M.55 is not known, but it may be taken to be held at Army or Corps level, and may be used to provide general fire support with HE shell. It is seen on formal Moscow parades towed by a large truck which also carries the crew, but it may be assumed that in the field it has some sort of tractor to provide the motive force, and severa accompanying vehicles carrying the crew, firing equipment and ammunition.



203-mm Gun howitzers M.55 in Red Square on the anniversary of the October Revolution

STATUS:

In service.

CHARACTERISTICS:

Total weight: 20,400 kg
Shell weight: 136 kg
Range – max: 29,000 m

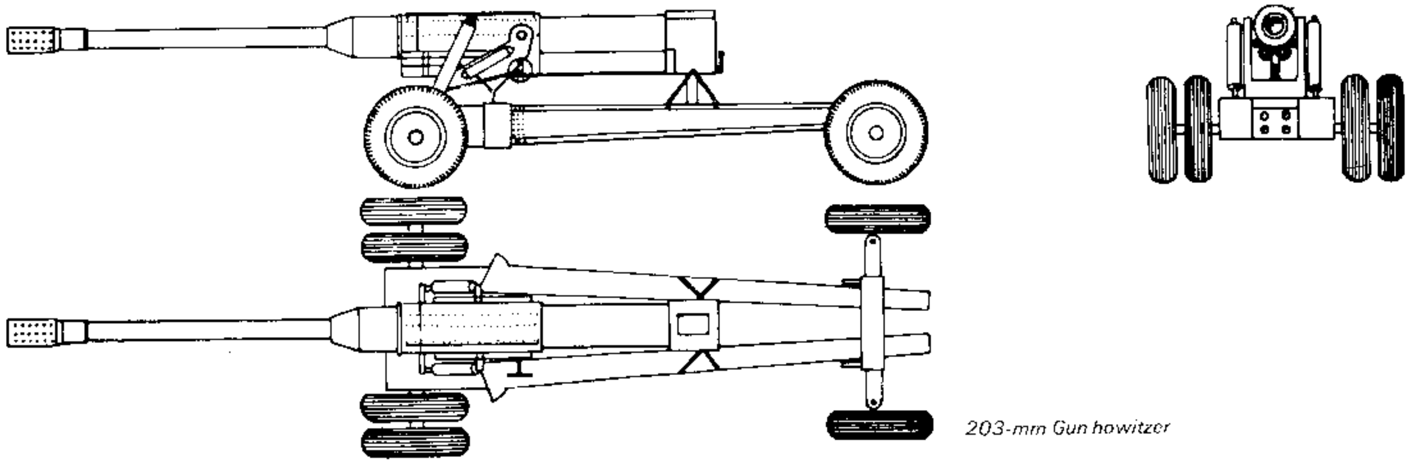
Traverse: 44°
MV: 790 m/s

COUNTRIES SUPPLIED:

Thought to be confined to USSR only.



203-mm Gun howitzer

2927.103
180 mm FIELD GUN

DESCRIPTION:

According to reports from Israeli sources, a new 180 mm Russian field gun was encountered in service with Egyptian forces during the 1973 Arab-Israeli war. The epithet "new" should, of course, be treated with some reserve; it has not so far appeared to be standard USSR practice to field entirely new weapons with the armed forces of their overseas clients – unlike some Western manufacturers who sometimes find it easier to sell weapons overseas than to persuade their own authorities to spend money on them.

On the other hand it is surprising that, if the weapon is not new (and of course assuming, as is probable, that the report is accurate) it is surprising that it has not hitherto been seen in service with Warsaw Pact forces. We have not seen any pictures, however, and it could be that the "new" gun closely resembles a more familiar one of a different calibre.

According to the report, the gun has a range of 44 km. If true, this is a most impressive figure –

which may be compared with the 32.7 km of the American 175 mm M107 (**5524.103**) and the Russians' own 130 mm M-1946 (**5554.103**) which has a maximum range of about 31 km.

STATUS:
Presumably in service. No other details available.

2886.103
152 mm GUN-HOWITZER M-37
DESCRIPTION:
This is the earliest pattern of 152 mm gun howitzer still in service in Russia – and it is to be found there only in reserve units. Noticeably prewar in design and of massive construction it is a heavy and, by modern standards, unwieldy weapon. In performance however, although inferior to its modern replacement (M-55, **5521.103**), it is still a far from negligible weapon.
CHARACTERISTICS:
Calibre: 152 mm
Barrel length: 32 calibres
Elevation: $-2°$ to $+65°$
Traverse: 58°
Weight in firing order: 7.128 t
Shell weight: 43.5 kg
Range: 15,800 m
Rate of fire: 4 rounds/min
STATUS:
Reserve formations of the Russian Army. In more active service in less well-endowed client (and former client) countries of the Soviet Union.

5521.103
152 mm GUN-HOWITZER M-55
Twelve of these gun-howitzers appear in the organic artillery of the Soviet motor rifle division, and are employed to give general fire support. There is also a 152 mm howitzer, the difference being in the length of barrel and shorter maximum range. The M-55 is the version which is more generally encountered. It is a very large gun, equating to 6 inch calibre, and is heavy for a simple towed carriage. Mobility must be fairly restricted, but there is adequate range which is some compensation.

The design is quite old, although there have been successive modifications and variants. However, the present-day version still displays the basic Russian artillery philosophy of a simple, reliable robust gun firing the heaviest possible shell. This gun-howitzer is distinctive when moving by the fact that it has a small two-wheeled limber under the ends of the trail, and there are no reports of an SP version in service. There was a 152 mm assault gun mounted in the JS-2 chassis, and this was known as the JSU-152.

STATUS:
In service.

COUNTRIES SUPPLIED:
Czechoslovakia, East Germany, Poland.

CHARACTERISTICS:
Gun-Howitzer M-55:
Barrel length: 37 calibre
Elevation: $-3°$ to $+63.5°$
Traverse: 60°
Total weight: (firing) 5,900 kg
Ammunition: Separate loading. Round weighs 48 kg HE, AP, Chemical
MV: 670 m/sec
Range: 18 km
Rate of fire: 4 rounds/min
Armour penetration: 100 mm
Crew: 8
Field Howitzer M-43:
Barrel length: 25 calibres
Elevation: $-3°$ to $+63°$
Traverse: 35°
Total weight: (firing) 3,600 kg
MV: 510 m/sec
Range: 12 km
Rate of fire: 4 rounds/min

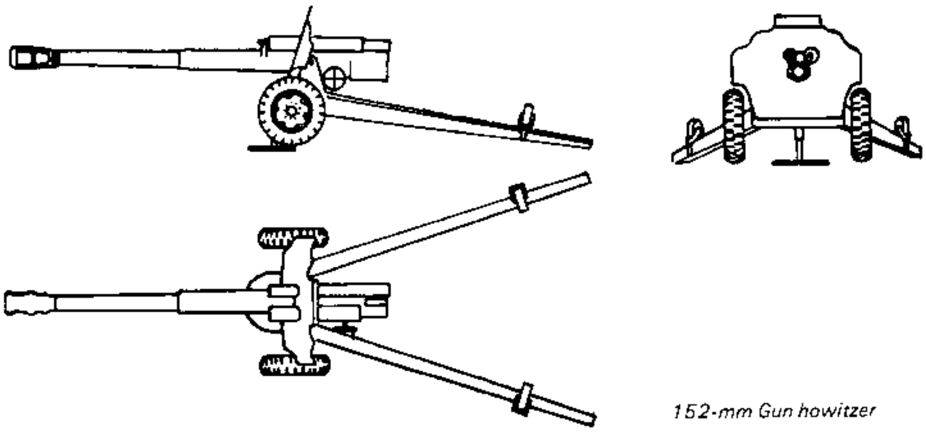
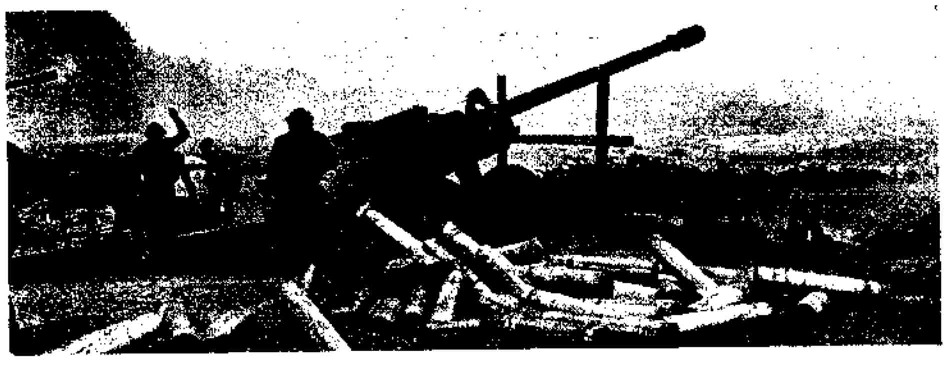
152 mm Field howitzer M-43 (Novosti)



152-mm Gun howitzer

5554.103
130 mm FIELD GUN M-46 AND M-54
DESCRIPTION:
These two weapons are similar in appearance and are essentially the 130 mm naval gun in a field mounting. The gun is used both as a field gun and as an anti-tank gun: it is also used for coastal defence. Details given below relate to the M-54 weapon.



130 mm Field Gun

CHARACTERISTICS:
Barrel length: 55 calibres
Total weight: 7,500 kg

Weight of shell: 33.5 kg
MV: 930 m/sec
Rate of fire: 5-6 rounds/min
Armour penetration: 170 mm

5578.103
130 mm ANTI-AIRCRAFT GUN M-55

DESCRIPTION:

Whereas the 130 mm field guns (**5554.103**) of the Russian Army appear to derive from the earlier surface-fire naval guns of the same calibre, the M-55 anti-aircraft gun appears to have been developed for army use and subsequently adapted for naval use. The M-55 is intended for static air defence and is used in conjunction with a fire control radar. It has an automatic fuse-setter and an automatic rammer, the design of which may well have been taken from the British 3.7-inch or 4.5-inch guns.

CHARACTERISTICS:
Elevation limits: —5° to +80°
Traverse: 360°
Total weight: 25,200 kg
Shell weight: 33.5 kg
MV: 945 m/sec
Max range: 25 km
Max height: 16.5 km
Rate of fire: 10-15 rounds/min

5520.103
122 mm HOWITZER M-1938

DESCRIPTION:

The M-1938 howitzer, or its later derivations, appears in the inventory of every type of Soviet, Chinese and Satellite Army Division. It is deployed in batteries of six guns, sometimes with three batteries to a Battalion, sometimes two. The howitzer provides general fire support for the division and army. Large numbers have been made, and whilst generally seen in the towed version, SP assault guns on a J8-2 chassis have also been produced.

The modest muzzle velocity restricts the range to rather less than would be accepted from a modern design, but this shortcoming is made up by the Soviet Army's aggressive tactics and their habit of keeping their artillery well forward.

For travelling, the barrel is retracted and fixed to the trail by a tie-rod.

A wide range of projectile is fired, and a total of nine charges used to get the necessary range overlap.

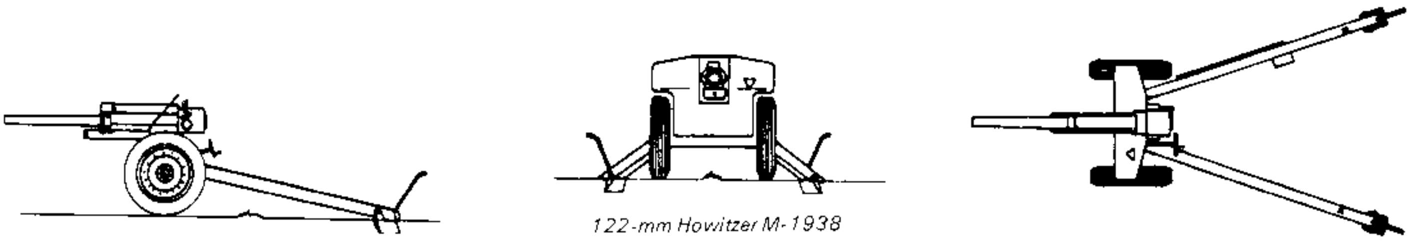
CHARACTERISTICS:
Total weight: 2,450 kg
Barrel length: 22.7 calibres
Range – max: 11,800 m
Elevation: —3° to +63°
Traverse (on carriage): 50°
Rate of fire: 5-6 rounds/min

122-mm M.38 Howitzers firing a ceremonial salute (Tass)

Ammunition: Separate loading. Round weighs 25.8 kg
Shell: HE, HEAT, Smoke, Illuminating, Chemical
Armour Penetration: 100 mm

STATUS:
In service.

COUNTRIES SUPPLIED:
All satellites. China. Egypt.



122-mm Howitzer M-1938

2894.103
122 mm GUN M-37

DESCRIPTION:

This gun dates from before the Second World War; and like its contemporary, the 152 mm gun-howitzer (**2886.103**), is now only to be found in reserve units. It is, however, deployed for coastal protection in Yugoslavia.

CHARACTERISTICS:
Calibre: 122 mm
Barrel length: 46 calibres
Elevation: —2° to +65°
Traverse: 58°
Weight in firing order: 7,117 kg
Weight of shell: 25 kg
MV: 800 m/sec
Range: 20.8 km
Penetration: 129 mm at 1,000 m and 60°
Trail: Spread

STATUS:
Reserve formations in Russia. Active overseas.

5519.103
122 mm GUNS D-74 and D-30

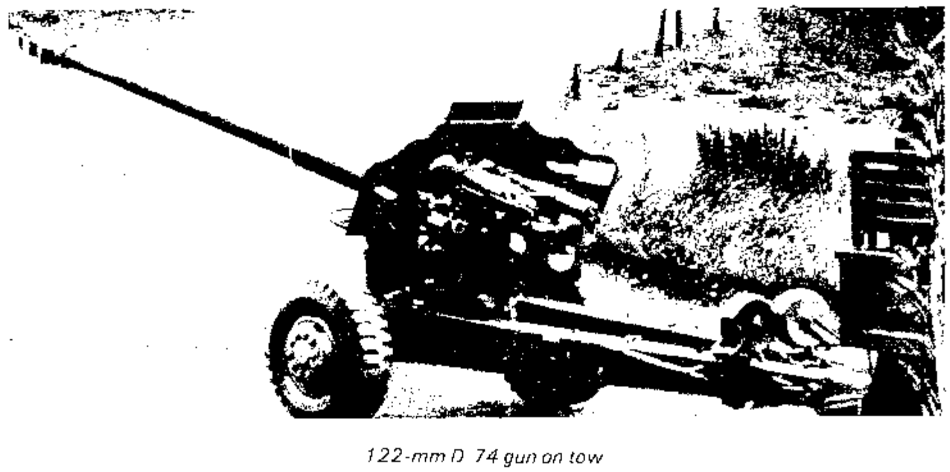
DESCRIPTION:

The 122 mm gun howitzers of the Soviet Army resemble the M.38 howitzer only in respect of their calibre. The gun fires a larger and more effective shell to a greater range than the howitzer achieves.

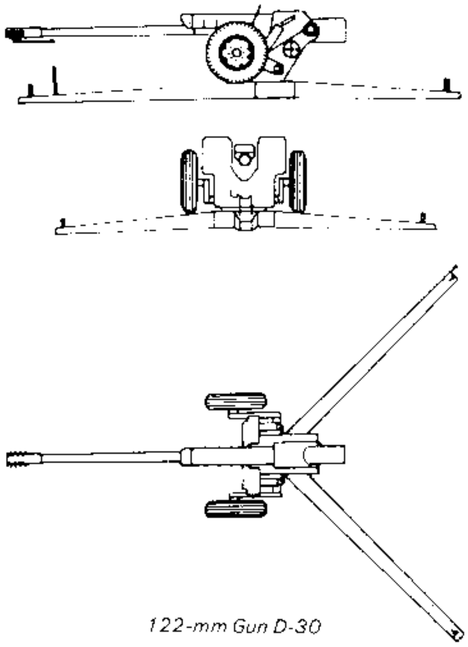
The D-74 is the older version, and is used to give general support to the infantry and mechanised divisions. It is also extensively used as an anti tank gun. In the latter role it appears to be large and difficult to conceal.

D 30 is a more modern gun, with a sophisticated mount permitting 360° traverse and stable platform. It is fitted with a multi baffle muzzle brake and appears to have a modified or new buffer and recuperator.

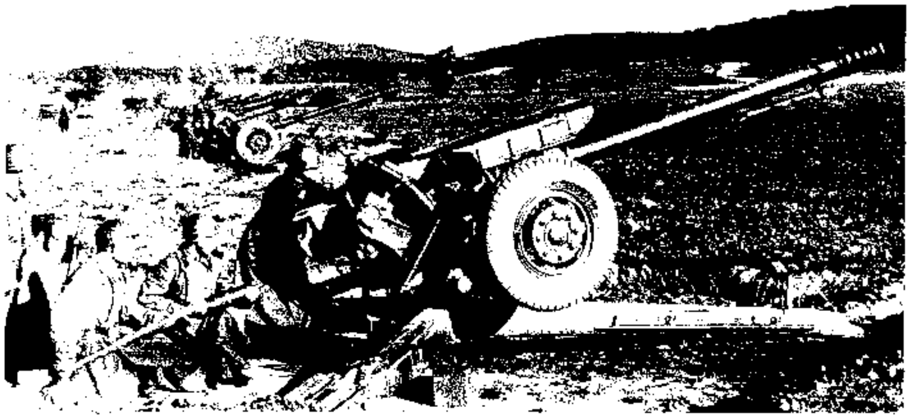
These gun howitzers provide the backbone of



122-mm D 74 gun on tow



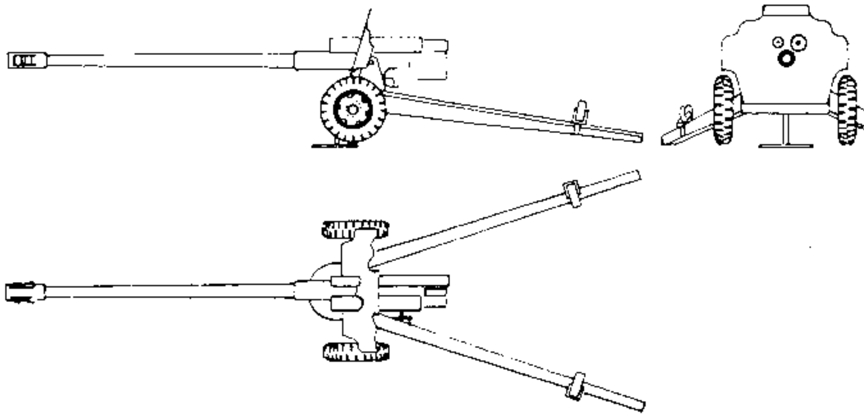
122-mm Gun D-30



122-mm gun D-30 emplaced and ready to fire. The trails are prominent in this view, and the raised wheels clearly shown (Tass)

the general fire support to the Soviet Army, their range is good and their shells effective. Variants of the 122 mm gun are fitted to equipment and tanks.

CHARACTERISTICS:
Range, both versions: 21,900 m
Ammunition: Separate loading. Round weighs 39 kg
Shell: HE, Smoke, Illuminating, APHE, Shell weight 21.7 kg
MV: 807 m/s
STATUS:
In service.
COUNTRIES SUPPLIED:
All Satellite armies. Egypt, Cuba, China.



122-mm Gun D-74

2972.103
115 mm TANK GUN U-5TS
DESCRIPTION:
The U-5TS is the main armament of the T-62 Main Battle Tank. It is a smoothbore gun and fires fin-stabilised ammunition. It has no muzzle brake but is fitted with a bore evacuator. The U-5TS also has a two-plane stabilisation system and infra-red night fighting equipment.

CHARACTERISTICS:
Calibre: 115 mm smooth bore
Barrel length: 55 calibres
6.325 m
Elevation: $-3°$ to $+17°$

Ammunition:

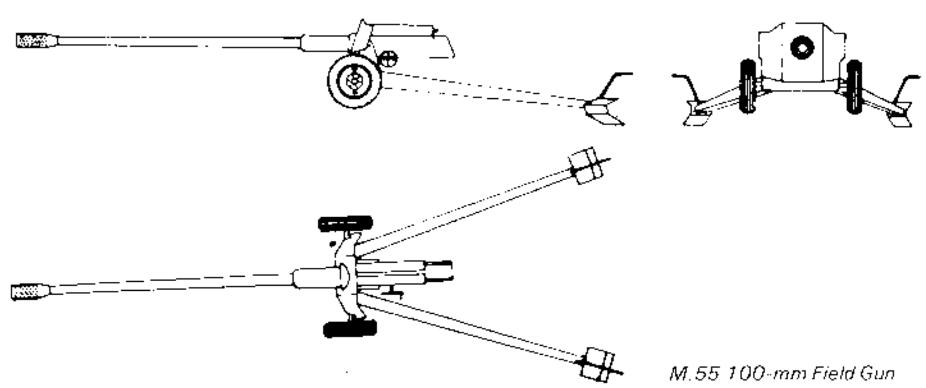
Type	Projectile weight	M/V
HE	17.7 kg	—
APDS	6.8 kg	1500+ m/s
HEAT	11.8 kg	1000 m/s

Rate of fire: 5 rounds per minute (maximum)
Penetration: APDS round will penetrate 300 mm of armour at 1000 m. HEAT round will penetrate 450 mm of armour at any range
STATUS:
In service.

5518.103
100 mm FIELD GUN M.1955
DESCRIPTION:
This gun has appeared in various forms, and has been described as both an anti-tank and a field gun. It seems to be equally effective in both roles, though as a field gun it cannot be used in the same way as such guns are in Western Armies, since it fires fixed ammunition and so will be unable to produce a wide range overlap. However, it still appears in the Soviet motor rifle division and several types of formation in Bloc countries. It is the main armament of the T-54A and T-55 tanks, and also appears on naval mountings. Its armour piercing rounds can penetrate considerable thickness of armour, and its HE rounds have a high anti-personnel capability. As a towed equipment it is heavy and cumbersome, and must be difficult to conceal, but these drawbacks are obviously thought to be worth while accepting for the sake of the heavy and effective shell which it fires.

As a tank gun it is now surpassed for the new battle tanks, but it is likely to survive for many years yet in the armies of the lesser satellites, and there are, no doubt, fairly large stores of ammunition in various countries.

100-mm Field Gun M.55 towed by its tractor



M.55 100-mm Field Gun

CHARACTERISTICS:
Total weight: 2,700 kg
Barrel length: 54 calibres
Elevation: $-5°$ to $+40°$
Traverse: 55°
Ammunition: Fixed
Shell: HE, APHE, AP, HVAP
Range – max: 21,000 m
Rate of fire: 10 rounds/min
Penetration (max): 181 mm armour
Crew: 8
STATUS:
In service. Probably still in production.
COUNTRIES SUPPLIED:
All satellites.

2888.103
100 mm SP ANTI-TANK GUN SU-100

DESCRIPTION:

This elderly but formidable gun is still in widespread use among the nations of the Warsaw Pact and in one or two others. It consists of a 100 mm L/54 gun mounted on a modified T34/85 chassis and has frontal armour up to 75 mm.

Operationally the weapon's main disadvantage is the small gun depression angle available. At only 2 degrees in earlier marks – improved to 4 degrees in the later, postwar, versions – it makes it difficult to engage a target from a reverse slope position without exposing the vehicle.

CHARACTERISTICS:
Crew: 4
Weight: 32 t
Main armament: 100 mm 54-calibre gun
MV: 900 m/sec
Rounds carried: 52
Secondary armament: MG
Engine: 520 bhp diesel
Road speed: 53 km/h
Range: 300 km
Ground pressure: 0.8 kg/cm²
Gradient: 30°
Dimensions: length 5.93 m (9.45 m with gun); width 3.0 m; height 2.45 m

STATUS:
In service in Warsaw Pact countries. Supplied also to Iraq, UAR and Yugoslavia.

5579.103
100 mm ANTI-AIRCRAFT GUN N-49

DESCRIPTION:

Although this weapon was designed a long time ago it appears still to be in use by AA batteries as the largest mobile AA gun in the Russian Army. It is radar controlled by a Fire Can radar (**2871.153**) – which is similar both in appearance and function to the American SCR-584 mobile fire control radar.

CHARACTERISTICS:
Barrel length: 54 calibres
Elevation limits: −5° to +82°
Traverse: 360°
Total weight: 11,000 kg
Shell weight: 15.9 kg
Muzzle velocity: 900 m/sec
Max range: 21 km
Max height: 13 km
Rate of fire: 15-20 rounds/min

2966.103
100 mm TANK GUN D10TG

DESCRIPTION:

This gun was designed during the Second World War and is based on a naval gun. The first version was the D-10T, which was mounted in the first T-54 tanks. Early D-10Ts did not have a bore evacuator, but later models did, and there was no stabilisation. The next model was the D-10TG, which has stabilisation in the vertical plane and is fitted to the T-54A. The D-10T2S is fitted to the T-54B, T-55 and T-55A tanks and has both vertical and horizontal stabilisation. Infra-red night fighting equipment is fitted.

CHARACTERISTICS:
Calibre: 100 mm
Barrel length: 56 calibres 5.608 m
Elevation: −4° to +17°
Ammunition: HE 15.7 kg projectile, MV 900 m/s; APHE 15.9 kg projectile, MV 1000 m/s; HEAT MV 800 m/s. In recent years the HEAT & APDS rounds have been fin-stabilised
Rate of fire: The figure usually quoted is 7 rounds a minute but reports from the Middle and Far East say that 2-4 rounds a minute is a good average
Penetration: APHE round will penetrate 185 mm of armour at 1000 m. HEAT round will penetrate 380 mm of armour

STATUS:
In service.

5517.103
85 mm ANTI TANK GUN D-48

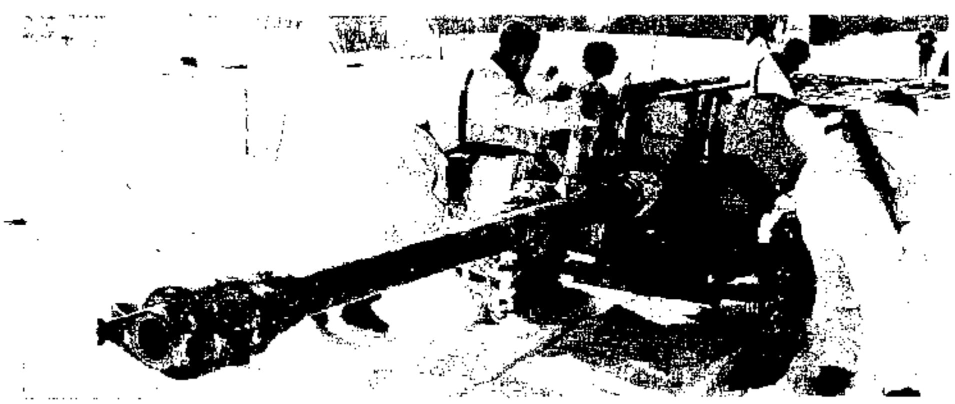
DESCRIPTION:

The 85 mm calibre has been in service with the Soviet forces since World War II, and although the design is old several varieties are still in use.

The D-48 anti tank gun is a reliable and effective weapon which appears in the inventories of most of the Armies of the Eastern Bloc. Guns of this type and size are no longer used in Western Armies where they have been replaced by missiles or recoilless guns. The D-48 is entirely conventional in design and appearance. Some versions have been seen with an auxiliary power unit mounted on the trail to provide a measure of mobility.

CHARACTERISTICS:
Barrel length: 53 calibres
Elevation limits: −5° to +25°
Traverse: 30°
Total weight: 1,725 kg
Range: 15.5 km
Rate of fire: 20 rounds/min

STATUS:
Obsolescent.



85-mm D-48 gun being manhandled by its crew (Tass)

COUNTRIES SUPPLIED:
Most, if not all of the Eastern Bloc, China and Egypt.

85-mm Anti-tank/Field gun D-48

5580.103
85 mm ANTI-AIRCRAFT GUN M-44

DESCRIPTION:

Long a standard AA weapon of the Russian Army, the 85 mm gun is used with the Fire Can S-band fire control radar. (**2871.153**).

CHARACTERISTICS:
Barrel length: 53 calibres
Elevation limits: −3° to 82°
Traverse: 360°
Total weight: 4,300 kg
Shell weight: 9.75 kg
Max range: 15.4 km
Max height: 9.4 km
Rate of fire: 15-20 rounds/min

5516.103
76 mm DIVISIONAL GUN M.1942 (ZIS-3)

DESCRIPTION:

The 76 mm family has followed through all branches of Soviet artillery, and has also appeared in naval mountings. There has been progressive improvement, and the ZIS 3 is described as a typical example of the mark. Over the years the carriage has become lighter, the range greater, and the shell more effective. There is a pack version which is used by mountain troops – particularly in Communist China – and one version was used as a tank gun.

Now no longer powerful enough for modern mechanised war, the 76 mm still appears in the satellite armies, and is supplied to many of the smaller emergent nations. It might be said to equate in versatility, age and general use to the British 25 pounder, though it would be unwise to carry the comparison too far.

CHARACTERISTICS:
Total weight: 2,500 kg
Range – max: 13,300 m
Elevation: max. 37°
Traverse: 54°
Ammunition: Fixed. Round weight 8.6 kg
Shell: HE, APHE, HVAP
MV: HE, 680 m/s, HVAP, 965 m/s
Penetration: 92 mm armour
Crew: 6

STATUS:
In service.

COUNTRIES SUPPLIED:
All Warsaw Pact, People's Republic of China, Indonesia, Cuba.

5515.103
57 mm ANTI-TANK GUN M 1943 (ZIS-2)

DESCRIPTION:

This is an elderly gun which is probably phasing out of the Soviet first line formations. It is known to be still in service with several satellite countries, and variants exist. Its penetration is no longer sufficient for modern Armoured Fighting Vehicles although APCs would be highly vulnerable to it. It is interesting that the calibre of this gun is the same as a German anti-tank gun, though whether the Soviets took the idea in such complete details as to copy the actual calibre is not known. This equipment has been seen with an Auxiliary Power Unit (APU) on the trail, thus giving it a limited capability for self-propulsion. This version of the gun is generally known as the M-55. Its characteristics are much the same as those of the M-43.

CHARACTERISTICS:
Total weight: 1,419 kg
with 20 hp trail motor: 1,800 kg
Elevation: 5° to 25°

Traverse: 54°
Shell: HE, APHE, AP, HVAP, weights from 1.75 kg to 3.74 kg
MV: HE, 700 m/s HVAP 1,270 m/s
Range: Approx 8 km
Rate of fire: 20 rounds/min
Penetration: HVAP, 100 mm armour

STATUS:
In service.

57 mm Anti-tank gun M-1943

COUNTRIES SUPPLIED:
All Warsaw Pact, People's Republic of China.

5514.103
57 mm TOWED AA GUN AND AA SP GUN

DESCRIPTION:

The towed anti-aircraft gun S-60 is in general use throughout the Soviet and Satellite Armies and Navies. It is a radar-controlled light gun with a dual capability of engaging aerial or ground targets. The design is thought to have come directly from the German 5.7 cm FLAK Gerat 58 which was not completed in 1945 and which was then taken over by the occupying Soviet Forces. From what is known of the gun it has a good performance, and is comparable with the Bofors 40 mm.

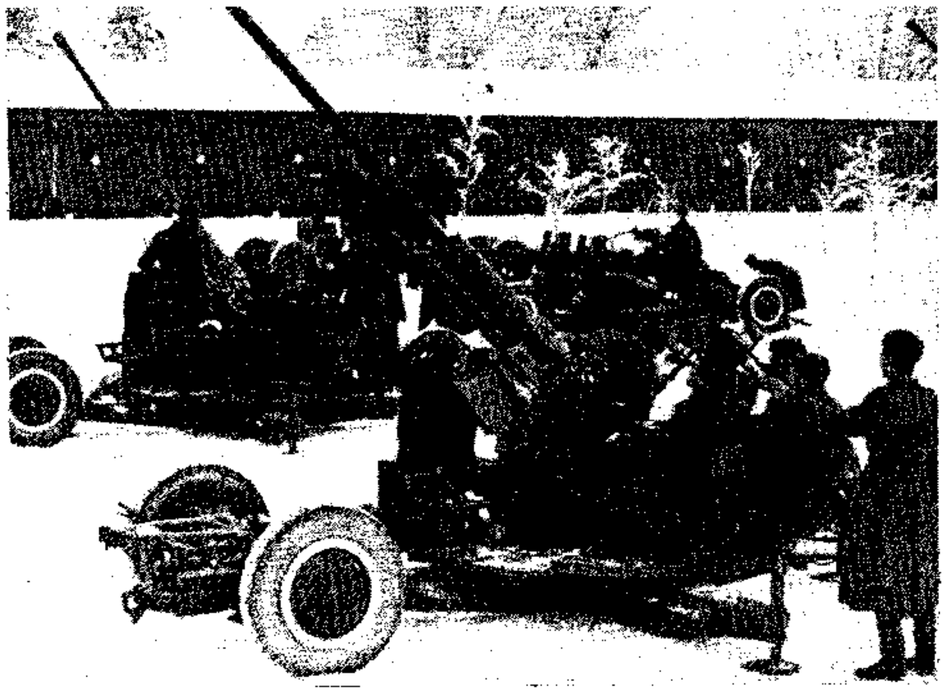
In the self propelled version, the ZSU 57 mounts two guns in a large square turret. The total cyclic rate of fire of this combination is about 240 rounds per minute, but it is not known how much ammunition is carried.

The chassis has four road wheels and no return rollers. The sprocket is at the rear, driven by the same engine as the T-54. The top deck is very flat, and not much higher than the track-guards, thus leaving space for the large and distinctive turret. The driver is in the extreme left front corner of the chassis.

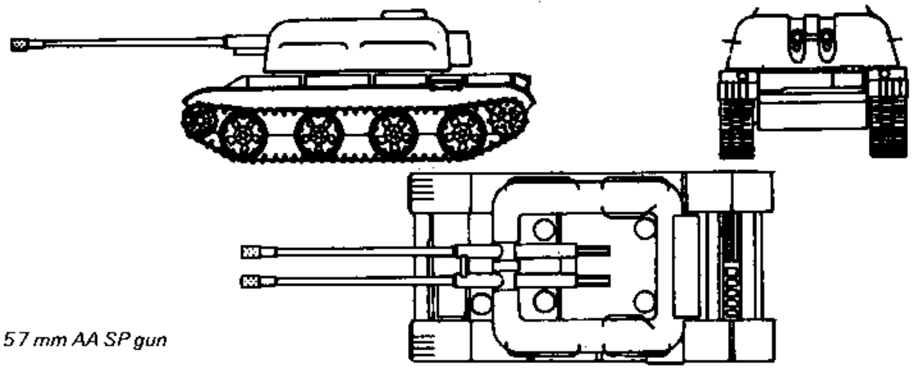
CHARACTERISTICS:
Overall length: 6.20 m
Width: 3.27 m
Height: 2.75 m
Total weight: 30,000 kg
Range: 4,875 m vertically, 1,200 m horizontally
Elevation: 2° to 87°
Traverse: 360°
Ammunition: 57 mm fixed
Shell: HE, weight 2.79 kg
Rate of fire: 120 r.p.m. per gun

STATUS:
In service.

COUNTRIES SUPPLIED:
Poland, Czechoslovakia, Egypt.



57 mm AA gun M-50. This is the towed version of the gun used in the SU-57 and has the same characteristics (Novosti)



57 mm AA SP gun

2887.103
37 mm ANTI-AIRCRAFT GUN M38/39

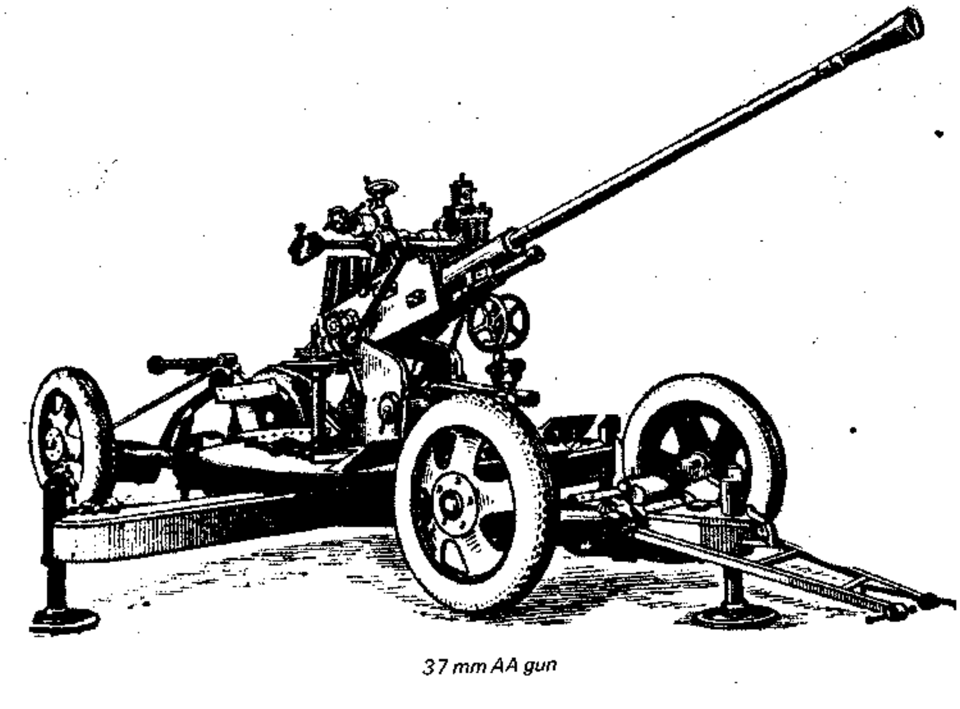
DESCRIPTION:

Probably the earliest light anti-aircraft gun still in service with Russian land forces, this weapon, though in more active use elsewhere, is now confined to reserve formations in Russia. Designed for use only with optical sights it is a mobile weapon with a very respectable performance. It is mounted on a four-wheel trailer for transport.

CHARACTERISTICS:
Calibre: 37 mm
Barrel length: 70 calibres
Elevation: −5° to +85°
Traverse: 360°
Weight in firing order: 2 t
Shell weight: 725 gm
MV: 960 m/sec
Range: maximum: 8,000 m
effective AA: 1,500 m
Rate of fire: 180 rounds/min

STATUS:

Reserve formations of USSR. Supplied to many other countries including Albania, Yugoslavia and North Vietnam, where it has recently been in action.



37 mm AA gun

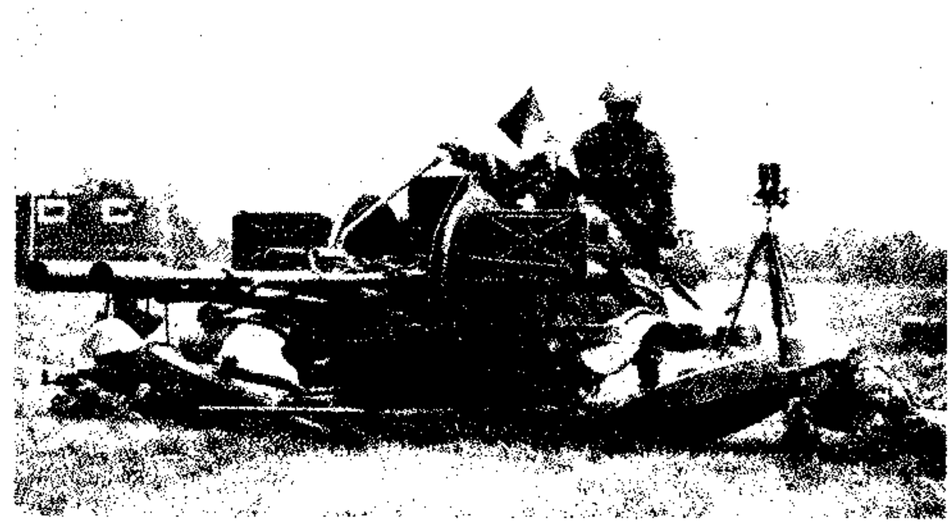
5581.103
23 mm AA CANNON

DESCRIPTION:

This is a twin-mounted 23 mm rapid-fire cannon mounted on a trailer the wheels of which can be detached to settle the gun on the ground. The guns are visually laid.

CHARACTERISTICS:

Barrel length: 80 calibres
Elevation limits: $-5°$ to $+90°$
Traverse: 360°
Total weight: 950 kg
Projectile Weight: 0.2 kg
MV: 970 m/sec
Max range: 7 km
AA engagement range: 1.2 km
Rate of fire: 1,000 rounds/barrel/minute



Twin 23 mm AA cannon

5582.103
QUAD-MOUNTED 14.5 mm AA MACHINE GUN ZPU-4

DESCRIPTION:

This is a quadruple-mounted version of a 14.5 machine gun that is also to be found in a variety of twin (ZPU-2) mountings on Russian AFVs. The quadruple mount is carried on a 4-wheel trailer drawn by a light truck. As can just be made out in one of the accompanying pictures, the trailer wheels can be detached when the weapon is in use. The other picture shows some detail of the guns and sight.

CHARACTERISTICS:

Barrel length: 93 calibres
Elevation limits: 0° to 90°
Traverse: 360°
Total weight: 2,100 kg
Projectile weight: 65 gm
M.V.: 1,000 m/sec
AA engagement range: 1,200 m
Rate of fire: 600 rounds/barrel/minute

ZPU-4 on exercise

Close-up of ZPU-4

5583.103
RECOILLESS ANTI-TANK GUNS

DESCRIPTION:

Russian Army units are known to have at least two different recoilless guns in service: one of these has a calibre of 82 mm and the other, which is a more modern weapon, a calibre of 107 mm.

CHARACTERISTICS:

Type:	**B-10**	**B-11**
Calibre:	82 mm	107 mm
Barrel length:	20 calibre	33 calibre
Total weight:	86 kg	225 kg
Shell weight:	3.6 kg	9.0 kg
MV:	320 m/sec	410 m/sec
Engagement range:	500 m	1,000 m
Armour penetration:	250 mm	380 mm

STATUS:

In service with Warsaw Pact armies. The Czech Army is equipped with 82 mm recoilless weapons of more modern design than the elderly B-10 described above. So far as is known, however, the Czech weapons – which are made at the Skoda works – are not yet in service with the army of any Warsaw Pact country other than Czechoslovakia. (See entry **5588.103**).

YUGOSLAVIA

2276.103
YUGOSLAV ORDNANCE

Yugoslav ordnance is both extensive and varied. Before the Second World War the country relied on imported weapons for its armed forces: important sources being Schneider (France) and the Skoda works. Since the war, however, a significant armaments manufacturing operation has been developed in the country.

In the following entries are listed those weapons that are or have been manufactured in Yugoslavia together with a few older weapons, of foreign manufacture, which are not known to be found elsewhere. Apart from these two categories of weapons, however, there are many current and obsolete weapons which have been acquired by the Yugoslavs over the years and kept in service. The following list is probably not comprehensive, but it at least gives some idea of the extent and variety of the weapons available.

Czechoslovakia
- Twin 30 mm SP AA gun M-52/59 (**2029.103**)

Germany
- 105 mm Light field howitzer M-18M (**2190.103**).

USA
- 155 mm Medium field howitzer M-1 (**5510.103**)
- 155 mm Gun M-2 (**5506.103**)
- 105 mm Light field howitzer M-2 (**5511.103**)
- 90 mm SP Gun M-36 (Jackson)
- 76.2 mm SP gun M-18 (Hellcat)
- 75 mm Recoilless gun M-20 (**5584.103**)

USSR
- 152 mm Gun-howitzer M-37 (**2886.103**)
- 122 mm Medium field howitzer M-38 (**5520.103**)
- 122 mm Gun M-37 (**2894.103**)

100 mm Anti-tank gun M-55 (**5518.103**) with locally modified muzzle brake
SU-100 Tank destroyer (**2888.103**)
85 mm Anti-aircraft gun M-44 (**5580.103**)
76.2 mm Anti-tank gun M-42 (**5516.103**)
57 mm Anti-tank gun M-43 (**5515.103**)
57 mm Anti-aircraft gun M-50 (**5514.103**)
SU-57 Twin SP AA guns (**2890.103**)
37 mm Anti aircraft gun M-39 (**2887.103**)

Status:
All these weapons are believed to be in service with active formations of the Yugoslav forces.

2267.103
105 mm FIELD HOWITZER M-56

Description.
This weapon is believed to be substantially a new development by the Yugoslavs; but since it exhibits features both of the US M-2 weapon (**5511.103**) and of the Rheinmetall modernisation thereof (**5576.103**) it is difficult to be sure. Most noticeable differences from the American weapon are the new shield and the muzzle brake.

Characteristics.
Calibre: 105 mm
Barrel length: 3.48 m
Elevation: −12° to +68°
Traverse: 52°
Weight: 2,100 kg
Weight of shell: 15 kg
MV: 570 m/sec
Range: 13 km
Rate of fire: 6-7 rounds/min
Ammunition: HE, HEAT, Smoke, Illuminating
Crew: 6 men

Status:
In service in considerable numbers.

Manufacturers:
Yugoslav State Factories.

105 mm Field Howitzer in production

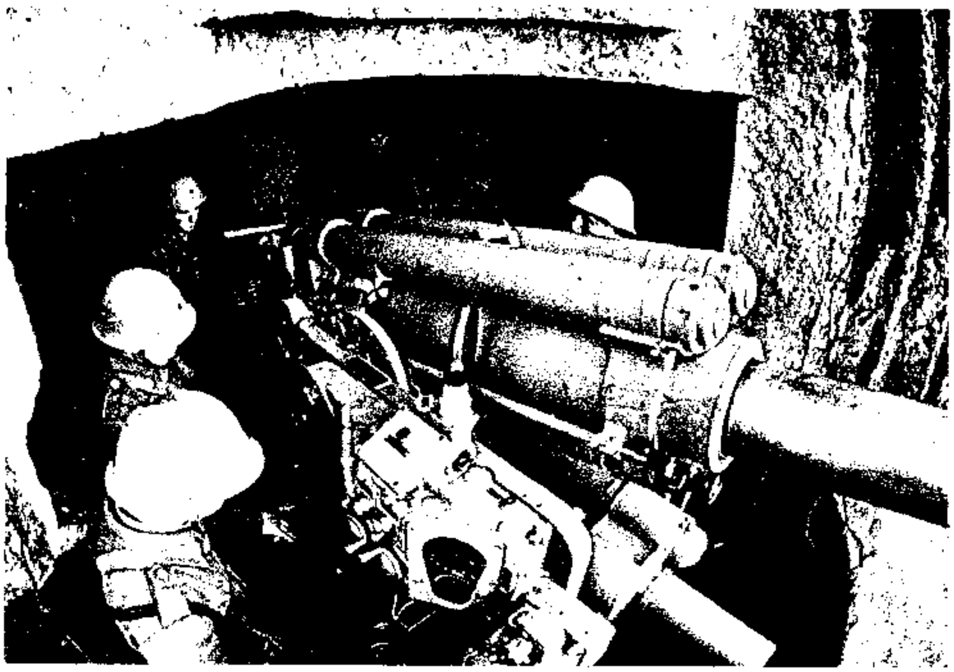
2274.103
88 mm COASTAL DEFENCE GUN (FLAK-36)

Description
Although described here as a coastal defence weapon, because that is the purpose for which it is currently deployed in Yugoslavia, this is in fact the famous 88 mm flak gun so extensively used by the German forces in the Second World War. The model in service in Yugoslavia is the Flak-36, effectively the second mark of the gun which incorporated the modifications designed to correct weaknesses revealed in the original Flak-18 during the Spanish Civil War.

Characteristics:
Calibre: 88 mm
Barrel length: 56 calibres
Weight in firing order: 5 t
Range: 14.8 km
Rate of fire: 15-20 rounds/min

Status:
In service in coastal installations on the Adriatic coast.

Manufacturer.
Originally Krupp.



88 mm Coastal Defence Gun emplacement

2268.103
76.2 mm MOUNTAIN GUN M-48 B-1

Description.
This weapon, built in Yugoslavia, is designed for use in all kinds of difficult terrain. It can be towed by truck or by horse and breaks down easily into loads which can be carried by pack animals. Conceptually it is not unlike the Italian pack howitzer (**5501.103**); the latter is a larger weapon, of course, but weight for weight the Yugoslav gun has a respectable performance.

Characteristics
Calibre: 76.2 mm
Barrel length: 15.5 calibres
Elevation: −15° to +45°
Traverse: 50°
Weight in firing order: 705 kg
Weight of shell: 6.2 kg
MV: 222.298 m/sec
Range: 500-8,600 m
Ammunition: HE, HEAT, Smoke
Rate of fire: 6-7 rounds/min
Trail: spread and folding

Status:
In service.

Manufacturers.
Yugoslav State Factories

2275.103
75 mm ANTI-TANK GUN M-40

Description:
This was a highly successful anti-tank gun used by the German Army in the Second World War. So far as is known, however, it is now in service only in Yugoslavia.

Characteristics:
Calibre: 75 mm
Weight in firing order: 1,500 kg
Weight of shell: 5.7 kg
MV: 550 m/sec
Range: 7,700 m

Status:
In service.

Manufacturer
Rheinmetall, Germany.

2265.103
TRIPLE 20 mm ANTI-AIRCRAFT CANNON M-55

Description.
The Triple 20 mm anti-aircraft gun M-55 consists of three Hispano-Suiza HSS 804 guns mounted on a HSS 630-3 towed carriage. The guns and carriage are built under licence in Yugoslavia. The Yugoslavs have also mounted the M-55 on some naval vessels.

Characteristics:
Calibre: 20 mm
Length of tube: 70 calibres
Weight in firing position: 1,171 kg
Length travelling: 4.04 m
Width travelling: 1.27 m
Height travelling: 1.93 m
Elevation: 5° to +83°
Traverse: 360°
Cyclic ROF per barrel: 700 r.p.m.
Capacity of magazine: 50 rounds/barrel
Effective A/A range: 1,500 m
Ammunition: HE and AP
Crew: 6

Status:
In service.

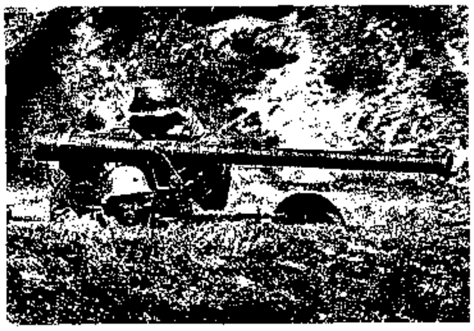
Supplier
Yugoslav State Factories.

2269.103
82 mm RECOILLESS ANTI-TANK GUN M-60

Description:
The larger of the two recoilless anti-tank guns in Yugoslav service, this is a fairly modern weapon of Yugoslav design and manufacture.
The weapon is mounted on a two-wheel trailer; the towing bar forms the third leg of a tripod

mount for firing.
CHARACTERISTICS:
Calibre: 82 mm
Elevation: —20° to +35°
Traverse: 360°
Weight: 122 kg both in travelling and firing order
Weight of shell: 7.2 kg
MV: 388 m/sec
Range: maximum, indirect fire: 4,500 m
practical, stationary target: 1,500 m
practical, moving target: 1,000 m
Ammunition: HEAT
Penetration: 220 mm, 25-90°
Rate of fire: 4-5 rounds/min
Crew: 2-5 men
STATUS:
In service

MANUFACTURERS:
Yugoslav State Factories.



82 mm Recoilless Anti-tank Rifle

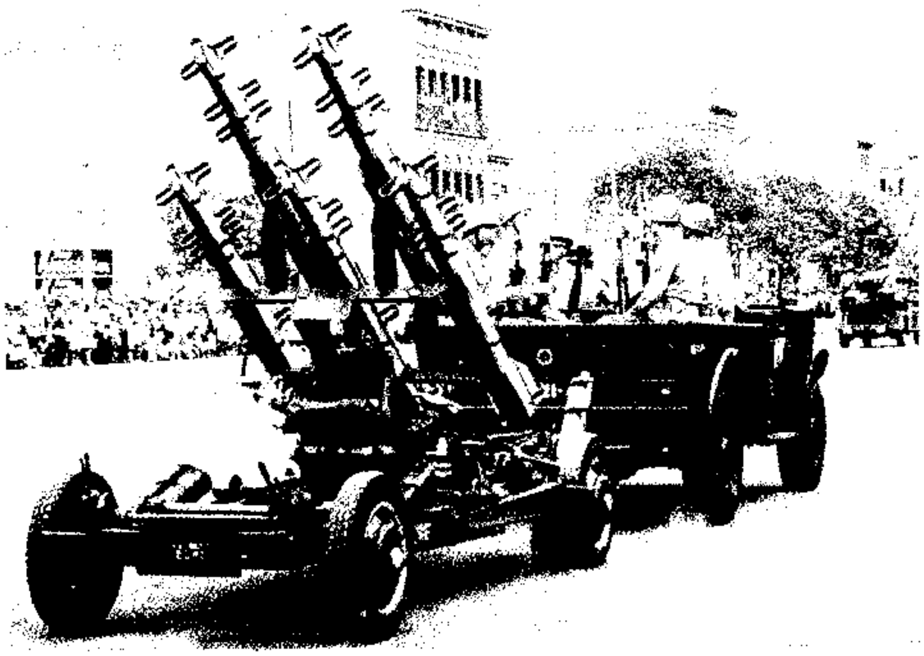
ARTILLERY ROCKETS

BRAZIL

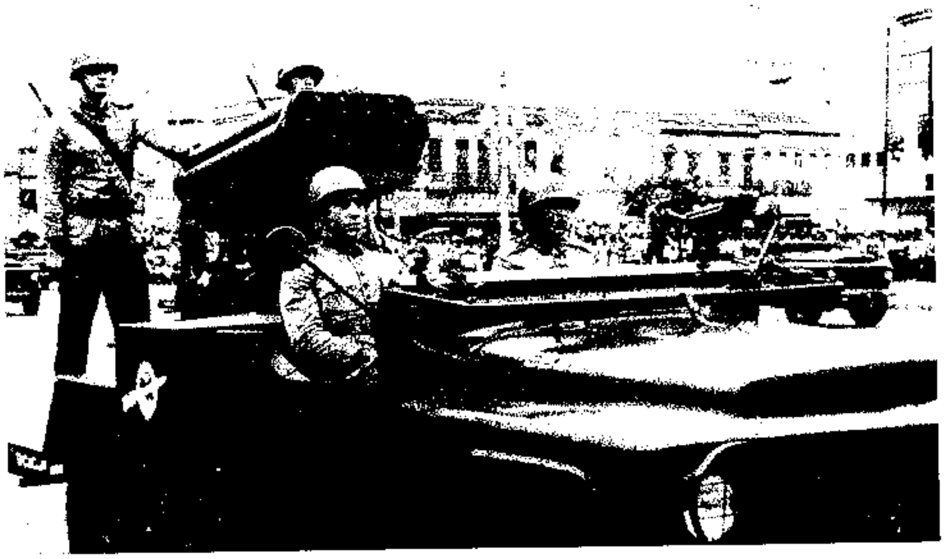
2026.103
ARTILLERY ROCKETS
DESCRIPTION:
Two types of solid-propellant artillery rocket – both launched from multiple launchers – have been developed by the Department of Studies and Technological Research.

114 mm Rocket
This is an unguided spin-stabilised rocket which is fired from a 5-round launcher which is an adaptation of a 40 mm anti-aircraft gun mounting. Spin is imparted by the rocket's cruciform fins.
The rocket is two metres in length, is powered by a two-stage solid-propellant rocket motor and has a high explosive warhead. Maximum speed is Mach 1.8 and the rocket has a range of 25 km.

Rocket Type 108-R
This is a simple unguided cylindrical rocket with no fins; spin-stabilisation being imparted by the canted nozzles of its solid-propellant rocket motor. It is fired from a 16-tube launcher which is designed for vehicle mounting. The rocket has a high-explosive warhead. Maximum range is believed to be about 12 km
DEVELOPMENT AUTHORITY:
Departamento de Estudos e Pesquisas Tecnológicas.



Brazilian Army's 114 mm artillery rockets (Ronaldo S. Olive)



Brazilian Army's Type 108-R artillery rocket launcher (Ronaldo S. Olive)

CZECHOSLOVAKIA

2024.103
RM-130 ARTILLERY ROCKET LAUNCHER
DESCRIPTION:
This is a multi-barrel rocket launcher similar in principle and appearance to weapons developed in several countries since the Second World War. The launcher assembly is commonly carried in the V2S Praga 6-ton 6 × 6 truck which is also made in Czechoslovakia.
CHARACTERISTICS:
Calibre: 130 mm
Number of barrels: 32

Elevation: 45°
Traverse: 360°
All-up weight: 12 t including truck
Weight of rocket: 26 kg
Speed at burnout: 410 m/sec
Maximum range: 8.2 km
Maximum rate of fire: 300/min

STATUS:
In service in the Czechoslovakian and Austrian armies. A similar weapon is in service in the Rumanian Army but mounted on a SIL-157 vehicle.

FRANCE

2134.103
RAP 14

DESCRIPTION:
RAP 14 is a short-medium range unguided fin-stabilised ground-to-ground artillery rocket system. Launched either singly or in salvoes from a multiple launcher it is a robust and simple weapon, easy to handle and of high reliability.

HANDLING AND FIRING:
Rockets are stored with the warhead and body separate in special fireproof, damp-proof and shock-resistant containers. When required for use the warhead is assembled to the body and loaded into the multiple container/launcher that holds 21 rockets. A safety pin that renders the fuse totally inoperative is withdrawn when the warhead is assembled to the rocket.

Further security is provided by a mechanism that ensures that even after the safety pin has been withdrawn the fuse remains locked until after the warhead has been subjected to an acceleration of at least 15g for more than 0.2 seconds. This means in practice that the warhead cannot be detonated until the rocket is at least 500 metres from the launcher.

Firing is controlled by a sequencer connected to the trailer on which the multiple launcher is mounted by a multicore cable. Rotation of the launcher turntable is hydraulically actuated and the trailer is fitted with hydraulic brakes and hydraulic levelling jacks.

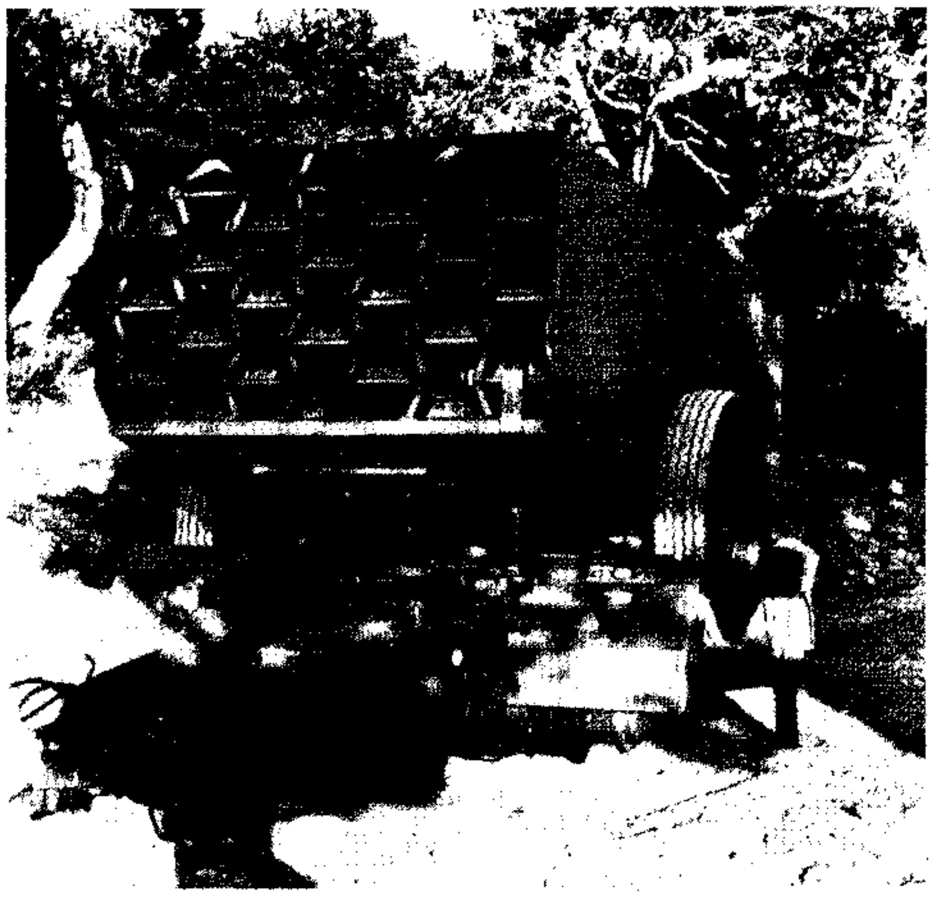
The low dispersion of the system makes it possible to use the kind of ranging techniques traditionally employed with conventional artillery as well as making use of it as a quick-reaction barrage weapon. Moreover, this low dispersion means that a salvo fired by RAP 14 can concentrate a very great weight of missiles on a small area and can do so with minimal warning.

The original design of the rocket incorporated a fragmentation warhead. Currently in development, however, is a new type of warhead which projects a large number of metal balls and which is considered to be more effective than the fragmentation type. Incendiary, smoke and illuminating heads can also be fitted.

Another development is of a new type of proximity fuse. Particular features of the new design are an accurate height of operation, the dispersion of which is measured in centimetres rather than metres, and independence of the reflection coefficient of the ground and the impact angle of the projectile.

Recently introduced is a device which will correct the effect of the surface wind on the trajectory of the rocket, thus making the use of an anemometer unnecessary and avoiding the need for observing the impact of the shots. Observation of a single round in flight is used to generate a correction which is applied before ripple fire commences.

CHARACTERISTICS:
Missile:
Propulsion: Single-stage solid propellant rocket motor



Multiple Launcher for RAP 14

Warhead: Fragmentation (but see text). Weight 19 kg with 5.5 kg of explosive
Fuse: Impact or proximity.
Total rocket weight: 54 kg.
Launch method: Rocket guided by two rectilinear launch rails and simultaneously rotated by a helical ramp.
Stabilisation: By non-rotating cruciform monobloc fin assembly (thus there is no induced lag).
Burn-out speed: About Mach 2 after 2 seconds.
Range: 16 km (20 km rocket RAP-14S in development).
Circular error probable: 90 m.
Launcher:
Type: Trailer-mounted, road-rail compatible, air-transportable.
Capacity: 21 rounds.
Combat weight: 4.8 tons.
Elevation: 0-52°, hydraulic operation, elevation determined by range setting
Traverse: 360°, hydraulic operation.
Time into action: 2 minutes
Firing method: Electronic sequencing.
Rate of fire: 10 seconds for 21 round salvo.
Interval between salvoes: 4 minutes with manual reloading or 1 minute by replacement of container launcher.

LARS—110 mm ARTILLERY ROCKET LAUNCHER

DESCRIPTION:
A multiple rocket launcher mounted on a 7.5 ton 6 × 6 Magirus Jupiter vehicle. The launcher comprises two groups of 18 launch tubes (4-5-5-4), which can be mechanically trained and elevated, from which are launched 100 mm calibre

rockets. These rockets can be equipped with a variety of warheads and can be launched singly or in partial salvoes or salvoes. The rockets are flight stabilised by fins which are folded and protected by a cover for storage and handling.

CHARACTERISTICS:

Missile:

Calibre: 110 mm

Propulsion: Single-stage, solid-propellant rocket motor.

Warhead: Choice of high-explosive, incendiary or smoke.

Range: 15km. Minimum 6.5 km

Launcher:

Capacity: 36 rockets in two groups of 18 launch tubes mounted on a 6 × 6 wheeled prime mover.

Laying: Mechanical.

Traverse limits: +105°.

Elevation limits: 0-55°

Rate of fire: 36 rockets in 18 seconds.

Weights: Rocket 25 kg. Truck and launcher 13 t. System weight in battle order 15 t.

STATUS:

209 supplied to German Army.

MANUFACTURERS:

Wegmann, W. Germany. Rocket by Diehl-Werke under licence from Dynamit Nobel.

110 mm Artillery Rocket Launcher

INTERNATIONAL

2194.103

RS80 ARTILLERY ROCKET SYSTEM

DESCRIPTION:

Accompanying the trilateral FH 70 and SP 70 155 mm gun projects (**2195.103**) and (**2196.103**) is a British-German-Italian project for a multiple artillery rocket system.

Little has yet been said officially about this project, which appears to have originated in a British project code-named *Foil*, but it seems likely that it will use a fin-stabilised rocket with a calibre in excess of 150 mm and a range of 20-30 km.

STATUS:

Project definition – early development.

MANUFACTURERS:

Not definitely known – but it is believed that the German interest will be looked after by Messerschmitt-Bolkow-Blohm and that OTO Melara, CGE-Fiar and SNIA Viscosa will be Italian participants. British participation is not known.

ISRAEL

2593.103

WOLF BATTLEFIELD MISSILE

DESCRIPTION:

Little is known about this missile at the time of writing: although, apparently, it was used extensively by Israeli forces in the 1973 Arab-Israeli war, its existence was not revealed until some six months after the cease-fire.

It appears that the weapon, known as Ze'ev (Wolf) is a short-range ground-to-ground missile – or rather missiles, since there are two significantly different versions. One version has a 170 kg warhead and a range of only about 1,000 metres: the other carries a 70 kg warhead up to 4,500 metres: The missile, which is fired from a framework-type launcher, is said not to be very accurate but effective against large concentrations of men and vehicles.

STATUS:

Believed operational in Israel only.

ITALY

2044.103

154 mm ARTILLERY ROCKET SYSTEM BR 51 G3

DESCRIPTION:

This is a battlefield area weapon system which is being developed by Breda Meccanica. It involves a multi-tube launcher arrangement which is in some respects similar to the now numerous other artillery rocket systems; but which differs from many of them by being mounted on a tracked vehicle; and is believed to be unique in making provision for adjusting the range of its 158 mm rockets by means of an air brake.

CHARACTERISTICS:

Rocket calibre: 158 mm

Type: Fin-stabilised, unguided

Range: adjustable up to 24 km

Rocket weight: 123 kg

Warhead weight: 60 kg

Warhead types: pre-formed fragmentation, canister, anti-tank, incendiary

CEP: 0.75% of range

Rate of fire: 300 rounds/hr

STATUS:

Believed late development. Work on this project will certainly be relevant to the new RS 80 rocket project (**2194.103**).

2594.103

BORA ARTILLERY ROCKET

DESCRIPTION:

Bora is the name given by its makers to that of their family of artillery rockets which has the longest range. It is a substantial weapon which will normally be launched from a 3-round two-wheel trailer launcher (either singly or in salvo) and will carry a 20 kg warhead over a range in excess of 10 km. Like the other missiles of the family it uses a hypergolic fuel which is characterised by the difficulty that it presents to an enemy seeking to locate the launch point.

CHARACTERISTICS:

Type: ground-to-ground

Range: over 10 km

Cut-off speed: 390 m/sec

Take-off acceleration: 384 m/sec^2

Overall length: 4,700 mm

Body diameter: 194 mm

Fin span: 474 mm

Total take-off weight: 226 kg

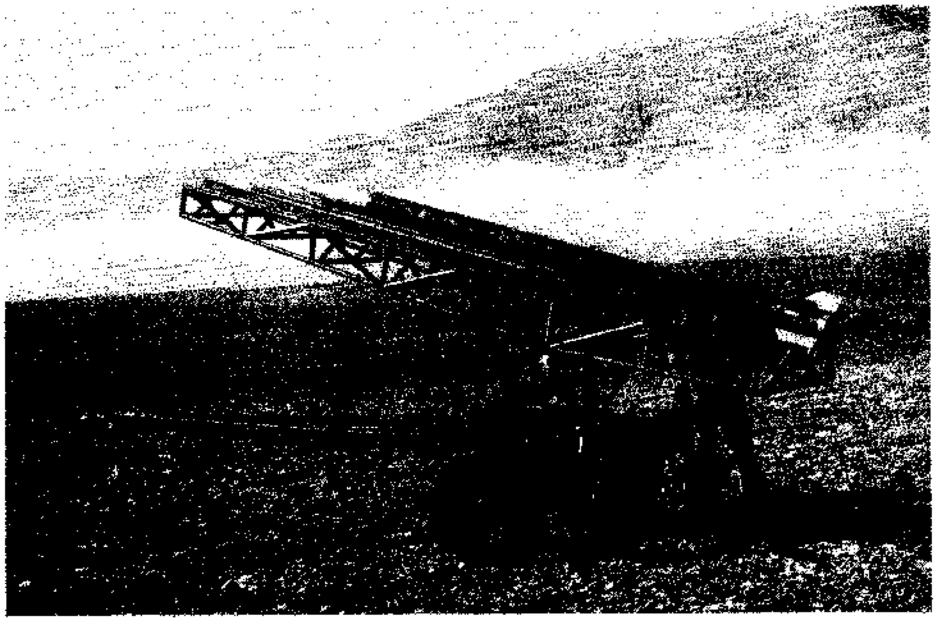
Warhead: 20 kg HE fragmentation semi-armour piercing

Fuse: Impact

Rocket engine: pre-packaged hypergolic self-pressurised liquid propellant unit

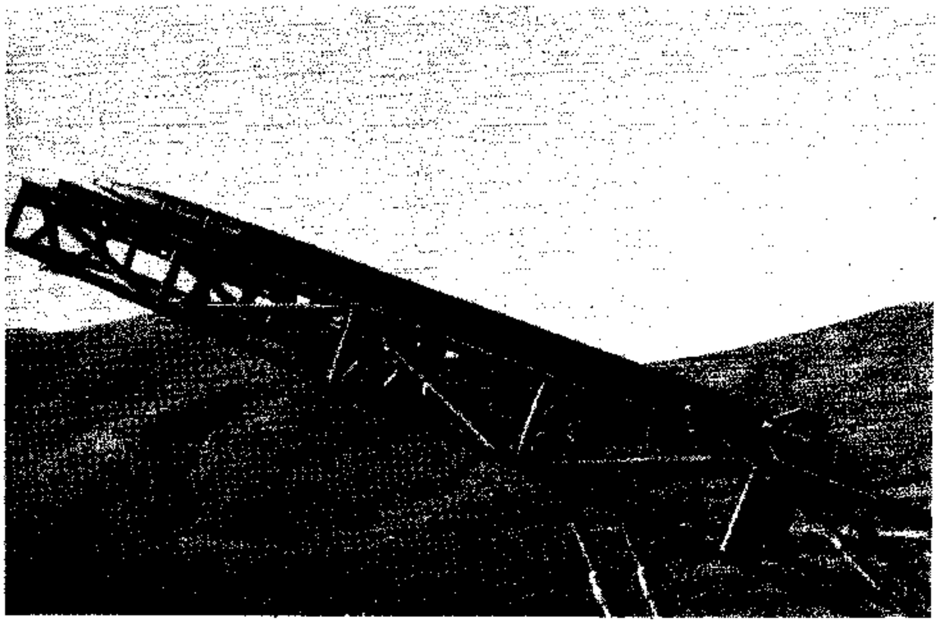
MANUFACTURER:

SAI-Ambrosini SpA, Passignano sub Transimeno Perugia, Italy.



Bora Rocket

2595.103
MIRA ARTILLERY ROCKET
DESCRIPTION:
Mira is the name given by its makers to an artillery rocket which is similar to Bora (**2594.103**) but smaller and having a shorter maximum range. It carries a 10 kg warhead over a distance of some 5 km. It can be fired either from a 12-round trailer launcher (singly or salvo) or from a man-pack single launcher.
CHARACTERISTICS:
Type: Ground-to-ground
Range: over 5 km
Max cut-off speed: 280 m/sec
Take-off acceleration: 338 m/sec^2
Overall length: 2,960 m
Body diameter: 108 mm
Fin span: 268 mm
Total take-off weight: 50 kg
Warhead: 10 kg. HE fragmentation semi-armour piercing
Fuse: impact
Rocket engine: pre-packaged hypergolic self-pressurised liquid propellant unit
MANUFACTURER:
SAI- Ambrosini SpA, Passignano sul Transimono, Perugia, Italy.

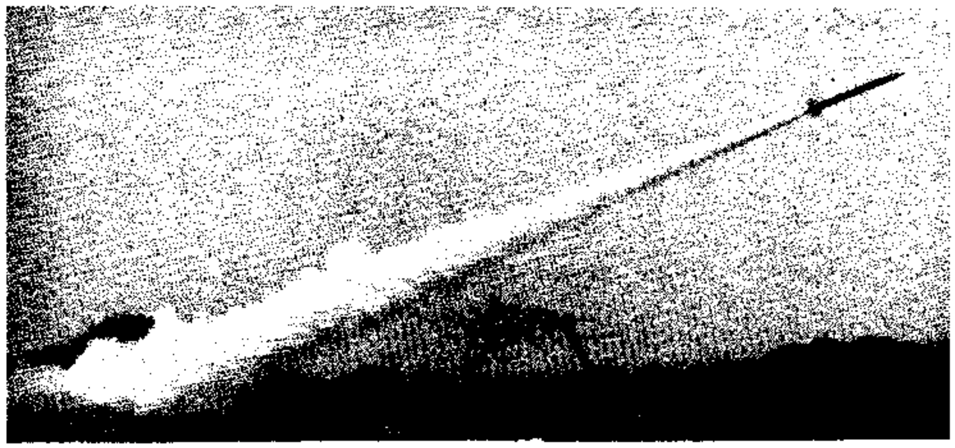


Mira Rocket

2152.103
ATTILA MK II ROCKET
DESCRIPTION:
This weapon is a successor to the now-obsolete Attila Mk I (**5553.103** 1973-74) and is a fin-stabilised 82.5 mm ground-to-ground rocket which can be launched either from a portable launcher – with which it forms a man-pack – or from a mobile 40-rail launcher-trailer from which a sequential salvo can be fired.

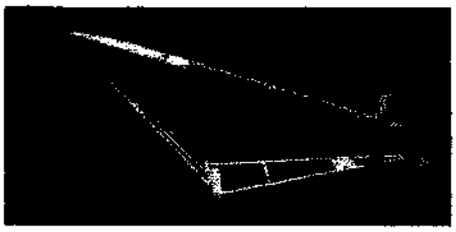
The rocket carries a 3 kg warhead which is normally of the AP fragmentation type and has a range in excess of 4.5 km. Propulsion is by a pre-packaged hypergolic self-pressurised liquid propellant unit, the exhaust trail of which has no flashback and cannot be picked up by conventional IR detectors.

CHARACTERISTICS:
Length: 1.4 m
Body Diameter: 82.5 mm
Fin-span: 225 mm
Launch Weight: 14 kg
Warhead Weight: 3 kg
Fuse: Impact
Propellant: See text
Max Cut-off Speed: 295 m/sec
Range: More than 4.5 km
STATUS:
Production.



Attila II launch

MANUFACTURERS:
Design: Centro Studi Trasporti Missilistici, Via Squarcialupo 19/A 00162 Roma, Italy.
Production: SAI-Ambrosini SpA, Passignano sul Trasimeno (Perugia), Italy.

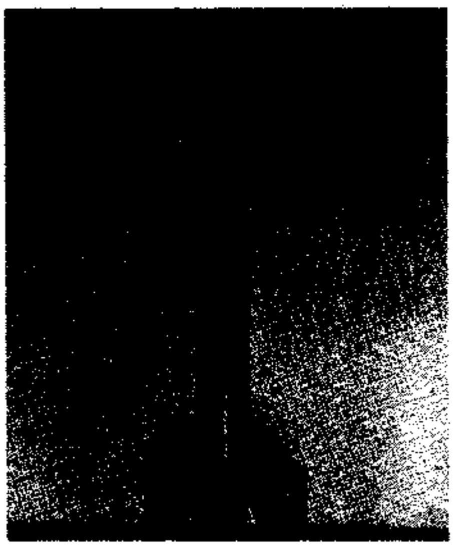


Attila II

5590.103
SAMURAI ARTILLERY ROCKET
DESCRIPTION:
This is a low cost artillery and air-to-ground rocket that is currently under development. The propulsion system is a self-pressurised liquid unit with a specific impulse of about 300 sec.

CHARACTERISTICS:
Dimensions: Overall length 1,200 mm. Calibre 76 mm, fin span 200 mm.
Weights: Total launch weight 10.6 kg. Warhead weight 3.0 kg.
Performance: Maximum speed 1,100 m/sec. Maximum range 18 km. Total impulse 1,000 kg/sec.

MANUFACTURER:
Centro Studi Trasporti Missilistici, Via Squarcialupo 19/A 00162 Rome, Italy.



Samurai Rocket

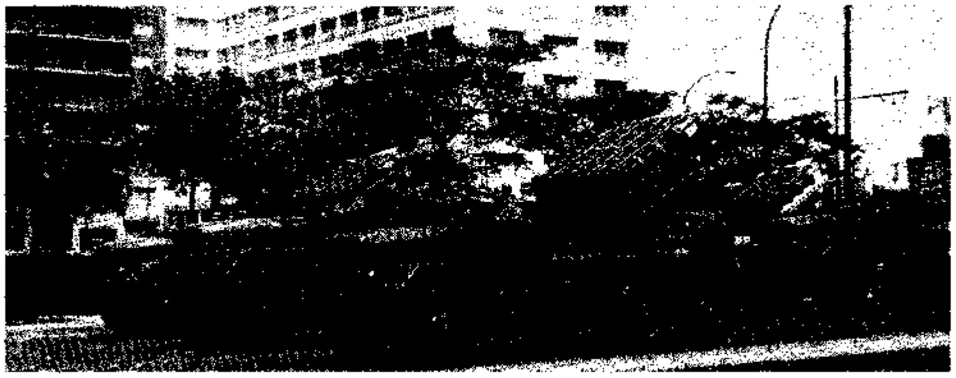
JAPAN

2255.103
ARTILLERY ROCKETS
DESCRIPTION:
A range of surface-to-surface solid-propellant unguided rockets has been made in Japan over many years. Formerly undertaken by the Prince Motor Car Engineering Co. Ltd, the development and production of these rockets is now part of the activities of the Nissan Motor Co Ltd, with whom Prince merged in 1966. The Prince Space and Aeronautical Department (itself derived from the pre-World War II Nakajima Aircraft Company) is now a department of Nissan.
Largest of the series of rockets is the "30-rocket" a 300 mm unguided missile that can be launched from a mobile (prime mover) twin launcher. It has a range of 25 km.
MANUFACTURER:
Space and Aeronautical Department, Nissan Motor Co Ltd, 5-1 3-chome, Momoi, Suginami-ku, Tokyo.

Japanese Type 30 rockets

SPAIN

2033.103
SPANISH ARTILLERY ROCKETS
DESCRIPTION:
Three types of artillery rocket and launcher have been developed in Spain. It is interesting to note that whereas most Western European nations have developed or are developing rockets of less than 150 mm calibre, two of the Spanish weapons are significantly larger than this.



D-3 rocket launchers

CHARACTERISTICS:

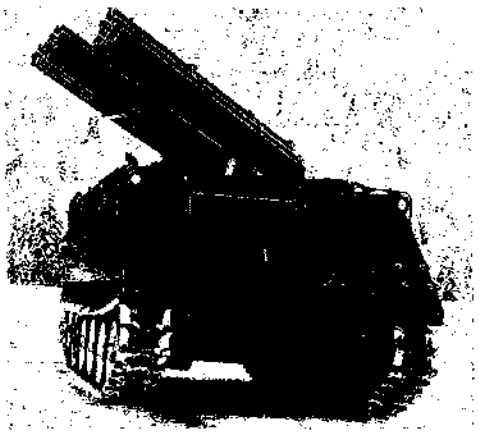
Type:	**R-2B**	**E-3**	**D-3**
Calibre:	108 mm	216 mm	300 mm
Weight:	16.4 kg	101.1 kg	247.5 kg
Range:	7.5 km	14.5 km	17.0 km
Rockets in launcher:	18	21	10

STATUS:
In service with Spanish forces.

SWITZERLAND

2386.103
DIRA 8 cm ROCKETS
DESCRIPTION:
DIRA is an unguided spin-stabilised and fin-stabilised rocket which can be used for a variety of military purposes. It can be used with the Oerlikon multiple rocket launcher or in various other field and naval applications but it is also suitable for use as an airborne rocket.

CHARACTERISTICS:
Calibre: 81 mm
Length: (rocket) 1.3 m
Weight: complete rocket: 16 kg. Warhead: 7 kg
Max velocity: 490 m/sec
Max range: 8.7 km
MANUFACTURER:
Machine Tool Works, Oerlikon Bührle Ltd, Birchstrasse 155, Zürich, Switzerland.



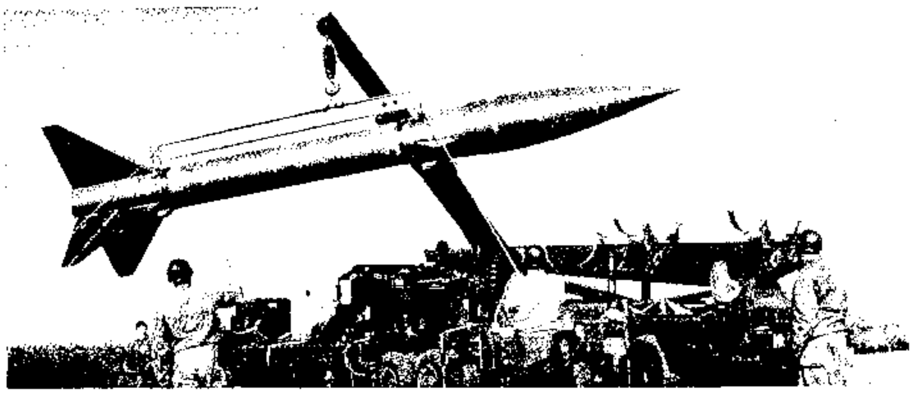
Oerlikon 8 cm DIRA rocket launcher

UNITED STATES OF AMERICA

2652.103
HONEST JOHN BATTLEFIELD SUPPORT MISSILE
DESCRIPTION:
Honest John is a simple surface-to-surface free-flight rocket that has the accuracy of standard artillery and considerably better battlefield mobility. Operational for several years with the US and NATO forces the system has undergone substantial improvement. The unguided rocket is driven by a single-stage solid propellant motor and can carry either a nuclear or a high-explosive warhead.
Designed to fire like conventional artillery in battlefield areas, Honest John is now the oldest missile system still fielded by the US Department

of Defense. Studies were begun by US Army Ordnance in 1950, and shortly after that Douglas Aircraft (now McDonnell Douglas) submitted proposals based on the Ordnance specifications and became prime contractor for the system. Firing tests were successfully completed in 1951 at White Sands, New Mexico.

The resultant system comprises a simple rocket and a highly mobile self-propelled launcher. Operation is simple – there are no electrical controls – and normal crew training and standard fire control techniques are employed.



Honest John being swung on to its launcher

CHARACTERISTICS:
Military Designation: MGR-1B
Type: Mobile surface-to-surface unguided tactical missile
Propulsion: Single-stage solid-propellant rocket motor
Warhead: Nuclear or high-explosive
Length: 7.5 metres
Diameter: 76 cm
Launch Weight: 2,040 kg
Range: 7.5 to 37 km

STATUS:
Honest John has been in service with the armed forces of Belgium, Denmark, the Federal German Republic, France, Greece, the Netherlands, South Korea, Turkey, the United Kingdom and the USA. Production ceased some time ago; and the missile is being replaced, in US Army service by Lance (**2682.111**); replacement is expected to be complete in 1975. Many other NATO nations are expected to replace Honest John by Lance in due course.

5585.103
ARTILLERY ROCKETS

DESCRIPTION:
Multiple rocket launchers in the US Army appear not to be intended primarily for barrage purposes as they are in some other armies: instead it seems that their primary purpose is envisaged as part of a chemical warfare operation. Be that as it may, there are two such launchers currently in US Army service, the M-21, 114 mm 24 barrel launcher and the M-91 115 mm 45-rocket launcher. Both are trailer-mounted.

CHARACTERISTICS:

	M-21	M-91
Calibre	114 mm	115 mm
Number of rockets	24	45
Weight of each rocket	18-19 kg	25.9 kg
Total weight (less rockets)	694 kg	544 kg
Range	5-8 km	11.3 km

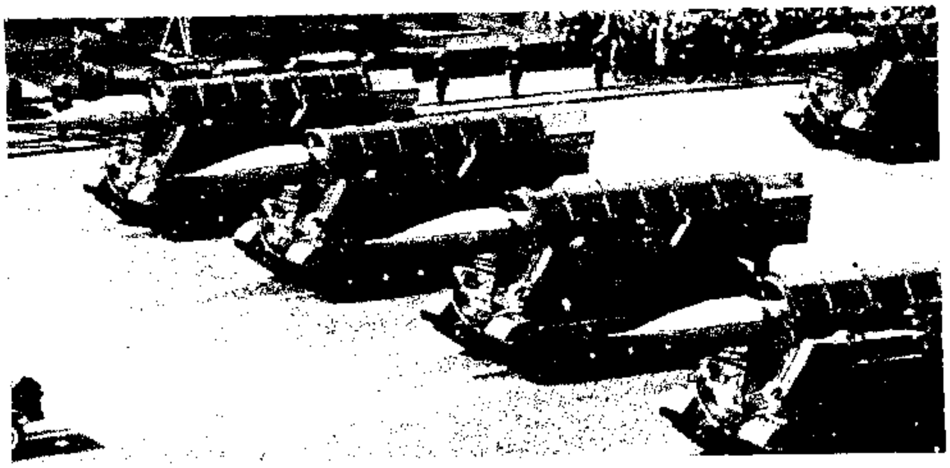
THE UNION OF SOVIET SOCIALIST REPUBLICS

2920.103
FROG 1 BATTLEFIELD SUPPORT MISSILE

DESCRIPTION:
The series of unguided tactical missiles known by the NATO code name Frog and numbered from 1 to 5 is generally of a type similar to the US Honest John missile. References to these missiles in Warsaw Pact literature suggest that the Russian name for at least some of them is Luna.

Frog 1 is a spin-stabilised missile carried on a tracked vehicle based on the JS III amphibious reconnaissance AFV with enclosed accommodation for the crew. The missile is covered by a heavy ribbed casing which elevates with it to form a launch-tube. This container also incorporates a heating unit to prime the solid propellant.

CHARACTERISTICS:
Type: Surface-to-surface spin-stabilised unguided tactical missile
Propulsion: One solid-propellant sustainer
Warhead: Nuclear or high-explosive
Length: About 10 metres
Diameter: About 85 cm
Launch Weight: About 3,000 kg
Range: Estimates vary from 25-65 km



FROG 1 Battlefield Support Missile in 1966 Parade in Moscow (Novosti)

STATUS:
Frog 1 first appeared around 1957 and is certainly obsolescent. Since the Russians seem rarely to discard anything that works, however, these may well be still in service – though almost certainly only in the USSR.

2921.103
FROG 2 BATTLEFIELD SUPPORT MISSILE

DESCRIPTION:
Similar in general conception to Frog 1 the unguided spin-stabilised missiles known by the NATO code names Frog 2, 3, 4 and 5 are all carried on tracked vehicle launchers derived from the PT 76 amphibious reconnaissance tank. Frog 2 differs from Frog 3, 4 and 5 in being powered by a single-stage motor whereas the others have two stages in tandem.

FROG 2 Battlefield Support missile in Moscow Parade (Novosti)

CHARACTERISTICS:
Type: Surface-to-surface spin-stabilised unguided tactical missile
Propulsion: One solid-propellant sustainer
Warhead: Nuclear or high-explosive
Missile Length: About 9 metres
Diameter: About 60 cm
Launch Weight: About 2,400 kg
Range: About 25 km
STATUS:
Frog 2 is of much the same age as Frog 1 and is probably also obsolescent and in limited service.

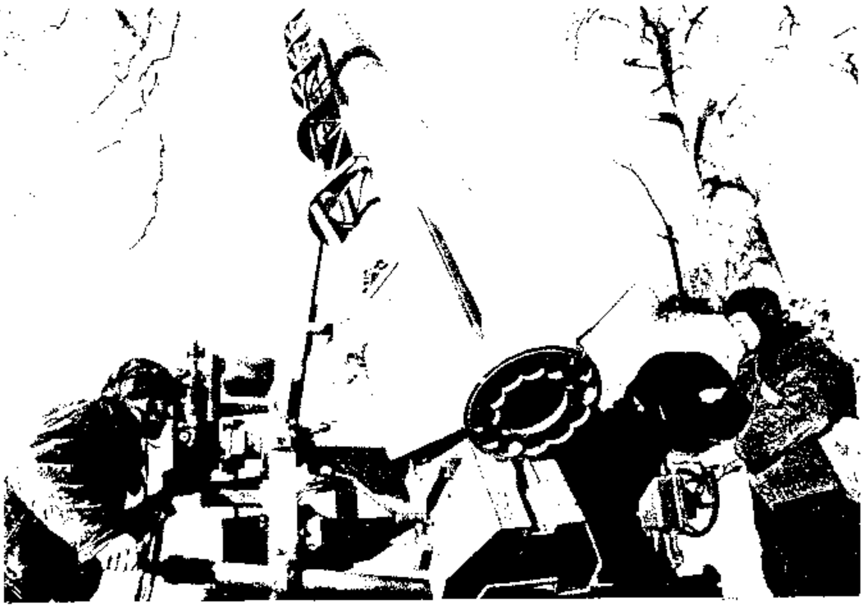
2922.103
FROG 3 BATTLEFIELD SUPPORT MISSILE
DESCRIPTION:
The main difference between this missile and Frog 2 is that it has two rocket stages in tandem giving it a greater range. Like Frog 2 it is mounted on the PT-76 derived armoured vehicle which is lighter than the massive Frog 1 vehicle (about 15 tonnes aginst about 36) and much more mobile – the vehicle has a range of about 235 km and a maximum road speed of about 35 km/hr.
CHARACTERISTICS:
Type: Surface-to-surface spin-stabilised unguided tactical missile
Propulsion: Two-stage solid-propellant motor
Warhead: Nuclear or high-explosive, 250 kg
Missile Length: 10.5 metres
Diameter: About 55 cm
Launch Weight: About 2,000 kg
Range: About 40 km
STATUS
Although of more recent date (about 1960) than Frogs 1 and 2, Frog 3 is also almost certainly obsolescent.

FROG 3 Battlefield Support missile on tactical exercise (Novosti)

2923.103
FROG 4 BATTLEFIELD SUPPORT MISSILE
DESCRIPTION:
Substantially similar to Frog 3, the most obvious difference of this missile from its predecessor is in the shape of the warhead which has the same diameter as the body of the missile but is otherwise similar in appearance to that of Frog 3.
CHARACTERISTICS:
Type: Surface-to-surface spin-stabilised unguided tactical missile
Propulsion: Solid-propellant sustainer and booster in tandem
Warhead: Nuclear or high-explosive
Missile Length: 10.2 metres
Diameter: About 40 cm
Launch Weight: About 2,000 kg
Range: 50 km
STATUS:
Believed operational in USSR.

2924.103
FROG 5 BATTLEFIELD SUPPORT MISSILE
DESCRIPTION:
The only known difference between this missile and Frog 4 is yet another change of shape of warhead, the nose cone of which is almost perfectly conical. Otherwise it is assumed to have much the same characteristics as its predecessor.
STATUS:
Operational in USSR and some other Warsaw Pact countries.

FROG 5 Missile (Tass)



FROG 5 unguided tactical missile on its launcher (Tass)

2926.103
FROG 7 BATTLEFIELD SUPPORT MISSILE
DESCRIPTION:

The introduction of Frog 7, first shown to the public in 1967, marked a new departure in carrying vehicles – the vehicle used being a modern, wheeled, erector launcher (ZIL-135). The missile, too, has a more modern look about it: reverting to the original single-stage design and having a cylindrical warhead of the same diameter as the missile. It has a much cleaner appearance than its predecessors.

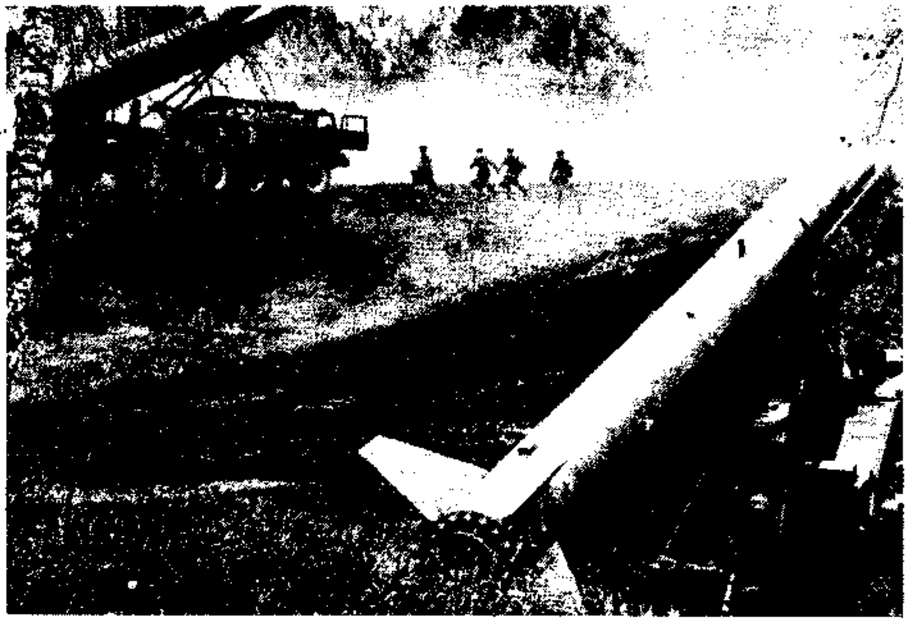
The main nozzle of the single-stage rocket motor is surrounded by a ring of much smaller nozzles.

CHARACTERISTICS:

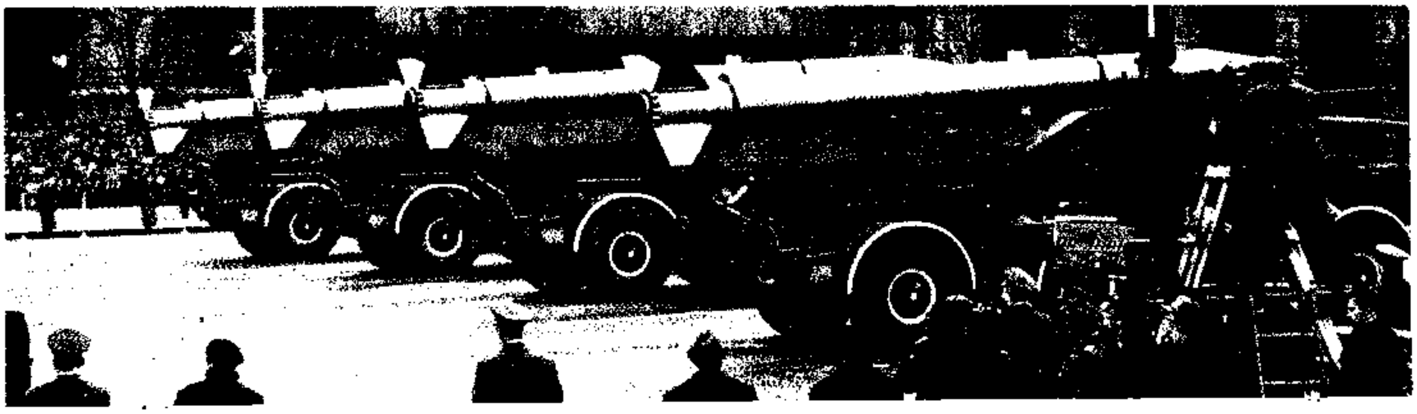
Type: Surface-to-surface, spin-stabilised unguided tactical missile
Propulsion: Single solid propellant motor
Warhead: Nuclear or high-explosive
Length: About 9 metres
Diameter: About 60 cm
Launch Weight: About 6.3 t
Range: About 60 km

STATUS:

Operational in the armies of several Warsaw Pact countries. Also supplied in quantity to the United Arab Republic. Some Frog 7 missiles, supplied by the Russians to Syria, were actually fired against the Israelis in the 1973 Arab-Israeli war. They were equipped with high-explosive warheads. It is not certain however whether they were this unguided version or a guided version (**2927.111**) of Frog 7. In any case they appear not to have been very effective as HE weapons.



FROG 7 missiles in launch position (Tass)



FROG 7 single-stage tactical missiles

5555.103
ARTILLERY ROCKETS
DESCRIPTION:

Artillery rockets have been a feature of Soviet Army operations for many years. They first became famous in 1941 when the Katyusha rockets went into action. Few details of the performance of the various types currently in service with the Soviet forces are available, but a selection of these weapons is illustrated here and the available information is tabulated below.

CHARACTERISTICS:

There are five basically different types of multiple rocket launcher in use in the Russian army. One of these (BM-14) has several different configurations and a second (BM-24) appears on two different vehicles.

Number and calibre of rockets:
BM-14, 8, 16 or 17—140 mm
BM-21 40—122 mm
BM-24 12—240 mm
BMD-20 4—200 mm
BMD-25 6—250 mm

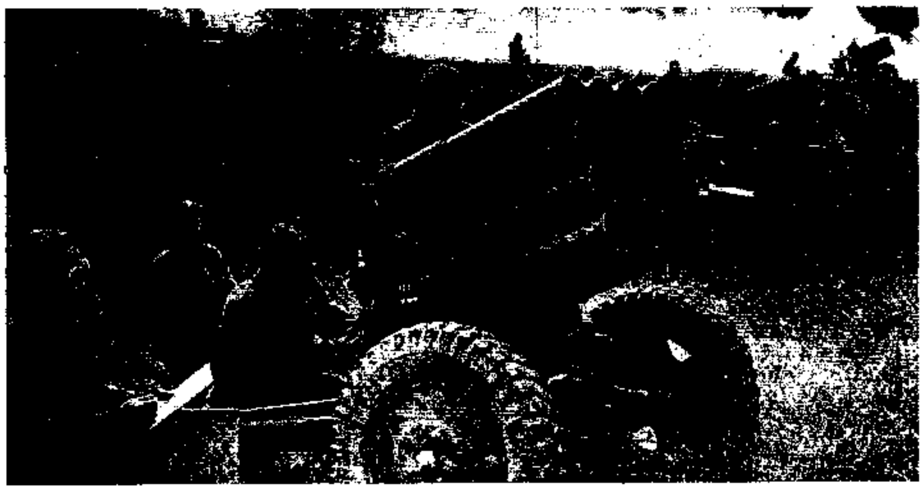
Rocket weight and range:
BM-14 41 kg—9 km (note A)
BM-21 46 kg—15 km
BM-24 113 kg—7 km
BMD-20 194 kg—18 km
BMD-25 450 kg—20 km

BMD-25 rockets in foreground BM-14/17 rockets can just be seen to the right of the picture

Total weight and associated vehicles:
BM-14 (8) 0.6t, GAZ-63 towing
BM-14 (16) 8.2t, SIL-151 mounted (note B)
BM-14 (16) M-1965 1.5t trailer
BM-14 (17) 4.5 t, GAZ-63 type; mounted
BM-21 11.5t, URAL-375
BM-24 9.6t, SIL-151 or 15t AT-5
BMD-20 8t, SIL-151
BMD-25 18.2t, JAAS-214

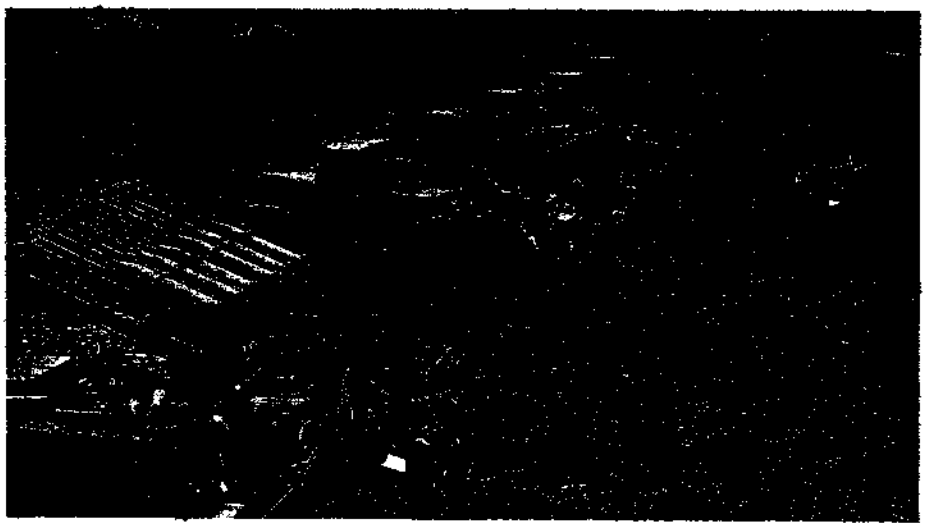
Note A
One source gives two different weights and ranges for BM-14 rockets. For the BM-14 (8) it gives a weight of 39.6 kg and a range of 10.5 km; for all other BM-14 variants it gives 37.1 kg and 9 km.

Note B
This is the earlier of the two BM-14 (16) arrangements. The rockets are arranged in two rows of eight and mounted on a turntable on the vehicle. The later, M-1965, version is a trailer-mounted arrangement in four rows of four launchers.



BM-14 M1965 Rocket Launcher (Novosti)

BM-21 rockets on URAL-375 truck (Tass)



BM-24 rockets on ZIL-151 / 157 truck (Novosti)

YUGOSLAVIA

2266.103
130 mm ROCKET LAUNCHER M-66
DESCRIPTION:
Based on the Czech RM-130 rocket launcher (**2024.103**) this artillery rocket system is made in Yugoslavia. It comprises a 32-tube launcher for 128 mm spin-stabilised rockets. The launcher is mounted on a two wheel trailer and the road wheels, together with the spread trails form the platform for the launcher when in operation. The launcher assembly can be elevated or depressed by handwheel: there is also a traverse handwheel, but the available traverse is limited to a few degrees for correction of aim – otherwise the launcher box would foul the road wheels. Firing is electrical.

CHARACTERISTICS:
Rocket: calibre: 128 mm
length: 80 cm
weight: 23 kg
Launcher: capacity 32 rockets
weight 2.5 t approx
Elevation: 0° to 48°
Traverse: 30°
System range: 9.6 km
Rate of fire: 160 rounds/min
Crew: 3-5

STATUS:
Service.

MANUFACTURER:
Yugoslav State Factories.

MORTARS
CHINA

2176.103
160 mm MORTAR TYPE 60
DESCRIPTION:
China is reported to have a 160 mm mortar in its inventory and it is believed that this, designated Type 60, is based on the M-1953 Russian weapon of the same calibre (**2931.103**). Available details regarding this weapon will be found in the USSR entry.

STATUS:
No definite information.

2175.103
120 mm MORTAR TYPE 53/55

DESCRIPTION:
Designation of the Chinese 120 mm mortar is uncertain: it has been referred to both as the Type 53 and as the Type 55. It is a copy of the Russian 120 mm M-1943 weapon (**5567.103**) which is in widespread service with Warsaw Pact countries and their clients. Available details are given in the USSR entry.

STATUS:
In service. Supplied to North Vietnam, Pakistan and Tanzania.

2174.103
90 mm MORTAR TYPE 97
DESCRIPTION:
Based on a pre-war (and now believed to be obsolete) Japanese mortar of the same designation, the Chinese Type 97 90 mm weapon is also similar in appearance to the US 81 mm M-1 mortar (**2570.103**).

Total weight of the Chinese weapon is 105 kg and it has a range of some 3.7 km.
STATUS:
In service. Has also been exported to Algeria.

2173.103
82 mm MORTAR TYPE 53
DESCRIPTION:
Based on the Russian M-1937 weapon of the same calibre (**5566.103**), the Type 53 82 mm mortar is a modified version built in China. No details of the modifications are known: available data on the basic weapon can be found among the USSR entries.

STATUS:
In service with Chinese forces. Exports to Cambodia, North Vietnam, Pakistan, Tanzania and Uganda.

FRANCE

2089.103
120 mm RIFLED MORTAR MO-120-RT-61
DESCRIPTION:
This Thomson-Brandt 120 mm rifled mortar weighs about 570 kg and is designed to fire two types of 120 mm calibre pre-rifled bomb. The PR.14 bomb is comparable with the standard 105 mm artillery shell in accuracy and lethality. It weighs 15.7 kg and has a maximum range of 8,350 metres. The PRPA (Projectile Rayé à Propulsion Additionelle) weighs about 15.6 kg and has a maximum range of 13,020 metres resulting from additional rocket propulsion initiated during flight. PR 14 bombs are available in smoke and coloured HE versions as well as in HE; for illumination the Preclair round can be used with a range of 8,000 m. It has a burning time of 40 secs and produces 1.6 million candles. The mortar will also fire standard fin-stabilised bombs—M44, PEPA or PEPA LP—but a range conversion table must be used because these bombs are calibrated for a different barrel length. The mortar is fired from its wheels, stability being provided by the base plate. Time into action is 2 minutes.

The barrel is 1.75 metres long and is rifled with 40 grooves with a uniform twist of 10.5 degrees. The breech piece is screwed on and has a spherical boss with one flat which is inserted and locked into the rocket on the base plate. The firing mechanism is completely watertight. There is a muzzle towing attachment which can be screwed on the barrel and serves as a muzzle cap when the weapon is not in use.

Traversing and cross-levelling mechanisms are similar to those of the standard AM50 mortar: the elevation gear, however, is different. Rough elevation is obtained by varying the position of the cradle axis relative to that of the wheels by means of a worm drive. Fine adjustment is obtained by varying the position of the cradle collar on the barrel—which is externally threaded for this purpose.

CHARACTERISTICS:
Barrel:
Length (including breech): 208 cm
Weight: 105 kg
Weight of towing ring: 16 kg
Mount:
Weight: 257 kg
Field of fire in mid position: 250 mils
Elevation limits: 30° to 85°
Base plate:
Weight: 192 kg
Weight of clamping collar: 4 kg
General:
Overall length: 301.5 cm
Overall width: 193.0 cm
All-up weight: 574 kg

Thomson-Brandt 120 mm Rifled Mortar

Firing method: Manual or automatic
Normal rate of fire: 6 rounds/min
Maximum rate of fire: 10 rounds/min
Time into action: 3 minutes

STATUS:
Mass production.

MANUFACTURER:
Compagnie Francaise Thomson Houston Hotchkiss Brandt, 52, avenue des Champs Elysées, 75-Paris 8e, France.

2087.103
120 mm HEAVY MORTAR MO-120 AM 50
Designed for use by ground forces in all kinds of operational conditions, this weapon can be fired either from its own road wheels or from a bipod. Standard bombs used are the PEPA/LP long-range finned bomb, the M44 explosive bomb and the Mk 62 smoke and illuminating bombs.

CHARACTERISTICS:
Barrel:
Length (including breech): 164.7 cm
Weight (with breech and towing ring): 76 kg
Mount:
Weight: 86 kg
Field of fire in mid-position: 300 mils
Elevation limits: 45° to 80°
Base Plate:
Weight: 80 kg
Weight of collar: 8kg
Undercarriage:
Weight (with wheels): 137 kg
Weight of pospective casing: 17 kg
General:
All-up weight: 402 kg
Weight without undercarriage: 242 kg
Firing method: Manual or automatic
Normal rate of fire: 8 rounds/min
Maximum rate of fire: 12 rounds/min

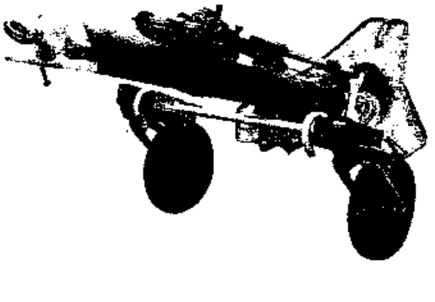
STATUS:
In service in the French Army.

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.

2086.103
120 mm MORTAR-MO-120-M-65
This weapon has been designed to incorporate as much as possible of the performance of the AM 50 heavy mortar (**2087.103**) while retaining much of the lightness and mobility of the M60 light mortar (**2088.103**). Like the latter it is fired from a bipod, the breech of the mortar being clamped to a light (36 kg) base plate.

Normally transported by towing on a removable two-wheeled undercarriage, the mortar can also be carried by soldiers – the total weight of the weapon (144 kg) being distributed in three loads of similar weight.

Ammunition that can be used includes the long-range PEPA/LP bomb up to charge 6, the HE bomb M44/60 also up to charge 6 and the Mk 62 illuminating which produces one million candlepower with a burning time of a minute.
CHARACTERISTICS:
Barrel:
Length (including breech): 164 cm
Weight: 44 kg
Mount:
Weight: 24 kg
Field of fire in mid-position: 300 mils
Elevation limits: 40° to 85°
Base Plate:
Weight: 36 kg
Undercarriage and Towing Ring:
Weight: 40 kg
General:
All-up weight: 144 kg
Weight in firing position: 104 kg



120 mm Mortar M-65

Firing method: Manual or automatic
Normal rate of fire: 8 rounds/min
Maximum rate of fire: 12 rounds/min
Maximum range: PEPA/LP HE: 8,370 m
M.44/66: 6,150 m
Mk 62: 4,900 m

STATUS:
Mass production.

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.

2088.103
120 mm LIGHT MORTAR (MO-120 M60)

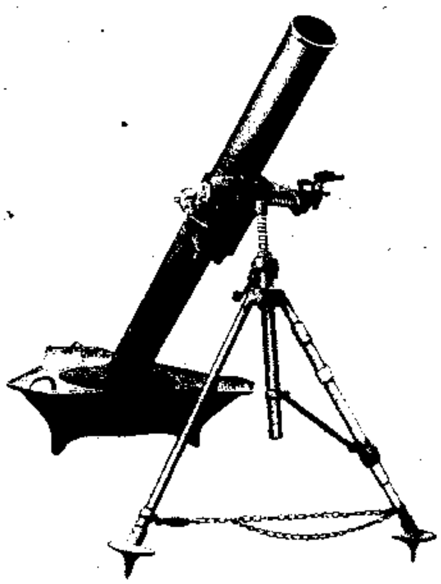
The lightest in the Thomson Houston-Hotchkiss Brandt family of 120 mm mortars the M60 has a total weight, in its minimum configuration, of only 92 kg – which can be divided into three loads for easy transport.

Inevitably, this weight reduction has meant the elimination of most refinements and there is a range penalty in that bombs can be used only up to charge 4 – whereas the M65 (**2086.103**) can use up to charge 6 and the AM50 (**2087.103**) up to full charge. Nevertheless the weapon has valuable fire power for highly mobile forces.

CHARACTERISTICS:
Barrel:
Length (including breech): 163.2 cm
Weight: 34 kg
Bipod and Base Plate:
Weight of bipod: 25 kg
Weight of base plate: 33 kg
Elevation limits: 40° to 80°
General:
All-up weight: 92 kg
Normal rate of fire: 8 rounds/min for 3 mins
Maximum rate of fire: 15 rounds in one minute

STATUS:
In mass production and in service with the French Army.

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.



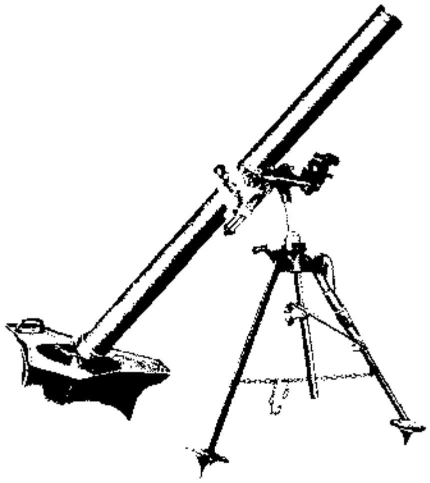
120 mm Mortar M-60

5559.103
81 mm LIGHT MORTAR MO-81-61

DESCRIPTION:
This mortar has been designed to support dismounted, carried or parachuted infantry in all battle conditions. It is light, easy to use and accurate and can be brought into action quickly.

Two alternative barrel lengths are available, the long-barrelled and short-barrelled versions being designated MO-81-61L and MO-81-61C respectively. Each consists of a barrel, bipod mount and base-plate and each of these makes a reasonable load for one man.

High explosive, smoke, illuminating and practice bombs can be fired from either weapon. M57D ammunition can be fired from either – giving a maximum range of 4,100 metres for high-explosive – or MK61 ammunition from the long-barrel mortar. Maximum range for the larger ammunition is 5,000 metres with high explosive.



81 mm Light Mortar M-61

CHARACTERISTICS:	MO-81-61C	MO-81-61L
Calibre	81 mm	81 mm
Barrel length	1.15 m	1.45 m
Barrel weight	12.4 kg	14.5 kg
Base plate weight	14.8 kg	14.8 kg
Mount weight (excluding sight)	12.2 kg	12.2 kg
Azimuth laying	Unrestricted	Unrestricted
Minimum Elevation:	30°	30°
Maximum Elevation	85°	85°
Rate of fire	15 rounds/min	15 rounds/min
Standard ammunition	M57D	MK61
Weight of H.E. round	3.3 kg	4.325 kg
Minimum range	120 m	75 m
Maximum range	4,100 m	5,000 m
Illuminating ammunition	Mk 62	Mk 68
Maximum range	2,300 m	4,100 m
Burning time	More than 35 sec	More than 40 sec
Candle Power	More than 250,000	More than 400,000

STATUS:
In production. MO-81-61C is in service with the French Army using M57D ammunition

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.

5560.103
60 mm LIGHT MORTAR (MO-60-63)

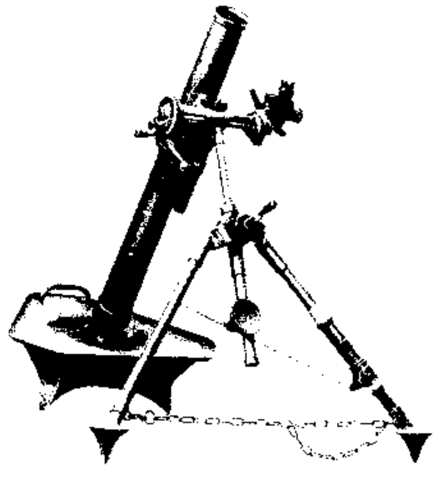
DESCRIPTION:
A portable mortar of conventional pattern, this weapon has been designed for infantry use in mobile operations. With an all-up weight of less than 15 kg the complete mortar can readily be carried by one man. An eight-round pack makes a similar load.

Barrel length is 724 mm (including breech) and it weighs 3.8 kg. The base plate weighs 6.0 kg and the bipod 5.0 kg. The base plate design permits firing on all azimuths and the adjustment with bipod erected gives a traverse of 300 mils. Elevation limits are 40° and 85°.

Ammunition suitable for the mortar include the old Brandt and US 60 mm bombs. The 60 mm MK61 bombs, however, provide a full range of possibilities; with these, ranges from below 50 to 2,000 metres can be achieved with high-explosive bombs. The H.E. round weighs 1.73 kg. The Mk 63 illuminating bomb can also be used: this has a range of 1,750 m and will produce in excess of 180,000 candles for more than 30 seconds.

STATUS:
Both the mortar and the MK61 ammunition are in production.

MANUFACTURER:
Thomson Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.

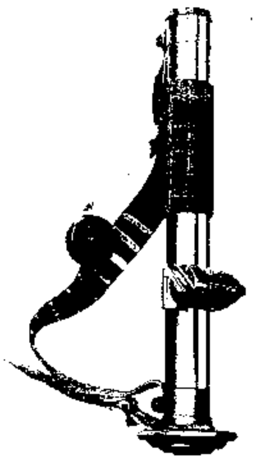


60 mm Mortar M-63

5561.103
60 mm "COMMANDO" MORTARS
DESCRIPTION:

These two lightweight mortars have been designed for use by infantry on special operations where a short-range, highly portable weapon is required. Both weapons fire the same ammunition: the principal differences between them are in weight and in the fact that the lighter weapon has a fixed firing pin whereas firing from the other can be controlled. Each has a breech base plate and is supported by hand: a simple clinometer is provided.

Standard ammunition is the 60 mm MK61 but there is a restriction on the charge that can be used; normally this should not exceed charge 2 but as an exception charge 3 may be used.



Commando Mortar (Automatic)

Commando Mortar (Controlled)

STATUS:
Both mortars are in production.

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52 avenue des Champs Elysées, 75008-Paris, France.

CHARACTERISTICS:	Controlled firing	Automatic firing
Barrel length	650 mm	650 mm
Overall length	850 mm	680 mm
Total weight	10 kg	8.1 kg
Firing method	Breech control	Fixed pin
Range (charge 2)	1,050 m	1,050 m

2151.103
60 mm VEHICLE MORTAR (60-MC-A1)
DESCRIPTION:

Designed for installation on light combat vehicles or APCs, this weapon can be used either as a conventional mortar or in a direct-fire role.

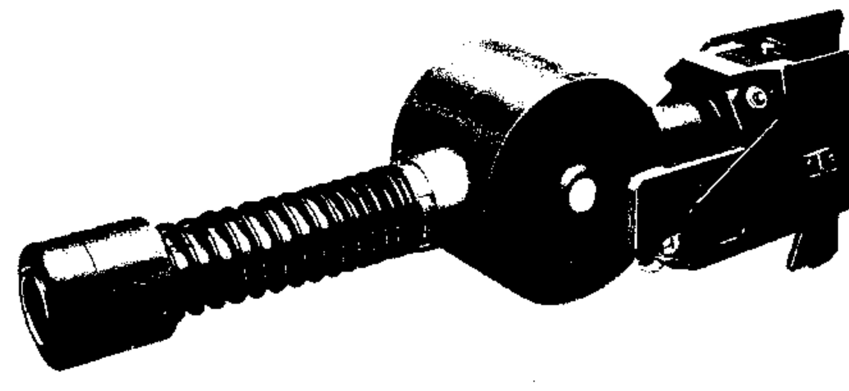
To enable it to be used in both these alternative roles and to be mounted on a wide variety of either soft or hard skinned vehicles, the mortar is arranged for both breech and muzzle loading and is equipped with a hydraulic recoil and recuperator mechanism which reduces the firing stress on the vehicle and makes for greater consistency in aiming.

Provision is made for the firing pin to be withdrawn so as to avoid premature firing when breech loading is used; alternatively the pin can be fixed forward for rapid gravity firing in the mortar role. The firing mechanism can be operated either manually or electrically and is provided with mechanical safety devices.

When used in the direct fire role, with the barrel at low elevation angle, the bomb is held against the firing pin bush by two spring-loaded retaining pins which engage in recesses in the tail fins. These are withdrawn on firing.

The recoil system comprises a piston working in an oil-filled cylinder as the main energy absorber. A spring which is compressed on recoil helps to absorb energy and provides the recuperation force required to move the barrel forwards again.

The mortar fires the same Mk 61 ammunition as is fired by the 60 mm standard and commando mortars (**5560.103** and **5561.103**). It can also fire the special Mk 72 series of bombs which have longer ranges. These bombs are similar to the Mk 61 series but are fitted with a plastic obturating ring around the rear of the ribbed guide band. This ring reduces windage and leads to a higher and more consistent muzzle velocity. At maximum charge the maximum range with the Mk 72 bomb is 2,590 m compared with 2,050 m for the Mk 61.



60 mm Vehicle Mortar

CHARACTERISTICS:
Overall length: 1,210 m
Shot travel length: 0.905 m
Total weight: 50 kg
Recoiling mass: 42 kg
Recoil length within vehicle: 135 mm
Maximum recoil thrust: 2.0 kg
Minimum range: 100 m
Maximum range: Mk 61 bomb: 2,050 m
Mk 73 bomb: 2,590 m

STATUS:
In service in several countries.

MANUFACTURER:
Thomson-Brandt, Branche Armement & Mécanique Générale, 52, avenue des Champs Elysées, 75008-Paris, France.

5562.103
60 mm CS MORTAR TYPE 1969
DESCRIPTION:

This mortar is a breech-loading weapon designed for mounting in the turrets of an armoured vehicle. It fires the same ammunition as the other French 60 mm mortars. All-up weight is 18 kg, overall length 1,325 mm and maximum range 1,600 m.

The weapon is loaded by opening the breech and withdrawing the breech block along a guide to the rear of the weapon. In so doing a receptacle for the bomb is withdrawn and when this clears the breech, the bomb can be inserted. Breech block and bomb are then slid home and the breech locked. An interlock between the breech lock and the trigger prevents the weapon from being fired with the breech unlocked. When thus inserted, the bomb is prevented from moving along the barrel and away from the firing pin by a retaining device which releases the bomb after firing when the pressure in the breech chamber reaches a predetermined level. Firing is electrical and a second interlock prevents a second firing if the trigger plunger has not returned to its normal rest position after firing. Double loading is prevented by arranging that if the breech is opened with an undischarged round in position the round is withdrawn with the breech block and must be removed before another round can be inserted. In addition, of course, there is a safety catch on the trigger.

In other respects the weapon behaves in a manner similar to that of a standard smooth-bore mortar except that provision is made for varying the range of the weapon without altering the charge or the elevation setting. This is achieved by venting a variable fraction of the propellant gases to the outside air, thus reducing the energy transferred to the bomb. This venting is controlled by a 40-position control.

STATUS:
Prototype

MANUFACTURER:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211 Saint Cloud, France.

ISRAEL

2318.103
160 mm TAMPELLA MORTAR

DESCRIPTION:

The 160 mm Tampella mortar has a smooth-bore, close-tolerance barrel and fires fin-stabilised bombs. For transport purposes it breaks down into two main units – carriage and base plate – and the weapon is normally towed by a standard army vehicle. In firing position the travelling wheels are turned inwards – their tangent position permitting the mortar to be traversed around on a full 360° arc – quickly by using the wheels or more slowly by the traversing mechanism which is situated on the left hand travelling wheel.

The carriage incorporates the barrel with breech piece, recoil-buffer, elevating and divergence correcting mechanism, and the slow-motion traversing gear. The spring loaded striker is actuated by pulling a lanyard attached to the firing lever. A folding elevation gear permits the barrel to lower itself automatically, thus enabling fast and easy loading of the mortar. A counter-balance mechanism facilitates the raising of the barrel after loading the bomb. Israel uses large numbers of these weapons mounted on Sherman tank chassis.

CHARACTERISTICS:
Calibre: 160 mm
Barrel length: 2,850 mm
Range: 9,300 m
Accuracy: ¾ to 1 ¼% of range
Rate of fire: 5-8 rounds per minute
Total weight: 1,450 kg (travelling order without base plate)
1,700 kg in firing position
Weight of sight: 1.45 or 1.57 kg
Weight of base plate: 250 kg
Elevation limits: +43° to +70°
Traverse: 360°
Ammunition: HE bomb weighs 40 kg with fuze, of which 5 kg is TNT.
Propellant system is made up of a primary charge and a combination of up to 9 secondary charges.
Smoke Bombs (two types)
Practice bomb

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

2317.103
120 mm TAMPELLA MORTAR

DESCRIPTION:

The 120 mm Tampella mortar has a smooth barrel. Normally towed by a vehicle, for mountain and jungle warfare it may be dismounted into four main components – barrel, bipod, base plate and carriage, weighing approximately 90 kg each – and carried by pack mules. It may also be man-handled for short stretches, parachuted for airborne operations as well as being mounted on armoured vehicles. The baseplate is circular, designed for stability and strength and enables the mortar to be fired over an arc of 360° by moving the bipod only. It has a maximum elevation of +87° giving a high trajectory with steep angle of descent and allowing the mortar to engage targets effectively on reverse slopes or behind cover.

CHARACTERISTICS:
Calibre: 120 mm
Length travelling: 2.65 m
Width travelling: 1.53 m
Height travelling: 1.05 m
Height travelling: 1.05 m
Range: 6,500 m (maximum)
400 m (minimum)
Total weight: 346 kg all up, or 220 kg (firing position)
Barrel: 84 kg
Sight: 1.45 or 1.57 kg
Bipod: 66 kg
Baseplate: 72 kg
Carriage: 110 kg
Barrel length: 1.94 m
Elevation limits: +39° to +87°
Traverse: 240 mils
Ammunition: HE bomb weighs 12.6 kg (of which 2.25 kg is TNT). There is a primary charge and up to 9 secondary charges. Two types of smoke bomb. Practice bomb.

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

2316.103
120 mm LIGHT TAMPELLA MORTAR

DESCRIPTION:

The light 120 mm Tampella mortar consists of four main units, barrel with breech piece, base plate, bipod and sight. It can be transported on a two wheeled trailer, mounted in an armoured vehicle or carried in three man pack loads. An important feature of this weapon is the capability of firing the standard 120 mm Tampella ammunition with the same degree of accuracy.

CHARACTERISTICS:
Calibre: 120 mm
Barrel length: 1.73 m (including breech piece)
Range: 6,200 m (maximum)
300 m (minimum)
Total weight: 108.5 kg (firing position)
Barrel Weight: 38.6 kg
44 kg (with breech piece)
Sight: 1.57 kg
Bipod: 27.5 kg
Baseplate: 37 kg
Elevation limits: +45° to +70°
at 45° elevation 83 mils
at 70° elevation 130 mils
Weight of round: HE bomb weighs 12.6 kg (of which 2.30 kg is TNT)
Three types of smoke bomb (FM, PWP and WP)
Practice

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

2315.103
81 mm TAMPELLA MORTAR

DESCRIPTION:

The 81 mm Tampella mortar has a smooth-bore barrel and fires fin-stabilised bombs, with primary and secondary charges, from a stable base plate. The mortar breaks down to three one man loads of approximately 13 kg each, consisting of the barrel, bipod and base plate. Special carrying equipment is provided for this purpose. If required it can be mounted in an armoured fighting vehicle, for example a M-113 or a half-track.

CHARACTERISTICS:
Calibre: 81.4 mm
Barrel length: 1,455 mm (long barrel)
1,155 mm (short barrel)
Range: 4,660 m long barrel (maximum)
150 m long barrel (minimum)
3,980 m short barrel (maximum)
140 m short barrel (minimum)
Total weight: 40 kg (long barrel)
37 kg (short barrel)
Barrel weight: 14.5 kg (long barrel)
11.5 kg (short barrel)
Sight: 1.45 or 1.57 kg
Bipod: 12.3 kg
Baseplate: 13.2 kg
Elevation limits: +43° to +80°
Traverse: at 45° elevation 100 mils
Weight of round: 3.86 kg (HE bomb with fuse), primary charge and up to 7 secondary charges. Also Smoke (two types) and practice.

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

2313.103
81 mm TAMPELLA MORTAR TYPE C

DESCRIPTION:

This differs from the standard 81 mm mortar (**2315.103**) only in the barrel design. The barrel consists of two parts of approximately equal length joined by an overlapping interrupted thread, which ensures a tight fit and eliminates any possible gas escape. Total length of the barrel, as well as ballistic data, are identical with the standard 81 mm mortar. Total weight of the barrel is 17.5 kg compared with 15.5 kg of the standard model.

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

2314.103
60 mm TAMPELLA MORTAR

DESCRIPTION:

The Tampella 60 mm mortar is an extremely light, simple and mobile weapon, capable of producing a large volume of fire, quickly and accurately, on any target within its range.

It has been designed to be employed in all phases and types of land warfare on every type of terrain under weather conditions ranging from the tropics to the arctic. The mortar can be used with or without the bipod.

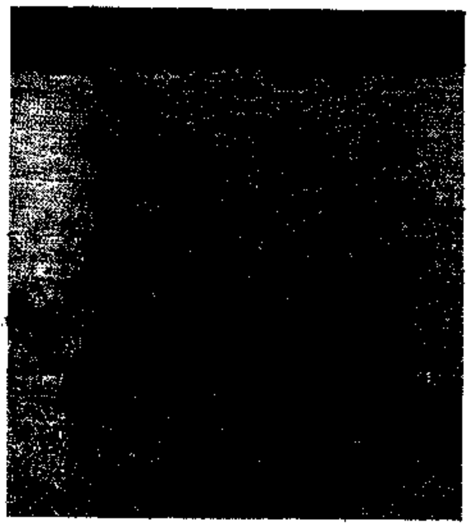
CHARACTERISTICS:
Calibre: 60.75 mm
Range: 2,555m (maximum)
150 m (minimum)
Total weight: 14.50 kg
Barrel and breech piece: 5.50 kg
Sight: 1.10 kg
Bipod: 4.50 kg
Baseplate: 3.40 kg
Barrel length: 740 mm
Elevation limits: +40° to +79°
Traverse: at 50° elevation 116 mils
at 70° elevation 137 mils
Weight of round: HE weight 1.54 kg (4 charges)
Smoke weight 1.54 kg

STATUS:
In service.

SUPPLIER:
Soltam Limited, Israel.

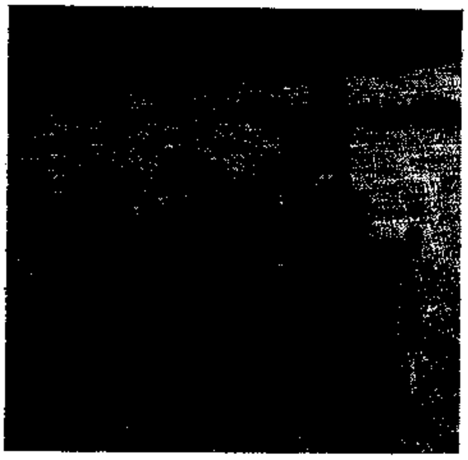
SPAIN

2600.103
120 mm MORTARS ECIA MODELS L & SL
DESCRIPTION:
These are conventional mortars which are normally carried on a two wheeled carriage and towed behind a vehicle, for example a Land Rover or M-113 APC. When required for action they can be quickly assembled.
CHARACTERISTICS:
Calibre: 120 mm
Barrel length: 1,600 mm (both models)
Range: SL 5,000m maximum with N bomb
5,940 m maximum with L bomb
L 6,660 m maximum with L bomb
5,700 maximum with N bomb
Weight travelling: SL: 257 kg
L: 316 kg
Weight firing: SL: 123 kg
L: 213 kg
Maximum rate of fire: 12 rounds per minute
Ammunition:
Round N: HE wt 16.745 kg, filling 3.175 kg TNT, effective damage radius 150 m
Round L: HE wt 13.195 kg, filling 2.34 kg of TNT, effective damage radius 150 m
Smoke and practice
STATUS:
In service
SUPPLIER:
Esperanza Y Cia, S A Marquina, Spain



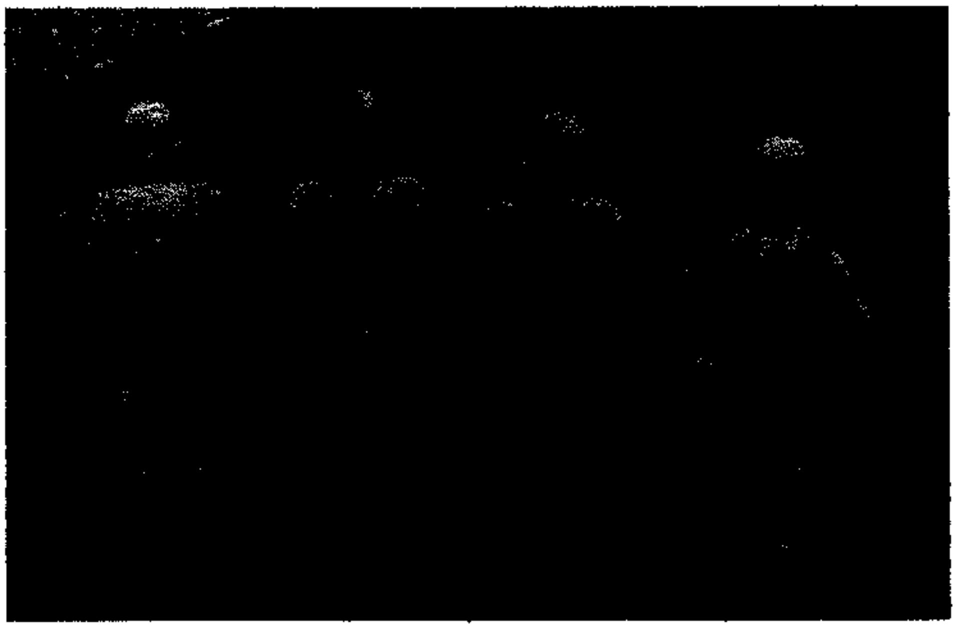
120 ECIA mortar Model SL

2599.103
105 mm MORTAR ECIA MODEL L
DESCRIPTION:
This mortar is mounted on a bipod and has a circular base plate. For transportation it breaks down and is carried on a two wheeled trailer; this trailer also carries 12 rounds of ready ammunition.
CHARACTERISTICS:
Calibre: 105 mm
Barrel length: 1,500 mm
Maximum range: 7,050 m
Weight in firing position: 105 kg
Weight of the carriage: 111 kg
Total weight travelling: 239 kg
Maximum rate of fire: 12 rounds per minute
Ammunition: HE round weighs 9.20 kg of which the TNT filling weighs 1.704 kg
Length of round = 546 mm
Diameter = 104.25 mm
Effective radius is 150 m
Smoke
Practice
STATUS:
In service.
SUPPLIER:
Esperanza Y Cia, S A Marquina, Spain.



105 mm ECIA mortar

2601.103
81 mm MORTARS MODELS ECIA L & L1
DESCRIPTION:
These mortars are unusual in that instead of having a bipod they are used with a tripod. If required they can be broken down to form three man pack loads – tripod, base plate and barrel. The Model L and L1 differ only in the lengths of their barrels.
CHARACTERISTICS:
Calibre: 81.35 mm
Barrel length: 1.15m or 1.45 m
Range: 4,500 m (1.45 barrel)
4,100 m (1.15 m barrel)
Weight in firing position: 45 kg (1.45 m barrel)
43 kg (1.15 m barrel)
Maximum rate of fire: 15 rounds per minute
Ammunition: Bomb N(HE)wt 4.13 kg, filling .675 kg effective damage radius 100 m Smoke and Practice
Bomb NA(HE)weight 3.20 kg, filling .496 kg, effective damage radius 100 m.
Illuminating
STATUS:
In service
SUPPLIER:
Esperanza Y Cia, S A Marquina, Spain.



81 mm ECIA mortar divided into man-pack loads

2602.103
60 mm MORTAR ECIA MODEL L
DESCRIPTION:
This is a small smooth-bore weapon which is carried in a man pack complete with accessories weighing less than 15 kg. It is fired from a tripod stand.
CHARACTERISTICS:
Calibre: 60 mm
Barrel length: 650 mm
Range: 2,100 m
Elevation: 49.5° to 89.5° (approx)
Weight in firing position: 11.46 kg including round
Complete man pack: 14.96 kg with accessories
Rate of fire: Normal 15 rounds/min. Maximum 30 rounds/min
Ammunition: HE weight 1.44 kg, filling 0.232 kg effective damage radius 50 m. Smoke, Practice.

STATUS:
In service.

MANUFACTURERS:
Esperanza Y Cia S A, Marquina, Spain.

SWITZERLAND

2392.103
120 mm HEAVY MORTAR Mw 41
DESCRIPTION:
This design has been in service for many years but still has an important role to play in the Swiss armoury. It is, of course, a heavy weapon and is not, as are some mortars of similar calibre, permanently trailer mounted, and therefore is somewhat unwieldy in use.
CHARACTERISTICS:
Calibre: 120 mm
Weight in firing order: 262 kg
Weight of bomb: about 13 kg
MV: 270 m/sec
Range: 5 km
Rate of fire: 10 rounds/min
STATUS:
In service with reconnaissance battalions and armoured regiments of the mechanised divisions. Formerly in service also with the artillery of the frontier divisions but now replaced by howitzers.

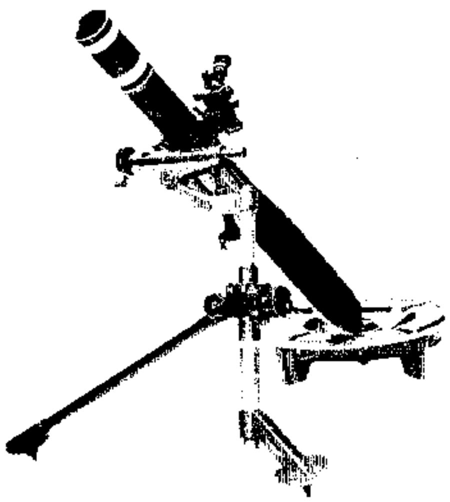
2391.103
81 mm MEDIUM MORTARS Mw 33 and Mw 72
DESCRIPTION:
In external appearance the Mw 33 mortar resembles the M-29 American weapon of the same calibre (**5564.103**). Quoted characteristics, however, are significantly different.
CHARACTERISTICS:
Calibre: 81 mm
Barrel length: 15 calibres
Elevation: 45°-75°
Weight in firing order: 62 kg
Weight of bomb: 3.25 kg
MV: 300 m/sec
Mobility: Mounted on two-wheel trailer for transport
STATUS:
Deployed in the heavy company of fusilier battalions

Mw 72 Mortar
For use initially by mountain troops but possibly by others later this weapon is understood to be similar to the Mw 33 but much lighter. No other details are available except that it was due to be introduced in 1972, and it is believed that it was

---

UNITED KINGDOM

5563.103
81 mm LIGHT MORTAR L1A1
DESCRIPTION:
Currently in service with the British Army and several others, this mortar is man-portable in three loads, the heaviest of which weighs 12.3 kg. It is normally fired from the ground, but a special mounting is available that allows it to be fired from the FV432 APC.
Developed as a replacement for the 3-inch mortar (**2485.103**) the L1A1 is strictly a joint British/Canadian project because the base plate and sight were designed in Canada.
CHARACTERISTICS:
Range: 4,500 m with standard charge or 5,600 m with special charge
Accuracy: 0.5% probable error in range 1½ miles in direction
Rate of fire: 15 rounds/min with standard ammunition. Slightly less with special charge
Total Weight: Excluding sight, 35.4 kg
Barrel: 127 cm, 12.3 kg
Bipod: 11.8 kg. Elevation range 45-85°. Traverse ∓ 100 mils at 45° elevation
Box plate: 11.4 kg. Diameter 558 mm
Sight unit: (C2) 1.25 kg or 5.22 kg including case and illuminating apparatus
STATUS:
In service in the UK and at least 10 other countries.
SUPPLIER:
Ministry of Defence Sales, St. Christopher House, Southwark St, London SE1, England.



81 mm mortar

2485.103
THREE-INCH MORTAR
DESCRIPTION:
No longer in British Army service but still in world-wide use, the 3-inch (76 mm nominal but 81 mm actual calibre) was developed before the Second World War but later marks were introduced during the war. An improved sight was introduced with the Mk IV and the Mk V was designed for jungle warfare.
It is a smooth-bore muzzle-loaded drop-fire weapon with a distinctive cross-levelling clamp and plate at the top of the bipod and a rectangular heavily-ribbed baseplate.
CHARACTERISTICS:
Calibre: 81 mm
Length of tube: 122 cm
Elevation: +45° to +80°
Traverse: 36°
Combat weight: 56.3 kg
MV: 192 m/s
Range: 2,560 m
Rate of fire: 10 rounds/min
Ammunition: HE, Smoke, Chemical
Crew: 3
STATUS:
In service in many countries – especially the Middle and Far East.

UNITED STATES OF AMERICA

5564.103
81 mm MORTAR M-29
DESCRIPTION:
Replacement for the 81 mm mortar M-1, which has a shorter barrel and correspondingly lower performance, this is the standard medium mortar of the US Army. Despite its better performance it weighs considerably less than the M-1.
Barrel length is 1.3 m, all-up weight 48.5 kg and maximum range at full charge nearly 4,000 metres. Elevation limits are from 40° to 85° and a traverse of 10° is possible without moving the bipod. A rate of fire of 25 rounds per minute can be achieved.
STATUS:
In production and in service with US and other NATO forces.

5565.103
107 mm MORTAR M-30
DESCRIPTION:
Formerly known as the 4.2-inch mortar, and known in Italy as the 106/7 mortar, this is the heaviest mortar in standard US service.
Barrel length is 152 cm (compared with 173 cm for the British 4.2-inch mortar) and the total weight is 290 kg. With full charge it has a maximum range of 5,490 metres. Elevation limits are from 45° to 85.8° and a traverse of 14° is possible

Russian troops with medium mortars (Novosti)

without altering the position of the front support. A rate of fire of 25 pounds per minute is possible.

The M-30 mortar is intended to be transported into action using a M-24 or similar vehicle.

STATUS:
In service with US and other NATO forces.

THE UNION OF SOVIET SOCIALIST REPUBLICS

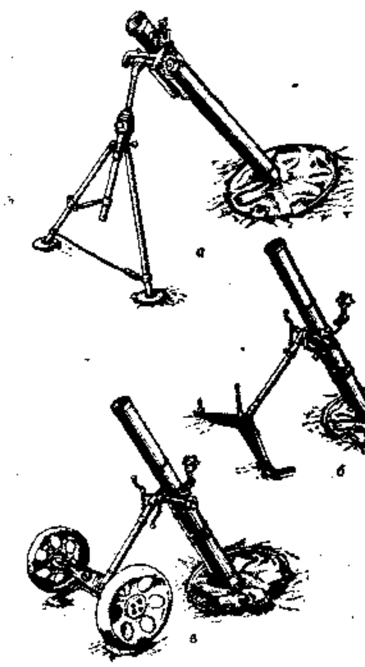
5566.103
82 mm MEDIUM MORTAR
DESCRIPTION:

Various marks of this mortar are in service with the Warsaw Pact countries, but the following data is typical:

Barrel length is 15 calibre (1.23 metre) and all-up weight 56 kg. Base plate mounting permits all-azimuth firing and a traverse mechanism on the bipod mount gives a lateral movement of 6 deg without moving the bipod. Elevation limits are from 45 deg to 85 deg. Firing its own ammunition, the mortar has a full-charge maximum range of approximately 3,000 metres and a firing rate of 25 rounds per minute can be achieved. The choice of 82 mm calibre means that the mortar can also fire 81 mm NATO ammunition.

For transport, the mortar can be broken down into three one-man loads, man-handled on a two-wheel carriage or carried on a vehicle.

STATUS:
In service with Warsaw Pact Forces. Scale of issue is 3 or 6 mortars per motorised infantry battalion.



82 mm mortars. Top – 1937 model. Centre – 1941 model. Bottom – 1943 model

5568.103
160 mm HEAVY MORTAR M-53 (& M-43)
DESCRIPTION:

Warsaw Pact forces are extensively armed with mortars and the 160 mm M-53 is one of the largest of their weapons. It is capable of firing either conventional ammunition or small atomic weapons. The older M-43 is still in service but it is smaller and probably not suitable for use with atomic ammunition.

The M-53 has a 28-calibre barrel (448 cm) and an all-up weight of 1,470 kg. It is mounted on a two-wheel trailer and is not demounted for firing so that it is not easy to traverse quickly. Hand-wheel adjustment on the trailer, however, gives a traverse of 6 deg. Elevation limits are from 45 deg to 85 deg. The weight of a conventional round is 40.8 kg and the maximum range at full charge is just over 8 km. A rate of fire of 3 rounds per minute can be achieved.

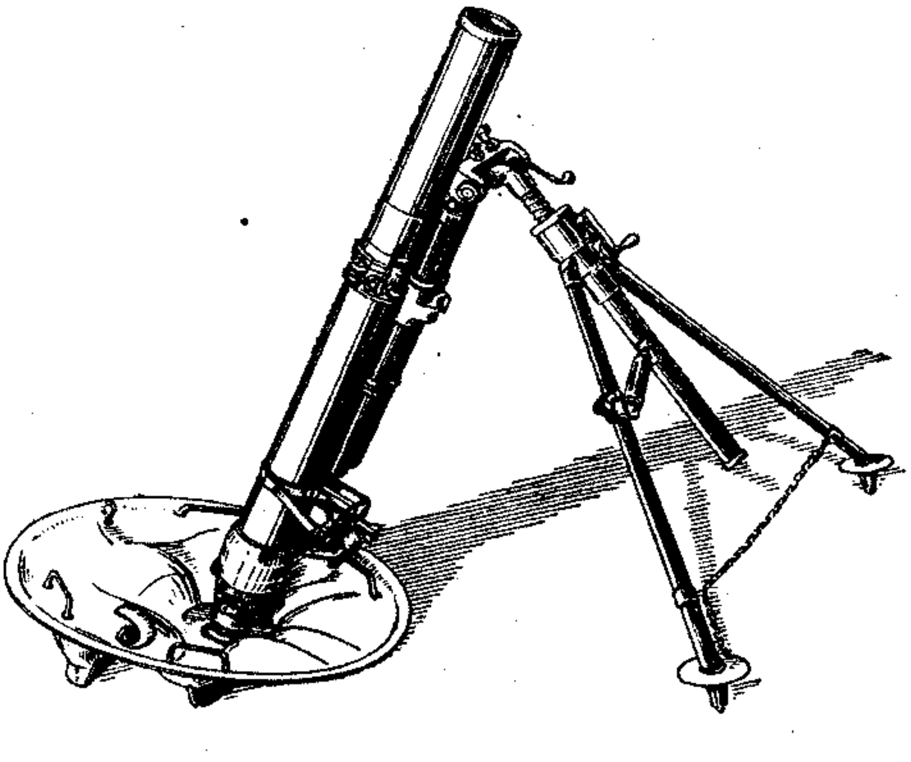
Significant differences of the older M-43 weapon are a shorter barrel (290 cm), a lower weight (1,100 kg) and a shorter range (about 5 km).

STATUS:
In service with Warsaw Pact forces. Scale of issue is 12 mortars per motorised infantry division or, in special circumstances, 6 mortars to a mortar company in place of 120 mm mortars (**5567.103**).

5567.103
120 mm MEDIUM MORTARS M-38 and M-43
DESCRIPTION:

These mortars are standard equipment of the mortar companies of the motorised rifle regiments of the Warsaw Pact forces.

Typical characteristics are a barrel length of 13 calibres (156 cm) and an all-up weight of 272 kg. The base plate mounting permits all-azimuth firing and a 6° traverse is available without change of bipod position. Elevation limits are from 45° to 80°. Weight of the round is about 16 kg and maximum range at full charge nearly 6,000 metres. A firing rate of 15 rounds per minute can be achieved.



120 mm Mortar

STATUS:
In service with mortar companies as noted above. Scale of issue is 6 mortars per company.

Training with M-38 medium mortar (Novosti)

5569.103
240 mm HEAVY MORTAR M-53
DESCRIPTION:
This is the largest mortar in standard service in the Warsaw Pact forces. Like the 160 mm weapon (**5568.103**) it can be used to fire either conventional or atomic ammunition.

Barrel length is 25 calibres (6 metres) and all-up weight 4,150 kg. Elevation limits are not known but a top limit of 70°-80° seems likely and a bottom limit of 45° fairly certain. The mortar is not easily trained over large angles but a training adjustment of some 17° appears to be possible.

Weight of a conventional round is 130 kg and this can be projected to a maximum full-charge range of nearly 10 km. One shot per minute appears to be the maximum practical rate of fire.

STATUS.
In service. Scale of issue 6 weapons per motorised infantry division.

YUGOSLAVIA

2270.103
120 mm HEAVY MORTAR UBM-52
DESCRIPTION:
This is the heaviest modern mortar in Yugoslav service, although there were, and probably still are, some old American, German and Russian mortars remaining from the Second World War (see, in particular, entry **5567.103** for 120 mm Russian mortars, some of which were certainly in Yugoslav service until recently). It is made in Yugoslavia under licence from Thomson-Brandt, the French designation being MO-120 AM 50.

Mounted for travelling on a two-wheel trailer, the mortar can be fired from this or from a tripod mount. It is towed by a ring attached to the muzzle cap.

CHARACTERISTICS:
Calibre: 120 mm
Barrel length: 1.29 m
Elevation: 45° to 85°
Traverse: 6° to 45°
Weight in firing order: 420 kg (without trailer wheels)
All-up weight: 470 kg
Weight of bomb: 15.9 kg (heavy) 12.25 kg (light)
Range: 4,760-6,010 m
Rate of fire: 25 rounds/min
Crew: 5
STATUS:
In service.
MANUFACTURER:
Yugoslav State Factories under licence from Thomson-Brandt (France).

2271.103
81 mm MEDIUM MORTAR M-68
DESCRIPTION:
This is the most modern medium mortar in Yugoslav service. Based on, and very little different from the French (Thomson-Brandt) MO-81-61L mortar (**5559.103**), it is made in Yugoslavia. Brief performance details are given here: further information can be found in the entry for the French weapon.

CHARACTERISTICS:
Calibre: 81 mm
Weight in firing order: 41.5 kg
Weight of bomb: 3.2 kg or 4.2 kg
Range: 5,000 m
Rate of fire: 25 rounds/min

The only apparent difference between the two mortars lies in the mechanical construction of the bipod, but there may be other minor differences.
STATUS:
In service.
MANUFACTURER:
Yugoslav State Factories. Made under licence from Thomson-Brandt (see **5559.103**).

2272.103
81 mm MEDIUM MORTAR M-38
DESCRIPTION:
In appearance this medium mortar is very much like the American M-1 mortar of the same calibre (**5564.103**). Its performance, however, is somewhat different.
CHARACTERISTICS:
Calibre: 81 mm
Weight in firing order: 61.5 kg
Weight of bomb: 3.2 kg or 4.2 kg
Range: 4,100 m
Rate of fire: 25 rounds/min
STATUS:
In service.

MANUFACTURER:
Yugoslav State Factories.

2273.103
60 mm MORTAR M-57
DESCRIPTION:
Similar to the American M-1 mortar, the M-57 is made in Yugoslavia. Weighing less than 20 kg including baseplate it is a highly mobile weapon which, while lacking the extreme portability of the old British 2-inch mortar – and, of course, of the even lighter weapons of recent years – can still be readily manhandled into action.
CHARACTERISTICS:
Calibre: 60.75 mm
Weight in firing order: 19.7 kg
Weight of bomb: 1.35 kg
MV: 159 m/sec
Range: 1,690 m
Rate of fire: 30 rounds/min
STATUS:
In service.
MANUFACTURER:
Yugoslav State Factories.

PORTABLE UNGUIDED ANTI-TANK WEAPONS

2589.103
INTRODUCTION

In parallel with the extensive development of portable – and notably of shoulder-fired – guided missile systems in recent years, there has also been considerable activity in the field of development of shoulder-fired unguided weapons.

Some of these are simply the lineal descendants of the wartime "bazooka" weapon, but there has also been a move recently in the direction of single-shot disposable weapons.

Some recent developments are described in this section together with a selection of well-established (and in some cases obsolescent) weapons but it is emphasised that the list is not exhaustive.

BELGIUM

5595.103
100 mm ANTI-TANK ROCKET LAUNCHER
DESCRIPTION:

One of the most powerful of current man-portable infantry rocket launchers, this Belgian weapon differs from many others in this section in having a bipod mount forward. The launch tube, like many others, is in two parts for greater ease of carriage.

CHARACTERISTICS:
Calibre: 101 mm
Launch tube length: 180 cm
Weight in launcher: 12 kg
Weight of projectile: 2.75 kg
MV: 195 m/sec
Effective range: 220 m
Penetration: 400 mm

STATUS:
In service in the Belgian Army.

CHINA (PEOPLE'S REPUBLIC)

2305.103
57 mm RECOILLESS RIFLE TYPE 36
DESCRIPTION:

Based on the American M-18 RR of the same calibre (**5596.103**) the Type 36 57 mm recoilless rifle made in China is said to be a modified version of the American original. No details of the modifications are known, however, and the reader is referred to the US entry for details of the unmodified weapon. It is assumed that the modifications do not preclude firing from the shoulder.

STATUS:
This weapon has been in extremely widespread use among both NATO and NATO-friendly countries on the one hand and Third World countries on the other, and is probably still to be found in many of them even though it is no longer in the US inventory. Most supplies to other countries probably originated in the USA but China may have exported some.

5598.103
ANTI-TANK GRENADE LAUNCHER P-27
DESCRIPTION:

This is a heavier weapon than either of the two grenade launchers in service with Russian forces (**5597.103**). In principle of operation it is the same, however – a recoilless man-portable launcher firing a fin-stabilised hollow-charge grenade.

CHARACTERISTICS:
Calibre of launcher: 45 mm
Calibre of grenade: 112 mm
Weight of launcher: 6.4 kg
Weight of grenade: 3.75 kg
Effective range: 150 m
Penetration: 200-230 mm

STATUS:
In service with Czech forces.

FINLAND

2043.103
55 mm RECOILLESS ANTI-TANK GRENADE LAUNCHER M-55
DESCRIPTION:

This weapon, which is the current light anti-tank weapon of the Finnish Army, is of rather more elaborate construction than many such man-portable recoilless launchers. Replacing an earlier 41 mm launcher, the weapons are issued on a scale of six per company in the motorised battalions. The weapon was developed in Finland.

CHARACTERISTICS:
Calibre: 55 mm
Launcher length: 0.94 m unloaded; 1.24 m with grenade in place
Weight: weapon: 8.5 kg; grenade: 2.5 kg
Effective anti-tank range: 200 m
Rate of fire: 3-5 rounds/min
Penetration: About 300 mm

STATUS:
In service.

FRANCE

2068.103
ACL/APX 80 LIGHT COLLECTIVE ANTI-TANK WEAPON
DESCRIPTION:

This is a shoulder-fired portable 80 mm rocket-launcher weighing less than 16.5 kg loaded and with the sight attached. It has a powerful anti-tank action and will perforate the double NATO armour plate and be effective beyond.

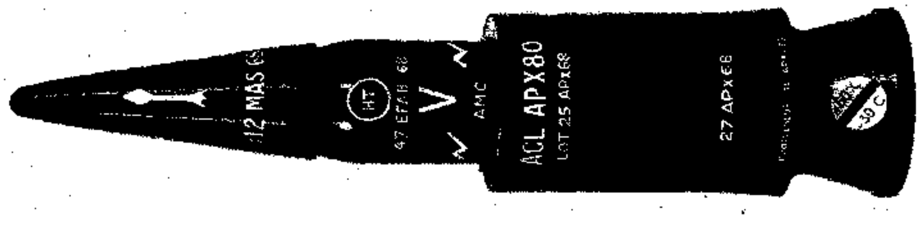
The rocket is launched using the recoilless gun principle and after launch a sustainer charge ignites to complete the flight. Direct-fire range is 550 metres and time of flight to this range is 1.2 seconds.

CHARACTERISTICS:
Weapon:
Type: Shoulder-fired rocket launcher
Length: 1.4 metre
Weight, unloaded: 13 kg
Weight, all-up: 16.44 kg
Direct-fire range: 550 m
Operational temperature: —40° to +50°C
Ammunition:
Types: Armour-piercing, anti-personnel, smoke or illumination
Calibre: 80 mm
Length: 530 mm
Weight – single round: 3.44 kg
Weight – two-round pack: 8.7 kg

STATUS:
Tests complete. Manufacture in hand.

SOURCE:
Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

ACL/APX 80 in firing position



The ACL/APX 80 round

2055.103
ACL-STRIM ANTI-TANK ROCKET LAUNCHER

DESCRIPTION:

This is a man-portable anti-tank weapon that has been adopted by the French Army where it is known as the 89 mm LRAC Model F.I.

Designed primarily for infantry use, the ACL-STRIM is a lightweight rocket launcher that fires an 89 mm rocket with an effective range of 400 metres. In the firing position the weight of the launcher and rocket is 7.3 kg: for transport, the launcher units weigh 4.5 kg and each round of ammunition in its container weighs 3.2 kg. The system is thus readily carried into action by combat troops.

The launching tube is made of glass and resin laminate and its shoulder piece and foregrip can be adjusted to suit the user. The firing generator handle is made of plastic and carries the trigger and the safe-arm lever. This handle contains the electromagnetic system for generating the firing current. The safe-arm device is primarily mechanical in character; but as an added safety precaution it incorporates a microswitch which is wired in series with a similar switch on the trigger and both switches must be closed to fire the weapon.

A sighting telescope, which is detached for transport, is clipped to the side of the launching tube.

The missile comprises a warhead and a propulsion system. The warhead has a streamlined plastic cap in which is mounted a piézo-electric generator that detonates the charge on impact with the target. The shaped charge is contained in an aluminium alloy casing streamlined by a plastic fairing. To the rear of this is the base fuse which is at safe in the transport position and is armed in flight by gases tapped off from the propulsion system. A new 'brush-type' charge is used to propel the missile and the body and nozzle are made of light alloy. In the tail of the body are nine retractable horns that are designed to stabilise the missile in flight. These are spun out into the flight position as the missile leaves the launching tube, the spinning motion having been imparted to the missile while in the tube by nozzle vanes.

Combustion of the propellant is very rapid and is complete before the missile leaves the tube. There is thus no danger to the user. Moreover, the arming of the base fuse is not complete until the missile is several metres from the launcher.

For transport the missile is carried in a sealed container which in operation forms part of the launching tube and contains the electrical circuits that mate with the firing circuits in the launcher. It is therefore unnecessary to remove the missile from its container before firing.

At normal incidence the missile will penetrate 400 mm of armour and the weapon is effective at incidence angles up to 75 degrees from normal.

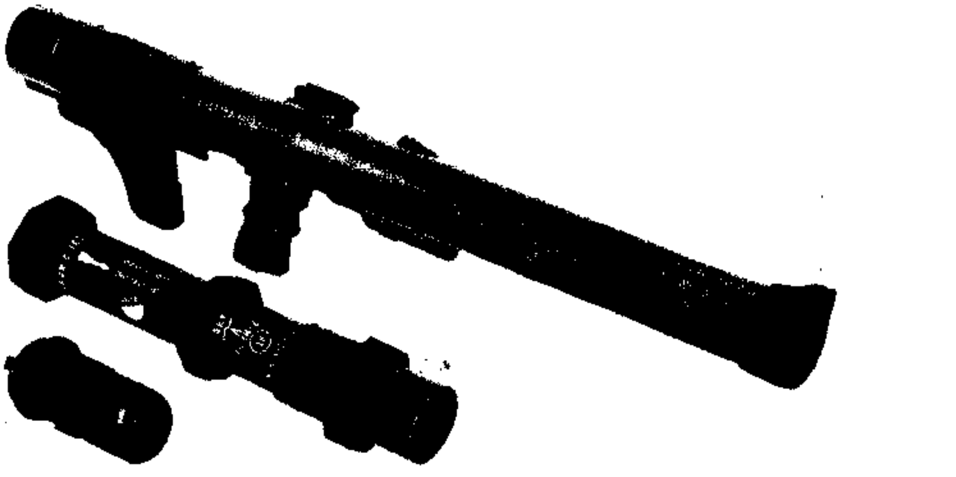
OPERATION:

Operation is simple. All that the firer has to do is to remove the protective caps, clip the sighting telescope to the launcher, insert the missile container into the rear of the launcher, set the safe-arm lever to the armed position, aim and fire.

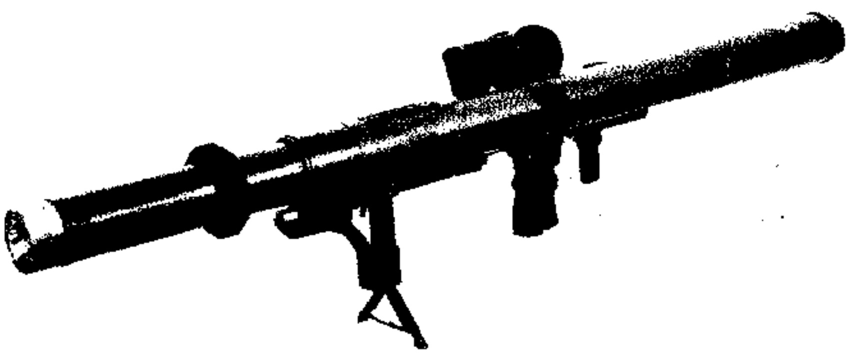
Targets can be effectively engaged up to a range of 400 metres. Since the time of flight at this range is about 1.5 seconds, significant aiming-off for movement is necessary only for crossing targets moving at relatively high speeds. The NATO standard – which is also adopted by the French Army – calls for a flight time of no more than 1.25 seconds, and this corresponds to a range of 330 metres with the ACL-STRIM. Standards adopted by some other armies, however, accept flight times as long as 2.2 seconds—corresponding to a range of 550 metres with the ACL-STRIM.

DEVELOPMENT:

Development of the ACL-STRIM was initiated by Luchaire S.A. and the first design study was made in 1964. The system is now in production and went into service with the French Army in 1969.



ACL-STRIM container assembly and shielded sighting telescopic during transport



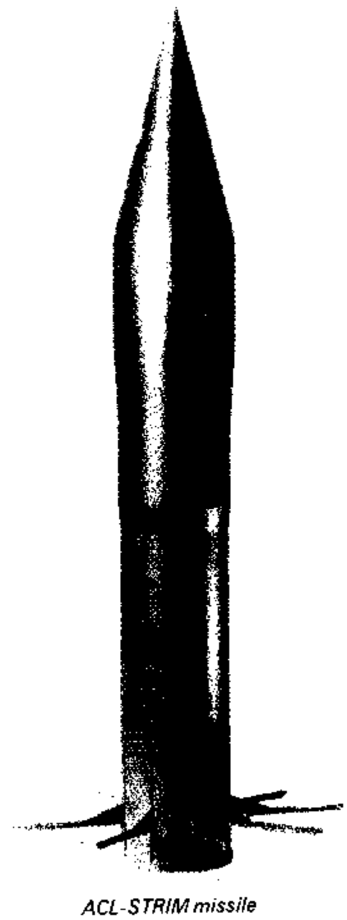
ACL-STRIM loaded and ready to fire

TRAINING EQUIPMENT:

Instruction equipment is provided by the manufacturers. No details are known.

CHARACTERISTICS:

Weapon:
Calibre: 88.9 mm
Length during transport: 1.168 m
in firing position: 1.600 m
Mass during transport, with 0.5 kg sighting telescope: 4.5 kg
In firing position: 7.3 kg
Missile:
Diameter: 88.9 mm
Diameter of shaped charge: 80 mm
Total length: 0.600 m
Container length: 0.626 m
Total mass, without container: 2.2 kg
with container: 3.2 kg
Mass of explosive of the shaped charge:
0.565 kg
Ballistic Characteristics:
Muzzle velocity:
at +20°C, 291.2 m/s
at +51.5°C, 293.2 m/s
at –31.5°C, 287.2 m/s
Combat range for a 1.25 s flight time (maximum ordinate: 1.9 m) 330 m
For a 2.30 m maximum ordinate (1.36 s): 360 m
Effective range: 400 m
Time of flight at 400 m range: 1.56 s
Effectiveness of the shaped charge:
Thickness of armour plating steel perforated at 0° incidence: 400 mm
NATO targets 80-90% perforated:
– single target, heavy tank, 120 mm/65°
– dual target, heavy tank, 40+110 mm/60°
Operating limit incidence: 74-75°



ACL-STRIM missile

MANUFACTURERS:

The system is being produced jointly by the STRIM department of Luchaire S.A., 171, Boulevard Haussmann, 75 Paris 8e, and by the Manufacture Nationale d'Armes de St Etienne. Subcontractors include SAGEM Manurhin and Atelier de Construction de Puteaux.

2085.103
ARPAC 68 mm ANTI-TANK ROCKET LAUNCHER

DESCRIPTION:

ARPAC is a small, highly portable anti tank weapon using a tube-launched rocket projectile to engage tanks and fortifications at ranges up to about 50 metres.

The most unusual feature of this launcher is that the launch tube is mounted on top of a supporting arm which carries a periscopic sight: the weapon can thus readily be armed and fired while the user is still under cover. The rocket is stored in the launch tube: and for carriage the tube and sight fold together making – with a cover which hermetically seals the whole – a one-shot expendable weapon.

The rocket is fin-stabilised, the fins opening out as the rocket leaves the tube. Arming is automatic on firing and takes place about 6 metres from launch.

STATUS:

Preproduction.

CHARACTERISTICS:

Type: Expendable single-shot anti tank rocket launcher
Weight: Storage: 1.850 kg. Ready-to-fire: 1.395 kg. Rocket only: 0.850 kg
Dimensions: Folded: 340 × 155 × 74 mm
Open: 340 × 395 × 74 mm
Initial velocity: About 75 m/s
Penetration: 300 mm
Incidence: More than 70°
Range: 50 m

MANUFACTURER:

Thomson-Brandt, Branche Armement & Mécanique Générale, 52, avenue des Champs Elysées, 75008-Paris, France.

2090.103
SARPAC 68 mm ANTI TANK ROCKET LAUNCHER

DESCRIPTION:

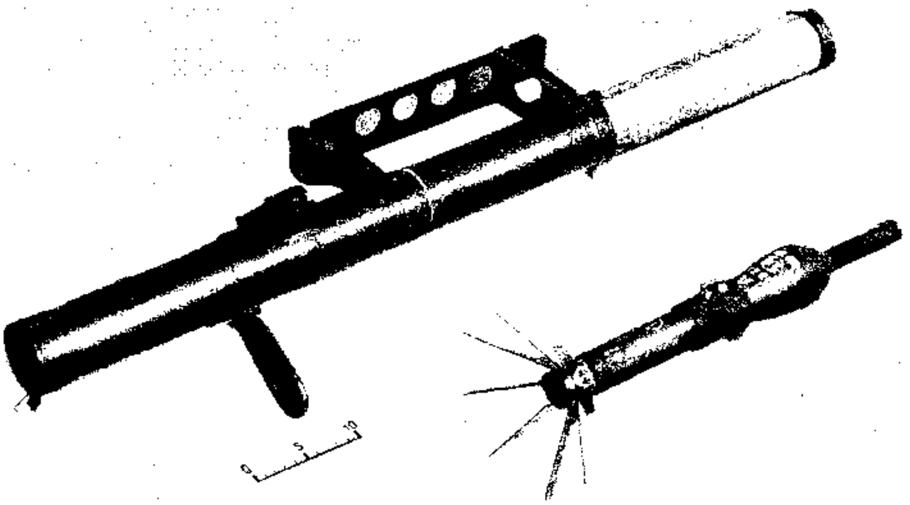
Primarily designed for anti-tank operations, the SARPAC portable rocket launcher may also be used against blockhouses, earthworks and other fortifications.

The launcher consists of a telescopic tube to which is attached a sight, a percussion firing mechanism and a shoulder butt. In the carrying position the telescopic tube is retracted, thereby rendering the firing mechanism inoperative—so that the weapon can safely be carried with a round in position. The sight is hinged with a parallelogram motion and lies flat against the tube in the carrying position. The completely folded weapon can be carried by a sling harness.

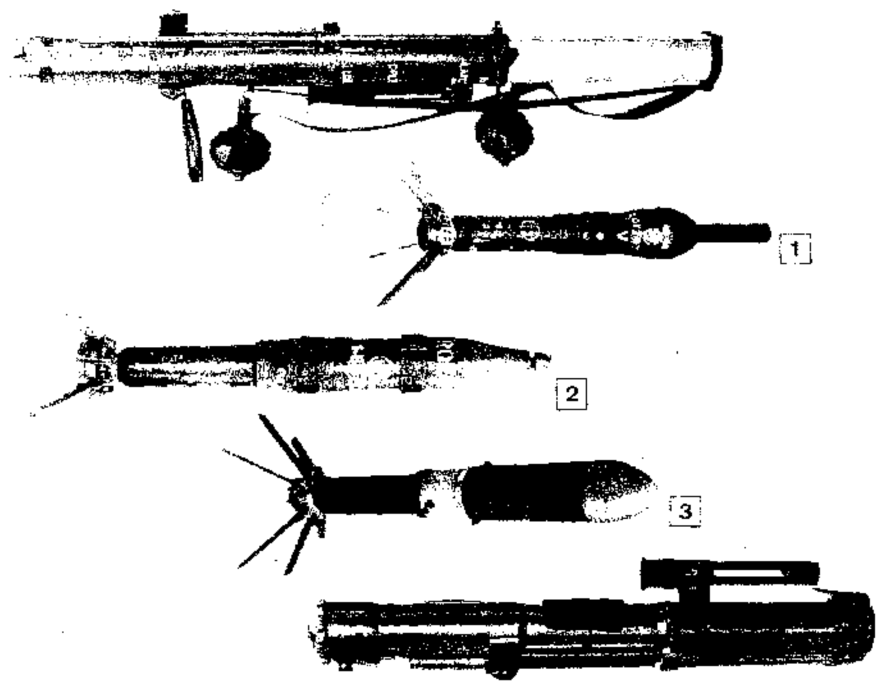
A fin-stabilised rocket is fired, the eight fins being folded while the round is in the tube and springing out after launch. The rocket is armed by gas pressure during launch but a delay element ensures that it is about 10 metres from the launcher.

SARPAC is designed for short-range operation, engaging targets at ranges of up to 150-200 metres. With a total weight of around 3 kg it can be fired from the shoulder in the standing, kneeling or lying positions.

The first design of launcher was extremely simple and inexpensive: and while it could probably be used to fire more than one round it could not be used for many. Since then an improved design has been produced which may be re-used for 20 rounds and can be fitted with an improved sight to fire anti-personnel or illuminating rounds.



Original designs of SARPAC (launcher with rear round)



SARPAC (launcher open and closed) and the types of projectile that can be launched by it

CHARACTERISTICS:

Launcher (improved pattern):
Calibre: 68 mm
Length:
—open, 99.7 cm
—folded, 73.4 cm
Weight:
—empty, with sling, 1.90 kg
Rocket—HEAT round:
—fins folded, 472 mm
—fins open, 505 mm
Weight: 1.07 kg
Initial velocity: 150 m/sec
Flight before arming: About 10 m
General:
Effective range: 150-200 m
Armour penetration: 300 mm at 0°
Effective incidence: 70° or less
HEAP round (ROCAP):
Weight: 1.8 kg
Initial velocity: 92 m/sec
Flight before arming: 10 m
Weight of fragmenting body: 0.83 kg
Effective range: 650 m
ROCLAIR (Illuminating) round:
Weight: 1.3 kg
Initial velocity: 138 m/sec
Effective range: 700 m
Burn time: More than 30 sec
Candle power: More than 180,000

STATUS:

Mass production.

MANUFACTURER:

Thomson-Brandt, Branche Armement & Mécanique Générale, 52, avenue des Champs Elysées, 75008-Paris, France.

GERMANY (FEDERAL REPUBLIC)

2184.103
ARMBRUST-300 INFANTRY ANTI-TANK WEAPON

DESCRIPTION:

Armbrust-300 is a man-portable, shoulder-fired expendable infantry anti-tank weapon with a practical anti tank range of 300 metres and an armour penetration capacity of 300 mm when a hollow-charge shell is used.

The weapon is recoilless and produces no firing report, muzzle flash, rear flash or blast, and no smoke. A soldier can thus use it close to an enemy vehicle without giving away his position. Sighting and firing is easy for any rifle trained soldier.

Armbrust is a single-shot weapon, but since it weighs only 4.8 kg it is perfectly possible for a soldier to carry three of them looped together. Although primarily designed as an anti-tank weapon it can also be used against other types of target and both a fragmentation and a flare shell version are available for this purpose.

After firing the launch tube and associated sighting and firing ancillaries are discarded.

CHARACTERISTICS:

Type: Shoulder fired, recoilless, unguided anti-tank weapon.
Length: 820 mm
Tube Diameter: 74 mm
Hollow charge diameter: 67 mm
Total weight: 4.8 kg

Firing the Armbrust-300

Armbrust-300 Infantry Anti-tank Weapon

Armour penetration: 300 mm armoured plate. Specified NATO impact angle greater than 73°.
Muzzle velocity: 220 m/sec
Flight duration: 300 m in 1.5 sec
Sights: Reflex sight, notch and bead.
Controls: Pistol trigger mechanism with cocking lever and safety catch.
Arming distance: 7.12 m
Rear safety area: 20 m for training; 10 m for field operation. No acute danger beyond 3 m.
Sound pressure[2]: At firer's ear, less than 135 dB.

MANUFACTURER:

Messerschmitt-Bolköw-Blohm Ottobrunn, Munich.

2591.103
PANZERFAUST LEICHT – PORTABLE ANTI-TANK WEAPON

DESCRIPTION:

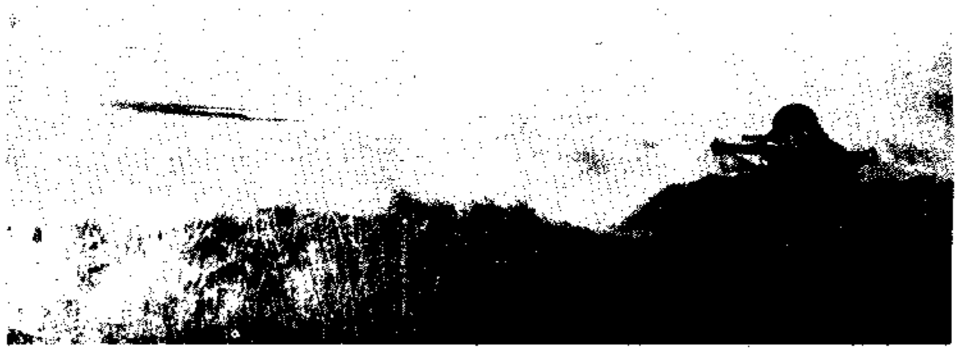
This weapon is similar to but more effective than the PZF-44 (**5591.103**). It is a light muzzle-loaded recoilless anti-tank weapon firing a fin-stabilised rocket-propelled projectile with an effective range of 400 metres and an armour penetration capability of 370 mm.

Unloaded, the weapon is 88 cm long; and when loaded with the 55 cm long projectile the total length becomes 116.2 cm. All-up weight, loaded, is 10.3 kg, and the weapon can be fired from the shoulder in the standing, kneeling or prone positions.

MANUFACTURER:

Dynamit Nobel AG.

Panzerfaust aimed from the prone position



Firing the Panzerfaust

5591.103
LIGHT ANTI-TANK GRENADE LAUNCHER PZF-44

DESCRIPTION:

This is a lightweight short-range, shoulder-fired projectile working on the recoilless weapon principle and capable of inflicting considerable damage on armoured vehicles at ranges up to about 200 m.

CHARACTERISTICS:

Launch tube: Calibre: 42.8 mm. Length: 88 cm
Grenade: Calibre: 81 mm. Weight: 2.1 kg
Total weight: 6.9 kg
MV: 107 m/sec
Effective range: 200 m
Penetration: 320 mm

STATUS:

In service in Germany.

ITALY

2257.103
FOLGORE ANTI-TANK WEAPON

DESCRIPTION:

Little information concerning this weapon had reached us up to the time of going to press. It appears, however, that Folgore is a simple shoulder-fired unguided anti-tank weapon. The calibre of the rocket is understood to be 80 mm and the rocket is equipped with a hollow-charge warhead. Range is said to be 600 m.

STATUS:

Development. Intended to enter service in the 1980s.

MANUFACTURER:

Breda Meccanica Bresciana SpA, Via Lunga 2, 25100 Brescia, Italy.

SPAIN

2330.103
89 mm ANTI-TANK ROCKET LAUNCHER M-65
DESCRIPTION:
This is a Spanish-developed weapon of fairly conventional design similar to that of the American M-20 bazooka and fired from the shoulder in the same way. It can also use the American 3.5 inch ammunition.
CHARACTERISTICS:
Calibre: 88.9 mm (3.5 inches)
Launcher length: 1.6 m
Weight: weapon. 5.4 kg; rocket 2.0 kg
MV: 230 m/sec
Effective anti-tank range: 450 m
Penetration: 330 mm at 450 m and 90°
STATUS:
In service in the Spanish Army.

SWEDEN

5557.103
84 mm RCL CARL-GUSTAF
DESCRIPTION:
Two versions of this weapon are described—the 84 mm RCL Carl-Gustaf M2 and the more recently developed M2-550.

M2 Weapon
This is a recoilless gun intended primarily for use as an anti-tank weapon but suitable also for other assault roles. It can fire HEAT, HE, smoke or flare ammunition and has practical ranges, with HEAT rounds, against moving or stationary targets of 400 or 500 metres respectively and with HE rounds of 1,000 metres. Smoke can be fired up to 1,300 metres and flare shells up to 2,300 metres. A rate of fire of about 6 rounds per minute is readily achieved.

The weapon can be carried, loaded and fired by one man but a two-man team is standard—one carrying and firing the gun and the other carrying ammunition and assisting in the loading operation.

The gun is breech loaded and cannot be fired until the venturi has been rotated back into position and locked after the round has been inserted. The round is fired by a percussion-operated side primer, the firing mechanism being contained in a tube on the right-hand side of the barrel. This mechanism is hand-cocked, is operated by a two-pressure trigger and has a safety-catch.

Open or telescopic sights can be used: the telescopic sight has a ×2 magnification and a 17° field of view and is fitted with a temperature correction device. The weapon is fired from the shoulder, and when fired in the prone position, or over a trench or parapet, a sprung bipod gun mount provides support just forward of the shoulder pad.

Cartridge cases of the ammunition are made of light metal alloy with a plastic blow-out disc at the rear. HE, smoke and flare shells are spin-stabilised, the HEAT shell is aerodynamically stabilised and fitted with a slipping ring to ensure that the hollow charge performance is not reduced by excessive speed of rotation.

M2-550 Weapon
The 84 mm RCL Carl-Gustaf M2-550, also described as the Anti-Tank System FFV 550, is a later development of the M-2 weapon and features a range- and lead-finding sight and a new rocket-assisted HEAT round.

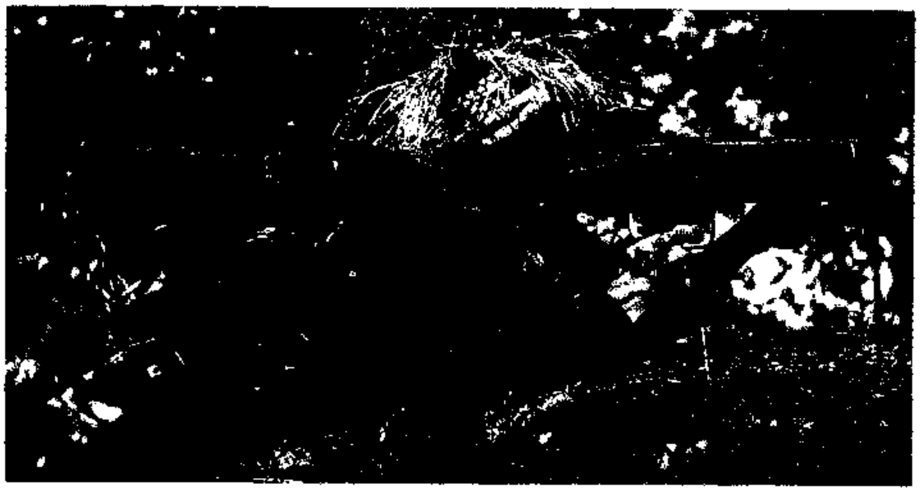
The FFV 555 sight, which replaces the earlier telescopic sight, is an optical-electronic system comprising a telescope, a range-finder and a lead-finder. The range-finder is a coincidence device with a range drum that is rotated to bring the upper and lower parts of the "picture" into coincidence. Range can be read out (or set in) if required.

By means of an ammunition control lever the sight mechanism is set to HEAT or HE (SMOKE) ammunition, and this, when range finding automatically results in the correct elevation of the weapon for the type of ammunition selected. When a trigger control on the sight is operated, the electronic unit of the sight produces light pulses (twinkles) which appear in the field of view at intervals, corresponding to the time of flight of the HEAT shell for the determined range. By noting the amount of movement of the target in the graticule between two twinkles the required lead can be determined and the target thereafter engaged.

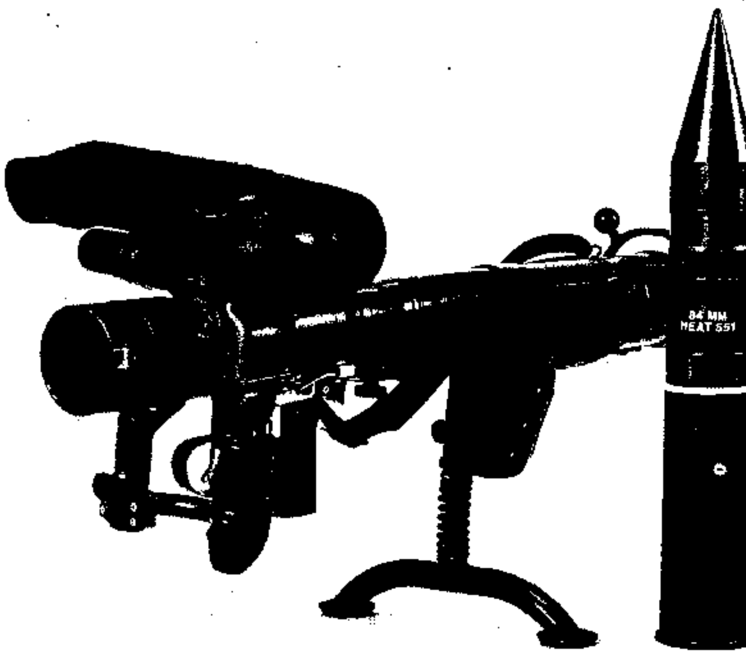
The 84 mm FFV 551 HEAT round is stabilised by fins which unfold as the round leaves the barrel and has a rocket motor which increases the shell speed from its muzzle velocity of 260 m/sec to a maximum of 350 m/sec. The rocket motor comes into operation when the shell is about 18 m from the muzzle and burns for 1.5 seconds. The shell will penetrate 400 mm of armour, and the piezo-electric fuse system enables the weapon to function up to 80° incidence.

Like the HEAT round for the M2 weapon the FFV 551 round is fitted with a Teflon slipping ring to reduce the spin imparted by the rifling of the Carl-Gustaf barrel. Practical engagement range with this ammunition is 700 m.

The family of ammunition for the earlier M2 version is compatible with the 550 system.



Firing the Carl-Gustaf M-2



M-2 550 weapon with double FFV 551 round

Firing the M-2 550

CHARACTERISTICS:	M2	M2-550
Calibre:	84 mm	84 mm
Weapon length:	1,130 mm	1,130 mm
Weight of gun and mount:	15 kg	15 kg
Weight of sight:	1 kg	3.4 kg
Weight of HEAT round:	2.5 kg	3.2 kg
Anti-Tank Range:	4-500 m	700 m

TRAINING EQUIPMENT:
Sub calibre adapters are available for both weapons to enable them to be used with small-arms ammunition for training purposes.
STATUS:
In production, and in service in several countries.
MANUFACTURER:
Förenade Fabriksverken, Eskilstuna, Sweden.

5558.103
MINIMAN RECOILLESS ANTI-TANK WEAPON

A light short-range one-man anti-tank weapon, the Miniman, complements the Carl Gustav (**5557.103**) recoilless anti-tank rifle.

Miniman has an effective range of about 200 metres – but it weighs only 3.25 kg and is pre-loaded. It is thus an extremely convenient emergency weapon for infantry and is simple and inexpensive enough to be used on a large scale.

The projectile is a HEAT round which will penetrate 340 mm of armour at zero incidence.

STATUS:
In production and in service.

MANUFACTURERS:
Förenade Fabriksverken, Eskilstuna, Sweden.

SWITZERLAND

2394.103
83 mm PORTABLE ANTI-TANK ROCKET LAUNCHER M-58

DESCRIPTION:
This is a small shoulder-fired man-portable rocket launcher which is in service with the Swiss Federal Army. Of simple construction with open sights, it is fitted with a shield (with a sighting window) to protect the firer's hands and face from the rocket blast.

CHARACTERISTICS:
Calibre: 83 mm
Launch tube length: 1.3 m
Weight: launcher: 7.5 kg; rocket: 1.82 kg
MV: 300 m/sec
Effective range: 200 m

STATUS:
In service in fusilier battalions of infantry regiments.

THE UNITED STATES OF AMERICA

5593.103
90 mm ANTI-TANK RIFLE M-67

DESCRIPTION:
This is the heaviest of the man-portable recoilless anti-tank weapons in US service. It fires a 3.1 kg projectile with an effective range of 400 metres.

CHARACTERISTICS:
Calibre: 90 mm
Barrel length: 135 cm
Weight of rifle: 15.9 kg
Weight of projectile: 3.1 kg
MV: 213 m/sec
Rate of fire: 5 rounds/min

STATUS:
In service with US and West German forces.

5592.103
LIGHT ANTI-TANK WEAPON (LAW) M-72

DESCRIPTION:
This lightweight rocket launcher is replacing the M-20 bazooka in many applications. Weighing only 2.5 kg complete with a round and folding down to a length of only 63.5 cm for carriage, it lends itself readily to infantry use. A ready round can be carried in the folded weapon, and to launch it all that the soldier has to do is open the launch tube, withdraw the inner tube, raise the sights, aim and fire.

CHARACTERISTICS:
Calibre: 66 mm
Length: Launch tube closed, 63.5 cm
Launch tube extended, 88.9 cm
Weights: Launch tube, sights etc, 1.25 kg: projectile 1.25 kg
MV: 145 m/sec
Effective range: 250 mm
Penetration: 260 mm

STATUS:
In service with NATO forces.

5594.103
3.5 inch ROCKET LAUNCHER M-20A1

DESCRIPTION:
Better known as the "super bazooka" this weapon, after many years of successful service in the American, British, French, Italian and other armies, has largely been replaced by more modern weapons. Much of its success has no doubt been due to its simplicity of design and operation – which is certainly reflected in one of its successors, the M-72 Light Anti-tank Weapon (**5592.103**).

CHARACTERISTICS:
Calibre: 88.9 mm (3.5 inch)
Length of launch tube: 1.53 m (in two parts)
Weight of complete weapon: 5.9 kg excluding projectile
Projectile weight: 3.31-4.09 kg
MV: 148.97 m/sec
Effective range: 100-150 m
Rate of fire: 8 rounds/min
Penetration: 279 mm

STATUS:
Obsolescent

5596.103
57 mm RECOILLESS ANTI-TANK RIFLE M-18A

DESCRIPTION:
This American rifle is no longer in service with the American Army but was in fairly widespread NATO use and may still be encountered.

With a weight of more than 20 kg it is on the heavy side for a portable weapon while naturally lacking the performance of the vehicle-borne or towed recoilless rifles. Nevertheless it has a useful specification.

CHARACTERISTICS:
Calibre: 57 mm
Barrel length: 157 cm
Weight of weapon: 20.15 kg
Weight of projectile: 1.25 kg
MV: 366 m/sec
Effective range: 450 m
Maximum range: 4,000 m
Rate of fire: 15 rounds/min

STATUS:
Obsolescent.

2795.103
SMAWT ANTI-TANK ROCKET LAUNCHER

DESCRIPTION:
It is understood that a new anti-tank rocket launcher is being developed at the US Army Missile Command's MICOM research and development laboratories, with some help from the Army Material Command.

Known as SMAWT (Short-range Man-portable Anti-tank Weapon Technology) the weapon is evidently of light weight and simple construction. Few details are available at this time, and the accompanying photograph is not very informative, but it is understood that the MICOM programme was selected after a competition with a recoilless rifle being developed jointly by the US Army Weapons Command and Army Munitions Command. It is believed that the launch tube is made wholly or partly from glass fibre and that a new carborane propellant has been developed for the weapon: this propellant has a high burning rate and is said to be immune to temperature variations.

STATUS:
Prototype.

SMAWT anti tank weapon

USSR

5597.103
ANTI-TANK GRENADE LAUNCHERS RPG-2 AND RPG-7

DESCRIPTION:

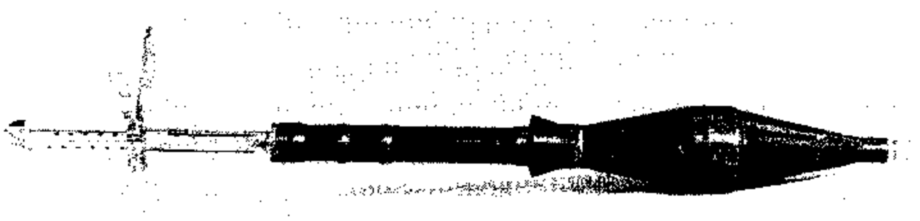
RPG-2 has long been a standard weapon with Russian forces. RPG-7 is a comparatively recent and significantly improved version. Both are conventional, highly-portable, recoilless launchers firing fin-stabilised hollow-charge grenades.

CHARACTERISTICS:

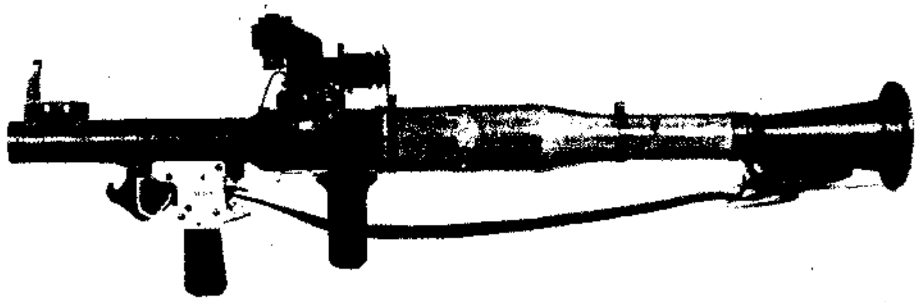
	RPG-2	RPG-7
Launcher calibre:	40 mm	40 mm
Grenade calibre:	82 mm	100 mm
Weight of launcher:	2.75 kg	5 kg
Weight of grenade:	1.6 kg	2.5 kg
Effective range:	150 mm	300 mm
Penetration:	180 mm	200-250 mm

STATUS:

In service.



RPG-7 rocket



RPG-7 launcher

2928.103
76 mm RECOILLESS RIFLE SPG-9

DESCRIPTION:

This is similar to the American 75 mm recoilless rifle M-20. It is mounted on a tripod and has a weight of 55 kg. Crew consists of three men. It fires fin-stabilised anti-tank rounds to a maximum effective range of 900 m. The ammunition will penetrate 300 mm of armour. Rate of fire is 6 rounds a minute.

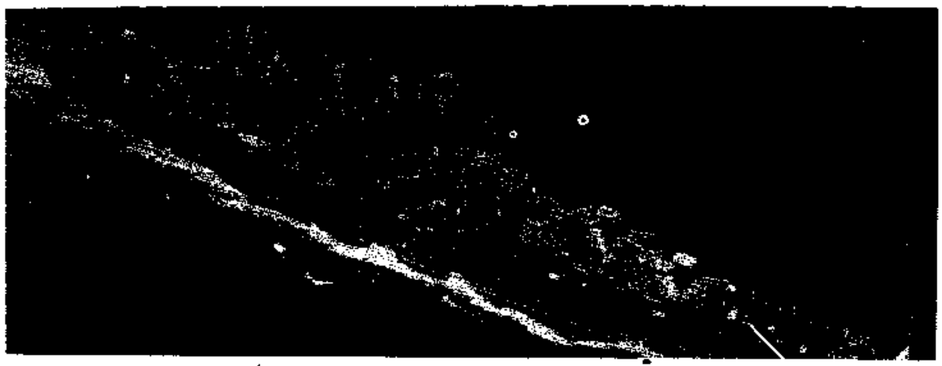
STATUS:

In service.

NAVAL GUNS AND BOMBARDMENT ROCKETS

ARGENTINA

6080.203
TRIPLE 6-inch GUN MOUNTING
DESCRIPTION:
Main armament of the cruiser *La Argentina* are three triple 6-inch (152 mm) 50-calibre gun mountings. These guns were made by Vickers and are of a type first introduced in 1923. They fire a projectile weighing 45 kg, have a muzzle velocity of 850 m/sec and an effective range of some 20 km (11 nm). A rate of fire of 5 rounds per barrel per minute can be achieved.
STATUS:
Operational but no longer in production and not available.



The cruiser 9 de Julio. *Main armament forward consists of nine 6-inch 47-calibre guns in triple mountings. The eight 5-inch guns are mounted singly, four on each side abreast of the superstructure* (Official Argentine Navy Photograph)

6050.203
SINGLE 5 inch DUAL-PURPOSE GUN MOUNTING
DESCRIPTION:
This 5-inch (127 mm) gun is mounted on the ex-US "Brooklyn" class cruisers of the Argentine Navy – and on similar vessels in the Chilean Navy. The gun is a short 25-calibre weapon and is mounted as eight single installations.
These weapons are assumed to be of American manufacture, but 5-inch guns of this calibre are no longer in service in the US Navy.
It should be noted that the 6-inch guns shown in the accompanying photograph of the cruiser *9 de Julio* are not of the same type as those on *La Argentina* (**6080.203**. They are of American manufacture and are described later in this section.

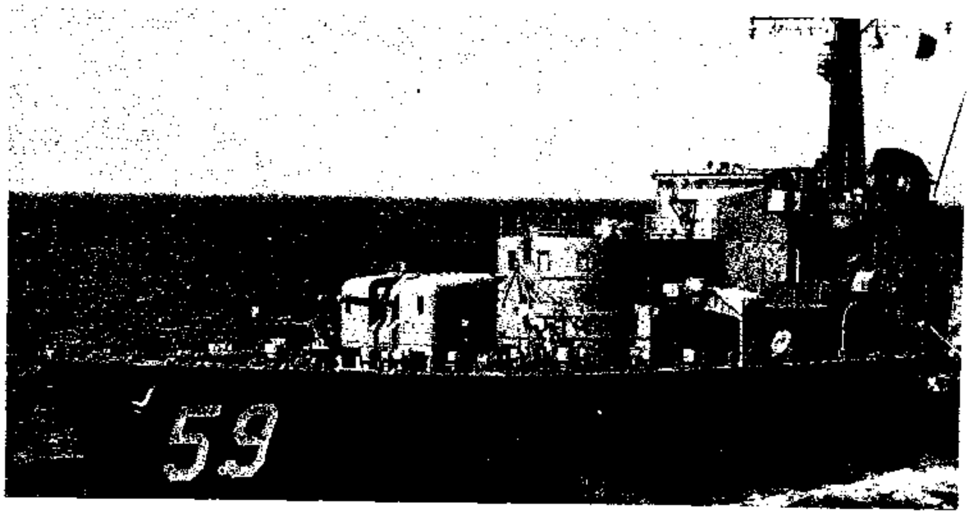
STATUS:
Operational.

6081.203
SINGLE 4.7-inch (120 mm) GUN MOUNTING
The three surviving "Buenos Aires" class destroyers carry either three or four 4.7-in (120 mm) 31-calibre guns. These destroyers were built in the United Kingdom in the 1930s and the guns were made by Vickers. This type of gun was first introduced in 1931; it fires a projectile weighing 28 kg with a muzzle velocity of 850 m/sec. Range is about 16.5 km (9 nm). A rate of fire of 8 rounds per minute is possible.

STATUS:
Operational but no longer in production and not available.

AUSTRALIA

6051.203
TWIN 4.5-inch GUN MOUNTING
DESCRIPTION:
Similar to the British Mk 6 Gun Mounting (**6012.203**) the twin 4.5-inch (114 mm) guns in the Australian "Battle" class destroyer *Anzac* were made entirely in Australia.
Weight of the turret is about 50 tons. The guns are fully automatic and have a rate of fire of approximately 25 rounds per minute. The shell weighs about 24 kg and can be fired accurately at ranges up to about 19 km (10 nm).
STATUS:
Operational.



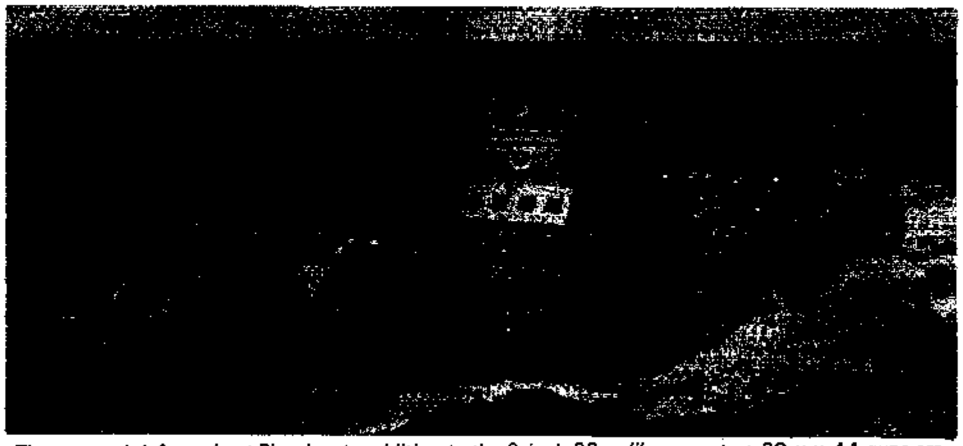
Twin 4.5 inch gun mounting on the destroyer Anzac (Official Royal Australian Navy photograph)

BRAZIL

6052.203
SINGLE 3-inch DUAL-PURPOSE GUN MOUNTING

DESCRIPTION:
A 3-inch (76 mm) dual-purpose 23-calibre weapon is carried by the "P" class seaward defence vessels of the Brazilian Navy. These vessels were built at Rio de Janeiro, but the origin of the guns is not known. Most probably they were made in the USA.

STATUS:
Operational on the one remaining vessel in the class (*Piraque*).



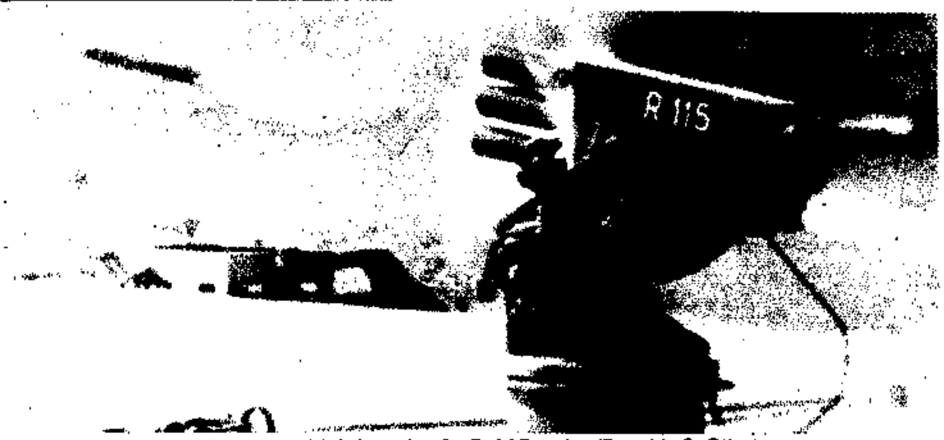
The seaward defence boat Piranha. *In addition to the 3-inch 23-calibre gun, two 20 mm AA guns are carried* (Official Brazilian Navy Photograph)

2027.203
SHIPBORNE BOMBARDMENT ROCKET R-115

DESCRIPTION:
This shipborne bombardment rocket is deployed operationally by the Brazilian Navy's Marine Corps in mobile launchers towed by motor vehicles. It is planned to equip ships of the Brazilian Navy with the missile, however, using special shipboard launchers, one of which is illustrated here.

R-115 is a cylindrical metal fin-less rocket. Its power plant is 1,400 kg st solid-propellant motor and the missile is spin stabilised by means of canted nozzles.

CHARACTERISTICS:
Type: Surface-to-surface bombardment rocket
Propulsion: Solid-propellant rocket motor. Propellant weight 3.1 kg. Static thrust 1,400 kg. Burning time 0.5 sec
Warhead: High-explosive. 1.35 kg



Shipborne multiple launcher for R-115 rocket (Ronaldo S. Olive)

Launch weight: 17.5 kg
Range: 7.5 km

MANUFACTURER:
Companhia de Explosivos Valparaiha, Brazil.

2553.203
SHIPBORNE BOMBARDMENT ROCKET FB.R127

DESCRIPTION:
This finless ship-launched bombardment missile has an ogival nose-cone, housing a high-explosive warhead, and a cylindrical body. Like the R-115 it is spin-stabilised by the canted nozzles of its motor.

CHARACTERISTICS:
Type: Surface-to-surface bombardment rocket
Propulsion: Solid-propellant rocket motor. Propellant weight 8.3 kg. Static thrust 2,000 kg. Burning time 0.8 sec
Warhead: High-explosive. Weight unknown but probably about 3 kg
Launch weight: 44 kg
Range: 10 km

MANUFACTURER:
Companhia de Explosivos, Valparaiha, Brazil.

CANADA

6053.203
TWIN 3-inch AA GUN MOUNTING

DESCRIPTION:
Certain of the destroyer escorts of the Canadian Navy are fitted with twin 3-inch (76 mm) AA guns of Canadian manufacture. This is a 70-calibre weapon in a light turret and it replaced the forward 3-inch 50 calibre American mount (**6030.203**), the aft mount being left unaltered.

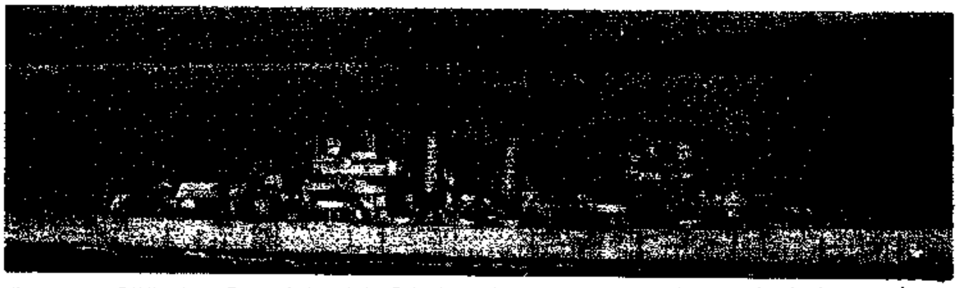
STATUS:
Operational.

Twin 3-inch 70-calibre guns on the destroyer escort Chaudière. (Official Canadian Maritime Command Photograph)

CHILE

6054.203
SINGLE 5-inch DUAL-PURPOSE GUN MOUNTING

Eight of these guns are fitted to each of the two ex-US "Brooklyn" class cruisers of the Chilean Navy—*O'Higgins* and *Capitan Prat*. They are believed to be of the same type as those installed in similar ships of the Argentine Navy (**6050.203**)



The cruiser O'Higgins. *Four of the eight 5-inch dual-purpose guns can be seen in single mountings abreast of the superstructure* (Official Chilean Navy Photograph)

6082.203
SINGLE 4-inch DUAL-PURPOSE GUN MOUNTING

DESCRIPTION:

This fully-automatic 60-calibre weapon is mounted as four single mounts on the two "Almirante" class destroyers of the Chilean Navy.

Built by Vickers (as were the destroyers) and introduced in 1955, the gun fires a projectile weighing about 16 kg with a muzzle velocity of 900 m/sec. Range is about 18.5 km (10 nm) for surface fire and aircraft can be engaged up to about 12,000 metres with a maximum elevation angle of 75°. Maximum rate of fire is said to be 40 rounds per minute. The gun and turret weigh a little over 26 tons.

STATUS:

Operational but no longer in production and unobtainable from the manufacturers.

CHINA (PEOPLE'S REPUBLIC)

6055.203
CHINESE NAVAL ORDNANCE

DESCRIPTION:

Much of the Chinese Navy is made up of vessels originally designed and constructed in the Soviet Union and subsequently transferred to China. A further section – but one of diminishing importance – consists of ex-Japanese and World War II ships inherited by the present regime from that of Generalissimo Chiang Kai Shek. Most of these latter vessels are now at least obsolescent if not obsolete.

Since the mid-1950s, however, the Chinese people have been building many of their own fighting ships. At first these were mainly built from parts supplied by the Soviet Union; but since the two countries became estranged the Chinese people have had to rely increasingly on their own resources.

Because of this overlapping supply situation it is not possible to say exactly for which vessels the guns have been built in China, or which of those have been entirely manufactured in China. It seems probable, however, that there are Chinese-built guns of at least the following types currently in service – 100 mm dual-purpose (twin and single mounts), 37 mm AA (twin mounts), 25 mm AA (twin mounts) and 20 mm AA (single mounts). Guns of several other calibres are in service with the fleet, and must therefore be being serviced in Chinese yards, but it cannot be said with certainty that they have been built in China.

A fast gunboat of the "New Shanghai" class designed for series production in China. Armament consists of four 37 mm and four 25 mm guns and a mortar (forward). The guns look very much like those used in the Soviet Navy but may well have been built in China

FRANCE

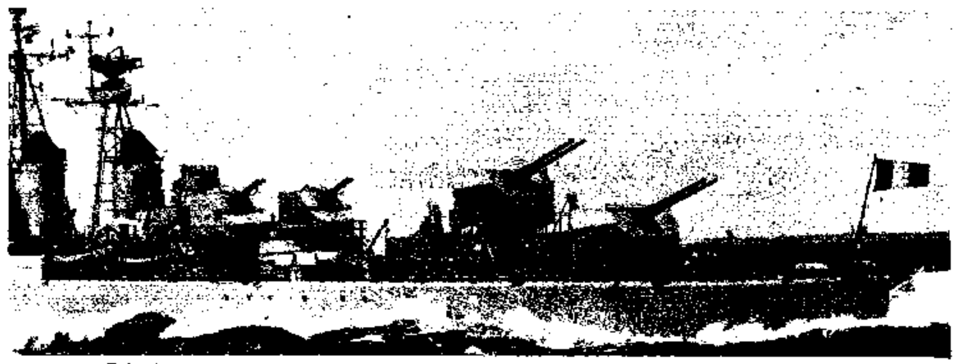
6063.203
TWIN 5-inch DUAL-PURPOSE GUN MOUNTING

DESCRIPTION:

Although this 127 mm gun is of French design and manufacture it was designed to use standard American 5-inch gun ammunition, and for that reason it has here been described by its Imperial measure calibre.

Now fitted only in "Surcouf" class destroyers (and not in those that have been fitted with surface-to-air missiles) these guns have elsewhere been replaced by the new single 100 mm gun (**6064.203**).

Barrel length is 54 calibres and the gun fires a projectile weighing about 32 kg with a muzzle velocity of 850 m/sec. Range against surface targets is about 22 km (12 nm) and aircraft can be engaged up to 13,000 metres with a maximum elevation angle of 80° Maximum rate of fire is 15 rounds per minute. The twin-gun turret weighs about 45 tons.



5-inch guns on the destroyer Maillé Brézé. *The smaller weapons are 57 mm guns* (Official French Navy Photograph)

6064.203
SINGLE 100 mm DUAL-PURPOSE GUN MOUNTING

DESCRIPTION:

This single gun is the medium-calibre weapon on which the French Navy has now standardised for new gun installations. It is already fitted in many ships including the guided-missile frigates *Suffren* and *Duquesne*.

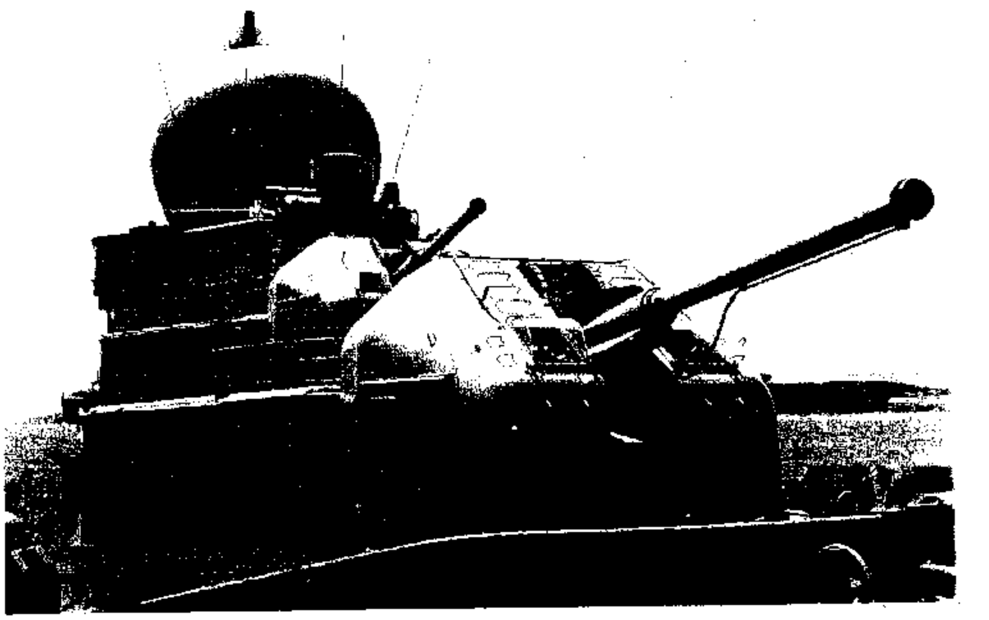
The gun is entirely automatic and operates with an unmanned turret. Firing rate is 60 rounds per minute; the cartridge weighs 23.2 kg, the shell 13.5 kg and the explosive charge 1.04 kg; the muzzle velocity is 870 m/sec; and the maximum range against surface targets is 17 km. Anti-aircraft engagement range is between 6,000 and 8,000 metres. Weight of the complete mounting is 24.5 t.

STATUS:

Operational in the French Navy, the gun has also been supplied for new installations in destroyers and frigates of the Navies of the Federal German Republic and Portugal.

MANUFACTURERS:

Developed as a programme laid down by the Direction Technique des Constructions Navales, 2, rue Royale, 75800 Paris. Work mainly carried out at the naval arsenal at Ruelle. SIGTEL gun remote control equipment is by CSEE, 2-8 rue Caroline, 7501 / Paris.



100 mm dual-purpose gun mounting

6065.203
TWIN 57 mm AA GUN MOUNTING
DESCRIPTION:

This 57 mm Bofors gun is still widely used in the French Navy but it is believed that it is no longer being fitted. It is still to be found on the "Surcouf" class destroyers and the "Le Normand" and "Le Corse" class fast frigates. On one of the latter, however, the after turret was replaced experimentally by a single 100 mm gun and the vessel in question still retains this gun. It may be, therefore, that guns of the 57 mm calibre will in due course be replaced either by 100 mm guns or by 30 mm or similar cannon.

The 60-calibre guns are mounted in pairs in turrets weighing some 15 tons. Maximum elevation is 80° and aircraft can be engaged up to 9,000 metres with a slant range of 14,500 metres. Projectile weight is about 2.6 kg and muzzle velocity about 900 m/sec.

6083.203
HS 30 mm GUN MOUNTINGS
DESCRIPTION:

Mountings of various kinds for the HS 30 mm gun are in service with many vessels of the French Navy. One of the more modern of these, the CAS 62 is described in entry **2559.203**. Another mounting, believed still to be in development, is described in entry **6035.203**, both mountings being by SAMM. It was at one time believed that the 30 mm gun was to be the small-calibre standard for the French Navy, the 100 mm gun (**6064.203**) being the medium calibre standard but the precise position is not known at the time we go to press.

2559.203
SINGLE 30 mm MOUNTING TYPE CAS 62
DESCRIPTION:

This is a remotely controlled turret which can be operated from an external aiming post or aimed by one or two gun layers. The gun is the HSS 831A and it can be used for either surface or anti-aircraft fire and with explosive, incendiary or practice rounds.

The principle of operation of the CAS 62 mounting is generally similar to that of the SAMM S401A turret on the AMX DCA 30 AA weapon system (**5539.103**).

CHARACTERISTICS:
Calibre: 30 mm
Rate of fire: 600 rounds/min
Ready rounds: 215
MV: 1000 m/s
Range: Maximum 10,000 m; practical 2,800 m
Mounting weight: 3,620 kg
Combat weight: 3,920 kg
Train limits: 350°; 50°/sec; 70°/sec^2
Elevation limits: −18° to +83°; 40°/sec; 240°/sec^2

STATUS:
In service in the French Navy at least.

MANUFACTURER:
SAMM SA, 224 Quai de Stalingrad 92130 Issy-les-Moulineaux, France.

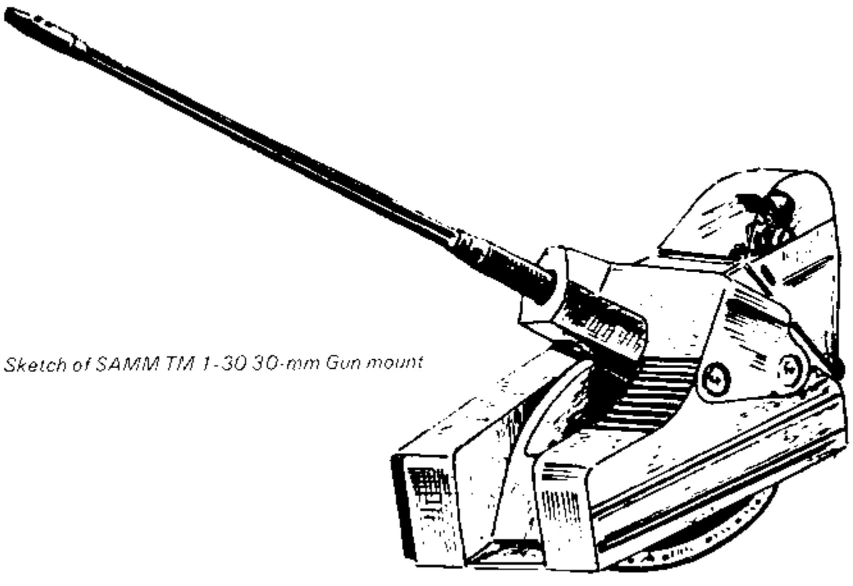
6035.203
SAMM/HS 30 mm GUN MOUNT TYPE TM-1-30
DESCRIPTION:

This new close range naval gun mount is being developed by Société D'Applications des Machines Motrices as an anti-aircraft weapon for installation in small or very small vessels. It employs the well known 30 mm calibre Oerlikon-Hispano 831 SL gun.

The mount is designed for local or remote control and has optical local stabilised aiming arrangements. The designed slewing and elevation rates are 90 and 60 degrees per second which should provide good ability to engage nearby high speed targets.

STATUS:
Under development.

MANUFACTURER:
Société d'Applications des Machines Motrices, 224, Quai de Stalingrad, 92-Issy les-Moulineaux, France



Sketch of SAMM TM 1-30 30-mm Gun mount

2125.203
RAP 14 NAVAL BOMBARDMENT ROCKETS
DESCRIPTION:

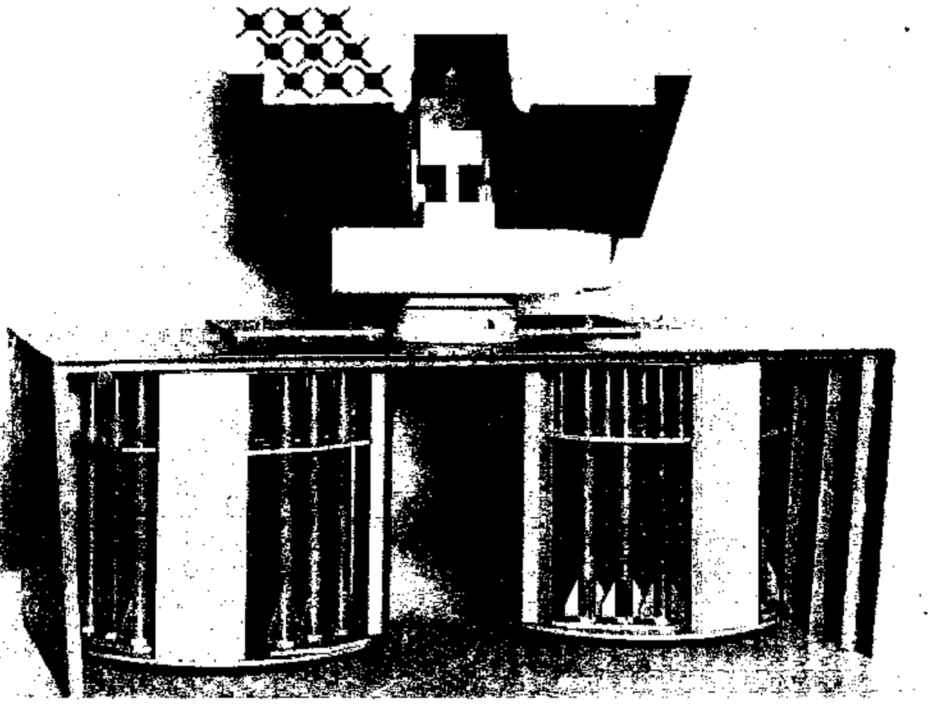
The multiple unguided rocket bombardment system known as RAP 14 is now firmly proposed for naval applications.

The land based version, which is at a much more advanced stage, is described in some detail in entry number **2024.103**, so that it is necessary here to draw attention only to these features that are peculiar to the naval version.

As can be seen from the accompanying picture of a model of the system, the naval version will have a 2 × 9 rocket launcher on a remotely controlled mounting with provision for automatic reloading from below deck with the launcher in the vertical position. Each of the two magazine drums will contain 36 rockets, giving a total capacity, with a full launcher and full magazine, of 90 rockets. The model shown here is of an installation suitable for ships of the "La Combattante II" type; other configurations are possible.

CHARACTERISTICS:
Weight: Complete launcher assembly, less rockets: 10.4 t. Complete assembly with rockets: 15 09 t.
Magazine dimensions: 5.9 × 2.5 × 2.5 m
Launch combinations: any number from one to eighteen
Range: maximum for standard rocket. 16 km
Rate of fire: 9 seconds for 18-round salvo
CEP: 90 m
Effective beaten zone: single salvo 10 hectares (25 acres)
Rocket calibre: 140 mm
Weight: 54 kg
Warhead: 19 kg HE standard. Special warheads possible
Speed: maximum Mach 2

MANUFACTURER:
System: C.N.I.M. (Constructions Navales et Industrielles de la Méditerranée). 50 avenue des Champs-Elysées, 75008 Paris, France.
Launcher: Creusot-Loire, Groupes Marine Schneider, 15 rue Pasquier 75008 Paris, France.



Model of shipborne launcher for RAP 14 rockets

ITALY

5534.203
SINGLE 127/54 GUN MOUNTING

DESCRIPTION:
The 127/54 is a dual purpose gun mount of an intermediate calibre and so more suitable to a slightly larger class of ship than the others in the new OTO series. It is intended as a main armament for frigates and destroyers.

Design work started in October 1965 as a joint venture with the Italian Government. The first prototype was completed in May 1969.

Ready use ammunition is held in three drums just below the turret. A central elevator hoists the ammunition, chosen from one drum, and delivers it to the turret where two oscillating arms perform the final movement to the loading trays.

The three drums are automatically reloaded through two hoists manually loaded in the magazine.

The three drum layout permits stowing of three different types of ammunition in the ready use magazine which can be chosen appropriate to the type of action. Remote controlled fuse setters are provided in the oscillating arms.

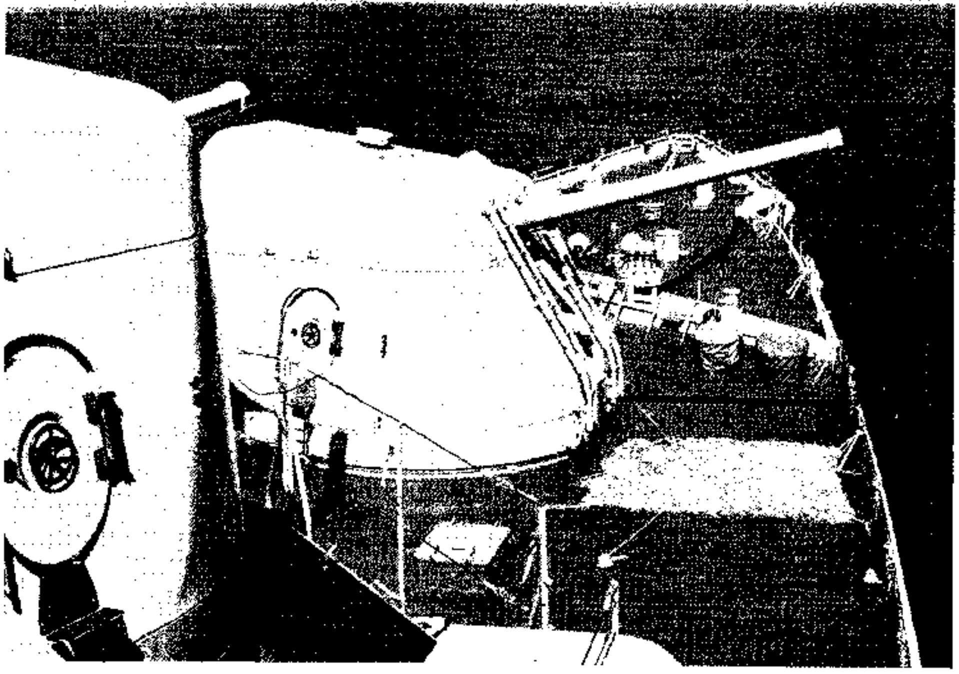
The reloading, feeding, loading and firing sequence is controlled by a control console operated by a single man.

The electrically-operated remote control servo-system is of modular construction using controlled rectifiers. The modules are the same as those used on other modern OTO Melara weapon systems.

Optionally, the mount can also be fitted with a stabilised line of sight local control system. The main technical features are the light alloy construction, the compact installation, and the light weight control mechanism.

The barrel is fitted with a multi-muzzle brake. The shield is of fibreglass and is watertight.

CHARACTERISTICS:
Calibre: 127 mm
Weight: 34 tons
Rate of fire: 45 rounds per minute



127/54 OTO Single Barrel Naval Mount

Ready ammunition: 66 rounds (3 × 22)
Trunnion thrust: 24,000 kg
Elevation: Maximum: 85°. Minimum: −15°
Traverse: 330°
Elevating speed: 30°/sec
acceleration: 40°/sec^2
Traverse speed: 40°/sec
acceleration: 45°/sec^2

STATUS:
In production.

COUNTRIES SUPPLIED:
Italian and Canadian Navies.

MANUFACTURER:
OTO Melara, Via Valdilocchi, 15 La Spezia, Italy.

5532.203
SINGLE 76/62 OTO M.M.I. GUN MOUNTING

DESCRIPTION:
The 76/62 OTO M.M.I. single barrel automatic gun has been developed to a Government contract as a secondary armament for use on board ships of the frigate and corvette type as a dual-purpose anti-aircraft and anti-ship weapon system.

The gun is a single barrel, water-spray cooled, on a powered mounting. It is protected by a watertight splinterproof shield, which also houses the one man required to direct the gun. Great efforts have been made to reduce the crew, and all operations are performed automatically.

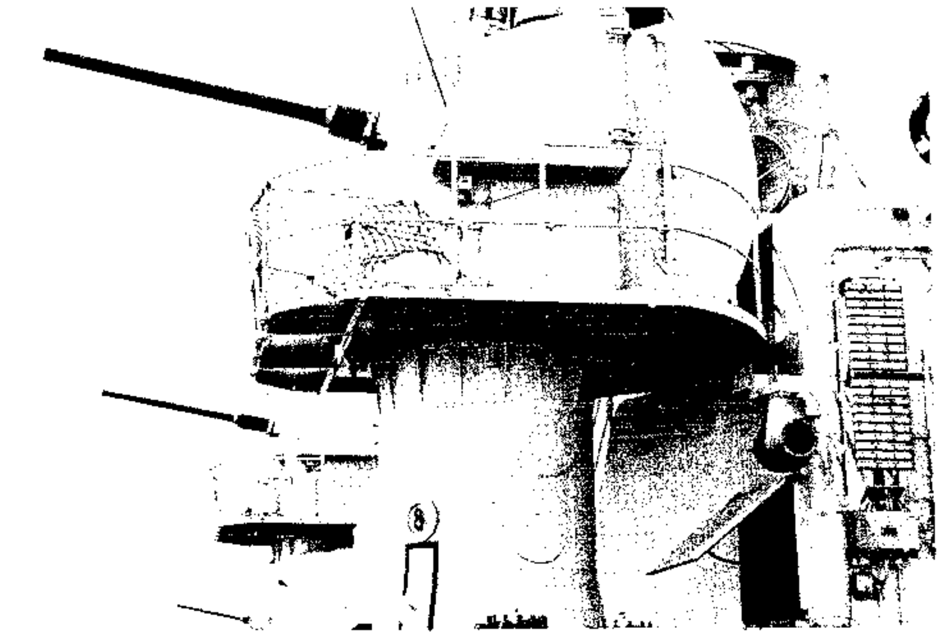
Ammunition is fed from the magazine up to the loading trays, from where it is rammed into the breech. This feed system can vary in length from a minimum of 2.50 metres to a maximum of 11 metres, and will therefore accommodate a wide range of alternative deck and magazine locations.

The gun has a high rate of fire for its calibre, the maximum being about 60 rounds per minute. Ammunition is fixed, and the empty cases are ejected automatically.

Elevation and traverse is by electric and hydraulic control, with an emergency manual operation. The whole system can be controlled remotely or the Fire Director can exercise local control from his position beside the gun.

Reloading of the ammunition system requires a maximum of three men. They receive ammunition from the magazine and stack it on a lower platform below rotating the gun mounting. From here it is automatically fed through an elevating duct to another platform just below the gun, and the final movement to the loading tray is by oscillating arms.

Development of this gun system began in 1958, the first prototype was completed in 1961, and the first production models entered service in 1962.



OTO 76/62 M.M.I. Single gun mountings

CHARACTERISTICS:
Calibre: 76 mm
Overall Weight: 12 tons
Rate of Fire: 55 to 65 rpm
Ready to Fire Rounds: 59
Elevation: $-15°$ to $+85°$
Traverse: 360°
Elevation Speed: 40°/sec
Traversing Speed: 70°/sec
Elevation Acceleration: 70°/sec^2
Traversing Acceleration: 100°/sec^2

STATUS:
84 in service with the Italian Navy. No longer in production and not available from the manufacturers.

5533.203
SINGLE 76/62 COMPACT GUN MOUNTING

DESCRIPTION:

The 76/62 OTO compact is a light, small calibre gunmount intended for installation in ships of any type and class down to motor gun boats and hydrofoils as a dual purpose anti-aircraft and anti-ship weapon system.

The gun and mounting was developed from the 76/62 OTO M.M.I. mounting (**5532.203**), the design study being started in 1964, and the first production units came into service in March 1969.

The mounting may be considered in two parts, the shank which is below the weather deck, and the turret which is installed on deck. The shank contains the ammunition feed system, which consists of a rotating platform and a hoist.

The gunhouse holds a loading tray, loading arms, and a feed drum. The hoist and feed system is very simple and reliable, but well able to maintain a high rate of fire. Individual rounds of ammunition are hoisted in a series of short movements rather than long continuous travel with the object of reducing accelerations on the moving parts and the round itself.

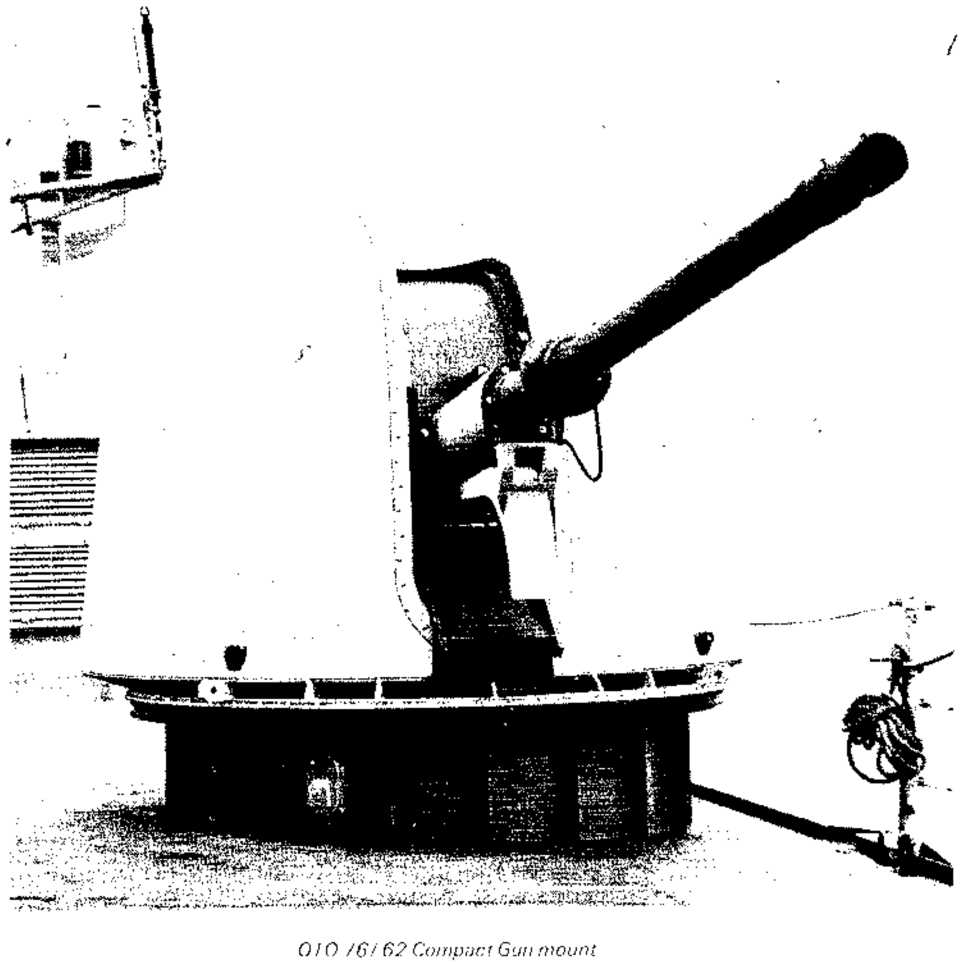
The lower platform will hold up to 80 rounds ready to fire, and the rate of fire is adjustable from 10 to 85 rounds per minute.

Generally, the system is controlled remotely, optionally it can also be fitted with a stabilised line of sight local control system.

The mount is fitted with modular servo-systems of very light weight using electric motors with controlled rectifiers, for both training and elevating motion. With remote control, the gun can be readily laid onto fast moving targets such as aircraft and retained in lay despite severe ship movement in all planes. The response time of the servos is fast, and accelerations on the gun can be quite high. There is an emergency local control.

The shield is made of fibreglass, and is watertight. It offers complete protection against nuclear fall-out. The gun barrel has a small multi-hole muzzle brake and a fume extractor.

STATUS:
Presently being manufactured in series for Italy, Federal German Republic, Venezuela, Denmark and Argentina.



OTO 76/62 Compact Gun mount

CHARACTERISTICS:
Calibre: 76 mm
Overall weight: 7.5 tons
Rate of fire: 85 rounds per minute
Maximum trunnion thrust: 7,000 kg
Elevation: Maximum: 85°. Minimum: $-15°$
Traverse: unlimited
Elevation Speed: Maximum. 35°/sec
acceleration: 72°/sec^2
Traverse speed: Maximum. 60°/sec
acceleration: 72°/sec^2

MANUFACTURER:
OTO Melara, Via Valdilocchi, 15, La Spezia, Italy.

6068.203
QUADRUPLE 40/56 BOFORS GUN MOUNTING

This multi-barrelled Bofors 40 mm 56 calibre gun mounting is found on the two destroyers *Impetuoso* and *Indomito*.

These two destroyers may be converted to carry Tartar missiles. If and when this happens the present four American 5-inch 38 calibre guns (**6026.203**) will be replaced by two OTO Melara guns of the same calibre and the Bofors guns by four OTO 3-inch (76 mm) guns.

2557.203
BREDA/BOFORS NAVAL MOUNTINGS

DESCRIPTION:

In collaboration with Bofors in Sweden, Breda Meccanica Bresciana make a range of single and twin naval anti-aircraft gun mountings incorporating a variety of different automatic feed systems. They also make some similar mountings for mobile use on land.

Set out in the following entries are brief details of current mountings. All use the 40 mm L/70 increased rate of fire pattern of Bofors gun (**2360.203**) which has the following general characteristics (which are not repeated in the individual entries below).

Calibre: 40 mm
Barrel length: 70 calibres
Weight of shell: 0.96 kg
MV: 1,005/m sec (range 12.5 km maximum)
Rate of fire: 300 rounds/min (per barrel)
Train: unlimited
Elevation: $-10°$ to $+85°$

STATUS:

As noted below. Mostly in service.

MANUFACTURER:

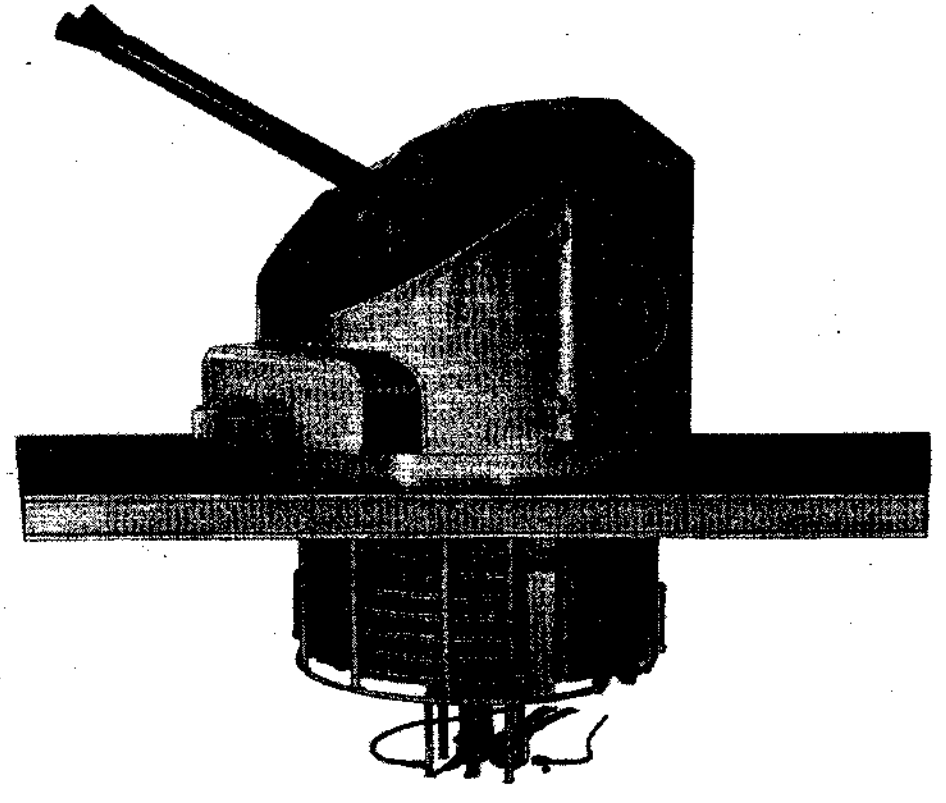
Breda Meccanica Bresciana, Via Lunga 2, 25100 Brescia, Italy.

2258.203
BREDA COMPACT TWIN 40 mm L/70 NAVAL MOUNTING TYPE 70

DESCRIPTION:

This twin 40 mm L/70 naval mounting has been developed by Breda Meccanica Bresciana in close cooperation with Bofors in Sweden as part of the Breda/Bofors System 75 (see also entry **2349.131**) which is particularly intended for point defence against aircraft and anti-ship missiles.

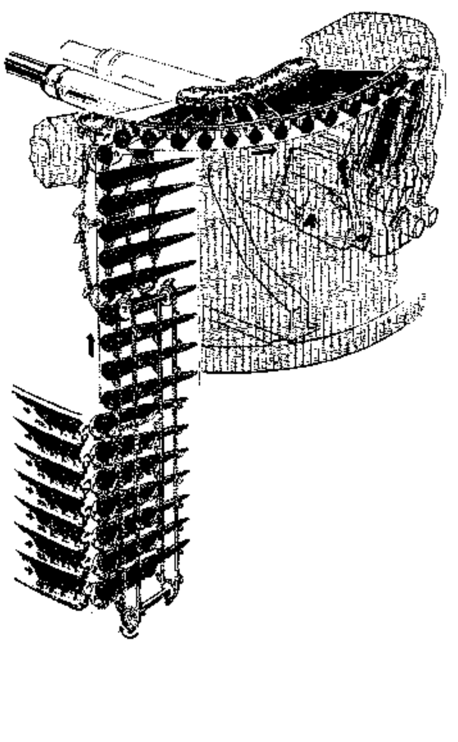
Claimed to be the lightest and smallest 40 mm mounting currently available, the compact mount is fully automatic in operation, employs new remote controlled servo-systems of high performance to improve accuracy – which is also improved by the reductions in weight, inertia and recoil disturbance resulting from the exceptionally small separation between the two barrels – and features a high rate of fire and a substantial supply of ready-use ammunition.



Breda Compact Twin 40 mm Naval Mounting

CHARACTERISTICS:

Calibre: 40 mm
Barrel length: 70 calibres
Max recoil: 250 mm
Elevation: $-13°$ to $+85°$
Traverse: unlimited
Elevation rate: 90°/sec
Traverse rate: 90°/sec
Elevation acceleration: 120°/sec^2
Traverse acceleration: 120°/sec^2
MV: 1,000 m/sec
Range: maximum: 12.5 km; maximum altitude 8,500 m
Rate of fire: 300 rounds/barrel/min
Ready rounds: 736 or 440
Weights:
Unloaded mounting: for 440 rounds: above deck 5.0 t; below 4.7 t
for 736 rounds: above deck 5.5 t: below 5.0 t
Loaded mounting: with 440 rounds: above deck 6.1 t; below 5.8 t
with 736 rounds: above deck 7.3 t: below 6.8 t
Heights:
Gun mounted on deck: 2.30 m; with 440 round loader: 2.92 m; with 736 round loader 3.29 m. Loader below deck: 0.94 m for 440; 1.32 m for 736 rounds
Swept radius: 3.0 m



Method of operation of the ammunition hoist of the Breda Compact Mounting

STATUS:

The mount is being installed on ships currently under construction in an Italian shipyard.

MANUFACTURER:

Breda Meccanica Bresciana SpA, Via Lunga 2, 25100 Brescia, Italy.

2556.203
TWIN 40 mm NAVAL MOUNTING TYPE 64

DESCRIPTION:

This is a sophisticated Breda / Bofors mounting comprising two 40 mm L/70 guns and twin 100-round automatic magazines. It can be controlled remotely or locally. A graticule, Mirasole or NIFE reflection sight can be fitted.

CHARACTERISTICS:

Generally as other 40 mm L/70 mountings.

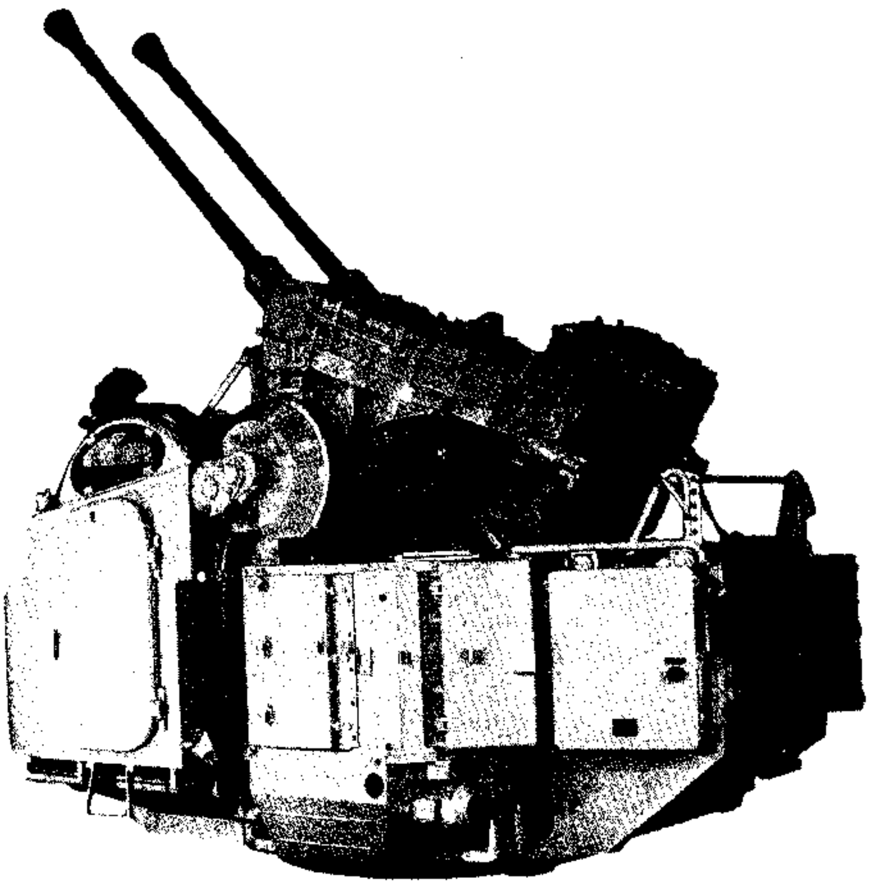
Total weight: excluding ammunition 7,900 + 150 kg
Training speed: 85°/sec minimum
Elevation speed: 95°/sec minimum
Training acceleration: 110°/sec^2 minimum
Elevation acceleration: 125°/sec^2 minimum
Power requirement: 6 kW each for training and elevation motors plus 1.6 kW for the feeder motor

STATUS:

Production.

MANUFACTURER:

Breda Meccanica Bresciana, Via Lunga 2, 25100 Brescia, Italy.



Breda / Bofors twin mounting Type 64

2558.203
TWIN 40 mm NAVAL MOUNTING TYPE 106

DESCRIPTION:

This Breda/Bofors 40 mm L/70 mounting comprises two guns and two 32-round magazines. It can be controlled remotely, locally – by means of the "cloche" on the left of the mount – or manually. Ammunition feed may be either automatic by means of the Breda 32-round feeder or manually by inserting a 4-round charger into the auto-loader of the elevating mass. The aiming device is either the NIFE type SRS-5 or the Mirasole line-of-aim type.

CHARACTERISTICS:

Generally as for other 40 mm L/70 mountings.

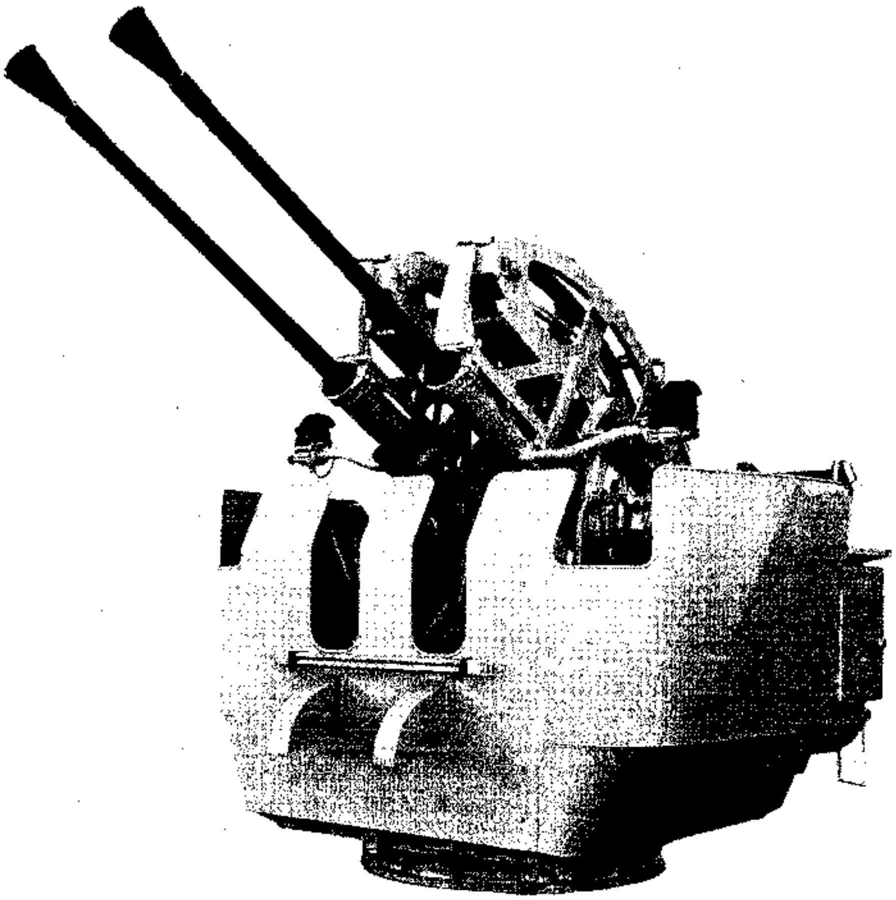
Gun weight: with feeder and battery, less ammunition 6/510 + 100 kg
Training speed: 95°/sec
Elevation speed: 95°/sec
Acceleration: 125°/sec^2
Power required: Elevation and training 4 kW each.
Recoil force: 2 × 2,700 kg

STATUS:

In production and service.

MANUFACTURER:

Breda Meccanica Bresciana, Via Lunga 2, 25100 Brescia, Italy.



Breda / Bofors twin mounting with 32 round magazines

2554.203
SINGLE 40 mm NAVAL MOUNTING TYPE 564

DESCRIPTION:

This mounting differs from earlier Breda versions of the Bofors L/70 gun in being equipped with a Model 1971 144-round automatic feed of compact design. This permits a more effective use of the gun's high rate of fire and reduces the number of men required on the mount to two – with a third at standby near the mount to reload the automatic feed. This reloading operation can obviously be carried out during lulls in the firing; but with a little practice it is possible to reload while the gun is firing.

A further advantage of this feed system is that it can be fitted retrospectively to gun mountings which incorporate earlier types of feed. Complete modification kits to enable a purchaser having access to reasonable engineering facilities to arrange for the modification to be carried out, under Breda supervision, at any convenient location.

CHARACTERISTICS:

Generally as for other 40 mm L/70 gun mountings.
Gun weight: with automatic feeder and with battery but excluding ammunition—3,300 + 100 kg
Training speed: local or remote control—80°/sec
Elevation Speed: local or remote control—45°/sec
Training acceleration: 120°/sec^2
Elevation Acceleration: 130°/sec
Power Consumption: 6 + 8 kW

STATUS:

In service and in production.

MANUFACTURERS:

Breda Meccanica Bresciana SpA, Via Lunga 2, 25100 Brescia, Italy

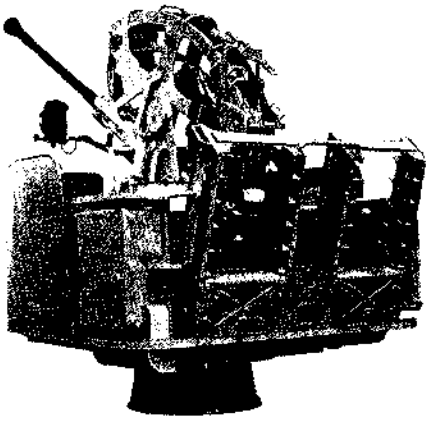
Type 148 missile boat (Federal German Republic) with Breda/Bofors Type 564 mounting aft

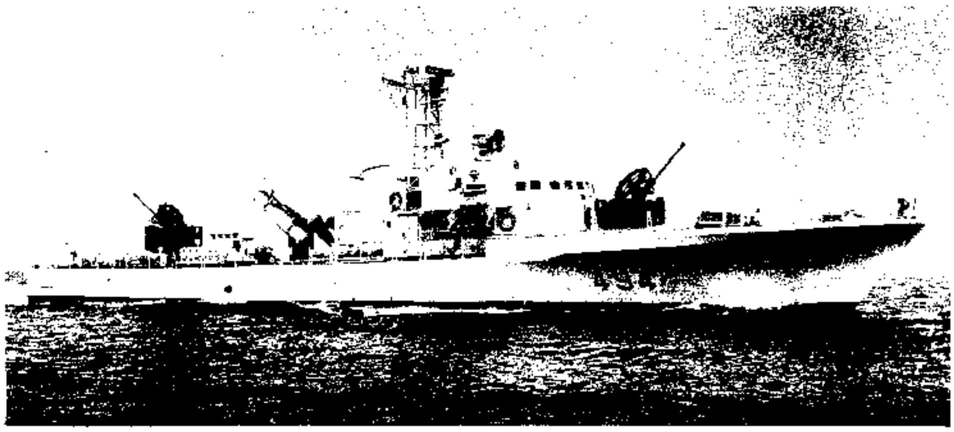
2555.203
SINGLE 40 mm NAVAL MOUNTING TYPE 107

DESCRIPTION:

This Breda/Bofors mounting comprises a single 40 mm L/70 gun and a 32-round magazine feed. It can be controlled remotely, locally – by means of the "cloche" on the left of the mount – or manually. Ammunition feed may be either automatic by means of the Breda 32-round feeder or manually by inserting a 4-round charger into the auto-loader of the elevating mass. The aiming device is either the NIFE type SRS-5 or the "Mirasole".



40 mm Breda/Bofors Mounting Type 107



40 mm Breda/Bofors guns on the FPB Saetta *of the Italian Navy. Missile launcher is for Sea Killer Mk I*

CHARACTERISTICS:
Generally as for other 40 mm L/70 mountings
Gun weight: with feeder and battery, less ammunition 3,610 + 100 kg
Training speed: 95°/sec
Elevation speed: 95°/sec
Acceleration: 125°/sec^2
Power required: Elevation and training 4 kW each
Recoil force: 2,700 kg

STATUS:
In production and service.

MANUFACTURER:
Breda Meccanica Bresciana, Via Lunga 2, 25100, Brescia, Italy.

5535.203
TWIN 35 mm OE/OTO GUN MOUNTING

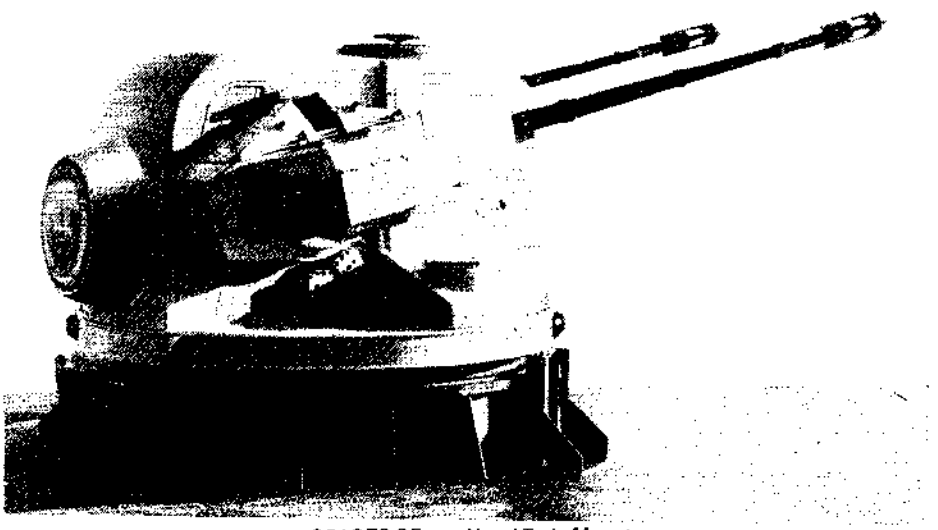
DESCRIPTION:
The 35 mm OE/OTO mounting has been produced as a private venture and is intended for use in any type of ship down to motor gun boats and hydrofoils, or as local defence for merchant ships in time of war. It is primarily for close anti-aircraft defence, with a secondary anti-ship and anti-shore role.

Two types of turret have been designed the first for installation above the weather deck thus not utilising any room below deck; and the second for installation with the shank below deck level. For each type there are three fire control systems: a remote control, a local control with sight for optical tracking, and a radar and computer in an integrated system with a sight for optical tracking.

The mounting utilises a high proportion of light alloys in its construction, this having been a feature of the 3 inch and 5 inch OTO Mountings. The shield is made of fibreglass and is watertight.

The mounting, as the 3 inch and 5 inch OTO, is fitted with modular servo-systems of very light weight using electric motors with controlled rectifiers developed by OTO Melara.

The Oerlikon gun has a high rate of fire and is belt fed. An interesting feature is that two belts are fed to each gun, and either may be selected in about 2 seconds. Thus the mounting can switch very rapidly from firing, say, anti-aircraft ammunition to armour-piercing. Each gun is provided with EVA at the muzzle to measure muzzle velocity, and this information is fed back into the computer to permit corrections in laying to be applied.



OE/OTO 35 mm Naval Twin Mount

STATUS:
Private Venture – prototype under evaluation trials.

CHARACTERISTICS:
Calibre: 35 mm
Barrel length: 90 calibres (3.150 m)
Maximum recoil: 60 mm
Range—max: 5,000 m (aerial targets)
6,000 m (surface targets)
Elevation: —15° to +85°
Traverse: unlimited
Elevating speed: maximum: 70°/sec
Traversing speed: maximum: 120°/sec
Elevating acceleration: 130°/sec^2
Traversing acceleration: 160°/sec^2
Crew: 3 (2 loaders, 1 layer, if not remotely controlled)

MANUFACTURER:
OTO Melara, Via Valdilocchi, 15, La Spezia, Italy.

2261.203
TWIN 35 mm ANTI-AIRCRAFT GUN MOUNTING (ITALY)

DESCRIPTION:
The twin 35 mm AA gun mounting type GDM-A using the Oerlikon gun type KDC is described in entry number **6036.203** (Switzerland) over the name of the parent manufacturing company, Oerlikon-Bührle of Zurich.

The same mounting is also available from Oerlikon Italiana. No differences between the two mountings are known.

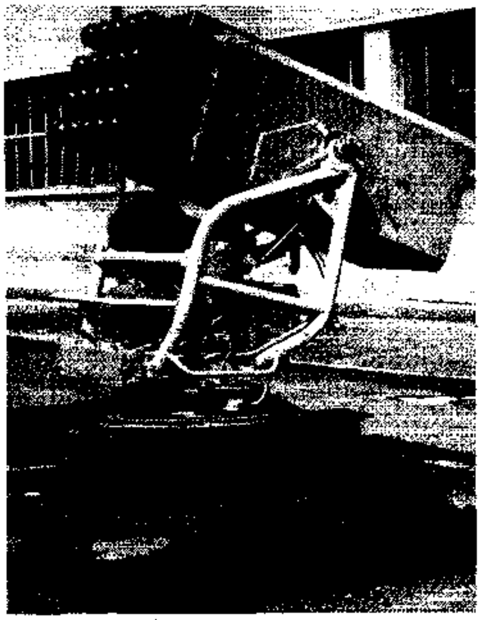
MANUFACTURER:
Oerlikon Italiana SpA, Via Scarsellini 14, Milan, Italy.

2278.203
MULTI-PURPOSE CHAFF/FLARE ROCKET LAUNCHER

DESCRIPTION:
Designed primarily for electronic warfare applications, but capable of being used for other purposes, and described as a third-generation device, this is a servo-controlled mounting which can be trained and elevated by remote control and on which is mounted a multi-tube launcher assembly for 105 mm rockets.

Both the mounting and the individual launch-tubes are remotely controlled from a console of sophisticated design. The twenty rockets can be fired in various sequences or in accordance with a fixed programme. Either chaff or flare rockets are normally used: the launcher could, of course, also fire similar rockets with HE warheads but so far as is known this has not been done (see, however, entry **2279.203** below).

MANUFACTURER:
Breda Meccanica Bresciana, Via Lunga 2, 25100 Brescia, Italy.



Multi-Purpose Chaff/Flare rocket launcher

2279.203
SCLAR MULTI-PURPOSE NAVAL ROCKET SYSTEM

DESCRIPTION:
SCLAR is a shipboard system for launching illuminating rockets and long-range or short-range chaff dispensing rockets. It can also be used for rockets with HE warheads.

Rockets are launched from tubes mounted in a 20-tube launcher which can be elevated and trained by remote control. The complete SCLAR system includes the Elsag fire control sub-system from which this remote control is exercised.

The rockets are of 105 mm calibre and are fin-stabilised, there being four fins on the short-range and six on the long-range rockets. These light alloy fins are pivoted so that they can be folded up flat against the rocket casing when inserted in the launch tube after launch they are twisted downwards and outwards by aerodynamic forces, settling firmly in position for the flight. Two types of chaff rocket are available for short and long-range operation, their lengths being 1,142 mm and 1,849 mm and weighs 18.4 kg and 27.0 kg respectively, and one type of illuminating rocket (long) is used. HF rockets are not available as standard but can be supplied if required and the warhead weight for all rockets is 10.2 kg. Rockets are fired electrically by remote control. Maximum ranges are 2,100 m and 11,600 m.

MANUFACTURERS:
Rockets: Snia Viscosa—BPD Division SpA, Via Lombardia 31, Rome, Italy.
Launcher: Breda Meccanica Bresciana SpA, Via Lunga 2, 25100 Brescia, Italy.
Fire Control: Elettronica San Giorgio SpA, Via Hermada 6, Genova-Sestri, Italy.

NORWAY

2299.203
NORWEGIAN NAVAL GUNS

The full extent of Norwegian involvement in naval gun manufacture is not known. It is known, however, that the Bofors single 3-inch (76 mm) automatic gun mounting (which is installed on the Norwegian "Storm" class fast patrol boats) is made, by arrangement with Bofors, in Norway (see entry **2302.203**).

It is possible that other Bofors guns, which are fitted in many Norwegian ships, may be made or modified in Norway.

MANUFACTURERS:
A/S Kongsberg Vaapenfabrikk, Postboks 25 3601 Kongsberg, Norway.

Norwegian "Storm" class fast patrol boat with Bofors 3 inch gun forward and power-operated 40 mm gun aft

SPAIN

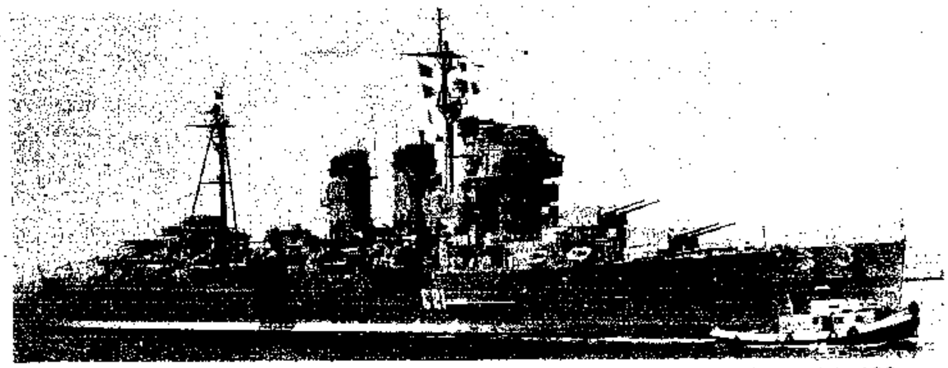
6058.203
TWIN 8-inch GUN MOUNTING

DESCRIPTION:
Slightly smaller than the 8-inch (203 mm) guns of the US Navy these are the second heaviest naval guns in service.

Fitted as four twin turrets in the heavy cruiser *Canarias*, these 50-calibre guns are of a design that was first introduced by Vickers in 1924. The *Canarias* was built by the Sociedad Española de Construction Naval, El Ferrol, was laid down in 1928, launched in 1931 and completed in 1936. Her design was basically that of the contemporary British "Kent" class cruisers.

A notable feature of the gun at the time of its construction was the maximum elevation capability of 70 degrees—comparing favourably with the contemporary US 8-inch gun of only 40 degrees. The later US 55-calibre gun (1944 model) had an elevation capability of 80 degrees.

Projectile weight for these guns is about 113 kg and the muzzle velocity is about 840 m/sec. Maximum range is about 30 km (16 nm) and rate of fire 6 rounds per minute.



The heavy cruiser Canarias. *Her 8-inch guns are mounted in twin turrets fore and aft, the eight 120 mm guns are mounted in single mountings four on each side.* (Official Spanish Navy Photograph)

STATUS:
Operational but weapon no longer available.

6060.203
TWIN 120 mm GUN MOUNTING

DESCRIPTION:
These 50-calibre semi-automatic 120 mm guns are fitted in the "Oquendo" type anti-submarine destroyers. They are of Spanish manufacture. Some of the "Oquendo" class were modified before completion to take 5-inch (127 mm) 38 calibre American guns.

Forward twin 120 mm gun mounting on the Oquendo *anti submarine destroyer.* (Official Navy photograph)

6059.203
SINGLE 120 mm AA GUN MOUNTING

DESCRIPTION:
Eight single 120 mm 45 calibre AA guns are mounted on the heavy cruiser *Canarias*. Like the cruiser's 8-inch guns, these are also of Vickers design, dating from 1923. Maximum elevation is 90° and aircraft can be engaged at heights up to 10 000 metres and slant ranges up to 16,000 metres. Projectile weight is 22 kg, muzzle velocity about 820 m/sec and rate of fire 9 rounds per minute. The guns can be seen in the illustration accompanying entry **6058.203** above.

MANUFACTURERS:
Vickers Ltd, Shipbuilding Group, Barrow Engineering Works, Barrow in Furness, Lancashire, England.

6061.203
SINGLE 120 mm AA GUN MOUNTING

DESCRIPTION:
This gun was installed as the principal weapon of the first "Bidasoa" class fleet minesweepers which were of the same design as the German M Boote 40. Some of these vessels were fitted with an 88-mm gun in place of the 105 mm weapon.

The 105 mm guns were made by Krupp and are of a design first introduced in 1933. The gun can be elevated to 90°, fires a 17.5 kg projectile with a muzzle velocity of 900 m/sec and can engage targets at heights up to 12,500 metres and slant ranges up to 17,500 metres. Rate of fire is 20 rounds per minute.

105 mm gun mounted on the "Bidasoa" class fleet minesweeper Lerez. (Official Spanish Navy photograph)

2303.203
SINGLE 3 inch (76 mm) 50-CALIBRE GUN MOUNTING MARK 34
DESCRIPTION:
This is an American-designed weapon built in Spain and mounted on destroyers and frigates of the Spanish Navy. Details of this mounting and of the American-designed and built twin Mk 33 mountings, which are also mounted on Spanish destroyers and frigates, will be found in entry **6030.203**, but the main data for the Mk34 are recapitulated below.
Mount weight: 7,700 kg
Range: 13 km (7 nm, 14,000 yds)
Projectile weight: 6 kg
Rate of fire: 45 rounds/min
STATUS:
Operational.
MANUFACTURER:
Fabrica de Artilléria, Sociedad Española de Construcción Naval, San Fernando, Spain.

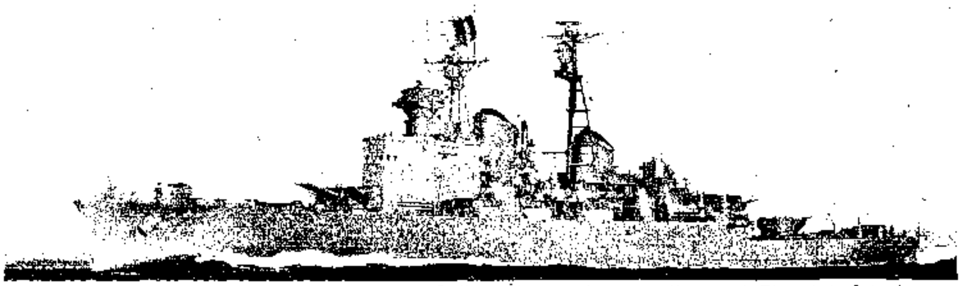
2304.203
40 mm L/70 LIGHT ANTI-AIRCRAFT GUN
DESCRIPTION:
This is a version of the Bofors L/70 gun (**2360.203**) built under licence in Spain. It is understood that the design used is that of the original version of the 40/70 weapon and that it has the characteristics set out below.

CHARACTERISTICS:
Calibre: 40 mm
Barrel length: 70 calibres
Elevation: 10° to +90
Elevation speed: 45°/sec
Traverse speed: 85°/secs unlimited
Range: 12 km maximum
Rate of fire: 240 rounds/min
Weight: 2.5 t
Power consumption: 220 V dc: 8 kW
24 V dc: 0.2 kW
110 V ac 50 c/s: 2KVA
120 V ac 400 c/s: 0.25 KVA
STATUS:
Operational in ships of the Spanish Navy.
MANUFACTURER:
Empresa Nacional Bazán, San Fernando, Spain.

6084.203
SINGLE 37 mm AA GUN MOUNTING
DESCRIPTION:
Like the Krupp 105 mm gun (**6061.203**) this 50-calibre AA gun is to be found on the *Eolo* class frigate minelayers and the *"Bidasoa"* class fleet minesweepers of the Spanish Navy.
Built to a Krupp design dating from 1932 the gun has a maximum elevation angle of 70°, fires a 0.9 kg projectile with a muzzle velocity of 830 m/sec and can engage targets flying at heights up to 3,000 metres and slant ranges up to 4,000 metres. Rate of fire is 80 rounds per minute.

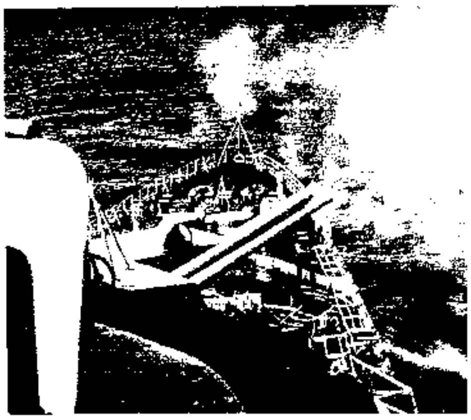
SWEDEN

6070.203
TRIPLE 6-inch GUN MOUNTING
DESCRIPTION:
These 6-inch (152 mm) Bofors guns were first introduced in 1942 and are now to be found as a triple mounting only in the cruiser *Latorre* of the Chilean Navy (formerly the *Göta Lejon* of the Royal Swedish Navy). This ship is the survivor of two cruisers programmed in 1941, laid down in 1943, launched in 1945 and completed in 1947.
Projectile weight is 46 kg, muzzle velocity 900 m/sec and range 26 km (14 nm). A rate of fire of 10 rounds per barrel per minute can be achieved.
MANUFACTURER:
AB Bofors, Bofors, Sweden.

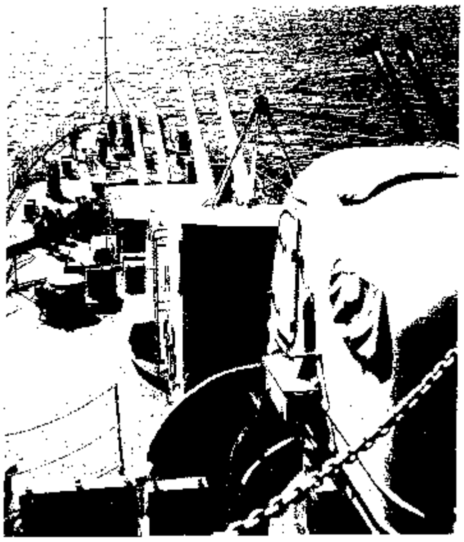


The cruiser Göta Lejon *(now transferred to the Chilean Navy and renamed* Latorre*). The triple 6-inch gun mounting forward can be seen clearly in this picture, less clearly seen are the two twin mountings aft.* (Official Royal Swedish Navy Photograph)

6085.203
TWIN 6-inch GUN MOUNTING
DESCRIPTION:
The Bofors 6-inch guns described in entry **6070.203** above are to be seen as twin mountings in the *Latorre* (two twin mountings aft) and in the cruisers *Almirante Gran* of the Peruvian Navy (formerly the *De Ruyter* of the Royal Netherlands Navy) and *De Zeven Provincien* of the Royal Netherlands Navy. It appears that in these mountings the guns can be elevated only to 60° – as compared with the 70° mentioned for the triple mount. There may be a genuine difference here, but it seems rather more likely that one of the figures is wrong. Conversely, the same source credits the 6-inch guns of the two Dutch cruisers with a rate of fire of 15 rounds per minute.
The guns are fully automatic and radar controlled
MANUFACTURER:
AB Bofors, Bofors, Sweden.

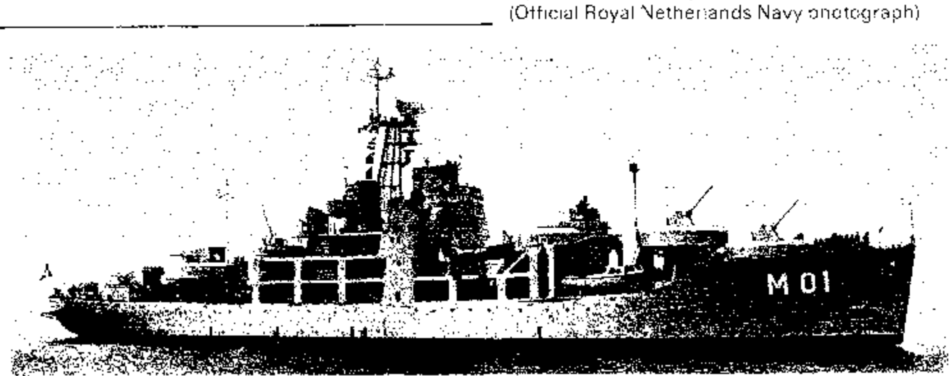


6-inch guns at firing practice (Official Royal Netherlands Navy photograph)



6-inch guns on a cruiser of the Royal Netherlands Navy. Guns in the foreground are of 57 mm calibre (Official Royal Netherlands Navy photograph)

6069.203
SINGLE 6-inch GUN MOUNTING
DESCRIPTION.
Two of these guns are mounted in the minelayer/training ship *Alvsnabben*, which formerly carried four – the two forward guns having been replaced by Bofors 57 mm AA guns. The ship was completed in 1943 and the guns are probably basically the same as those in the *Latorre* (**6070.203**).



The minelayer/training ship Alvsnabben. *The forward guns are Bofors 57 mm AA, the two larger mountings aft are for the single 6 inch guns*

6086.203
TWIN 120 mm DUAL-PURPOSE AUTOMATIC GUN MOUNTING

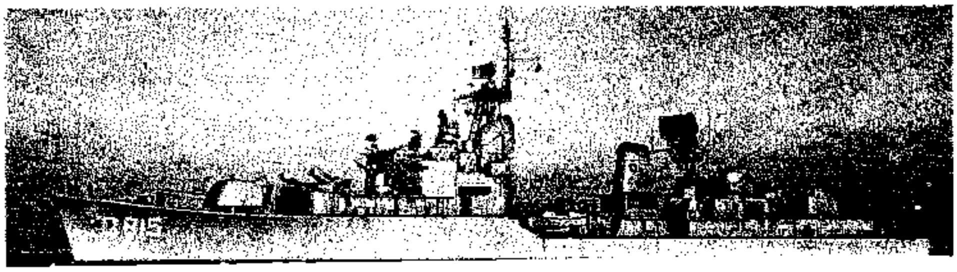
DESCRIPTION:

These 50-calibre Bofors 120 mm guns are mounted in twin mounts on the "Halland" class destroyers of the Royal Swedish Navy and on the "Halland" and "Friesland" class anti submarine escorts of the Royal Netherlands Navy.

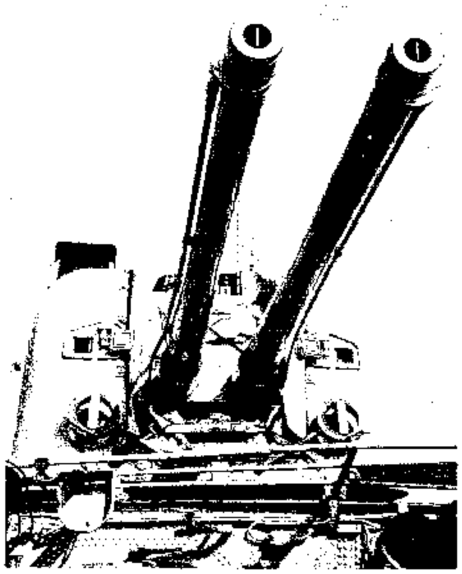
Introduced in 1950, the guns are fully automatic and radar controlled. They fire projectiles weighing 23.5 kg with a muzzle velocity of about 850 m/sec and can engage targets at ranges up to 20.5 km (11 nm) and heights up to 12,500 metres (at 85° elevation). Rate of fire is 40 rounds per barrel per minute. The complete twin mounting weighs 67 tons.

MANUFACTURER:

AB Bofors, Bofors, Sweden.



The "Friesland" class anti-submarine destroyer Overijssel *with twin 120 mm dual-purpose gun mountings fore and aft*



Twin 120 mm gun mounting
(Official Royal Netherlands Navy photograph)

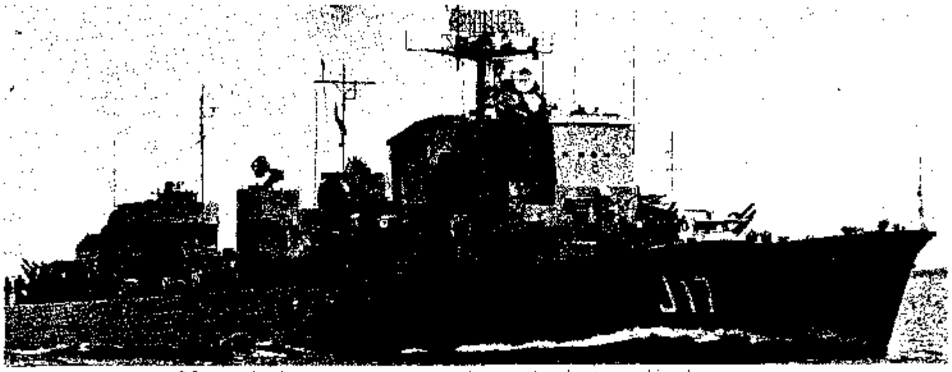
6074.203
TWIN 120 mm DUAL-PURPOSE SEMI-AUTOMATIC GUN MOUNTING

DESCRIPTION:

These guns are installed in the "Oland" and "Ostergötland" class destroyers of the Royal Swedish Navy. They are semi-automatic and mounted in lightly-armoured turrets. The guns can be elevated to 80 degrees and fire a 23.5 kg shell with a muzzle velocity of 850 m/sec. Range is about 19 km (10 nm) against surface targets and aircraft can be engaged up to 13,000 metres. Rate of fire is 20 rounds per minute.

MANUFACTURER:

AB Bofors, Bofors, Sweden



120 mm dual-purpose gun mounting on the destroyer Uppland
(Official Royal Swedish Navy Photograph)

6073.203
SINGLE 120/46 AUTOMATIC GUN MOUNTING

DESCRIPTION:

The Bofors L/46 120 mm Automatic Gun is designed for use against both surface and airborne targets and has a very high rate of fire.

Housed in a 4 mm steel turret mount the gun has two magazines, mounted on the elevating cradle, which are manually filled from a fixed-structure motor-driven rod hoist. Electro-hydraulic remote control is standard with the alternative of gyro-stabilised one-man local control. Telescopic sights are also fitted and the hoist and the elevation and traverse mechanisms can be operated by hand. The gun barrel is liquid cooled and has an exchangeable liner.

HISTORY:

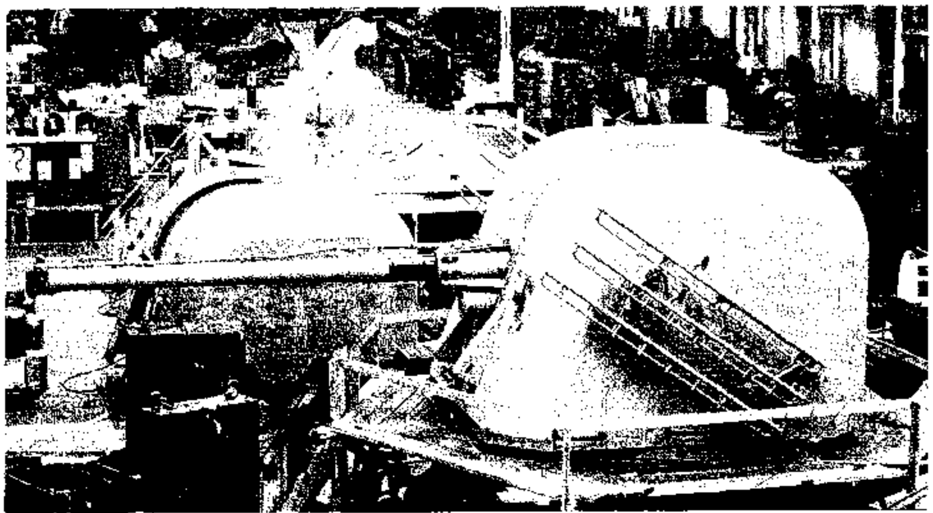
Bofors started work on this gun as a private venture in 1963 and the prototype was test-fired in 1967. It is not in regular production but is supplied to special order. It has been manufactured for the Finnish Navy for use in their "Turanmaa" class frigates, in which it has been in service since 1968.

MANUFACTURER:

AB Bofors, Bofors, Sweden.

CHARACTERISTICS:

Weight (excluding ammunition): 28.5 tons
Traversing speed: 40 deg/sec
Elevating speed: 30 deg/sec
Traverse limits: Unlimited
Elevation limits: −10 to +80 deg
Power Supplies: 440 V, 3-phase, 60 Hz
Power consumption: (Mean when firing): 60 kW
Number of rounds in magazine: 52
Rate of fire: 80 rounds/min
Weight of round: 35 kg
Weight of shell (HE): 21 kg
Weight of charge: 3.15 kg
Muzzle velocity: 1800 m/sec
Time of flight to 10 km: 21.7 sec
Range: 18.5 km

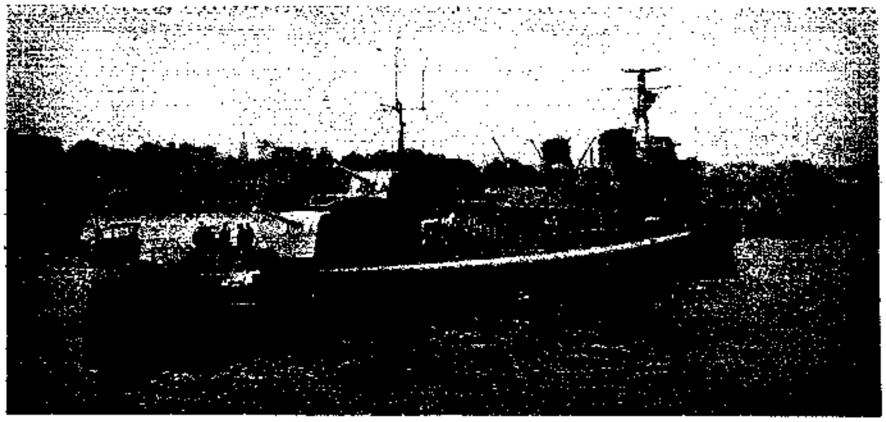


Bofors 120 mm 46 calibre gun on the assembly line

6071.203
SINGLE 120 mm DUAL-PURPOSE GUN MOUNTING

DESCRIPTION:

This gun mounting is found on some of the older fast anti-submarine frigates of the Royal Swedish Navy—the *Karlskrona* and some of the "Visby" class. Of pre war Bofors design it has long been superseded by more modern weapons. The gun is believed to be the 1934 pattern 50-calibre weapon which fires a 24 kg projectile with a muzzle velocity of 900 m/sec, has a range of 20 km (11 nm), and has a rate of fire of 12 rounds per minute.



Two of the three single 120 mm dual-purpose gun mountings on the fast anti-submarine frigate Karlskrona

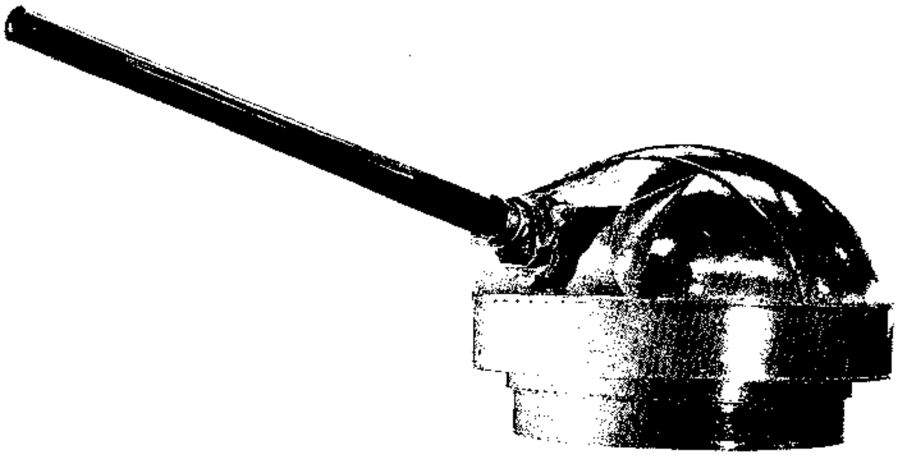
2362.203
SINGLE 3-inch AUTOMATIC GUN MOUNTING

DESCRIPTION:

The Bofors L/50 3-inch (76 mm) Automatic Gun is designed for surface fire.

This is a sturdy, simple, remotely-controlled single gun. Weighing only 6,500 kg and requiring only two loaders in the ammunition room, it is suitable for installation in small ships and is currently in service on "Storm" class fast patrol boats of the Norwegian Navy.

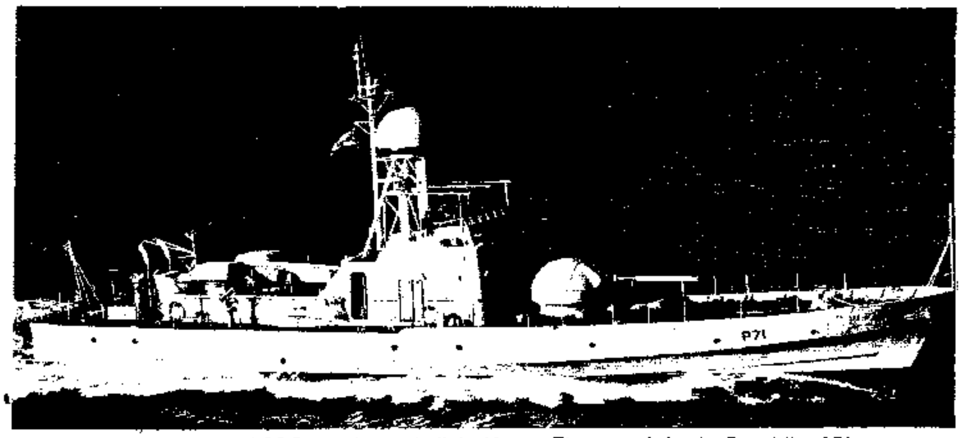
Electro-hydraulic remote control is used. The gun is mounted in a 6 nm steel gun house and has a fixed motor-driven hoist with lifting link levers and 5-round feed device. The gun has a monobolic barrel.



Bofors 3-inch automatic gun

STATUS:

Designed and developed as a private venture by Bofors, this gun was first conceived in 1962 and went into service with the Norwegian Navy in 1965.



Bofors 3-inch gun on RSS Sovereignty, *built by Vosper Thornycroft for the Republic of Singapore*

CHARACTERISTICS:

Weight, excluding ammunition: 6.5 tons
Traversing speed: 25 deg/sec
Elevating speed: 25 deg/sec
Traverse limits: +175 deg
Elevation limits: —10 to +30 deg
Power supplies: 440 V 3-phase 60 Hz
Power consumption: Mean when firing: 12 kW
Number of rounds in hoist and ammunition room: 100
Rate of fire: 30 rounds/min
Weight of round: 11.3 kg
Weight of shell: (H.S. Mk 27): 5.9 kg
Weight of charge: 0.54 kg
Muzzle velocity: 825 metres/sec
Time of flight: to 6 km: 13 sec
Range: (30 deg elevation) 12.6 km
Minimum operating crew: 2

MANUFACTURERS:

AB Bofors, Sweden and Kongsberg Weapon Factory

6087.203
TWIN 57 mm AA GUN MOUNTING

DESCRIPTION.

Introduced in 1950 these 60-calibre guns were at one time widely fitted. Now, however, they are to be found in the cruiser *Latorre* (formerly *Göta Lejon*) of the Chilean Navy and the "Halland" class destroyers of the Royal Swedish Navy. The same gun in a slightly different twin mounting is still in service in the French Navy (**6065.203**).

The complete turret of the Swedish installations weighs some 24 tons and the guns can be elevated to 90°. Aircraft can be engaged up to 9,000 metres with slant ranges of up to 14,500 metres. The projectile weight is about 2.6 kg, the muzzle velocity about 900 m/sec and the maximum rate of fire 130 rounds per barrel per minute.

MANUFACTURER:

AB Bofors, Bofors, Sweden.

2361.203
SINGLE 57 mm L-70 AUTOMATIC GUN MOUNTING

DESCRIPTION:

This 57 mm Bofors single gun in a plastic gun house is designed for both surface and anti-aircraft fire.

Alternatives of electro-hydraulic remote control or gyro-stabilised one-man local control are available. The gunfeed system contains 40 rounds of "ready use" ammunition with 128 rounds stowed in racks within the gunhouse, and there are dual step-by-step fixed supply hoists. The barrel is liquid-cooled.

Two types of ammunition are available: one is a proximity-fused and pre-fragmented shell for use against aerial targets; the other is a special surface target shell which penetrates the target and is detonated after a short delay.

The gun can be equipped with rocket-launching rails for 2-inch (51 mm) rockets.

STATUS:

Operational in the Royal Swedish Navy and other navies, and is the only defensive weapon on the second series of "Spica" boats of the Swedish Navy.

CHARACTERISTICS:
Weight, excluding ammunition: 6.0 tons
Traversing speed: 55 deg/sec
Elevation speed: 40 deg/sec
Traverse limits: Unlimited
Elevation limits: −10 to +75 deg
Power supplies: 440 V 3-phase 60 Hz
Power consumption: Mean, when firing: 10 kW
Rate of fire: 200 rounds/min
Weight of round: 5.9 kg
Weight of shell: (H.E.: DA or proximity fuse): 2.4 kg
Muzzle velocity: 1,025 metres/sec
Time of flight: 3 km 3.8 sec
Range: 14 km

SINGLE 40 mm L/70 AUTOMATIC GUN MOUNTING

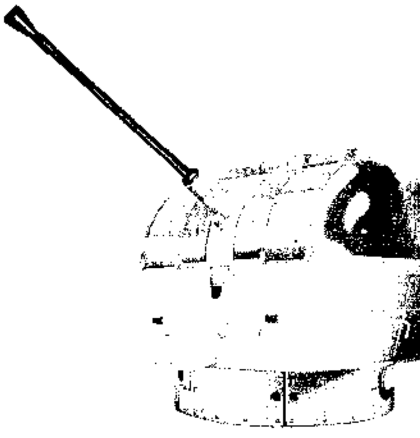
DESCRIPTION:
Bofors make a range of different mountings for their shipborne 40 mm L/70 gun for use against both surface and airborne targets.

Three versions are illustrated here. The simplest is a manually-controlled mount with reflex sight and speed rings: layer and trainer being separate. The second has electro-hydraulic drive and can be remotely controlled. The third has a lightweight plastic gun-house to give weather protection, the lower part of the mounting being of 3 mm steel plate. This model is also electro-hydraulically driven and can be remotely controlled or locally controlled with gyro stabilisation. The gun has a monobloc barrel which can be rapidly changed, and there is a feed device for an initial 18 rounds.

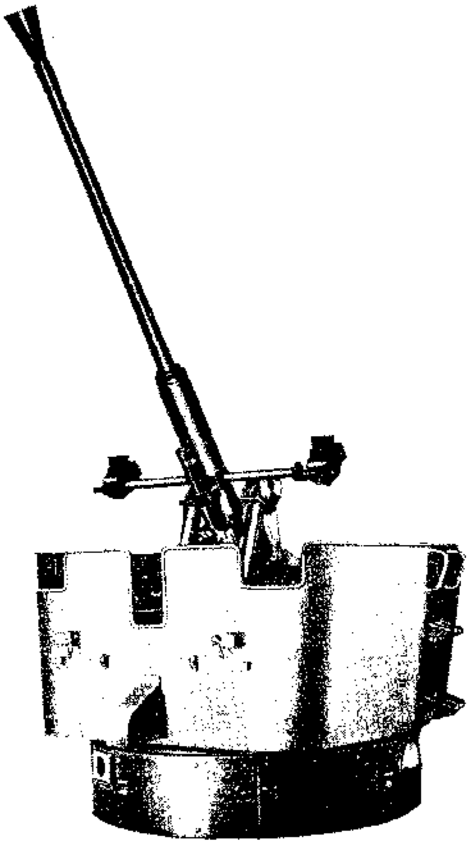
STATUS:
Operational in Swedish Navy and many other navies.

CHARACTERISTICS:
Weight, excluding ammunition: 1.7, 2.8 or 3.0 tons
Traversing speed: (Powered mounts): 85 deg/sec
Elevating speed: (Powered mounts): 45 deg/sec
Traverse limits: Unlimited
Elevation limits: −10 to +90 deg
Power supplies: (Powered mounts): 440 V 3-phase 60 Hz
Power consumption: (Powered mounts): 5 kW
Rate of fire: 300 rounds/min
Weight of round: 2.4 kg
Weight of shell: (H.E.): 0.96 kg
Muzzle velocity: 1,005 metres/sec
Range: 12 km

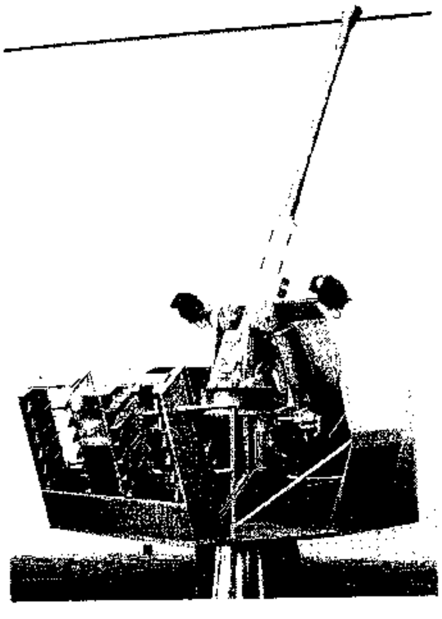
MANUFACTURER
AB Bofors, Bofors, Sweden.



40 mm Bofors gun with plastic gun-house



Power-operated version of the 40 mm Bofors gun

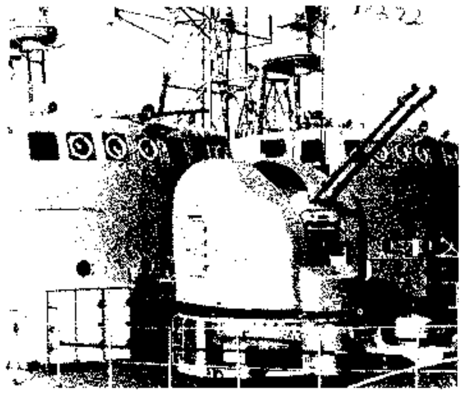


Manually controlled 40 mm Bofors gun

6088.203
SINGLE 40/60 AA GUN MOUNTING
DESCRIPTION
This 60-calibre version of the well-known Bofors 40 mm AA gun was introduced in 1942 and is still in service in many places. Its performance is, as one would expect, somewhat inferior to that of the modern 70-calibre weapon. Projectile weight is 0.9 kg, muzzle velocity 830 m/sec, slant range 10,000 metres and ceiling 5,500 metres. Rate of fire is 120 rounds per minute.
STATUS:
In service and still fitted in reconditioned form but obsolescent and no longer in production.
MANUFACTURER:
AB Bofors, Bofors, Sweden.

SWITZERLAND

6036.203
TWIN 35 mm ANTI-AIRCRAFT GUN TYPE GDM-A
DESCRIPTION:
This gun is similar in concept and design to the successful Oerlikon field gun. It is primarily intended for convoy protection or self-protection against air attack, but can also be used to engage surface targets.
DESCRIPTION:
Type GDM-A is an electrically-controlled, biaxial stabilised twin gun that can function equally well either with a radar fire control equipment or with an optical director equipment with auxiliary computer. In addition the gun is equipped with locally stabilised column control and a gunsight. High laying accelerations and speeds are an important feature of the design.
The 35 mm gun is gas-operated with a positively locked supporting snaplock. Both weapons are completely interchangeable and can be assembled for left or right feed without the use of additional parts. The hand cocking devices and barrels belonging to each weapon are also completely interchangeable.
OPERATION:
Four modes of operation are possible – three electrical and one mechanical. Electrical modes are automatic control by radar fire control equipment, or by optical director with auxiliary computer, or column control on the gun, with local stabilisation and auxiliary computer. The mechanical mode is control by handwheel on the gun and gunsight.
CHARACTERISTICS
Gun: Type KDC
Calibre: 35 mm
Length of barrel: 3,150 mm
Rate of fire per barrel: 550/min
Muzzle velocity: 1,175 m sec-1
Ammunition supply:
Ready-use ammunition Type MDC, in 8 clips: 56 rounds per cannon
Reserve containers Type LDC, in 16 clips: 112 rounds per cannon
MANUFACTURER:
Machine Tool Works, Oerlikon-Bührle Ltd, Zürich.



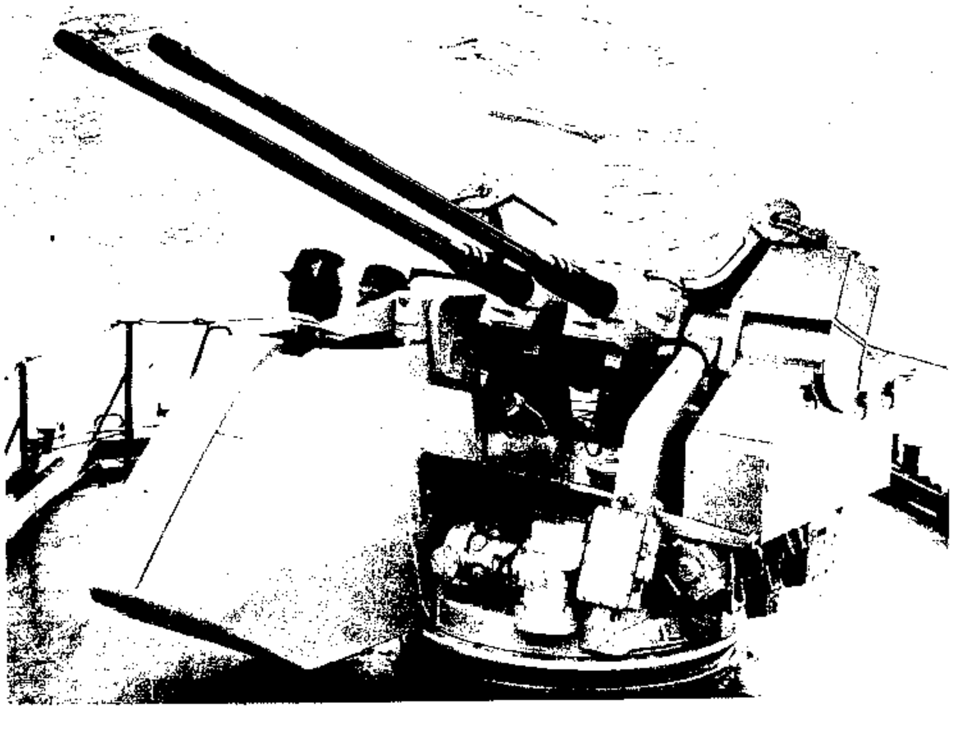
Oerlikon 35-mm Twin Naval AA Gun Type GDM-A

2395.203
TWIN 30 mm NAVAL MOUNTING TYPE A32
DESCRIPTION.
This twin Oerlikon mounting embodies the *Oerlikon cannon type 831 and is designed for in-*stallation on any of a wide range of vessels. Easy to operate and maintain, the guns can be operated by either local or remote control.

CHARACTERISTICS.
Calibre: 30 mm
Elevation: $-15°$ to $+80°$
Traverse: unlimited
Elevation rate: 60°/sec
Traverse rate: 90°/sec
MV: 1080 m/sec

Rate of fire: 650 rounds/min/barrel
Ready use ammunition: 160 rounds/barrel
Weight: complete with ammunition 2,018 kg

MANUFACTURER:
Machine Tool Works, Oerlikon-Bührle Ltd, Zürich.



30 mm Oerlikon naval mounting type A32

2396.203
20 mm NAVAL MOUNTING TYPE A41/804
DESCRIPTION:
This widely used Oerlikon mounting incorporates the type 804 drum-fed cannon. Suitable for small and very small naval vessels it is operated entirely by one man and can be used for either AA or surface fire. Sighting is by ring and bead.

CHARACTERISTICS
Calibre: 20 mm
MV: 835 m/sec
Rate of fire: 800 rounds/min
Ready rounds: 60 in drum magazine
Weight: including ammunition 240 kg
STATUS:
Weapon operational but no longer available.

20 mm Oerlikon naval mounting type A41/804

2397.203
20 mm NAVAL MOUNTING TYPE GAM/204 GK

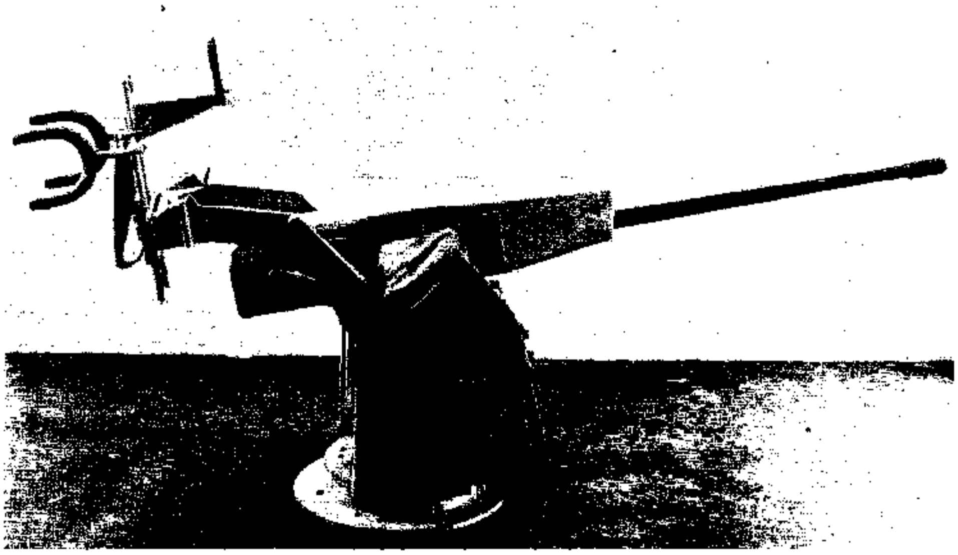
DESCRIPTION:

The Oerlikon GAM/204GK mounting is a simple, but modern and efficient, 20 mm naval mounting embodying the well proven 204GK cannon.

All-up weight is low enough to permit installation on any type of naval vessel and the gun can be used for either AA or surface fire. No electrical power is needed: the gun is laid by the gunner using a shoulder harness and sighting is by simple ring and bead.

CHARACTERISTICS:
Calibre: 20 mm
Elevation: $-15°$ to $+60°$
MV: 1,050 m/sec
Rate of fire: 1,000 rounds/min
Ready rounds: 200
Feed system: link belt
Weight with ammunition: 480 kg

MANUFACTURER:
Machine Tool Works, Oerlikon-Bührle Ltd, Zürich, Switzerland.



20 mm Oerlikon naval mounting type GAM/204GK

2398.203
81 mm ROCKET LAUNCHER

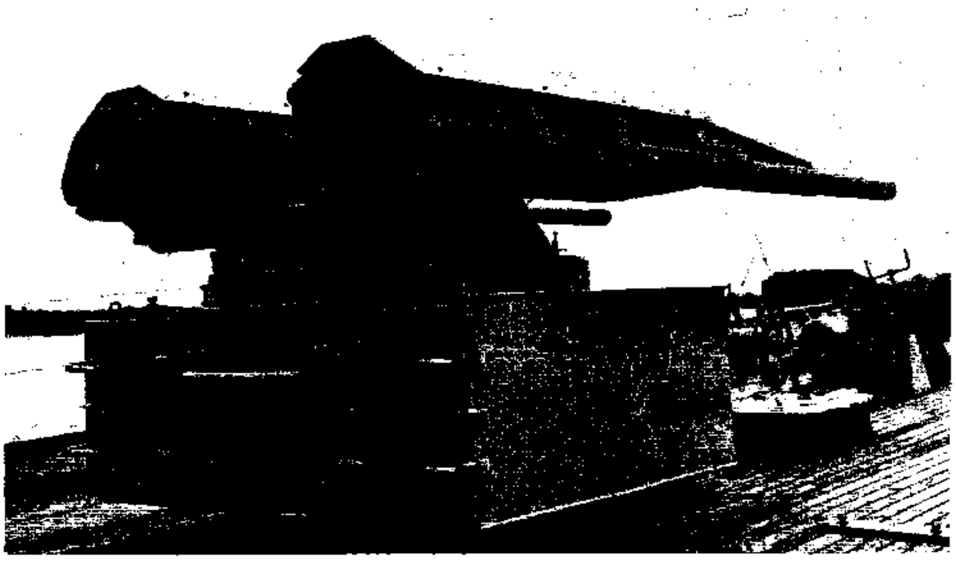
DESCRIPTION:

This Oerlikon unguided rocket launcher has been developed for installation on FPBs and other light naval vessels. It is also suitable for installation in light armoured vehicles.

The complete mounting comprises two single barrel-launchers, each of which has a 9-rocket magazine, mounted on a turntable. The mounting is power-operated and remotely controlled.

CHARACTERISTICS:
Rocket calibre: 81 mm
Elevation: $-10°$ to $+50°$
Traverse: unlimited
Rate of fire: about 80 rounds/min/launcher
Length overall: about 3 m
Weight: (without rockets) about 900 kg

MANUFACTURER:
Machine Tool Works, Oerlikon-Bührle Ltd, Zürich, Switzerland.



Oerlikon 81 mm naval rocket launcher

THE UNITED KINGDOM

6089.203
TRIPLE 6-inch GUN MOUNTING

DESCRIPTION:

This Vickers gun was first introduced in 1934 and has a barrel length of 50 calibres. It fires a projectile weighing about 50 kg with a muzzle velocity of about 820 m/sec and has a range of about 23 km (12 nm). A rate of fire of 8 rounds per barrel per minute can be achieved. Weight of the triple turret is about 135 tons. Elevation limit is 45° and the guns can be trained 120° either side of the fore and aft line. Training rate is about 7°/sec(powered). Hand training is possible.

STATUS:

The only remaining British ship carrying these guns mounted in this way is the cruiser *Belfast* which is no longer in commission but has been preserved as a floating museum on the Thames in London. The triple 6-inch gun mounting on the Indian cruiser *Mysore* (formerly HMS *Nigeria*) is, however, believed to be of similar pattern and to use the same guns. The *Mysore* is still operational.

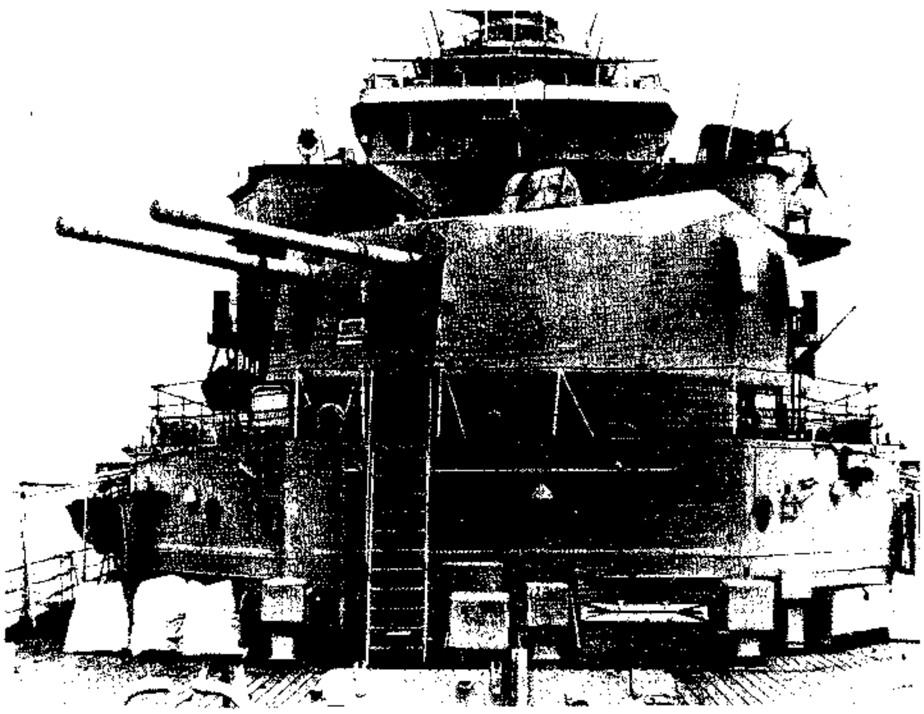
6017.203
TWIN 6-inch GUN MOUNTING Mk 26

DESCRIPTION:

Six-inch (152 mm) calibre, twin automatic dual-purpose naval gun mount. Remotely radar-controlled, electrically trained and elevated. Capable of high angle fire (up to 80°). Fitted with local sighting arrangements and joystick control. Ammunition consists of various types of shell and the propellant is encased in cartridges. Rate of fire about 20 rounds per gun per minute. Turret weight about 163 tons.

STATUS:

Operational in "Tiger" class cruisers. Weapon no longer available.



Mk 26 6-inch gun mounting

6012.203

TWIN 4.5inch GUN MOUNTING Mk 6

DESCRIPTION:

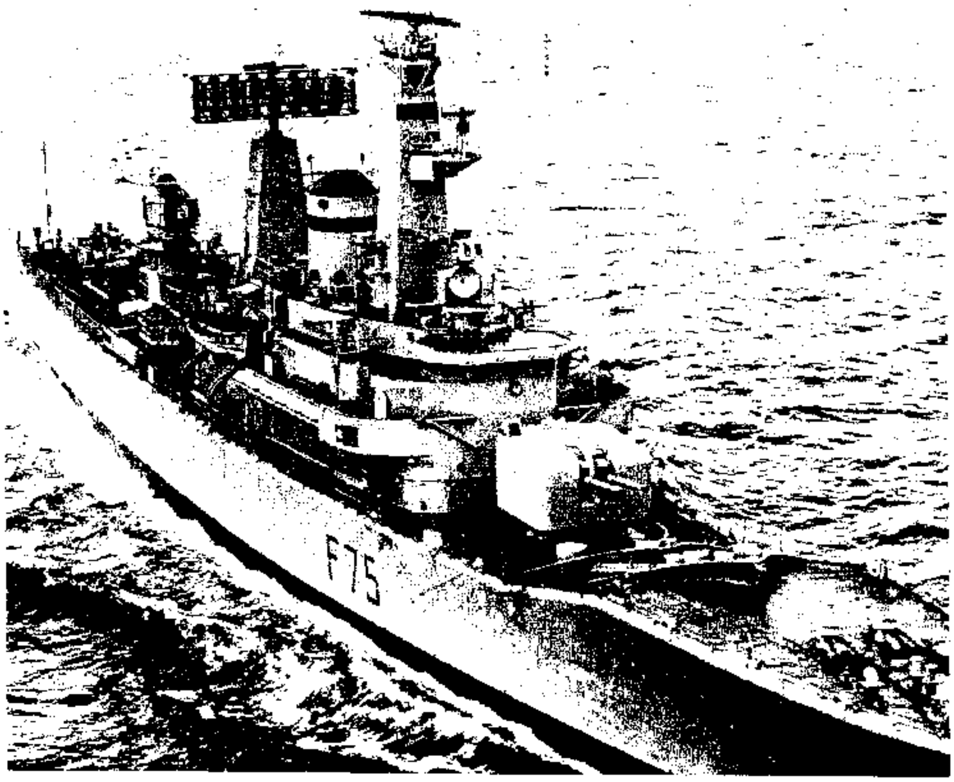
Twin-barrelled remotely controlled power operated, 4.5 inch (114 mm) naval gun mount. Electro-hydraulic power control normally remotely controlled, but can be locally controlled using joystick. Semi-automatic loading cycle. Ammunition comes up hoists from gun bay in separate hoists for shell and cartridge. The shell and cartridge are manually loaded into the loading tray and the loading cycle is automatic. Rate of fire about 14 rounds per gun per minute. Turret weight about 50 tons. Projectile weight about 25.5 kg.

STATUS:

Operational in British and Commonwealth navies.

MANUFACTURERS:

Vickers Ltd., Shipbuilding Group, Barrow Engineering Works, Barrow-in-Furness, Lancs



4.5-inch Mk 6 gun mount in HMS Charybdis
(Ministry of Defence (Navy) photograph)

6011.203

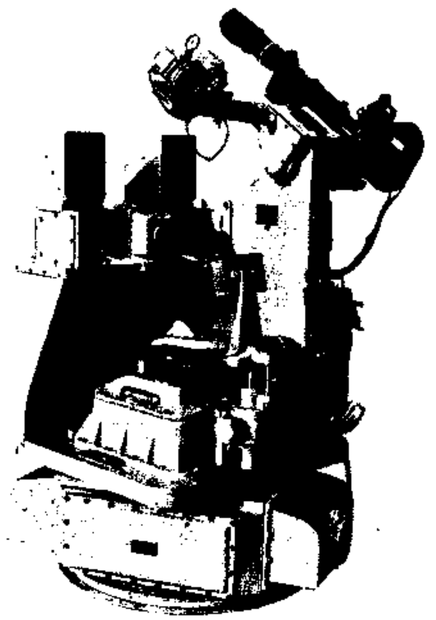
SINGLE 4.5-inch GUN MOUNTING Mk 8

DESCRIPTION:

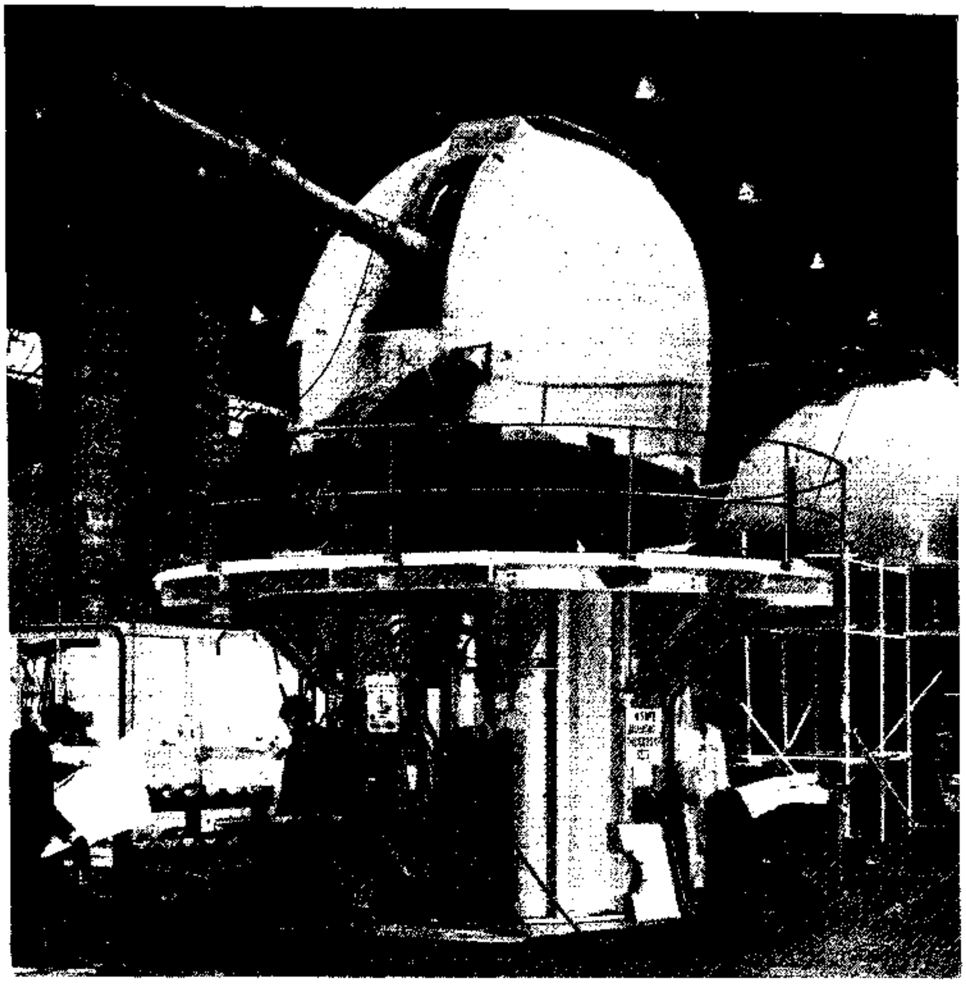
This fully-automatic single-barrelled 4.5 inch (114 mm) gun has been designed for the Royal Navy by the Royal Armament Research and Development Establishment. It is modelled on the British Army's Abbot gun (**5503.103**) and is fitted with muzzle brake and fume extractor. A completely new range of fixed ammunition has also been designed.

The major features of design of the mounting have been a simple ammunition feed system with the minimum number of transfer points, and a remote power control system with large stability margins that requires a stiff mounting structure with low inertia. To this end the revolving structure has been kept as light as possible and a sandwich construction glass-reinforced plastic gun-shield fitted. To keep the trunnion height as low as possible the gun is mounted front heavy,

Vickers 4.5-inch Mk 8 gun mounting on a frigate of the Imperial Iranian Navy



Vickers Mk 1 look-out and aiming sight used with the Mk 8 gun mounting. This combines the separate functions of an air look-out sight and an aiming sight in a single fully-stabilised unit.



4.5-inch Mk 8 gun in production

balance being restored by an oil spring. To reduce inertia the training gear is fitted to the fixed structure, the training motors are fitted inside the mounting pedestal, and the driving motors are secured vertically to the ring bulkhead which is part of the ship's structure.

The loading system is hydraulically operated from one power plant sited below decks. The system employs only four transfer points between the gunbay (ready use magazine) and the gun, and is designed so that the nature of ammunition may be changed without unloading or firing out a large number of rounds. A stockpile of ammunition may be accommodated at the mounting and fired remotely from the Operations Room with no crew closed up at the mounting.

A conventional coarse/fine system is used in both elevation and training for remote power control of the mounting. Processing of the error signal is carried out in transistor modules. The main feature of the remote power control system is the use of a new static direct armature control thyristor system, which is lighter and requires far less maintenance than the conventional rotating machines.

Fail-to-safe interlocks are included in all major operations to safeguard equipment and ammunition, and facilities are arranged for manual control of the various motors for maintenance purposes.

STATUS:

Development is complete and the gun is in production. In the Royal Navy it is fitted to the Type 82 Guided Missile Destroyer HMS *Bristol*, the Type 42 Destroyers – of which the first, HMS *Sheffield*, was launched in mid-1971 – and the Type 21 Frigates – the first of which, HMS *Amazon* was launched early in 1972. The gun has also been ordered by five overseas navies.

MANUFACTURER:

Designed and manufactured by Vickers Ltd, Shipbuilding Group, Barrow Engineering Works, Barrow-in-Furness, Lancashire, England.

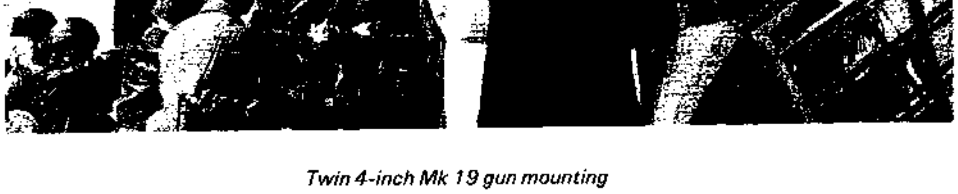
6014.203
TWIN 4-inch GUN MOUNTING Mk 19

DESCRIPTION:

Designed by Vickers, this is a twin-barrelled, hand loaded, remotely-controlled naval gun mount. Electrically trained and elevated. Normally laid by remote control, but can be locally controlled using joysticks. Fuse setting arrangements alongside each trunnion support. An extremely reliable and well proven gun mount. A good gun crew can achieve rate of of fire of up to about 16 rounds per barrel per minute. Projectile weight about 16 kg, muzzle velocity about 760 m/sec, range about 19.5 km (10.5 nm) and ceiling about 13,500 metres (80° elevation).

STATUS:

Operational in British, Commonwealth and many other navies. No longer in production but guns removed from older ships are still being reconditioned for use in new ships – e.g. the corvettes recently built by Vosper Thornycroft for the Nigerian Navy.



Twin 4-inch Mk 19 gun mounting

6010.203
SINGLE 4.5 inch GUN MOUNTING Mk 5

DESCRIPTION:

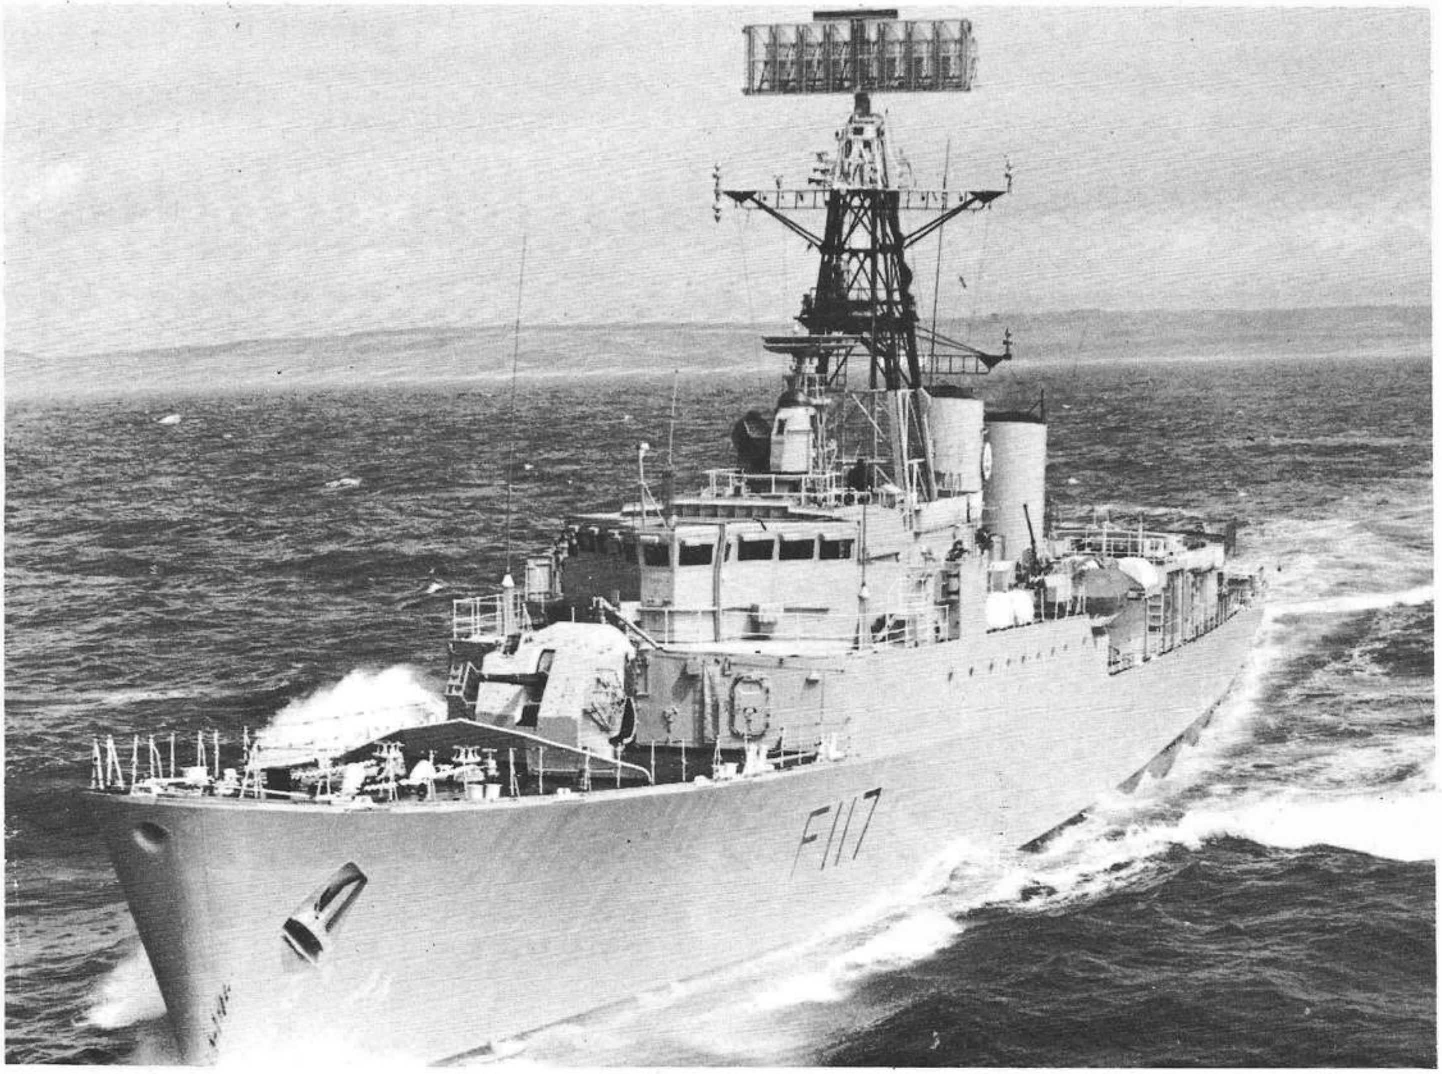
Single-barrelled remotely controlled 4.5 inch (114 mm) manually loaded naval gun mount. Can be controlled locally using a joystick. Automatic ramming of separate ammunition. Limited elevation of about 50 degrees. Rate of fire with a well drilled crew about 14 rounds per minute.

STATUS:

Operational in British and certain other navies.

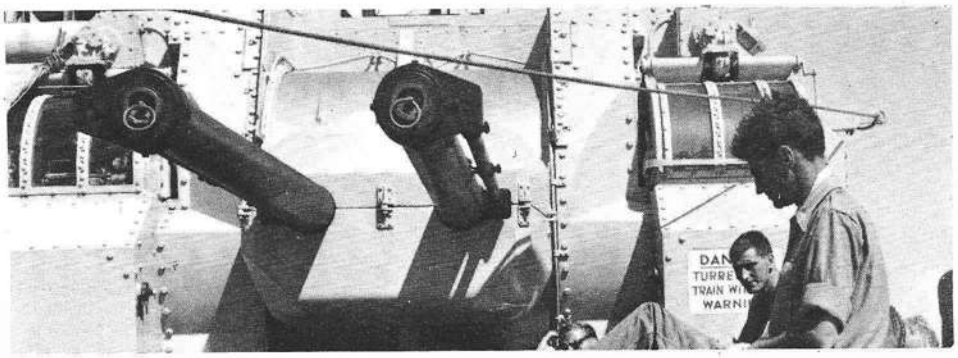
MANUFACTURERS:

Vickers Ltd., Shipbuilding Group, Barrow Engineering Works, Barrow-in-Furness, Lancs.



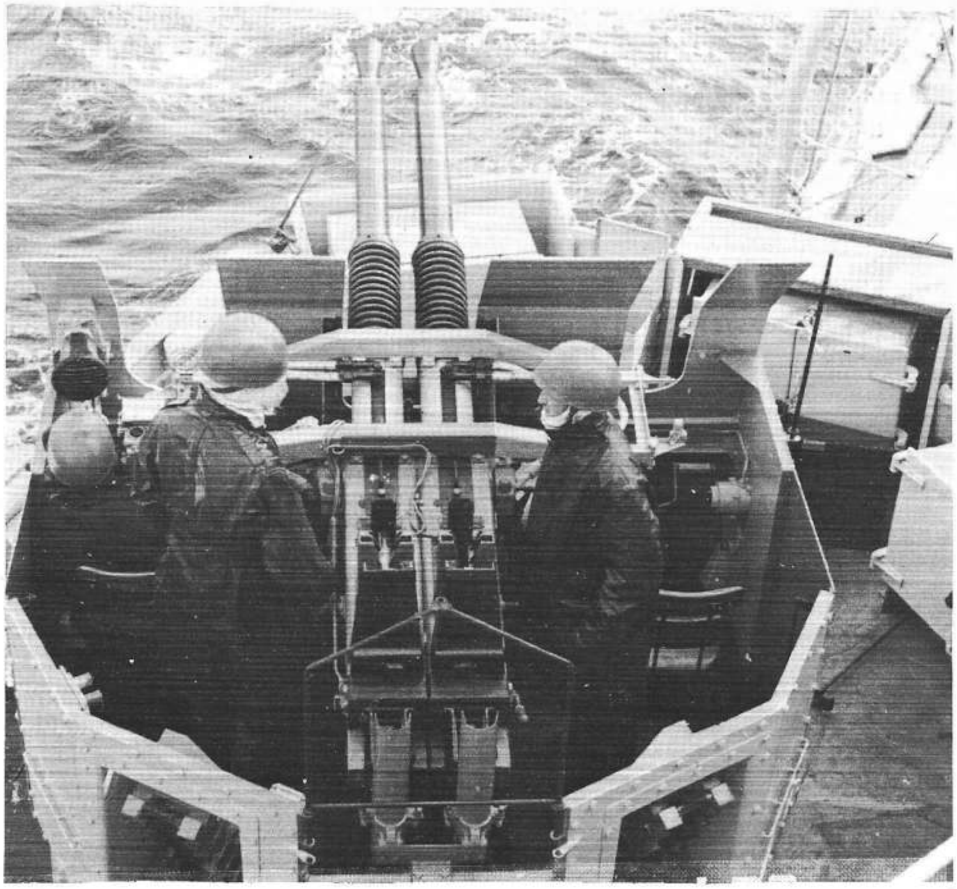
4.5-inch Mk 5 gun mount in Ashanti *frigate*

6016.203
TWIN 3-inch GUN MOUNTING Mk 6
DESCRIPTION:
Twin-barrelled three-inch (70-calibre) automatic dual-purpose, remotely controlled naval gun mount. Fully automatic electrically driven gun mount. Local control arrangements are provided; but the mounting can be operated "unmanned". Rate of fire about sixty rounds per gun per minute. Water cooled barrels to allow sustained fire. Turret weight about 38 tons.
STATUS:
Operational in British and Canadian Navies.
MANUFACTURERS:
Vickers Ltd, Shipbuilding Group, Barrow Engineering Works, Barrow-in-Furness, Lancs.



Twin 3-inch Mk 6 gun mounting on HMS Tiger

6015.203
TWIN 40 mm (BOFORS) GUN MOUNTING Mk 5
DESCRIPTION:
Remotely or locally controlled twin Bofors 40 mm 70-calibre close-range naval gun mount. Splinter protection shield to front of mounting. One "on mounting" loader per gun. One operator to lay and train the gun in "local control". Separate emergency manual laying and training arrangements using two men. Rate of fire about 300 rounds per minute per gun.
The Bofors guns used in this mounting are of an earlier pattern than the 40/70 guns described in entry number **2360.203** above. Characteristics are, however, generally similar.
STATUS:
Operational in many British and Commonwealth naval vessels.



Mk 5 twin 40 mm Bofors gun mounting

6013.203
SINGLE 40 mm (BOFORS) Mk 7 GUN MOUNTING

DESCRIPTION:

Single barrelled Bofors 40 mm power operated ships gun mounting. Lightweight mounting suitable for fitting in FPBs as well as larger vessels. One man control by joystick. Gyro sight for aiming. One man "on mounting" for loading. Rate of fire about 300 rpm.

For details of the gun in this mounting see entry number **2360.203** above.

STATUS:

Operational. Widely fitted in British and Commonwealth naval vessels.

Bofors 40 mm gun on Mk 7 mounting

5522.203
TWIN 30 mm GUN MOUNTING A.32

DESCRIPTION:

This 30 mm Twin Naval Mounting was developed by Hispano-Suiza (now Oerlikon Hispano) to provide close anti-aircraft defence for ships of all classes. The mounting gives a rate of fire of 1,300 rounds per minute, and thus a high hit probability against aircraft, whilst also offering a worthwhile weapon for ship-to-ship and ship-to-shore encounters.

There is an optional mounting available without cabin, sights or manual controls, and it is intended for use with Fire Director Control only. A metadyne power control system incorporates a coarse/fine positional servo to ensure accurate tracking and gun firing, whilst target selection can be made from the Fire Director Control.

Under local control, the mounting is operated by a gunner who is housed in a cabin on the front right hand side. He is assisted by two rate gyros which stabilise the gun against the effects of roll pitch, and yaw. A special feature which can be incorporated if needed allows the gunner in one mounting to operate a second mounting in a completely remote controlled condition.

Simple reflector sights are fitted as standard, and manual traverse, elevation, and firing gear are fitted for emergency use.

Two types of ammunition supply are available. Type A utilises twin 80 round magazines with the ammunition in coupled 20 round belts. The ammunition pattern can be changed by substituting different 20 round racks. Type B utilises twin magazines which have a continuous 140 round belt.

The two cannon are the Hispano-Suiza type 831 L, which is a well-proven and widely used design of considerable reliability.

CHARACTERISTICS:

Ordnance:
Cannon: HS 831 L
Calibre: 30 mm
Muzzle Velocity: 3,450 fs (1,080 ms)
Rate of Fire: 600-650 rounds/min
Weight: 343 lb (156 kg)
Recoil Thrust:
Maximum 3,520 lb (1,600 kg)
Average: 3,320 lb (1,510 kg)
Mounting:
Weight: remote and local control: 2,744 lb (1,698 kg)
Traverse arc: 360°
Elevation: −15° to +80°

Traverse velocity: 90°/sec
Elevation velocity: 60°/sec
Overall height: 4.80 ft (1.46 m)
Electrical power supply: 440 V 3 phase, 60 c/s, 2 to 4 KVA during tracking. 10 KVA peak while firing and tracking
115V, 1 phase, 400 c/s 150 VA servo equipment, synchros, and gyros
Gunsight: Gyro. NIFE Reflector or Delta IV

Ammunition:

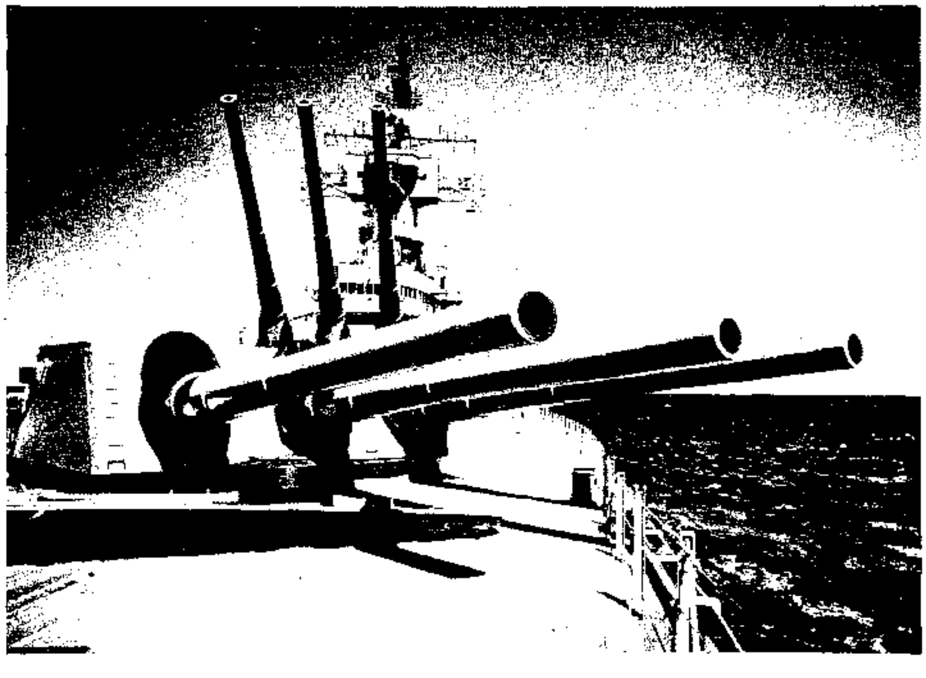
A.32 mounting for twin Hispano-Suiza 30 mm cannons

THE UNITED STATES OF AMERICA

6023.203
TRIPLE 16-inch GUN MOUNTING

DESCRIPTION:
These 16-inch 50-calibre guns were the main armament of the "Iowa" class battleships of the US Navy. Firing a projectile with a weight of 1,230 kg and with a muzzle velocity of about 850 m/sec they had a range of 39 km (26 nm). Rate of fire was two rounds per barrel per minute. The individual guns weighed about 125 tons and the complete triple mounting some 2,000 tons. Bagged charges were used for the propellant of which 300 kg was used in 6 bags at a time.
STATUS:
The last of the "Iowa" class to be in service – and indeed the last battleship in the world to be in action – was the USS *New Jersey* whose guns are illustrated here. She was last decommissioned in December 1969 and placed in the Pacific reserve.



The 16-inch guns of the battleship USS New Jersey (US Navy photograph)

6090.203
TRIPLE 8-inch MARK 16 GUN MOUNTING

DESCRIPTION:
In the *Salem* class heavy cruisers of the US Navy an 8 inch 55-calibre gun designed to fire cased ammunition was installed in triple turrets. Apart from the modification to fire the new ammunition fully automatically the gun characteristics were generally similar to those of the earlier 8-inch semi-automatic guns (see **6024.203** below). The turrets were larger, however, and the rate of fire was 10 rounds per barrel per minute instead of five.
STATUS:
There were three heavy cruisers in the "Salem" class, but of these, at the time of writing, only the *Newport News* is still in commission.

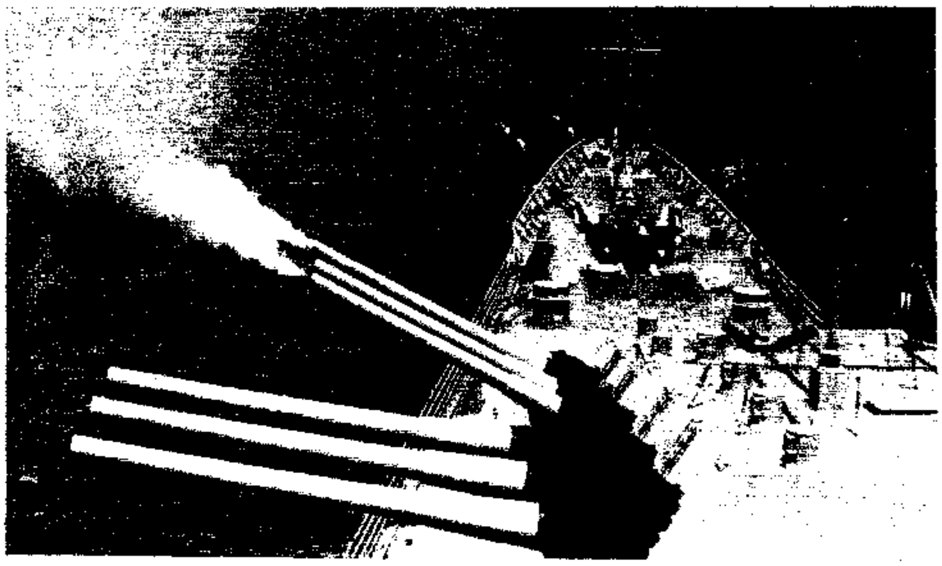
6024.203
TRIPLE 8-inch MARK 15 GUN MOUNTING

DESCRIPTION:

8 inch (203 mm) 55 calibre triple gun mount. The mount is remotely controlled and guns are independently laid. The projectile weight is approximately 125 kg and is propelled by separate bagged charges with a muzzle velocity of about 900 m/sec. Maximum range is about 28 km (15 nm) and the rate of fire is 5 rounds per barrel per minute. The barrels weigh 37,000 lbs (16,800 kg). The turret probably weighs about 500 tons. The original design of turret dates from 1935, but modifications since that date have considerably improved laying accuracy and reliability. The barrel is of two piece design featuring a radially expanded tube and a shrunk-on jacket.

STATUS:

Installed in some of the older US heavy cruisers now in reserve.



8-inch triple turrets of the guided missile heavy cruiser USS Boston *in action*

6091.203
TRIPLE 8-inch MARK 15 GUN MOUNTING (MODIFIED)

DESCRIPTION:

A modification was made to the 8-inch 55-calibre Mark 15 guns of the 'Baltimore' class cruiser *Saint Paul* during the war in Vietnam to enable them to fire 8-inch rocket-assisted projectiles.

Details of the modifications are not known, but it is understood that the weight of the projectile was less than half of that of the standard round – about 51 kg instead of 125 – and that a surface range of about 55 km (30 nm) was achieved during shore bombardments off Vietnam. This is believed to be a record for gun-launched projectiles: the range of the 16-inch guns of the '*Iowa*' class battleships was only about 39 km (21 nm).

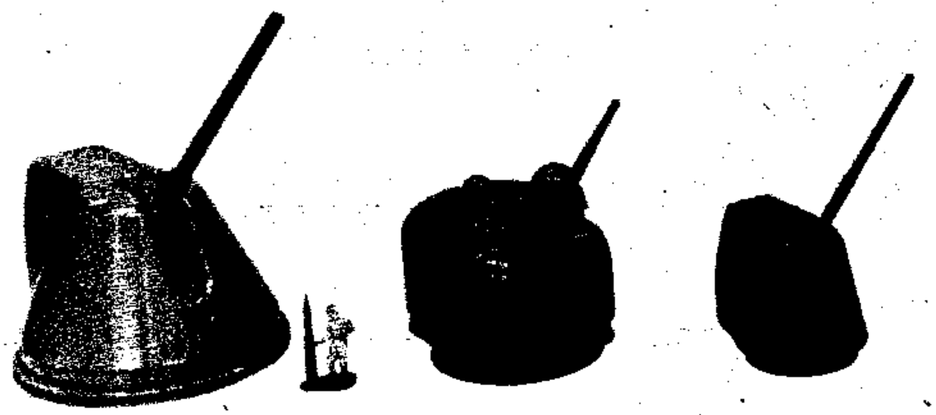
STATUS:

No longer in operational service. The USS *Saint Paul* was decommissioned at the end of April 1971. Rocket-assisted gun-launched projectiles – both guided and unguided – are, however, active US Army projects. Notes on such guided and unguided projectiles will be found in entries **2837.111** and **2834.103** respectively.

6094.203
SINGLE 8-inch MAJOR CALIBRE LIGHTWEIGHT GUN

DESCRIPTION:

An eight-inch gun is proposed for use with destroyer-size ships of the US Navy. No details of this weapon are known other than those implied by its title "Major Calibre Light Weight Gun" (MCLWG) and what can be inferred from the accompanying picture which shows a model of the new gun alongside models of the 5in/54 Mk 42 (see **6028.203** below) and the 5in/54 Mk 45 (**6029.203**).



The proposed lightweight 8-inch (left) *compared with the Mark 42* (centre) *and Mark 45* (right) *5-inch 54-calibre mountings*

6025.203
TRIPLE 6-inch MARK 16 GUN MOUNTING

DESCRIPTION:

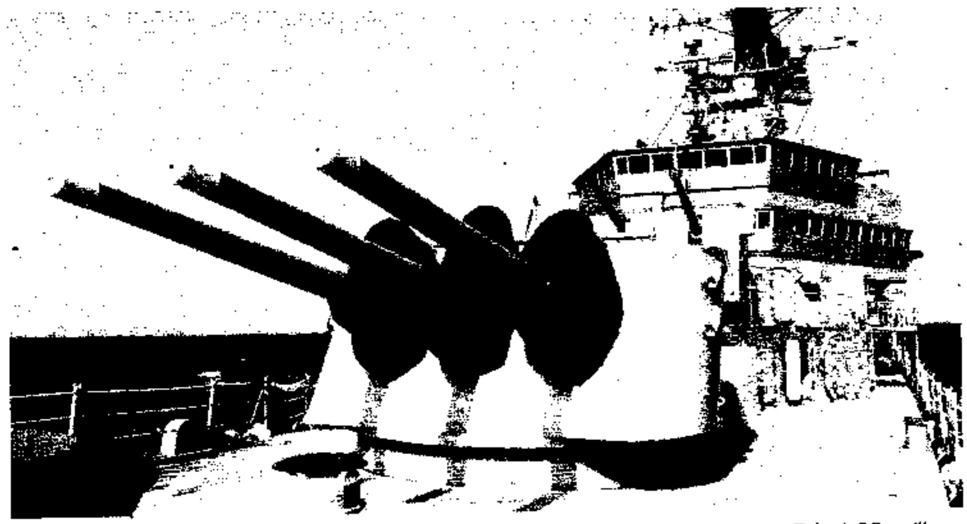
This 6-inch 47-calibre gun mounting in a triple turret is of an old semi-automatic design but is still in service in a few light cruisers of the US Navy. The turrets are remotely controlled but have local sighting and ranging facilities. The guns are independently laid.

Projectile weight is about 46.5 kg and muzzle velocity about 900 m/sec, giving a maximum range of about 23.5 km (13 nm). Rate of fire is 10 rounds per barrel per minute. The turret weighs 154 tons.

STATUS:

As noted above, these guns are in service in operational light cruisers and in cruisers in the US reserve fleet. It is believed that they are the same as the guns on the ex-US Navy cruisers now serving in various South American navies.

A later version of this gun adapted to fire cased ammunition and to be used as a dual-purpose weapon was mounted in twin turrets on the large '*Worcester*' class light cruisers. The ships concerned have now been scrapped, however, and so far as is known no other examples of this later version of the Mark 16 gun exist today.



A 6-inch triple turret on the USS Little Rock. *The guns immediately aft of this turret are 5-inch 38-calibre Mk. 12 dual purpose* (US Navy Photograph)

6026.203
TWIN 5-inch 38 CALIBRE GUN MOUNTING MARK 32

DESCRIPTION:

This is the oldest design of 5-inch mounting still in service with the US Navy, but it is also one of the most widely used. The 5-inch 38 calibre gun has indeed been described as "the prototype of the conventional US naval gun".

The Mark 32 mounting contains two Mark 12 5-inch 38 calibre guns and an enclosed mounting with ammunition-handling room beneath. It requires a crew of 13 on the mounting and 26 in all. Remotely-controlled, semi-automatic, dual-purpose it also has local laying facilities on the mounting. Normal rate of fire is 15 rounds per barrel per minute; but the gun's capacity for sustained fire is in excess of this and a good crew can achieve 22 rounds per minute over short periods. Train limits are 300° apart and elevation limits from —15° to +85° but train and elevation velocity and acceleration are significantly lower than those of the later 5-inch mountings.

Semi-fixed ammunition is used, consisting of a projectile weighing about 25 kg (varying according to type) and a case assembly weighing about 13 kg including a full powder charge of 6.8 kg. With a full charge the muzzle velocity is 792.5 m/sec giving a maximum horizontal range of 16.5 km (9 nm) and a ceiling of 11,400 metres. The ammunition is raised to the gun house by hydraulically powered hoists. The complete mounting weighs about 53 tons.

STATUS:

Twin mountings were installed in the *'Iowa'* class battleships, many heavy cruisers and a great many destroyers. Some of these are still in service in both the active and reserve fleets of the US Navy as well as in ex-US ships of other navies. They are also in service with Spanish-built ships of the Spanish Navy.

5-inch twin 38 calibre guns on the USS E. G. Small *in action* (US Navy photograph)

6092.203
SINGLE 5-inch 38 CALIBRE GUN MOUNTINGS

DESCRIPTION:

In addition to the enclosed twin mounting of the 5-inch 38 calibre gun (**6026.203**) there have been three other general types of mounting for this gun. They are:

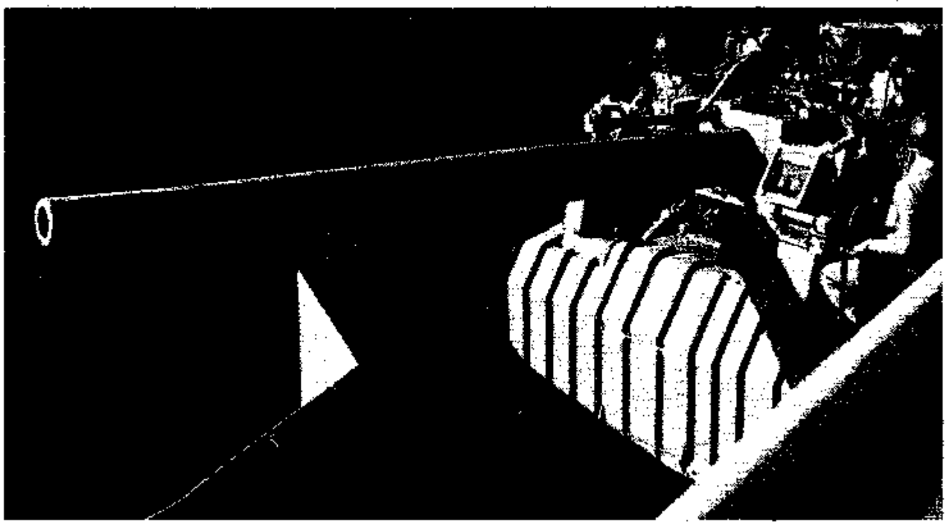
(a) Enclosed single mount with ammunition-handling room below. Originally on destroyers, destroyer escorts and auxiliaries. Now mainly found on auxiliary vessels of the US Navy, these single mounts are also the main surface armament of the *'Lepanto'* class destroyers and *'Legazpi'* class frigates of the Spanish Navy.

(b) Open single mount with ammunition-handling room below. Auxiliary vessels.

(c) Open single mount without ammunition hoists or handling room. Converted merchant vessels.

In performance there is essentially no difference between the first two of these and one gun of the enclosed twin mounting. The third arrangement is necessarily less efficient in terms of ammunition handling; but otherwise the gun characteristics are the same.

Enclosed mounting of a 5-inch 38-calibre gun on USS Brooke (US Navy photograph)



A 5-inch 38-calibre gun in an open mounting on the aircraft carrier USS Kearsarge (US Navy Photograph)

6093.203
SINGLE 5-inch 54-CALIBRE GUN MOUNTING MARK 39

This gun mounting is an intermediate stage between the 5in/38 mountings (**6026.203** and **6092.203**) and the 5in/54 Mark 42 mountings (**6027.203, 6028.203 and 6029.203**). It can be regarded as a 5in/38 single enclosed mounting Mark 30 with the Mark 12 38 calibre gun replaced by a Mark 16b54 calibre gun. This gun fires a heavier shell (about 32 kg instead of about 25 kg) with a slightly higher muzzle velocity and thus a longer range.

It may be noted that in this mounting an amplidyne all-electric power drive is used, whereas in both the 5in/38 mountings and the 5in/54 Mark 42 mountings the drive is electro/hydraulic.

STATUS:

Operational as a single enclosed mounting in "Midway" class aircraft carriers.

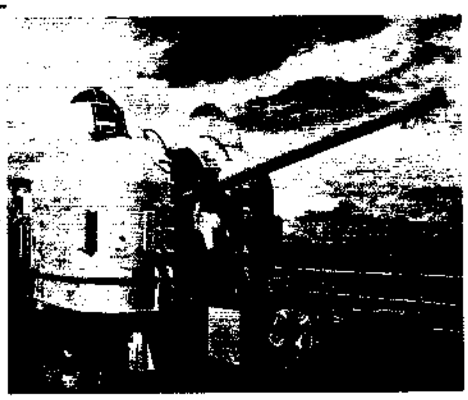
6027.203
SINGLE 5-inch 54 CALIBRE GUN MOUNTING MARK 42

This widely-adopted gun mounting had several advantages over both the 5-inch 38 calibre mountings and the 5-inch 54 calibre Mark 39 mounting (**6093.203**). It uses the Mark 18 54-calibre gun, and it is capable of very much higher rates of fire. The following description applies largely to Mod 7 which is the most widely used operationally of the earlier versions.

DESCRIPTION:

Mark 42 Mod 7 is a dual-purpose single enclosed mounting of the base-ring type fitted with automatic ammunition feed mechanisms. Driven by electric-hydraulic power units, it can be operated in local or automatic control.

The gun housing slide and breech mechanism are quite different from those of the semi-automatic 5-inch 54-calibre and 5-inch 38-calibre designs, as also is the ammunition feed system. The latter involves manual operations only in loading the cylindrical, power-driven loading drums that store complete rounds of ammunition and use them to feed the hoists. All subsequent operations are performed mechanically and as a result the single gun can achieve a continuous firing rate equal to that achieved only in short bursts by an expert crew on the two guns of the 5-inch 38-calibre Mark 32 mounting. A further obvious advantage is the reduction in the number of men required to man the gun. Crew for the Mark 42 is 14 total of whom 4 are on the mounting.



5-inch 54-calibre Mark 42 gun on USS John King (Official US Navy photograph)

Projectile weight is about 32 kg, muzzle velocity about 810 m/sec, range against surface targets about 24 km (about 13 nm) and ceiling (at 85° elevation) about 13,600 metres. Weight of complete turret is some 60 tons.

STATUS:

Operational in ships of the US Navy and elsewhere. To be mounted on the new "Andalucia" class frigates of the Spanish Navy.

6076.203
MODIFIED SINGLE 5-inch 54 CALIBRE GUN MOUNTING MARK 42

In some installations of the Mk 42 5-inch 54 calibre gun mount the starboard "bubble" or "frog-eye" on the mount has been removed. This dome is normally used for local anti-aircraft control; the port dome, which is retained in these installations, is for local anti-surface control.

6028.203
SINGLE 5-inch 54 CALIBRE GUN MOUNTING MARK 42 (Lightweight Mod 9)

DESCRIPTION:

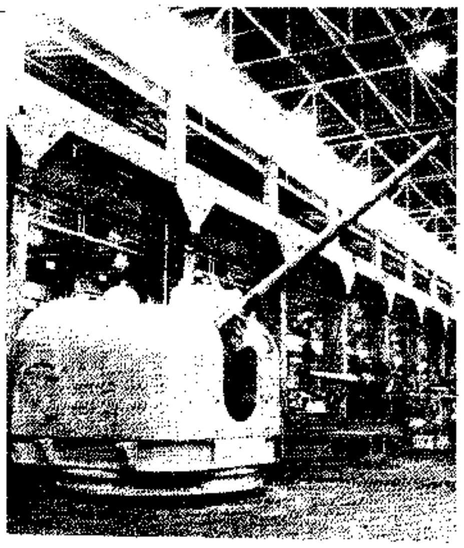
Functionally similar to the Mark 42 Mod 7 gun mount described above, the Mark 42 Mod 9 is an improved design featuring lower mount weight (58,700 kg), nearly 10% lower power consumption and a smaller crew requirement. State-of-the-art improvements incorporated included replacement of all electronic components of the earlier mount by solid-state devices. Only two men are needed on the mount as against four for the Mod 7, and the total crew requirement is 12 men instead of 14. The only respect in which the Mod 7 performance is known to be superior is that of elevation acceleration (60°/sec² against 40°/sec²).

STATUS:

51 units of the above-decks portion of the mount were manufactured by FMC/NOD and supplied for use on DE-1052 class ships. The below-decks portion was produced by the US Navy Naval Ordnance Station, Louisville.

MANUFACTURER:

FMC Corporation, Northern Ordnance Division, Minneapolis, Minn. 55421.



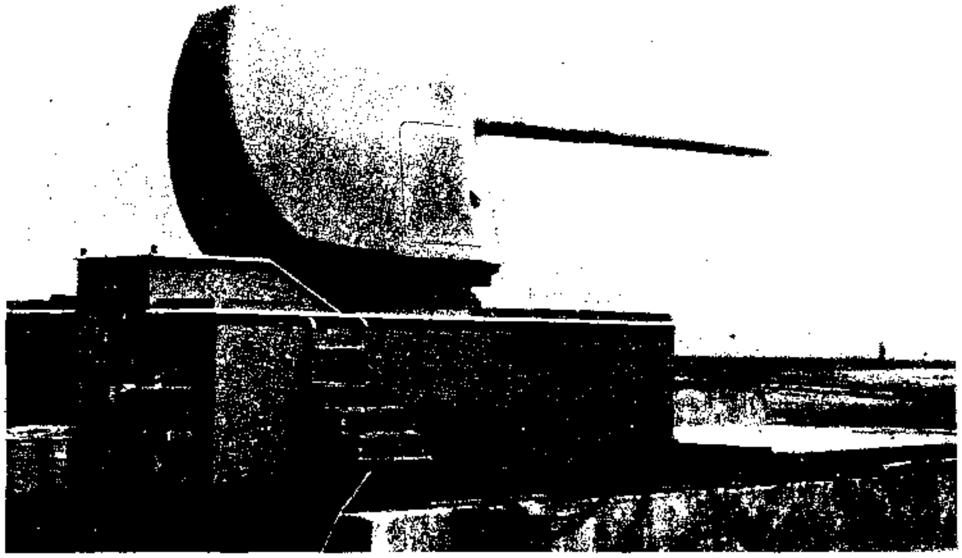
Lightweight (Mod 9) version of the 5-inch 54-calibre gun mounting Mk 42 in production

6029.203
SINGLE 5-inch 54 CALIBRE LIGHTWEIGHT AUTOMATIC GUN MOUNTING MARK 45

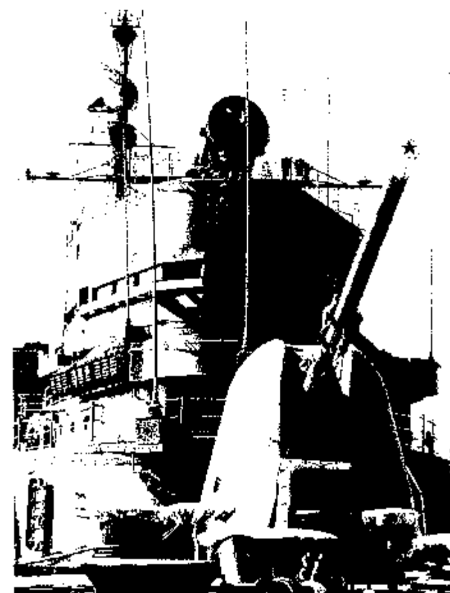
DESCRIPTION:

This completely new gun mounting represents a major step forward in medium calibre ordnance for the US Navy. It has been designed primarily for installation in new ships and was required to embody all relevant improvements developed over some 30 years since the 5-inch/38 was first introduced (**6026.203**). It was also required to be light, easily maintained and exceptionally reliable. The result is a weapon which requires only one-third of the crew of a 5-inch/38 and with which a single man in a control centre can fire a drum load of 20 shells without help.

Specifically, the major differences in characteristics between the Mark 42 (**6027.203**) and Mark 45 mountings are:



Side elevation of the Mark 45 gun being test-fired



5-inch 54 calibre Mark 45 lightweight gun mount on USS Norton Sound

Mount weight: reduced from 60 tons to 25 tons
Crew: reduced from 14 to 6
Crew on mounting: reduced from 2 to 0
Maximum elevation: reduced from 85° to 65°
Rate of fire: reduced from 40 rounds/min to 20
Ready service rounds: reduced from 40 to 20

The gun will be used with the lightweight Mark 86 GFCS

DEVELOPMENT AND PROCUREMENT:

Development of the new weapon started in 1964 on a contract placed with the Northern Ordnance Division of the FMC corporation. Initial production was by FMC/NOD, who continue to make the mounting, and General Electric Company Ordnance Systems have been brought in as a second source.

FMC/NOD were also the developers and are understood to be the sole manufacturers of the Mark 6 Ammunition Hoist, which is an integral part of the Mark 45 installations on DLGN-36 and DD-963 ships.

Gun barrels are produced by US Government Ordnance factories and are installed in the mount after it has been installed in the ship.

STATUS:

Deliveries of complete production units, less barrels, for installation on LHA, DLGN-36 and DD-963 class ships began in August, 1971, and are continuing; and the mount is now operational.

6030.203
3-inch 50 CALIBRE GUN MOUNTING MARKS 27, 33 and 34

DESCRIPTION

These 3-inch (76 mm) 50 calibre gun mounts are primarily intended for air defence but can be used also against surface targets. Planned during the Second World War but not completed in time for combat use in that conflict, the mounts have since proved themselves so effective that they have virtually displaced their predecessors – 40 mm twin and quadruple mounts – on combat vessels.

Mks 27 and 33 are twin mounts and Mk 34 a single. Mks 27 and 33 are identical in almost all respects, the main difference being in the slide. All marks use the same gun and similar backing mechanisms, except that in the twin mounts the assemblies are of opposite hand. Some models of the Mk 33 are enclosed twin mounts with an aluminium or fibreglass reinforced plastic (FRP) shield, and others again are twins with modifications for installation of a fire control radar antenna. The Mk 34 mount is an open single with a right-hand slide and loader assembly. Some models of the Mk 34 also are FRP shielded. Mount weights are in the region of 32,000 lb (14,500 kg) for the twins and 17,000 lb (7,700 kg) for the Mk 34.

Horizontal range is about 13 km and targets can be engaged at heights of more than 9,000 metres. Projectile weight is approximately 6 kg and the design rate of fire is 45 rounds per barrel per minute – although it is believed that higher rates can be achieved.

STATUS:

Operational.

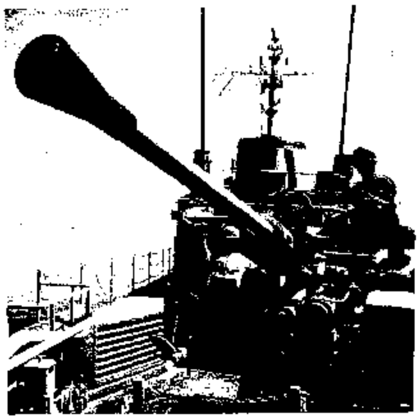
A single mounting of the 3-inch 50-calibre gun (US Navy photograph)

A 3-inch 50 calibre twin mounting (US Navy Photograph)

6031.203
40 mm ANTI-AIRCRAFT GUN MOUNTINGS

DESCRIPTION:

There are both single, twin and quadruple barrelled versions of the 40 mm automatic recoil operated gun. The gun has a range of approx 5,000 metres and a rate of fire of 160 rounds per minute. Most mounts can be either locally or remotely controlled, and are power operated, with emergency hand operation. The gun is derived from the Bofors design and the accompanying photograph shows a single barrel mount.



A 40-mm single mount on the USS Asheville (US Navy photograph)

6034.203
20 mm GUN MOUNTING MARK 56

DESCRIPTION:

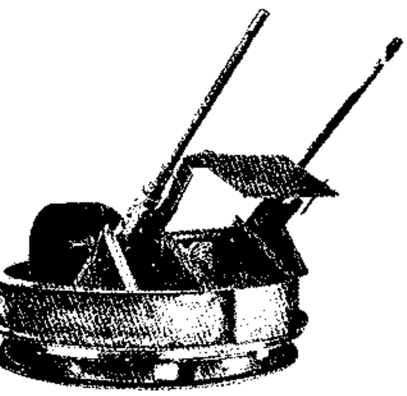
Colt's gun mount Mk 56 Mod 0 is available either as a twin 0.50 calibre M2H8 machine gun mount or as a combined 0.50 calibre and Mk 16 20 mm automatic gun. Without guns the mount weighs 166 kg and stands 50 cm above the deck. It can be trained in azimuth through 360° and in elevation from −15° to +65°. Ammunition capacity is 500 rounds for 0.50 calibre guns and 200 rounds for 20 mm guns.

The .50 inch (13 mm) machine gun is an air cooled, belt fed, recoil operated machine gun used in small craft. It has a range of approximately 7,000 yards (6.4 km) and a rate of fire of 450 rounds per minute. The barrel can be quickly exchanged without dismantling other parts of the weapon.

The 20 mm rapid fire gun is a 70 calibre magazine loaded machine gun type anti-aircraft gun. It is manually aimed and used as a close range defence weapon. The rate of fire is 850 rounds per minute and the range is 4,800 yards (4.65 km). The gun and mechanism weigh 150 lbs (68 kg).

MANUFACTURER:

Colt's Firearms Division, Colt Industries, Hartford, Conn.



Colt Mk 56 Mounting

2836.203
20 mm THREE BARREL DECK MOUNT

DESCRIPTION:

Designed for installation on a wide range of seagoing and riverine craft, this three-barrel 20 mm gun can provide a small vessel with very substantial fire-power.

The system comprises an M197 three-barrel 20 mm gun and ancillary equipment mounted on a US Navy Mk 10 stand. The gun and its associated delinking feeder (M-89) are currently in use by the USMC in helicopters and in US naval aircraft.

The M197 weapon is electrically operated and power for this is supplied by a battery mounted on the gun stand. Twenty complements of ammunition can be fired without battery recharging: the battery can conveniently be connected to a main power source to provide a 28V trickle feed, thus maintaining the battery in a charged condition.

The three barrel gun is derived from the six-barrel M-61 (Vulcan) gun (**5547.103**) and has alternative rates of fire of 600 and 1,200 rounds/min. The M-89 delinking feeder includes a declutching arrangement which, when the trigger is released, automatically stops the supply of ammunition to the gun but permits the gun to continue firing long enough to clear the barrels.

Pintle Mounting

The Mk 10 gun mount provides convenient room for the installation of the 300-round ammunition can behind the right-hand shield – the battery and control box being mounted behind the other half. The M-197 gun can, however, also be pintle-mounted, in which case there is no obvious location for the ammunition box. The ammunition feed system, however, permits the ammunition box to the gun by means of a flexible chute so that the box can be located in any convenient position near the gun. In addition, a larger ammunition box may be used if desired.

CHARACTERISTICS:
Deck-mounted on Mk 10 mount:
Weapon: M-197 20 mm three barrels
Elevation: −15° to +75°
Traverse: unlimited
MV: 1,030 m/sec
Dispersion: 80% in 8 mil circle
Rate of fire: 600 or 1,200 rounds/min
Ammunition: M-50 series
Feed: XM-89
Ready rounds: 300
Battery fireout capability: 6,000 rounds
Weight: (without ammunition) 500 kg approx
MANUFACTURER:
General Electric, Aircraft Equipment Division, Burlington, Vermont, USA.

2851.203
20 mm VULCAN GUN (NAVAL APPLICATION)
DESCRIPTION:
The Vulcan six-barrelled 20 mm anti-aircraft cannon has been established in the US Army for some years (see **2850.131** and **5547.103**). Recently, however, the possibility of using its considerable fire-power to provide a "last ditch" defence for ships attached by cruise missiles has been considered; this consideration has resulted in the Vulcan/Phalanx system.

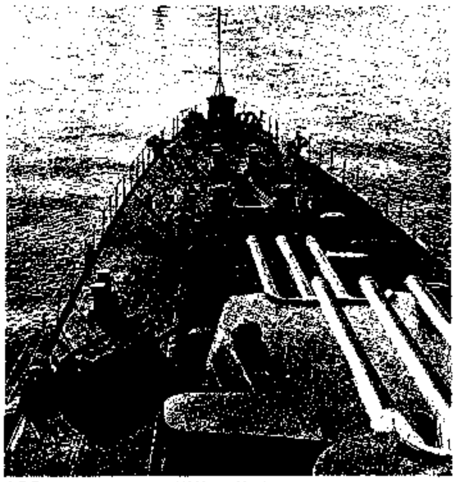
All available information on the radar-plus-computer-plus-gun system is set out in entry number (**2543.231**).

MANUFACTURER:
General Electric, Aircraft Equipment Division, Burlington, Vermont, USA.

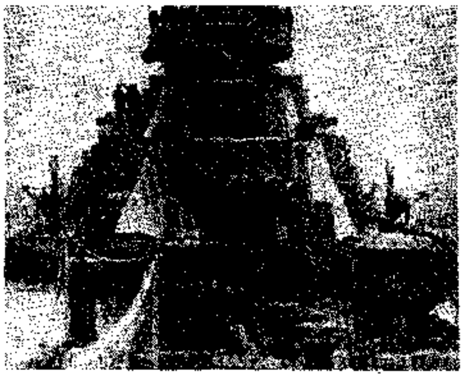
THE UNION OF SOVIET SOCIALIST REPUBLICS

6037.203
TRIPLE 180 mm GUN MOUNTING
DESCRIPTION:
In the Russian Navy, as in most others, big guns are nearing the end of their service life. The 180 mm gun is now the largest carried by Russian ships (and only in the US and Spanish Navies are larger guns to be found) and even this is restricted to the two surviving members, *Kirov* and *Slava* of the *Kirov* class cruisers. Both ships were launched before the Second World War, although *Slava* (formerly *Molotov*) was not completed until 1944.

Each cruiser carries 9 of the 180 mm guns in three triple mountings. The three guns in each mounting are mounted in a single sleeve and are thus not capable of individual elevation. Maximum elevation is 40 degrees. The guns are semi-automatic, 57 calibres long and can fire 6 rounds per minute. Muzzle velocity is 920 m/sec, projectile weight about 100 kg and range about 35 km.



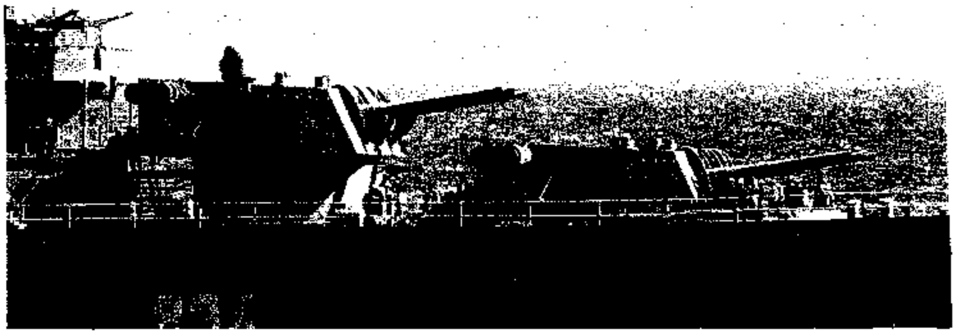
180 mm guns on a "Kirov" class cruiser (Novosti)



The forward 180 mm guns of the cruiser Slava

6038.203
TRIPLE 152 mm GUN MOUNTING
DESCRIPTION:
These guns are in service with several of the older cruisers of the Russian fleet. The "Sverdlov" class cruisers each carrying 12 guns in four triple mountings, except for the *Dzerjinski* which has had one of its turrets replaced by a launcher for the SAM-2 Guideline missile (**2943.231**). The older "Tchapaev" class cruisers also carry four triple turrets.

Guns in the turrets are mounted in separate sleeves, thus permitting individual elevation to at least 50 degrees. Projectile weight is believed to be about 50 kg and muzzle velocity 915 m/sec so that maximum range is probably in the region of 27 km. The gun is 50 calibres long, semi-automatic and can fire 10 rounds per minute. An 8-metre range-finder is incorporated in each turret.



The 152 mm triple turrets of the "Sverdlov" class cruiser Alexsander Suvorov *photographed in the Philippine Sea during the Soviet worldwide exercise* Okean (US Navy Photograph)

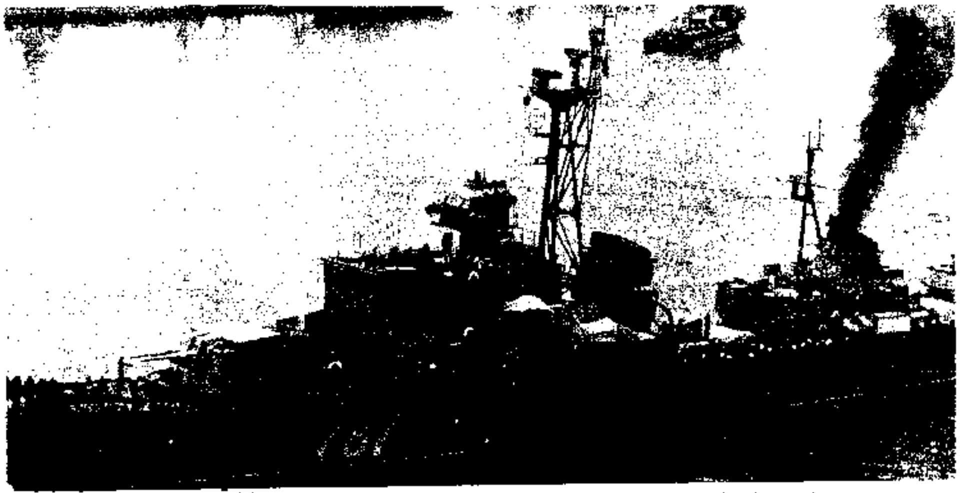
The "Sverdlov" class cruiser Mikhail Kutuzov *with its four triple 152 mm gunmountings. Note also the three starboard twin mountings for the ship's 100 mm guns, the port and starboard stabilised directors for these guns just aft of the forward funnel and the large director and tandem-mounted 9-metre range finders amidships aft of the after funnel. A similar director and range finder assembly is mounted on the control tower*

6039.203
TWIN 130 mm GUN MOUNTING
DESCRIPTION:

These gun mountings are to be found only on the older (unmodified) "Skory" class destroyers – including those supplied to Indonesia and to Poland. These vessels carry two twin mountings.

It is believed that the gun is 50 calibres long and fires a 27 kg shell with a muzzle velocity of 875 m/sec. The mountings are semi-automatic and a rate of fire of 10 rounds per minute can be achieved. Range is about 25 km. The 130 mm guns of the modified "Skory" class destroyers are housed in twin mountings of somewhat different design and it is believed that these mountings are the same as those of the "Tallin" and "Kotlin" class destroyers.

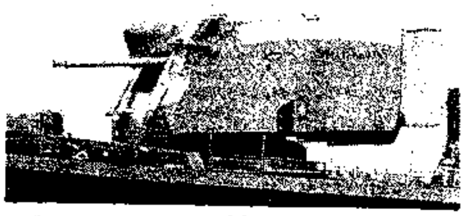


Twin 130 mm guns mounted on the "Skory" class destroyer Svobodnyi

6040.203
TWIN 130 mm DUAL-PURPOSE GUN MOUNTING
DESCRIPTION:

It is believed that this mounting is common to the modified "Skory" class and the "Tallin" and "Kotlin" class destroyers (but certainly not the modified "Kotlin" class ships that carry surface-to-air missiles).

On these vessels, assuming that all the installations are indeed similar, the 130 mm guns, in two twin turrets including firing directors are fully stabilised. The installation on the *Neustrashimyi* (or *Nastoichvyi* – opinions differ) is indeed believed to be the first of its kind on a ship of destroyer size. The guns are dual-purpose, semi-automatic and are believed to be 58 calibres long and to fire a 27 kg projectile at 10 rounds/min with a muzzle velocity of 875 m/sec. The two guns in the mounting can be independently laid and can be elevated to 70°. They are used with "Wasphead" stabilised directors with radar.



Fully stabilised twin 130 mm dual purpose gun mounting

6042.203
TWIN 100 mm DUAL-PURPOSE GUN MOUNTING
DESCRIPTION:

Guns of this type are in service with the Russian Navy on the "Sverdlov" class cruisers (including the *Dzerjinski*) and the "Tchapaev" class cruisers, on which they are associated with "Wackeltopf" stabilised directors with radar.

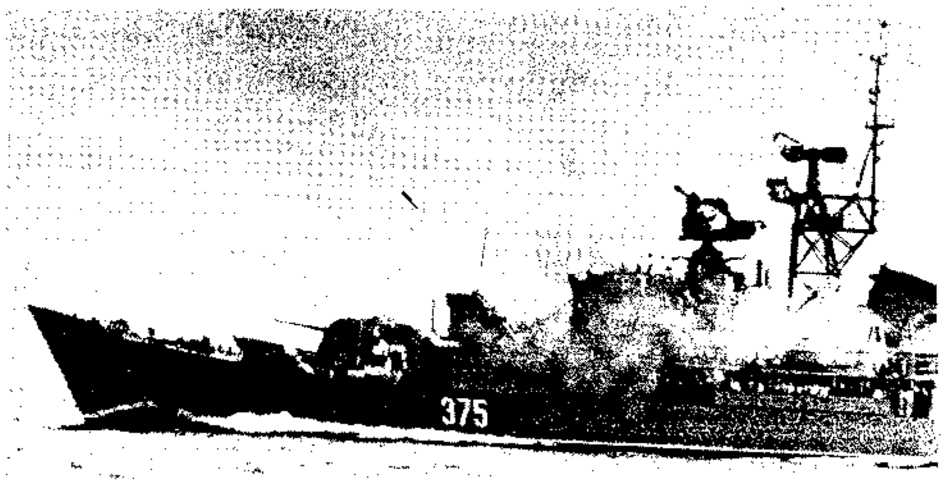
These guns are of more modern type than the single 100 mm gun fitted on the "Kirov" class cruiser and the "Kola" and "Riga" class destroyers (**6041.203**). They are reported as being capable of firing their 16 kg projectile with a muzzle velocity of 900 m/sec at 20 rounds/min. Maximum surface range is understood to be 18 km and maximum AA engagement height 12,000 metres (at 80° elevation). Barrel length is 60 calibres. The turret is stabilised and has been said to weigh 35 tons. It is believed that the trunk of the turret extends downwards for at least one deck and contains the ammunition hoist.

Stabilised twin mounting for 100 mm dual-purpose guns on a cruiser. The top of the fire director can be seen to the rear of the gun mounting

6041.203
SINGLE 100 mm DUAL-PURPOSE GUN MOUNTING
DESCRIPTION:

This gun mounting is to be found on the two "Kirov" class cruisers, on the many "Riga" and "Kola" class destroyers that are to be found in the navies of both Russia and its client countries, and on the "Don" class support ships.

These guns are all believed to be the 1947 model, to be 56 calibres in length and to fire a 13.5 kg projectile with a muzzle velocity of 850 m/sec. Surface range is believed to be some 16 km and maximum AA engagement height 6,000 metres. They are manually operated and obsolescent.



Anti-submarine rockets being fired from a "Riga" class destroyer. Two single 100 mm dual-purpose gun mountings can be seen. Note the elevation angle of the gun nearer to the rocket launcher (Novosti)

6043.203
SINGLE 85 mm DUAL-PURPOSE GUN MOUNTING

Fitted on some of the "Kronstadt" class coastal patrol vessels this gun may be presumed to be obsolescent. It has been replaced on many of these vessels by weapons of smaller calibre.

The guns are 52 calibres long and semi-automatic. Maximum range is about 15 km, the muzzle velocity being 800 m/sec. Rate of fire is 10 rounds/min. Maximum elevation is 75°.

2865.203
TWIN 85 mm AA GUN MOUNTING

Description:

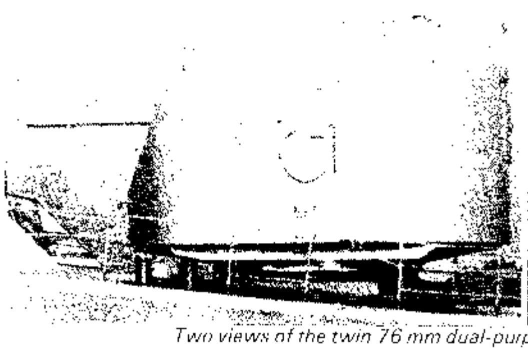
This is an elderly semi-automatic heavy anti-aircraft weapon believed to be installed now only in the "Skory" class destroyers. Barrel length is about 52 calibres, muzzle velocity about 800 m/sec. maximum range and height about 10,000 m and 5,000 m respectively. Maximum barrel elevation is 75°. Rate of fire about 15 rounds/min.

6044.203
TWIN 76 mm DUAL-PURPOSE GUN MOUNTING

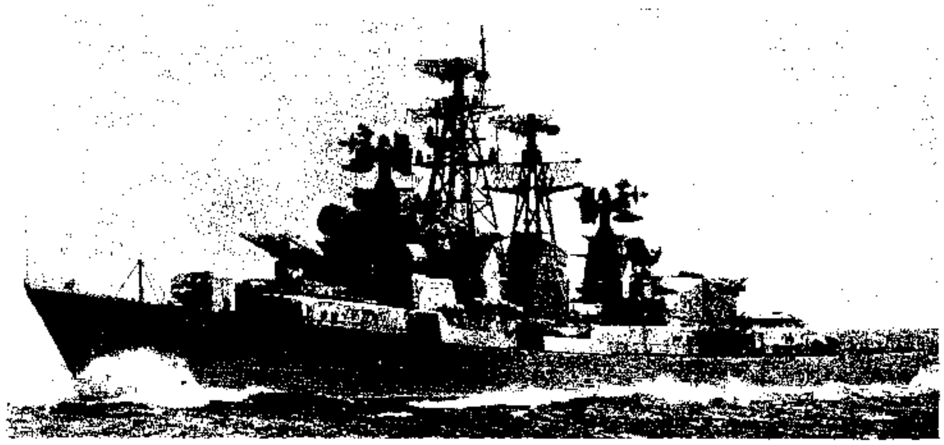
Description:

This is a relatively modern weapon and is fitted to the "Kynda" class guided missile cruisers, on the "Kashin" class guided missile destroyers and on the "Mivka" and "Petia" class.

The 60 calibre gun can be elevated to about 85°; and this with a muzzle velocity of about 900 m/sec. means that air targets can be engaged at slant ranges up to 14,000 m. Maximum range is 15 km. Rate of fire is said to be 60 rounds/min



Two views of the twin 76 mm dual-purpose gun mounting



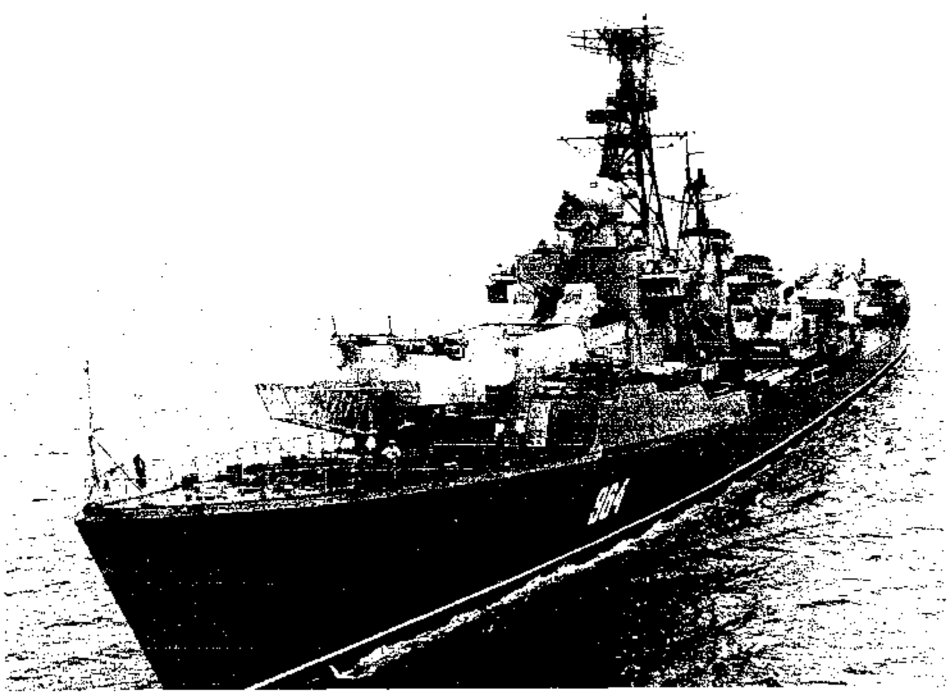
"Kashin" class guided missile armed destroyer with twin 76 mm guns mounted forward of the Goa missile launcher

6047.203
QUADRUPLE 57 mm AA GUN MOUNTINGS

Description:

In the "Kanin" and "Krupny" class destroyers and the "Lama" class supply ships quadruple 57 mm mountings are installed. The guns are arranged as two pairs mounted vertically one above the other and it is believed that the pairs are essentially similar to the twin 57 mm guns described below, except that the barrels of the quad-mounted guns do not have muzzle brakes.

The fire control radar for these guns is described in **1325.253**.



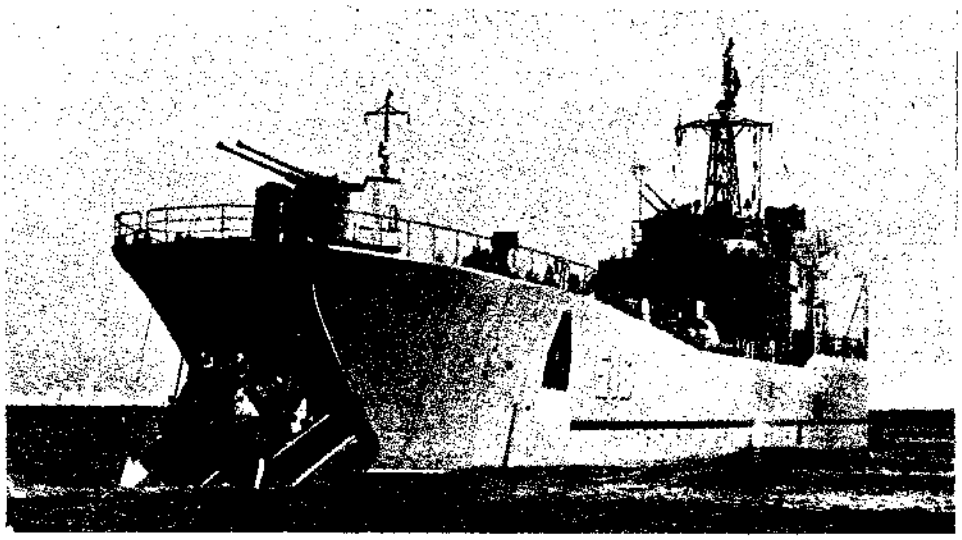
The "Krupny" class guided missile armed destroyer Gnevny. *Two of the four quadruple 57 mm AA gun mountings can be seen here together with the forward director and fire control radar. Note also the forward Strela launcher and hangar and the port 16 barrel A/S rocket launcher aft of hangar.* (UK Ministry of Defence. Official photograph)

6046.203
TWIN 57 mm AA GUN MOUNTINGS

Description:

Twin 57 mm AA guns are fitted to many of the more modern or recently modernised Russian ships. The guns have 70-calibre barrels with muzzle brakes and a rate of fire of some 120 rounds/min/barrel is believed to be possible. Muzzle velocity is about 950 m/sec. vertical range is believed to be about 6,000 metres and horizontal range about 9,000 metres; the weight of the shell is about 2.8 kg.

Guns of this type are installed in "T-58", "Don", "Lama II", "Oskol", "Tovba", "MP-8" and "Alligator" classes of ship. Although primarily AA weapons, the 57 mm guns are in some cases the sole armament of a ship and must therefore be intended for use in a dual-purpose role.



Twin 57 mm AA guns on "Alligator" class LST (Novosti)

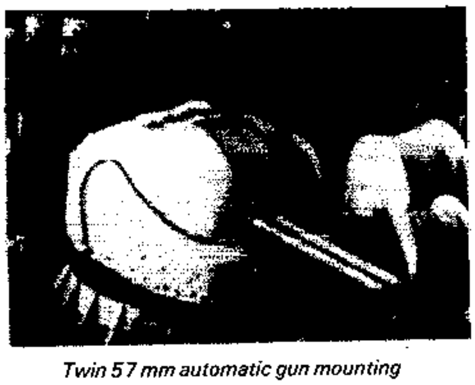
Twin 57 mm AA guns. (Novosti)

2869.203
TWIN 57 mm AUTOMATIC AA GUN MOUNTING

DESCRIPTION:

Several of the most modern classes of Russian ships are equipped with fully-enclosed, fully-automatic 57 mm guns in twin mountings. With 80-calibre barrels and muzzle velocities around 1,000 m/sec, these guns have maximum horizontal and vertical ranges of some 12,000 m and 5,000 m respectively. Rate of fire is believed to be 120 rounds/min/barrel. Maximum elevation is around 85°.

Guns of this type are found in the "Moskva", "Kresta",, "Grisha", "Nanuchka", "Poti", "Ugra" and "Chilikin" classes. Radar control is normally by Muff Cob (**1611.253**).



Twin 57 mm automatic gun mounting

Twin 57 mm automatic gun mounting

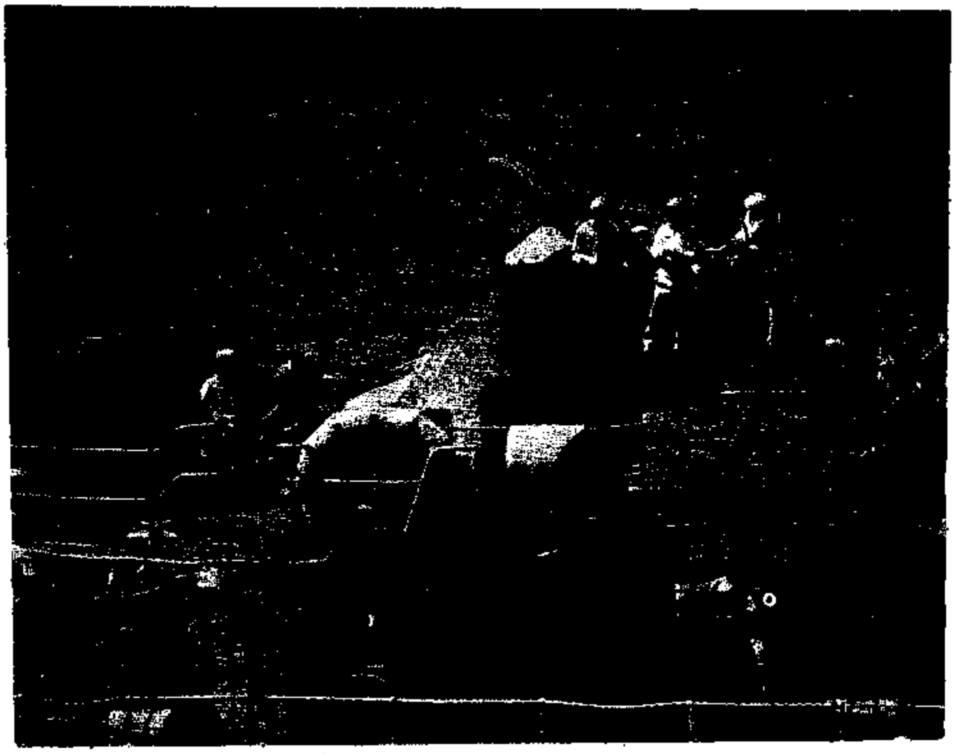
6045.203
SINGLE 57 mm DUAL-PURPOSE GUN MOUNTING
DESCRIPTION:

This 57 mm gun is fitted only to the "Sasha" class coastal minesweepers and the modified "Skory" class destroyers. It is believed that the gun performance is the same as that of the twin-mounted 57 mm gun described in entry **6046.203** but the gun barrel is not fitted with a muzzle brake.

6048.203
QUADRUPLE 45 mm AA GUN MOUNTS

These mounts are very similar in appearance to the quadruple 57 mm AA gun mounts described above. They are fitted to some of the older destroyers of the fleet – the "Kildin", "Kotlin" (unmodified) and "Tallin" classes.

Semi-automatic and with an 85-calibre barrel, each gun can fire about 160 rounds/ min with a muzzle velocity of about 1,000 m/sec and vertical and horizontal ranges of some 7,000 m and 9,000 m.



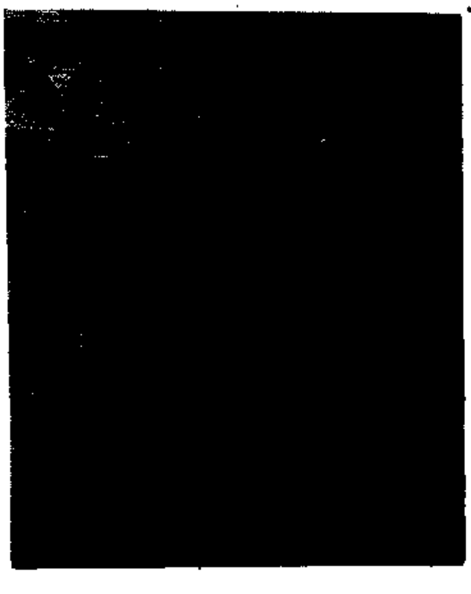
Quadruple 47 mm 85 calibre AA gun mounting on a "Kotlin" class destroyer photographed during the Okean *exercise* (US Navy Photograph)

2870.203
TWIN 37 mm AA GUN MOUNTINGS
DESCRIPTION:

Twin 63-calibre AA mountings of various types are found on many of the older cruisers, destroyers and auxiliaries of the Russian Navy. The 37 mm AA calibre was first introduced for naval use, adapted from the army weapon in 1943, but the twin mountings date from some five years later.

With a muzzle velocity of some 850 m/sec the guns have a range of around 4,000 m. Rate of fire is believed to be about 130 rounds barrel/ minute.

Twin 37 mm AA guns (Tass)



2883.203
SINGLE 37 mm AA GUN MOUNTING
DESCRIPTION:

Derived from an army weapon of the same calibre this gun was introduced for naval use in 1943 and is to be found in open mountings on the older "Skory" class destroyers, and on "Kronstadt" class submarine chasers and in turret mountings on T-301 class coastal minesweepers.

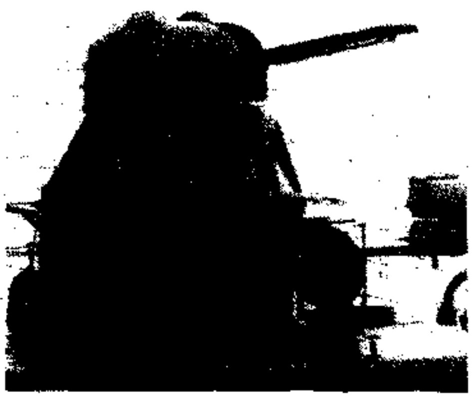
Characteristics of the gun are believed to be substantially the same as those given for the twin 37 mm mountings in entry **2870.203**.

Single 37 mm AA mountings

2896.203
TWIN 30 mm AA GUN MOUNTING
DESCRIPTION:

Widely fitted in missile boats and other small craft, this is a fully automatic remote-controlled weapon. Barrel length is 65 calibres, muzzle velocity around 1,000 m/sec, range about 3-4,000 m and rate of fire around 500 rounds/minute/barrel. Maximum elevation is about 85°.

The gun was first introduced in 1960. It is most commonly associated with the Drum Tilt fire control radar (**1330.253**) or more rarely with Muff Cob (**1611.252**).

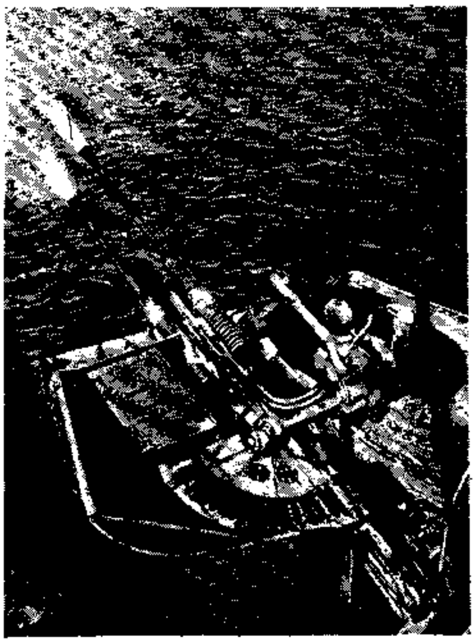


Twin fully-automatic 30 mm AA mounting as mounted on missile boats and other small vessels

2897.203
TWIN 25 mm AA GUN MOUNTINGS
DESCRIPTION:

LAA guns of this type are mounted in many of the smaller ships of the Russian Navy. The two guns are mounted vertically one above the other, have a barrel length of 70 calibres, a muzzle velocity of about 900 m/sec, a range of some 4,000 m and can fire about 350 rounds/minute/barrel. Elevation capability is about 88°.

This enclosed twin mounting is installed in a BK-class gunboat

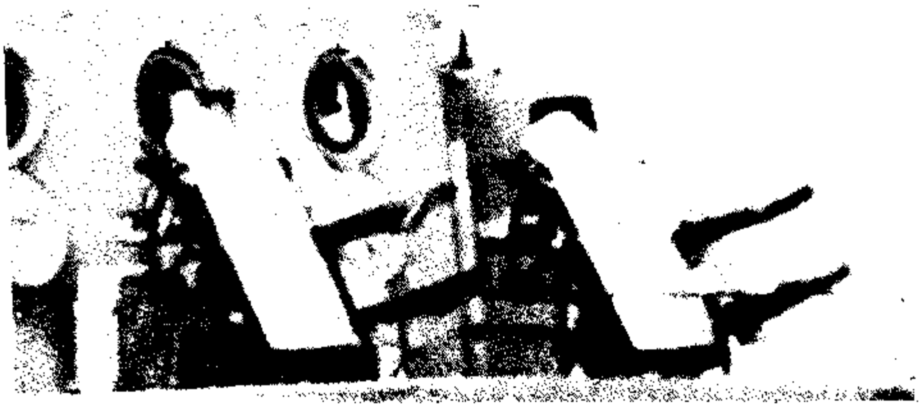


Twin 25 mm AA guns in open mounting

Modern semi-enclosed twin 25 mm gun mounting used on submarine chasers and similar vessels

2898.203
TWIN MG MOUNTINGS
DESCRIPTION:

Twin MG mountings are used for AA defence on many small Russian ships – especially the older ones. Typical are the twin 12.7 mm mountings on a "Kronstadt" class submarine chaser illustrated here.



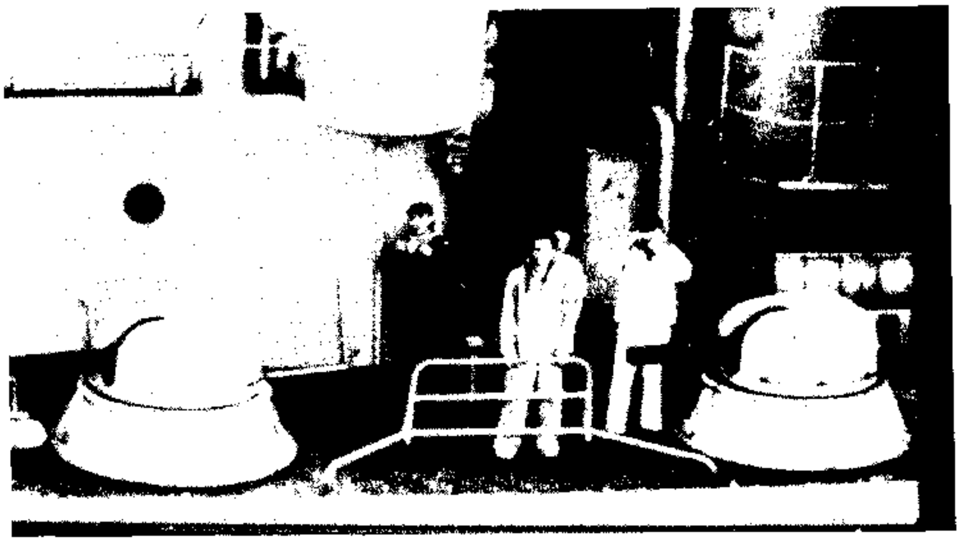
Twin 12.7 mm AA MGs on a "Kronstadt" class submarine chaser

2973.203
CLOSE-IN WEAPON SYSTEM
DESCRIPTION:

It was first thought that the pairs of small barbette mountings abaft the SS-N-10 missile launchers on the "Kresta II" class cruisers of the Russian Navy were twin 30 mm gun-mountings similar to but more modern than those described in **2896.203** above.

It now seems possible, however, that they are in fact a more sophisticated device intended as a close-in weapon system or "last-ditch" anti-missile system, similar in concept – but not in execution – to the Vulcan-Phalanx system (**2543.231**) of the US Navy.

No details of calibre or performance are available.



Barbette mountings on Kresta II

2899.203
140 mm ROCKET LAUNCHERS

DESCRIPTION.

For the past thirty years and more the Russian Army has been using and arranging for the development of a wide range of unguided barrage rockets (**5555.103**). It is not surprising, therefore, that the Russian Navy should also use these weapons: indeed it is surprising that they have not made greater use of them.

So far as is known at present the only confirmed installation is on the "Polnocny" class landing ship. This carries a trainable launcher with a capacity for 18 rounds of 140 mm rockets. These are credited with a range of some 9 km.

2991.203
SAN-4 UNGUIDED MISSILE SYSTEM

DESCRIPTION

A note on this new missile system is included here as well as in Section 1 (**2990.231**) because it is not definitely known whether or not the SAN-4 missiles are guided.

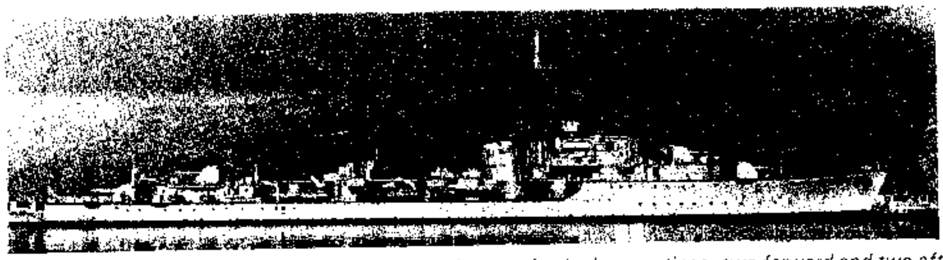
One possibility appears to be that the weapon comprises a fast reaction launcher assembly, which is capable of rapidly launching a large salvo of relatively small unguided rockets in the direction of an attacking aircraft or missile. Those who support this view suggest that the launcher assembly is installed below deck and can be moved up bodily when the system is brought into action. An argument in favour of this view would seem to be the advantage of being able to reload such a launcher under cover – possibly even by exchanging complete pre-load missile containers; an operation which it would be inconvenient to perform under fire on deck.

Until some pictures showing more than the top (if such it be) of the launcher are available, however, the true nature of this system must remain in doubt.

YUGOSLAVIA

6079.203
SINGLE 120 mm GUN MOUNTING

These guns are installed in the ex-British "W" class destroyers *Kotor* and *Pula*. The ships were refitted in 1956-59 but it seems possible that the 120 mm guns are Vickers 4.7 in 50-calibre weapons of the 1931 pattern. See also entry number **6081.203** above (Argentina).



The destroyer Pula *The four 120 mm guns can be seen in single mountings, two forward and two aft*

SHIPBORNE ANTI-SUBMARINE WEAPONS

6095.203
SHIPBORNE ANTI-SUBMARINE WEAPONS – INTRODUCTION

Many ships nowadays carry a considerable variety of ASW weapons and systems. This brief survey, which is indicative rather than exhaustive, deals with the more important categories of shipborne weapons: systems are covered in Section 1 and the following notes contain references to entries in that section.

A/S Torpedoes

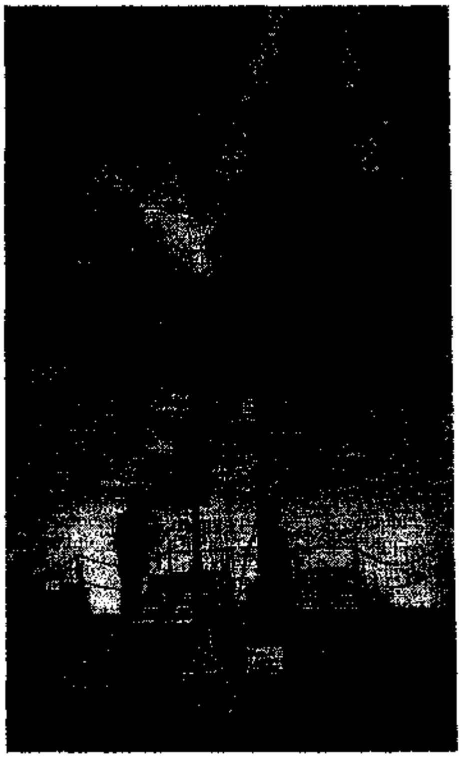
The torpedo is a major anti-submarine weapon. It may be launched directly from a torpedo tube on a ship, from a drone or missile launched from a ship, or from a manned aircraft or helicopter. All available information on torpedoes will be found in Section 1.

Drones and Missiles

Drone torpedo-launchers and torpedo-carrying missiles are also dealt with in Section 1. Their names and reference data are listed below.

Name	*Entry No.*	*Country*
Asroc	**6001.241**	USA
Dash	**2550.341**	USA
Ikara	**6002.241**	Australia
Malafon	**1179.241**	France

Of these it should be noted that Asroc has a dual role – as a carrier of either an A/S torpedo or a depth charge. The submarine-launched missile Subroc (**1128.441**) is not at present a torpedo carrier. The nature of the large Russian anti-submarine rocket (**6097.241**) is not known.



Depth charge launching from Russian ship (Novosti)

Quintuple trainable torpedo launcher on a Russian cruiser

The Italian frigate Cigno *with Menon three-barrelled depth charge launcher aft of the twin 76/62 guns*

Depth Charges

Relatively simple cylindrical depth charges that can be rolled or catapulted into the sea are the longest-established anti-submarine weapons: they were first used by the Royal Navy in the First World War. They are time-fused and have a low sinking rate – thus giving the launching vessel time to get clear. They are still used extensively by many navies: a typical weight of the depth charge is 150 kg and launcher can project the charge up to about 150 metres.

Depth Charge Mortars

Towards the end of the Second World War a more streamlined type of depth charge with a higher rate of sinking was introduced by the US Navy. The higher sinking rate makes it necessary to project the charge to a greater distance from the launching vessel and for this purpose a mortar is used. Such mortars have been developed in several countries, Squid (**6007.241**) and Limbo (**6008.241**) in the UK being two examples and the Italian Menon being a third. The Menon launcher, which exists in three-barrelled and six-barrelled forms, is notable for the length of its tubes: the three-barrelled mortar can be seen aft of the twin 76/62 guns on the frigate *Cigno*. It has a range of about 1,500 metres compared with 350-1,000 metres for the two British devices. A single-barrel mortar is fitted on some Italian frigates and corvettes. This is said to have a range of about 1,000 metres and a rate of fire of 15 DCs/minute.

Another weapon in this category is the French 4-barrelled mortar. This is mounted in a turret and is automatically loaded. It fires a heavier projectile and has a longer range (about 2,750 m) than any of the others. All these mortars fire 12-inch (305 mm) depth charges.

It is believed that the Russian Navy has not adopted the streamlined form of depth charge. They do, however, use depth charge mortars, but it is thought possible that they use compressed air to propel the charge whereas other countries use an explosive cartridge.

Nuclear Depth Charges

Also introduced by the US Navy is the nuclear depth charge. To take this clear of the launch vessel a rocket is required, and these depth charges have so far been associated only with Asroc (**6001.241**) and Subroc (**1128.441**).

Multiple Short-range Rocket Launchers

Another American innovation of the Second World War was the multiple launcher for small (c. 25 kg) rockets with impact fuses. Devices of this nature are widely used by many navies and are commonly known by the name Hedgehog, which was applied to the first US 24-rocket launcher, even though they may not be of identical design. The American Hedgehog has a range of about 350 metres: a smaller 8-rocket device known as Mousetrap has a range of about 200 metres.

Medium Range Rocket Launchers

One of the most widely adopted developments of the years since the Second World War has been the medium-range (200-600 metres) anti-submarine rocket launcher. Brief details of the French system (**2057.241**) and the Swedish system (**6021.241**) on which the French system is based, are given in earlier pages; and although it differs in some important respects from these systems the Norwegian Terne system (**6022.241**) is in this general weapon category. The US Navy has also developed systems of this kind, the current one being known as Weapon Alfa – successor to Weapon Able. Many such developments have also taken place in recent years in Russia.

The next two entries give details of the widely-used Swedish Bofors 4-tube launcher and the more recent 2-tube launcher. The final entries in this section give a little information concerning Russian developments.

MANUFACTURERS:

Many weapons in this group are made at government establishments or in circumstances which prevent disclosure of manufacturers' or contractors' names. The following list names some commercial manufacturers known to have been involved – but again it is certainly not exhaustive.

Torpedoes:
France: CIT-Alcatel
Germany: AEG
Italy: Whitehead Moto Fides
UK: GEC-Marconi, Plessey, Vickers
USA: Gould (formerly Clevite), Northrop, Westinghouse

Drones and missiles:
France: Latécoère
UK: BAC, Hawker Siddeley
USA: Goodyear, Gyrodyne, Honeywell

A/S Mortars and Rockets:
France: Creusot-Loire
Italy: Whitehead Moto Fides
Japan: Mitsubishi
Sweden: Bofors

SWEDEN

2369.203
SHIPBORNE 4-TUBE ANTI-SUBMARINE ROCKET LAUNCHER

The Bofors 375 mm 4-tube anti submarine rocket launcher is electro-hydraulically driven, has an integral fixed-structure loading hoist with a rotatable rocket table and is remotely controlled.

In an emergency the launcher can be hand laid using a follow the-pointer device and the hoist can be hand operated. Otherwise remotely controlled electro-hydraulic laying machinery is used. Fuse setting is with the rocket in the tube. The rocket table holds 8 rounds. Reload time for four rockets is three minutes, and the minimum interval between firings is one second. Minimum manning complement is four men.

STATUS:

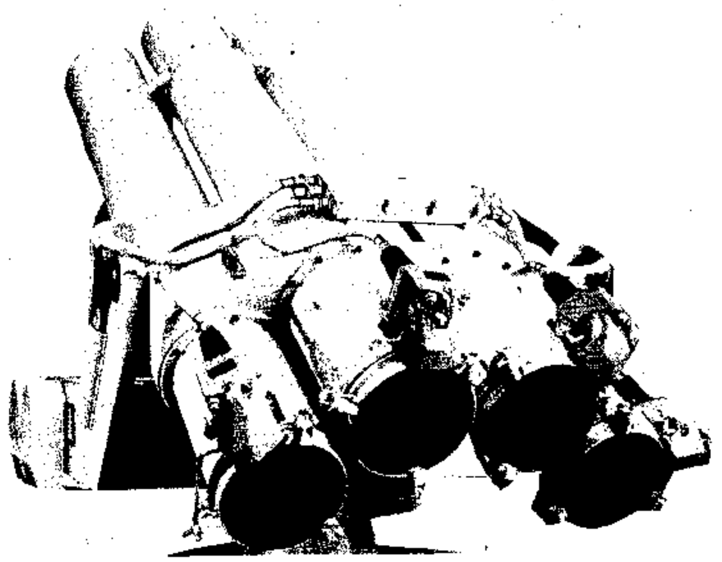
Design was started in 1948 and the launcher first went into service with the Royal Netherlands Navy – who had initiated the work – in 1954. Since then it has been supplied to the Argentine, Colombia, France, Germany, Japan, Portugal and Sweden.

CHARACTERISTICS:

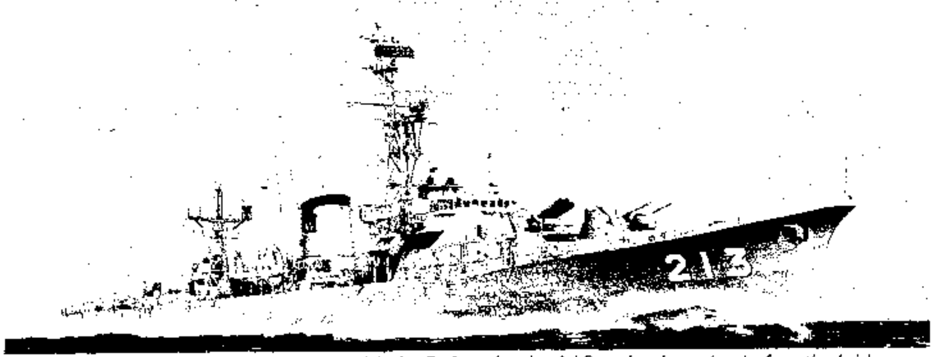
Weight, excluding rockets and flame guard: 7.3 tons
Traversing speed: 18 deg/sec
Elevating speed: 18 deg/sec
Traverse limits: +130 deg
Elevation limits: +15 to +90 deg
Power supplies: 440 V 3-phase 60 Hz
Power consumption: Loading: 6 kW
Tracking: 6 kW

MANUFACTURER:

AB Bofors, Bofors, Sweden.



Bofors 4-tube anti-submarine rocket launcher



Mogami-class Japanese frigate with the Bofors 4-tube A/S rocket launcher before the bridge. The launcher is built under licence in Japan by Mitsubishi H.I.

2368.203
SHIPBORNE 2-TUBE ANTI-SUBMARINE ROCKET LAUNCHER

This is a new Bofors rocket launcher with two launching tubes, which is currently at an advanced development stage. It has an integral motor-driven twin hoist for loading both tubes at once, and a rotating loading table. The laying mechanism is electro-hydraulic with choice of local or remote operation. Fuse setting is with the rocket in the tube. The rocket table holds four rounds and the total number of rockets in the operating room is 24. The shortest time between successive firings is one second; the time for firing six ready rockets (four on the table and two in the tubes) is one minute; and the firing rate for continuous fire is two rockets every 45 seconds – or, with an automatic loading device, one two-round salvo every 20 seconds. Minimum manning complement is three men.

CHARACTERISTICS:

Weight, excluding rockets but including flame guard and deck plate: 3.2 tons
Traversing speed: 30 deg/sec
Elevating speed: 30 deg/sec
Traverse limits: Unlimited
Elevation limits: (Mechanical) 0 to +90 deg
Elevation limits: (For firing): 0 to +60 deg
Power supplies: 440 V 3-phase 60 Hz
Power consumption: (Mean, during tracking): 4 kW

STATUS:

In production

6096.203
RUSSIAN ANTI-SUBMARINE ROCKET LAUNCHERS

As noted earlier in this section the Russians do not appear to have adopted the streamlined depth charge of the kind introduced by the Americans in the 1940s. Instead they appear to have leap-frogged a development stage and proceeded directly from the slow-sinking depth-charge to the medium range anti-submarine rocket.

The development of this type of weapon by the Russians was first noticed by outside observers around 1960. The earliest installation appears to have a small (150 cm long) twin launcher for rockets with a range of 6-800 m. This is found on the old "Kola" class destroyer escorts, and "Kronstadt" class submarine chasers. More recently a range of more powerful weapons has been introduced: these are described in the entries below.

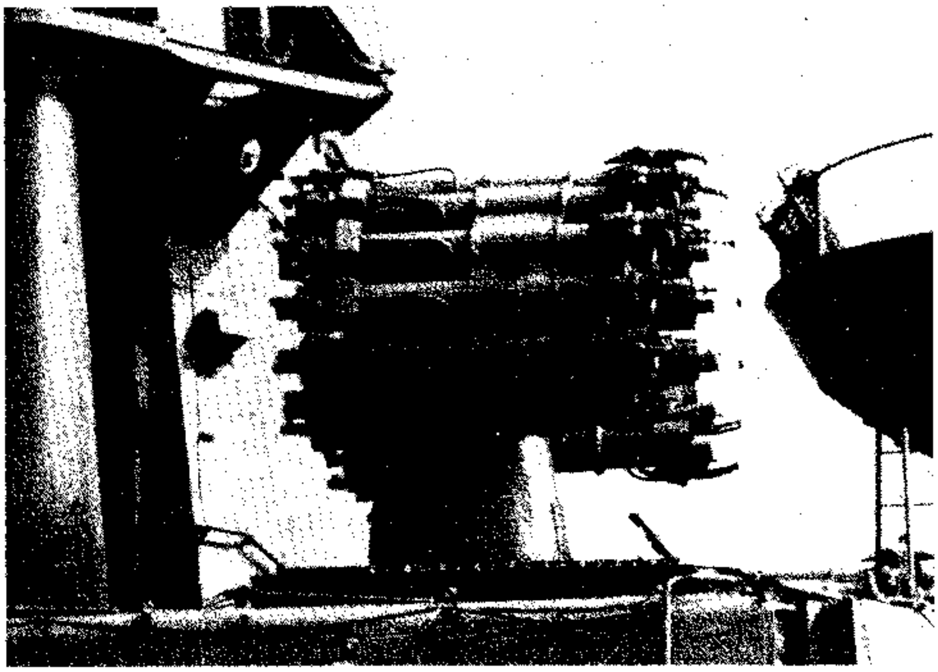
2902.203
250 mm ANTI-SUBMARINE ROCKET LAUNCHERS

DESCRIPTION:

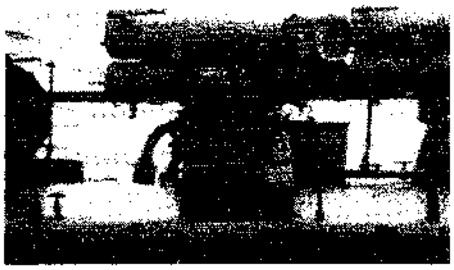
Three different types of mounting for 250 mm calibre anti-submarine rockets have been observed; and, according to one source, the performance of rockets launched from one of these – the earliest in service – is inferior to that of rockets launched from the other two.

This "inferior" model is the five-barrel launcher illustrated here. It can also be seen in action in the picture accompanying entry **6041.203**. The range of these rockets is said to be some 1,800 m; launch tube length is 180 cm – as also is that of the other two launchers.

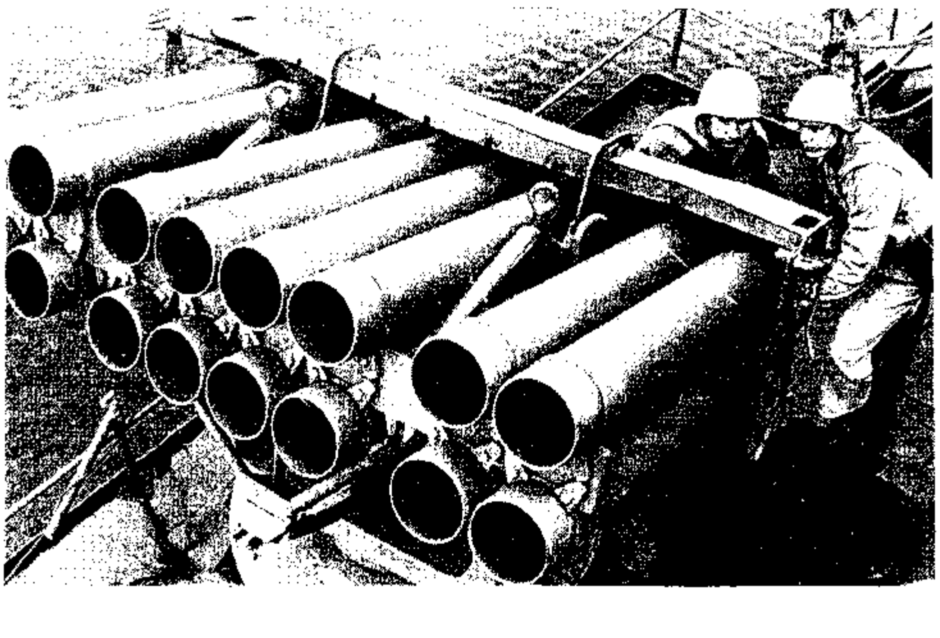
The more recent models are the 12-barrel and 16-barrel launchers illustrated here. Range of rockets launched from these launchers is said to be about 2,500 m.



12-barrel rocket launcher



5-barrel rocket launcher



16-barrel AS rocket launcher. The Russian caption to this picture describes the weapon as a "jet-propelled depth charge thrower" (Tass)

2903.203
300 mm ANTI-SUBMARINE ROCKET LAUNCHERS

Description:

These long-range anti-submarine rocket launchers have been reported in two slightly different forms. Both are six-barrel pedestal-mounted remote-controlled mechanisms; but in one the two columns of three barrels are parallel whereas in the other the top two barrels are closer together than the other two pairs.

The range of the rockets used with these launchers has been reported as 4,500 m. If correct, this figure compares favourably with that of anti-submarine rockets currently used by NATO and neutral nations – except, of course, for ASROC.

1274.303
68 mm SNEB ROCKET

DESCRIPTION:

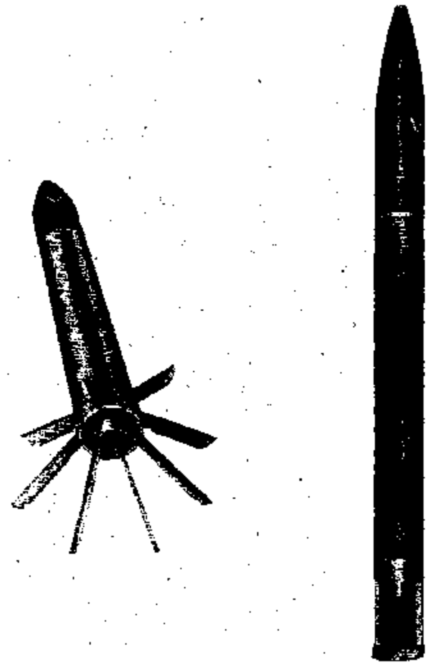
The 68 mm SNEB rocket has been developed as an air-to-ground and air-to-air weapon for subsonic and supersonic interceptor and ground attack aircraft.

The rocket is unguided and is stabilised in flight by eight folding fins. It is carried and fired from a conventional multi-tube launcher. The rocket motor gas is used to actuate the fin opening as the rocket leaves the launcher tube. In flight the fins are locked in the extended position. Fin stabilisation is supplemented by additional spinning of the rocket-flight, initially at a rate of about 30 revolutions per second. This spin is introduced by chamfering of the fin leading edges.

A variety of launchers are available for use with these rockets, for example MATRA launchers M116, M122, M150 and JL100.

Type	Length mm	Weight kg	Warhead kg	Warhead type	Velocity **m/sec	Role
250	911	5.05	1.8	Smoke	600	Practice
251P	834	4.3	1.05	Blast	800	Air-to-air
252	826	4.3	0.8	Inert*	—	Air-to-ground practice
253	911	5.05	1.8	Hollow charge and Fragmentation	600	Air-to-ground against armoured vehicles and personnel
256P	911	6.25	3.0	Fragmentation	450	Air-to-ground

*Inert warheads are available to simulate all types of operational warhead.
**Maximum velocity increment reached by rocket to be added to launching aircraft speed.



SNEB 68 mm aircraft rockets

STATUS:

In production and in service with the Royal Air Force and other air forces. Aircraft types fitted include: Mirage 3, F1 and 5, Fouga, SMB2, Mystère IV, Paris, Broussard, Ouragon, Mistral, Etendard, Milirole, Vautour, T6, T28, F84, F86, Corsair, Skyraider, G91, MB 326, Skyhawk, F-5, Phantom, HF 24, Hunter, Strikemaster, Lightning, Canberra, Buccaneer, Harrier, Jaguar.

MANUFACTURER:

1281.303
MATRA 30 mm GUN PODS

DESCRIPTION:

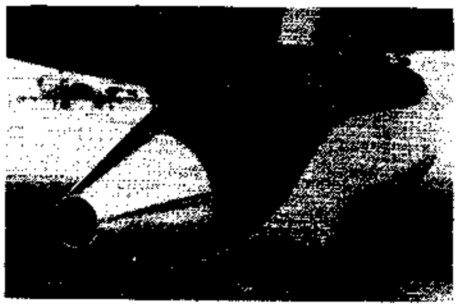
The MATRA gun pods carry a single 30 mm aircraft cannon, either DEFA type 552 or 553 or the British ADEN Mk 4. The DEFA 553 pod carries up to 400 rounds. The pod is designed to be used on subsonic or supersonic aircraft up to Mach 2 and may be fired to Mach 1.6. It is carried on standard external store racks which may be equipped for stores having twin-lug mountings at 356 mm (14 in) or 762 mm (30 in) centres.

The pod has a cylindrical body with nose and tail fairings. The 30 mm gun is mounted coaxially in the pod and is fed by standard linked ammunition contained in a rectangular cannister behind the gun. The aft compartment of the pod forms a container for spent cartridge cases which are not ejected overboard. Ammunition links are retained in the centre section of the pod. Both guns use similar electrically fired ammunition. The DEFA pod has provision for in-flight gun cocking or arming by an electrically fired pyrotechnic cartridge.

Ram air intakes are provided to purge the pod of gun gas. A shock damper is fitted to reduce the peak recoil loads transmitted to the aircraft, so that the pod is suitable for mounting on light tactical aircraft when required.

STATUS:

MATRA 30 mm gun pods have been installed on a variety of tactical aircraft including Mirage III, Macchi 326, SAAB 60 aircraft. The SA 10 pod is in service in Sweden on SAAB 105 aircraft and it will also be carried by the Viggen.



Latest version of Matra 30 mm gun pod, housing Type 553 DEFA cannon

MANUFACTURER:

SA Engins Matra, Avenue Louis Bregeut, Velizy-Villacoublay, 78-France.

1273.303
30 mm AIRCRAFT GUN DEFA 553

DEVELOPMENT:

The DEFA 553 30 mm aircraft cannon is a direct development of the DEFA 552. Its performance is similar to the 552 but design modifications have been made to improve service life and facilitate installation. A new barrel in nitro-chrome steel is used with a muzzle device to reduce muzzle pressure. Other changes have been made to simplify installation and the DEFA 553 weapon will now accept ammunition feed from either side without modification.

Other features, including in-flight recocking, correspond to the DEFA 552 model, and the same ammunition is used.

The electric control unit for the DEFA 553 provides the following facilities:

"OFF" – Firing of the gun completely inhibited.

"Continuous fire" – not normally used in action.

"0.5 second" – maximum continuous burst length 0.5 second.

"1 second" – maximum continuous burst length 1 second.

In twin installations a unit is needed for each gun and an additional control and junction box providing:

Position 1 – both guns inhibited.

Position 2 – continuous fire, both guns.

Position 3 – both guns in burst lengths (which may be different) set into each individual control unit.

Position 4 – gun camera switched on.

STATUS:

The cannon DEFA 553 is in production. It equips the Mirage F1 and Jaguar, and its use on the Alpha-jet is foreseen.

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

1271.303
30 mm AIRCRAFT GUN DEFA 552A

DESCRIPTION:

The 30 mm DEFA gun is the French development of the German Mauser revolver gun principle and is similar to, and virtually interchangeable with the British ADEN Mk 4. Over 10,000 units have been manufactured and the gun has been proved in combat in a number of theatres. Since 1971, a long-life version has been developed, called Canon Automatique de 30 mm, 550-F2A (DEFA 552A) which replaces the gun type 552, with which it is directly interchangeable.

The principal characteristics of the DEFA 552 and the DEFA 552A are light weight, a rate of fire of 1,200 rounds per minute and provision for automatic re-cocking in the event of a stoppage. The gun uses 30 mm ammunition developed for the DEFA/ADEN weapons which is available in the usual variety of types – armour piercing, HE incendiary, etc. Belted ammunition may be fed to either side of the gun. Spent cases are ejected from the same side of the weapon as accepts the feed. Links are ejected on the opposite side. The ammunition is electrically ignited.

The DEFA 552 revolver gun incorporates safety devices to ensure that firing is impossible unless the cartridge is in the firing position and the control slide, which carries the round firing contact, is in the forward position. In operation the whole gun recoils about 12 mm. On the ground a special device is used to cock the gun by hand. A single pyrotechnic cartridge is provided for automatic recocking during firing if a stoppage should occur.

STATUS:

The DEFA 552 and DEFA 552A cannon is in service with the French Air Force, the Israeli Air Force and others throughout the world. Two 552s are standard equipment on all Mirage III and Mirage V aircraft.

MANUFACTURER

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

1275.303
AIRCRAFT GUN 20 mm M.621

DESCRIPTION:

The Type 621 20 mm cannon is a versatile weapon developed in France by Manufacture Nationale d'Armes de Tulle, the national armaments factory. The weapon is particularly suitable for helicopter mounting because of its light weight and low recoil forces.

The Type 621 utilises 20 mm ammunition which is interchangeable with the US M.56 series used in Vulcan cannon. It is electrically ignited and a full range of types is available – armour piercing, incendiary, and fragmentation. Steel and brass cartridge case versions are manufactured. On firing, cases and links are ejected from the gun either downward or to the side according to installation.

Provision is made for left or right hand belt feed, and for special application ammunition of different types can be fed to each side of the gun and selected at will by the gunner. The rate of fire is either 300 or 740 rounds per minute. Provision can also be made for firing single shots.

Initial cocking of the gun is by cable, but provision is made for automatic recocking by pyrotechnic cartridge. This is available once only and is automatically triggered after a 0.3 second delay in firing. While firing the whole gun mechanism including the barrel recoils, sliding on guide rails which are part of the mount cradle.

A variety of accessories and mountings are available to adapt the M.621 to different applications. For helicopters a pintle mount is used with shields for the gunner, chutes for spent cases and links and a reflector sight mounted above the breech mechanism. In applications where minimum recoil force is essential, a muzzle brake can be fitted in place of the flash eliminator. By this means, and using a shock absorbing mounting, the average recoil force can be reduced from 400 kg to 250 kg.

CHARACTERISTICS:

Calibre: 20 mm
Gun weight: 47 kg
Muzzle velocity: 980-1,030 metres/second
Rate of fire: 740 or 300 rounds per minute
Accuracy: 80% rounds inside 2 mils (hard gun mount)
Length: 2,207 mm
Round weight: .32 kg
Projectile weight: 0.1 kg
Range*: over 1,500 metres
Average recoil force: 400 kg
*gun stationary

STATUS:

The M.621 is in production in France. Trial installations have been made in Alouette III and other helicopters. The 20 mm M.621 is also used in ground applications.

MANUFACTURER:

Groupement Industriel des Armements Terrestres (GIAT), 10, Place Georges Clémenceau, 92211-Saint-Cloud, France.

1509.303
GIBOULEE DISPENSER

DESCRIPTION:

Giboulée is a bomblet dispensing system developed in France by Thomson-Brandt in co-operation with Engins Matra and La Technique Electronique. Thomson-Brandt are the prime contractors responsible for the system with Matra contributing the container and installation design and La Technique Electronique the control units and timing system for the dispensing tubes.

Giboulée, in common with other similar systems, has been developed to increase the effectiveness of low altitude attacks on vehicles including tanks. The system consists of 12 or 24 launching tubes each of 50 mm bore contained in a streamlined pod for under-wing or under-fuselage mounting. Each tube carries five projectiles which are launched rearward successively initiated by a timing system. The tubes are aligned in azimuth at different angles to the pod axis and the effect of this aiming in azimuth and the forward speed of the aircraft is to distribute the bomblets uniformly in the target area. The launch velocity is 230 m/sec (450 kt) and should be matched by the aircraft speed if maximum effectiveness is to be achieved.

In typical conditions using a ventral pod having 24 tubes, each with five bomblets, the area covered is 100 m long by 20 m wide, the impact points of the bomblets being distributed on a rectangular mesh 4 m by 3.3 m. This high-density of distribution is optimum for the anti tank role. For anti-personnel use the pilot may operate a switch to lengthen the interval between successive bomblet firing so as to increase the size of the ground pattern by about four times to give impact points distributed over an area 300 m by 20 m.

Each bomblet weighs 0.7 kg and contains 100 gm of explosive. They are fitted with rear stabilising surfaces in the form of drag vanes attached to a closed end cap. This cap is coupled to the body of the projectile by a coil spring which deploys on launch. By these means the bomblet assumes a vertical attitude a few metres behind the point of launch and it falls to strike the ground or its target with zero forward speed.

Each bomblet is armed 1 second after launch and is fused to explode on impact. For the anti-tank role hollow charge bomblets are used which are capable of penetrating 250 mm of steel. Fragmentation bomblets are used for the anti-personnel role or for attack on soft skinned vehicles. Practice bomblets are also available either inert or fitted with flash charges to indicate impact.

The pilot's control box for Giboulée provides for the selection of anti-tank or anti-personnel patterns, the jettison of charges unarmed and to fire missiles with a time delay. This delay can be either 0.33 sec after the target has passed below the nose of the attacking aircraft or can be pre-set to a value corresponding with pre-determined launch conditions for a dive attack. The pilot also has the option to make two attacks, each with half his total bomblet load.

Specification:
Giboulée pod: Rectangular cross section with rounded corners and nose fairing
Size: 400 × 700 × 3,850 mm long
Weight: 490 kg
No. of tubes: 24
No. of bomblets: 120

STATUS:

Development initiated in 1966. Giboulée is due to enter service in France shortly on Mirage 4, Jaguar and F1 aircraft.

PRIME CONTRACTOR:

Thomson-Brandt Branche Armement et Mécanique Générale, 52 avenue des Champs-Elysées, 75008 Paris, France.

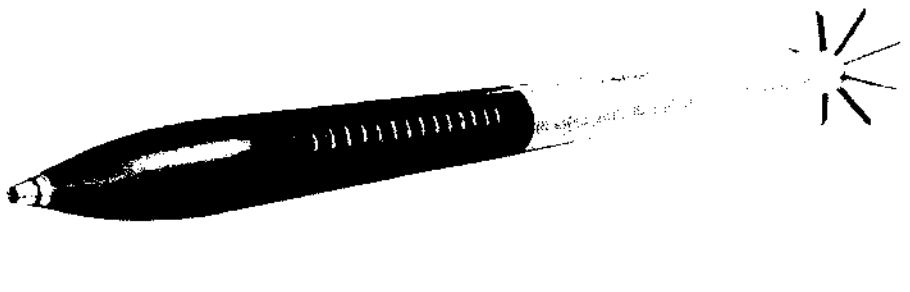
1510.303
THOMSON-BRANDT 100 mm AIRCRAFT ROCKET

DESCRIPTION:

The 100 mm Hotchkiss Brandt aircraft rocket has been designed as a larger calibre, longer range and higher lethality alternative to the well known 68 mm SNEB rocket. The principles of the 68 mm design including the stabilising system and warhead have been followed in this new design. A six tube launcher has been developed by Matra and is referred to in entry **1511.393**. Six versions of the 100 mm rocket have been developed, the only difference between them being the warhead type. All versions have the same dimensions, weight and ballistic properties.

CHARACTERISTICS

Calibre: 100 mm



Thomson-Brandt 100 mm aircraft rocket

Length: 2,480 mm
Weight: 38 kg
Warhead weight: 14 kg
Velocity: 760 m/sec gain over launch velocity
Typical firing range: 2,000 3,000 m
Time of flight to 2,500 m at launch velocity of

276 m sec (500 kt): 3 sec
Dispersion: Standard error 2 milliradian
Warhead:
EAP: General purpose fragmentation
ECC: Hollow charge armour piercing penetration 600 mm armour
ESP: Semi-AP hard cone – penetration 150 mm armour
DEM: Demolition, delayed action fuse, armour penetration 60 mm, sand – 5 m, concrete – 0.3 m
LUM: Flare, 60 second burning time, 750,000 candlepower
IN: Inert

STATUS:
Under development.

MANUFACTURER:
Thomson Brandt, Branche Armement et Méchanique Générale, 52, avenue des Champs-Elysées, 75008 Paris, France.

1599.393
ALKAN TYPE PM3 BOMB RACK

DESCRIPTION:
The PM3 bomb rack manufactured by Alkan is intended for tandem ejection of two stores fitted with 14-inch lugs and a maximum of 500 kg weight. The rack has a forward and trailing carrying section, each of which has a pyrotechnic ejector Alkan Type 257 and a twin fusing unit mechanically linked to the ejector. Each ejector contains a check device to ensure proper engagement of the store. Two pyrotechnic initiators type 28 are electrically activated to provide power for unlocking and ejection.

STATUS:
Installed in Mirage III and M5 aircraft.

MANUFACTURER:
Alkan & Cie, Rue d'Yerres, 94-Valenton, France.

Alkan type PM3 bomb rack

1598.393
ALKAN TYPE 65 BOMB-RACK ADAPTOR

DESCRIPTION
In order to use pylons, originally designed for large bombs, to be used for small bombs, Alkan have developed the Type 65 adaptor in which three small active or practice stores can be held. Three suspension rings give attachment to any rack or pylon with 14 inch (355.5 mm) lug spacing. There are three types of release mechanism; an electro-mechanical unit in which the bomb is released in free fall by an electrical impulse, a pyrotechnic unit in which the bomb is ejected, and the third type is a clamp for ringless bombs where an ejector opens the clamp and ejects the bomb. The weight of the adaptor is from 32 to 40 kg, according to ancillary fittings.

MANUFACTURER:
Alkan & Cie, Rue d'Yerres, 94-Valenton, France.

Alkan type 65 bomb rack adaptor

7503.393
ALKAN TYPE 500-OM BOMB RACK

DESCRIPTION:
Capable of carrying numerous types of bombs, as well as various packs, tanks, containers, cartridge launchers, and adaptors for bombs or missiles, its installation on the aircraft is simple, consisting of four mounting bolts.

Electro-mechanical stores release is initiated through the aircraft electrical system (24 V DC).

A special version may be adapted for rocket launching. The rocket carrying centre section can be housed in the tail end of the bomb rack so that rocket launching may be followed up immediately with a bombing mission, or vice versa, without any need to return to base in between.

Weight of the bomb rack ranges from 21 to 34 kg depending on the version.

MANUFACTURER:
Alkan & Cie, Rue d'Yerres, 94-Valenton.

7504.393
TYPE 10B SONO-BUOY ADAPTOR

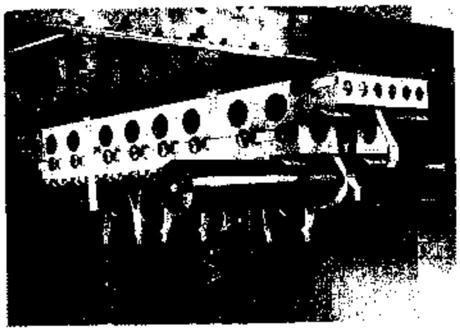
DESCRIPTION:
Intended for the carrying and the releasing of 10 omnidirectional sono-buoys. It is mounted in the bomb-bay of the Breguet 1150 "Atlantic".

It features a rigid light alloy framework fitted with 10 independent and similar carrying and releasing devices: each of these includes two sets of fixed pads for accommodating a buoy and used as rests; a strap which retains the buoy when in the latched position; adjustable in height, with respect to the pads, through an individual handwheel, which provides for the shimming of the buoy against its rests: an electro-magnetic release unit, which is cocked prior to the positioning of the buoy causes the strap to be unlatched, and the buoy to be released: a store-loaded indicator.

The release sequence of the buoys can be selected in flight and is reported through a signalling device.

Sono-buoy adaptor frameworks are produced for different types of aircraft or for different sono-buoys numbers, dimensions and shapes.

MANUFACTURER
Alkan & Cie, Rue d'Yerres, 94-Valenton.



Type 10B sono-buoy adaptor

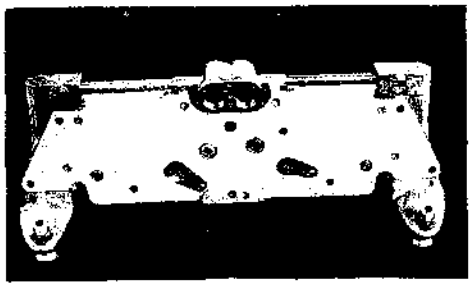
1600.393
ALKAN STORES EJECTORS

DESCRIPTION:
Despite differences which may appear in their design, configuration and performance, all Alkan ejectors are based on the same principle and have the same basic function. They rely upon pyrotechnic devices to power the release and ejection mechanisms. Pyrotechnic energy is transmitted to two pistons, the purpose of which is to eject the stores at the same time as they are released. The thrust on each piston can be adjusted to ensure correct attitude at the initiation of the store trajectory. Ejectors can be fitted with retractable pistons, thereby significantly reducing the drag of the unit. All components of the pyrotechnic device are designed for easy removal and maintenance.

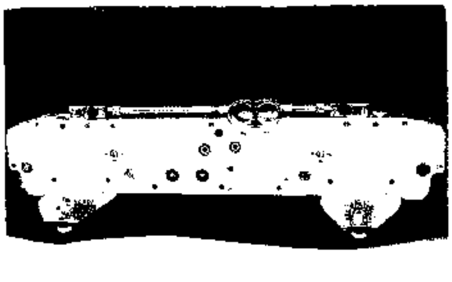
Integral construction has been adopted, and each unit consists of two half-shells machined from the solid metal, ensuring maximum rigidity. The mechanical assembly is attached to one half of the shell and the other forms a quickly removed inspection and maintenance cover for the ejector mechanism. Locking and unlocking of the actuators are affected by a special toggle joint which is designed to eliminated the need for excessive force due to the weight of the stores attached to the hooks. As a result, the mechanism operation is quite safe and almost independent of the stresses applied to the hooks. The manual locking and release controls are separated so that inadvertant unlocking cannot occur. Additionally, safety pins are provided for visual safety checking.

It is noted that all Alkan ejectors are designed so that the arming devices of the fuse arming wires included or associated with the ejectors are mechanically locked in the closed position when the hooks are closed and loaded.

The Alkan ejectors are delivered with or without sway braces with store pads which can accommodate stores from 180 to 680 mm diameter. Specific ejectors are fitted with two pairs of hooks, all interlinked, thus enabling the ejector to accept stores which have twin suspension at 14-in or 30-in centres.



Alkan Type 105 Ejector



Alkan Type 115 Ejector

The new generation Alkan ejectors, Type 132 and Type 145, have been designed to solve the problem of store diameter, and are equipped with double hooks and a store chocking system consisting of four independent spring-loaded wedges. The double hooks engage special saddle adapters attached to the store, and the spring-loaded wedges bear upon the upper surface of the saddle adapters to take up all clearance as the hooks are closed. As a result of the elimination of the crutch arms, these new ejectors have low drag, and are designated Minimum Drag Ejectors. The adjacent table summaries the various versions.

MATRA TYPE 200 BOMB RETARDING SYSTEM

DESCRIPTION:

The MATRA Type 200 bomb retarding system was approved for use by the French Air Force in 1964. It can be used with SAMP made 250 and 400 kg GP bombs. The equipment consists of a cruciform nylon parachute packed into a container within the tail of the bomb, together with the appropriate fusing equipment according to the mission being flown and the characteristics of the retarding system. In typical operations the bomb is released at an altitude of about 30 m (100 ft) at a forward speed of between 400 and 600 kt. The bomb will then hit its target, exploding on impact, at a time when the attacking aircraft is about 480 m (1500 ft) ahead of the explosion. This ensures complete safety for the attacker. Provision can be made before loading the weapon on to the aircraft to adjust the fuse operation for different release conditions.

Matra retarded bomb immediately after release

Comprehensive safety provisions are made in the MATRA 200 system. The parachute is locked to the bomb body only after release has taken place, so that should the parachute deploy while the weapon is still being carried by the aircraft it will pull away before dangerous turning moments are built up by the drag of the 'chute'. Similarly the parachute does not open until it is well clear of the aircraft. Provision is also made for the parachute to rotate with respect to the bomb while it is in flight eliminating the possibility of parachute twist.

Nose and tail fuses are fitted with the retarding mechanism. These normally operate in the 'instantaneous' mode unless safety requirements are not met, i.e. when parachute functioning, release altitude and release speed are all correct. If safety requirements are not met then there is a danger that the attacking aircraft will be damaged by the bomb explosion, and the fuse is automatically set to operate after a delay of 15 seconds. Provision is made within the fuse to prevent inadvertent instantaneous explosion in the case of a richochet when conditions required for normal operation have not been met and the system is operating within 15 seconds delay.

STATUS
In production and in service with the French and other Air Forces.

MANUFACTURER:
Engins MATRA, BP No. 1, Avenue Louis Breguet, 78-Velizy, France.

7507.393
ALKAN UNIVERSAL ADAPTOR TYPE F.1

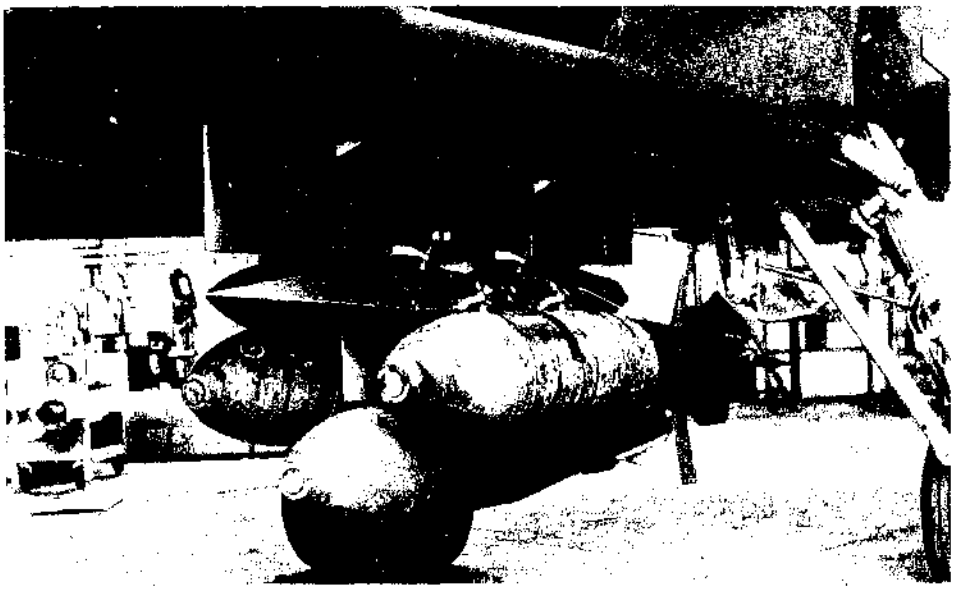
DESCRIPTION:
It can be hooked under bomb-releasers fitted with 14 inch spaced lugs (NATO type 500) or 30 inch spaced lugs (NATO type 1,000) and consists of a two-post streamlined main chassis and a removable lower bomb-release, which permits the carrying and shot-by-shot releasing of two or three stores (bombs, rocket-launchers) depending upon the case.

Each carrying and ejection system features an Alkan pyrotechnic ejector type 105, intended for the carrying of stores fitted with 14-inch spaced lugs; two Alkan fusing unit electrical devices type SL 60, which are mechanically locked when the ejector is on the "ARMED" position; signalling and firing transfer devices which are controlled by the ejectors and permit the stores to be ejected according to a preselected order; and a safety pin.

The electrical supply is normally made through a connector which is positioned according to NATO standards. The rocket-launchers which can be laterally positioned are normally fed through a pull-off connector located on each post.

Access to all the services of the adaptor and its ejectors is from the outside.

MANUFACTURER:
Alkan & Cie, Rue d'Yerres, 94-Valenton, France.



Alkan universal adaptor Type F1 on Jaguar aircraft and carrying three 250 kg bombs

MAIN DETAILS

	2 Posts	3 Posts
Length	2,150 mm	1,250 mm
Width	444 mm	444 mm
Height	184 mm	354 mm

Diameters	200 to 480 mm	200 to 360 mm
Typical loads	2 × 1,000 lb	3 × 500 lb

7508.393
JAGUAR & MIRAGE F1 WEAPON PYLONS

DESCRIPTION:
The five pylons developed by Alkan for the armament of the Jaguar are of three types, depending on their location on the aircraft: 1. one central pylon, under the fuselage; 2. two inboard pylons, under the wing; 3. two outboard pylons, under the wing.

These carry heavy stores such as bombs, rocket-launchers, tanks, various adaptors and containers.

The fixed pylons are built from two light-alloy integrated-structure shells and they are fitted with an Alkan pyrotechnic ejector of the same structure and featuring two embodied crutches.

The pylons accommodate the whole electrical system as well as the fusing unit devices, the latter remaining locked when the ejector hooks are closed, due to a linkage with the ejector mechanism. They feature "adaptor" and "rocket-launcher" connectors.

The central and inboard pylon accommodate an ejector type 115 with two sets of hooks (14-inch and 30-inch spaced). They are intended for stores up to 1,000 kg in the normal operational utilisation of modern aircraft. In addition, they feature a transfer and signalling electrical system which is mechanically controlled by the ejector mechanism, and the services for the fuel cross-feed.

The outboard pylons accommodate an ejector type 105 with one set of 14-inch spaced hooks, and they are intended for stores up to 500 kg. A similar set of pylons and ejectors of the same design has been developed by Alkan and Company for the Mirage F1

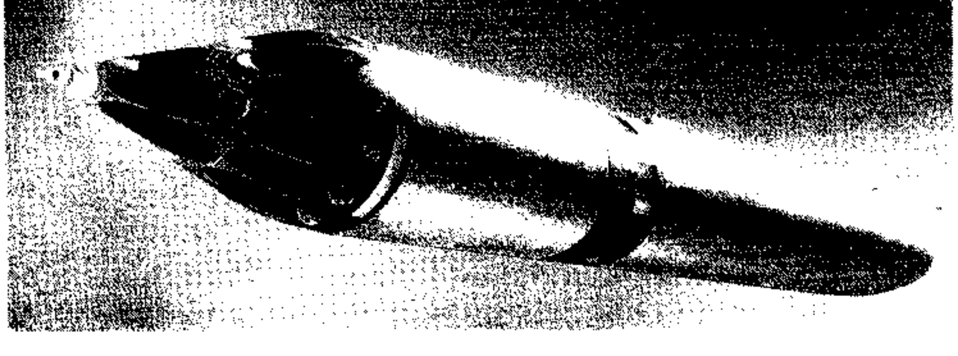
MATRA UNGUIDED AIRCRAFT ROCKET LAUNCHERS

DESCRIPTION:
The MATRA company in France have specialised in the design and manufacture of unguided aircraft rocket launchers. All calibres including the British 2 in rocket are catered for and Matra launchers are in widespread use. They have been adopted by NATO and are manufactured under licence in a number of countries.

Although the range of the launchers is wide they all embody similar design principles. The construction is in the form of a faired tube which, when charged with rockets, forms an aerodynamically smooth pod for external carriage under the wings or fuselage of fighter aircraft at high and low altitude. Provision is made to insulate the rocket pro-



Matra 100 mm Rocket Launcher

pulsion motors from thermal effects. Comprehensive safety provisions are built in to the electrical rocket firing systems.

Recent developments include a series of expendable launchers which are used once only and then jettisoned. Further flexibility is provided by launchers combined with an external fuel tank.

STATUS:

In production and in service with a large number of air forces. UK requirements are met by manufacture to Matra designs by Thomas French & Sons (Engineering) Ltd.

ALKAN CARTRIDGE LAUNCHERS

DESCRIPTION:

The Alkan company produces a range of launchers for the carriage and launching of 40 mm and 74 mm diameter cartridges of various types, such as flare, photo-flash, anti-personnel, chaff etc. Others are produced for the use of 45 mm or 1.75 inch diameter target illumination flares. These launchers consist essentially of a chassis supporting a breech, a relay unit, and a number of magazines containing the cartridges or flares. These components are disposed so that the overall equipment can be configured for either integral construction with the airframe or for mounting on aircraft stores pylons. Typical examples are shown in the accompanying illustrations.

Designed for mounting on aircraft weapon pylons, the Type 501 is intended for NATO standard 14 inch spaced hooks. The central part of the body carries the suspension system, and there are three positions providing for central, and 12 degrees left or right tilt to give increased lateral ground cover. This central part houses the single magazine for 28 cartridges. A Type T 30 distribution box is located in the front container shell and this can incorporate a ground-adjustable sequential timer for various firing sequences. Contact pins for the cartridge firing lines are located on the flat bottom part of the body along with the ground test connector. A safety switch, ground locked with a safety pin, is actuated at take-off by the airstream.

STATUS:

In production in various models for many types of French and other national air forces.

MANUFACTURER:

Société R Alkan et Cie, Rue du 8 mai 1945, 94460-Valenton, France.

ALKAN ASW AIRCRAFT ARMAMENT EQUIPMENT

DESCRIPTION:

Alkan Torpedo Racks Types 541 and 542 are designed for anti-submarine warfare and specially for mounting on a vertical frame, as for example on a helicopter, by means of tension rods. The Type 541 can carry a 1,200 lb torpedo, and the Type 542 is intended to carry two of 600 lb each. A sealed electrical system and other measures enable the equipment to withstand sea water immersion. The racks are provided with one or two, as appropriate, release units Type 540. Both versions of the complete torpedo rack are shown in the accompanying illustrations.

The Alkan Type J SD launcher is used for the deployment of sonar explosive sound generators for ASW operations by aircraft. The unit consists of a light alloy chassis, a number of launcher mechanisms and magazines, and a control panel. Up to 24 generators of American or French pattern can be carried. Each launcher incorporates a perforation system, which in the case of French stores allows either of two burst depths to be selected at the control panel. This equipment is fitted to the Breguet 1050 Atlantic maritime aircraft.

STREUWAFFEN

DESCRIPTION

The Federal Republic of Germany, like Great Britain, France and the US is developing airborne bomblet dispensing systems. One consists of a streamlined pod containing 19 launcher tubes which contain 409 0.5 kg bomblets. Each bomblet is equipped with six spring loaded stabilising fins and the whole load can be ejected in a short interval so that a high density can be achieved on the ground. References have been made to this weapon under the name Dragon Seed. The bomblet pod is equipped with standard weapon suspension lugs and is compatible with all Luftwaffe tactical aircraft.

1696.393
2 IN ARF/8M2 ROCKET

DESCRIPTION:

The 2-in ARF/8M2 air-to-ground rocket is an intermediate weapon system between machine gun and 2.75 in rockets, developed in order to provide efficient action by aircraft and helicopters, with a single weapon system, against small defence posts, scattered troops, surface transportation and general hard targets.

The main characteristics of this system are the following:

Low weight, such as the total number of rounds per aircraft or helicopter is substantially increased (120 rockets for a total weight, including launchers, of less than 700 kg).

Excellent accuracy, obtained with a special patented free rotating folded fin assembly which opening (by the action of an elastic, inertial and aerodynamic system) is completed 25 ms after firing and with free spinning, induced by gas deflectors in the nozzle, of the rocket body on its longitudinal axis.

Different types of warheads (HEI, high explosive incendiary, or API, armour piercing incendiary) assure firing efficiency against varied ground targets, whether protected or otherwise.

The following three different launchers (developed and manufactured by SIMPRES), fitted beneath the wings in sets of 2 or 4, can be used:

a) 7 rounds, for training;

SPECIFICATIONS:

Rockets	HEI Warhead		API Warhead
Diameter:		51 mm	
Length:	927 mm		1,002 mm
Weight:	3,567 kg		3,792 kg
Combustion time: (−30°C to +50°C)		1.1 ± 0.1 sec	
Total impulse: (−30°C to +50°C)		220 ± 6 kg/sec	
Max pressure:		120 kg/cm^2	
Burn out velocity:		700 m/s	
Time to target at 1,000 m/s:		2.15 ± 0.05	
Average dispersal:		10 mils	
Launchers:	25 rounds		30 rounds
Outside diameter:	39.5 cm		39 cm
Max length (in flight):	204 cm		180 cm
Weight without rockets	46 kg		73 kg
Weight in flight configuration (HEI rockets):	135 kg		165 kg

b) 25 rounds, for fighting, reusable for up to 10 missions;
c) 30 rounds, for fighting, reusable for up to 100 missions.

Inert warheads are available.

Four fins are folded within the diameter enabling the rocket to be fired from a tubular launcher.

STATUS:

In production and in service with the Italian Air Force and other air forces.

CASA TYPE 06.070 ROCKET LAUNCHER

DESCRIPTION:

This reusable rocket-launcher is designed to carry and launch six FFAR 2.75" 170 mm or six INTA S-11 rockets. It can be installed in any pylon type provided with the standard NATO suspension system (14"). Basic and low-drag versions are produced.

OPERATION:

Rocket firing is by means of an electronic intervalometer incorporated in the rocket-launcher. Single rocket firing or ripple firing is selected by the pilot in the cockpit or by adjusting the mode selector incorporated in the launcher. Rate of fire according to a firing interval of 30 milliseconds (The intervalometer can be adjusted for a different firing rate upon request).

DIMENSIONS:

Basic Model:
Length: 1.24 m
Diameter: 25 cm
Weight (Empty): 14.8 kg
Weight (Loaded): 63.6 kg

Low Drag Model:
Length: 1.9 m
Diameter: 25 cm
Weight (Empty): 17.8 kg

CASA 54.037 Launcher

1843.303
LANCO RC-06-100
DESCRIPTION:
This re-usable unit is designed to carry and fire six heavy 100 mm INTA S 12 rockets. It can be fitted to any aircraft with 14" and 30" NATO attachments. The conversion from 14" to 30" is carried out by changing the position of the rear attachment.
OPERATION:
Rocket firing is controlled by an electronic intervalometer incorporated to the launcher. Single rocket firing or continuous ripple firing can be selected by the pilot or set in on the ground if this unit is not available. The firing sequence can be controlled between 20 and 70 ms by adjusting the intervalometer without removing it from the rocket-launcher.

DIMENSIONS:
Length: 3.4 m approx
Weight (Empty): 100 kg
Weight (Loaded): 460 kg

MANUFACTURER:
Construcciones Aeronauticas SA, Rey Francisco 4, Madrid-8, Spain.

1601.393
CASA 04.080 ROCKET RACK LAUNCHER
DESCRIPTION:
The CASA 04.080 rack launcher carries four 80 mm Oerlikon rockets and is designed for light aircraft and helicopters. It may be pylon mounted, either using the AH 039220 pylon or others with NATO attachments. The firing rate is controlled electrically and can be adjusted from 20 to 50 milliseconds. The launcher is also available in the CASA 04057/080 version to carry and fire either four 57 mm (2.25 inch) rockets or four 80 mm Oerlikon rockets.
MANUFACTURER:
Construcciones Aeronauticas SA, Rey Francisco 4, Madrid-8, Spain.

CASA 04.080 rocket rack launcher

1603.393
CASA AH 039220 UNIVERSAL PYLON
DESCRIPTION:
The universal pylon produced by CASA can be used to attach honeycomb or rack launchers or machine-gun or bomb pods. The body has a main section, attached to the aircraft by four screws, and a forward fairing mounted by one screw. The forward fairing contains accessible electrical ejector and firing circuits. A detachable yoke at the trailing end provides for long weapons which might otherwise meet the trailing edge of the aircraft wing. Ejector hooks are located at the standard NATO distance of 14 inches.

MANUFACTURER:
Construcciones Aeronauticas SA, Rey Francisco 4, Madrid-8, Spain.

SWEDEN

7514.393
VIRGO 120KG FRAGMENTATION BOMB
DESCRIPTION:
The bomb is intended for use against targets such as landing craft, aircraft on the ground, anti-aircraft weapons, field artillery, un-armoured and light armoured vehicles etc, and as an anti-personnel bomb against troops in the open or behind light cover. It is designed to give a large number of fragments of a predetermined size and weight and with high striking velocity.
For the low level attack a brake parachute can be fitted which will retard the bomb sufficiently to give the aircraft enough lead to be safe at the time of burst.
The bomb is designed for supersonic speeds and has therefore protection against aerodynamic heating.
The fusing system consists of an impact nose fuse which can be combined with a proximity fuse which is interchangeable with the brake parachute, for air burst.

DATA

Bomb:
Length overall:
Nose fuse and parachute fitted: 1,541 mm
Nose fuse and proximity fuse fitted: 1,582 mm
Diameter of body, maximum: 214 mm
Fin span: 368 mm
Total weight of prepared bomb, maximum: 123 kg
Charge: RDX/TNT
Weight of charge: 30 kg
Position of lug from nose end (nose fuse fitted): 743 mm
Centre of gravity from nose end (nose fuse fitted): 736 mm
Position of contact plug in front of lug: 49 mm

Nose Fuse:
Length overall: 591 mm
Diameter (main body): 64 mm
Weight: 1.9 kg
Arming delay time: 4.3 s
Proximity Fuse:
Length overall: 287 mm
Diameter: 98 mm
Weight: 2.3 kg
Brake Parachute:
Container:
Length overall: 290 mm
Diameter: 89 mm
Weight: 1.2 kg
Parachute diameter, opened: 530 mm

The use of a proximity fuse substantially increases the size of the effective lethal area.
The system consists of a VIRGO 120 kg fragmentation bomb, VIRGO nose fuse, VIRGO brake parachute and VIRGO proximity fuse. The bomb and the nose fuse are always used together, either

alone (not low-flying attack) or with brake parachute (low-flying attack) alternatively proximity fuse (not low-flying attack).

The delivery units are separately packed in cases with one bomb (four bombs make a load unit on a loading pallet), 12 nose fuses, 12 brake parachutes, or 12 proximity fuses.

OPERATION:

The bomb has two separate initiation systems with joint arming function. The Impact Initiation System in the front of the nose fuse consists of a hammer primer, a detonator, and a front exploder and is always in action after release, giving an instantaneous impact burst.

The Proximity Fuse Initiation System in the middle and the rear of the bomb consists of a proximity fuse, an electric detonator, and a rear exploder and is in action only when the proximity fuse is adapted, giving an air burst 5-20 metres over the target or the ground.

The safety system has the following functions:

Ground transport safety means (in addition to air transport safety) that the nose fuse and the proximity fuse are kept separate from the bomb and that the transport safety device is blocked.

Air transport safety ensures that the arming of the nose fuse is blocked when the bomb hangs in its suspension lug. Should arming of the nose fuse begin during air transport, the nose fuse will lock the transport safety device in secured (partially armed) position.

Trajectory safety prevents the nose fuse arming until 4.3 seconds after release.

Brake safety (applies only to bomb with brake parachute) ensures that the arming of the nose fuse will be blocked if the tractive force of the brake parachute fails to reach a predetermined level within the trajectory safety time.

DEVELOPMENT:

First design study was completed in 1956; and was type-tested 1958-61. Production started in 1961 and it went into service with the Royal Swedish Air Force in 1963.

STATUS:

Designed for A32 Lansen and adaptable for A35 Draken and AJ37 Viggen attack aircraft, the Royal Swedish Air Force are the only known users.

MANUFACTURERS:

Förenade Fabriksversken, Fack, S-631 87 Eskilstuna 1, Sweden.

1513.303

135 mm BOFORS AIR TO GROUND ROCKET SYSTEM

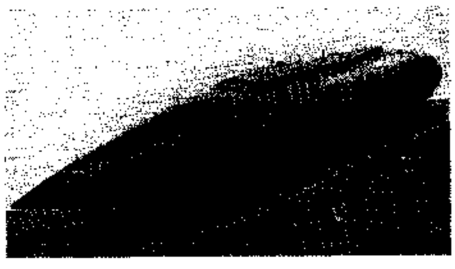
DESCRIPTION:

The 135 mm air to ground rocket system manufactured by AB Bofors is intended as part of a range of armament developed for the Saab AJ37 Viggen. It consists of a rocket launcher carrying six rockets which are salvo-fired from a built in firing pulse generator after initiation of the sequence by the pilot. The launcher is designed to give thermal protection to the rockets during high and low altitude flight at supersonic speeds; it is also a low drag design. Standard NATO type suspension lugs can be provided so that the 135 mm rocket system is compatible with a large range of tactical aircraft.

The rockets themselves can be fitted with either of two types of warhead, a general purpose one and an armour piercing fragmentation head. Further variations are possible as a choice of three fuses is available – instantaneous or delayed action, sensitive direct action fuse or electronic proximity (VT) fuse. The rocket motors give high velocity and low dispersion, leading to a time of flight of about 3½ seconds to 2,000 metres slant range in typical launching conditions.

CHARACTERISTICS:

Total weight with 6 rockets: approx 400 kg
Empty weight: 125 kg
Length: 3,226 mm
Diameter: 486 mm
Firing interval in salvo: 0.1 sec
Specification: 135 mm Rocket
Weight of rocket motor: 25 kg
Burning time: 2.0 sec



Bofors 135 mm Rocket Launcher

Velocity all-burnt: 600 m/sec
Warhead weight – GP: 19.5 kg
Warhead weight – AP Frag: 175 kg
Warhead charge weight – GP: 3.7 kg
Warhead charge weight – AP Frag: 5.0 kg

1684.393

SAAB EJECTOR RELEASE UNIT ULM-1

DESCRIPTION:

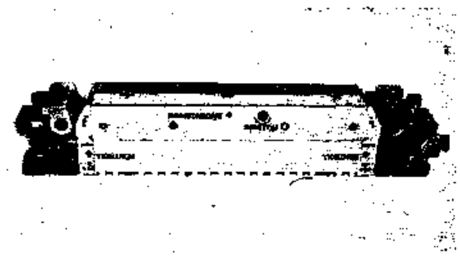
The ULM-1 Ejector Release Unit (ERU) is intended for heavy missiles, drop tanks, gun pods, bombs etc, with two T-lugs for suspension. The lug-matching hooks on the ERU are located according to NATO standard spacing at 30-inch centres. Pre-stressing devices and bomb supports are not needed as the T-lugs are secured by spring-loaded wedges. The power for opening the lock is derived from two powder cartridges in the upper centre. The cartridges also power the two ejectors, outside the hooks, thus ensuring positive separation of the load.

The ULM-1 is designed with a facility for variable pitch control by means of a ground-set orifice feature. The orifices can be in either open or closed positions, enabling the total thrust to be exerted on either the forward or the aft ejector. With both orifices open, each ejector receives equal thrust. On the ground, release of the store or opening of the lock is effected with a standard spanner, which can be applied on both sides of the ERU. After the ejectors have pushed the store clear, they return to their initial positions automatically by means of strong return springs.

To ensure that the hooks are in their correct positions and the linkage system in a locked state when the ERU is carrying a load, a dowel is placed through the check holes. For security locking, the dowel is placed into a security locking through hole. Two switches, separate from the ERU mechanism, are incorporated to sense if the ERU is carrying a load or not, and these switches are in the cartridge firing circuit so that no firing can take place if the ERU is not loaded.

DEVELOPMENT:

The ULM-1 ERU was developed by Saab-Scania under licence from the McDonnell-Douglas Aircraft Corporation.



Saab ejector release unit ULM-1

STATUS:

In full production for the Saab 37 Viggen multi-purpose STOL combat aircraft.

MANUFACTURER:

Saab-Scania, Datasaab Division, Jönköping, Sweden.

1685.393

SAAB BOMB LOCK ULM-3

DESCRIPTION:

The ULM-3 bomb lock is intended for bombs with a single suspension fitting and a normal weight of 120 kg. The bomb is secured in position by pre-stressing. The pre-stressing devices are not integrated in the lock, but form part of the carriage. The hook is designed for lug bolts as specified in Mil Standard A-8591 C, 1,000-lb weight class.

The power source for opening the lock is a powder cartridge, mounted on the upper side of the lock. The cartridge also powers two ejectors, one in front of and the other behind the hook, for positive separation of the bomb. The bomb lock is designed with a facility for variable pitch by means of a ground-set orifice feature. The throttling is such that a maximum of two-thirds of the total thrust can be obtained at the forward ejector with the remaining third at the aft ejector, and vice versa. Opening of the lock on the ground is by means of a spanner, and security locking is effected by a standard 8 mm diameter pin. Accidental firing does not effect the functioning of the lock or the removal of the safety pin.

The linkage system in the bomb lock operates, simultaneously with the hook, a pair of miniature switches, one of which indicates Open or Closed Hook to the pilot, and the other arms the bomb as the hook is opening. The unit is designed for a minimum of 250 firings without major overhaul, and it is stressed to permit a minimum of 1,000 flight hours in the loaded condition.

DEVELOPMENT:

Development was undertaken in connection with the Saab 37 Viggen combat aircraft programme.

STATUS:

Entering production for the Saab Viggen combat aircraft.

1263.303
HISPANO OERLIKON SURA 80 mm AIRCRAFT ROCKET

DESCRIPTION:

The Hispano Oerlikon SURA aircraft rocket has been developed primarily for ground attack purposes. It is of 80 mm calibre, carries a warhead of weight 3 kg and under typical conditions is fired when the aircraft-to-target range is about 1,000 metres.

The fin assembly is a sliding fit on the rocket body and has a double function. Before firing the assembly acts as the front suspension, engaging with the front suspension lugs on the aircraft underwing rail. Lower rockets in the same cluster can also be engaged by means of the fin slots and by an additional integral suspension ring located forward of the main fin ring.

The rockets are electrically fired and on firing the sliding fit fin ring acts as a guide until it is met by the rear cone of the motor. It is then carried on with the rocket stabilising it in flight.

Incendiary/blast, hollow charge armour piercing, fragmenting and inert practice warheads are available.

Specification:

Different warheads have slightly different lengths.

Typical characteristics are:

Rocket Type: SURA Type US
Calibre: 80 mm
Length: 1,060 mm
Total weight: 11 kg
Weight of warhead: 3 kg
Weight of propellant: 3 kg
Typical range: 1,000 metres
Accuracy: 50% of shots within 10 mils approximately

STATUS:

SURA rockets are in service with many air forces throughout the world. Successful installations have been made on numerous aircraft including Hunter, Fiat G 91, BAC Jet Provost/Strikemaster, F86.

MANUFACTURER:

Machine Tool Works, Oerlikon-Bührle Ltd, CH 8050, Zürich, Switzerland.

Oerlikon 8 cm rocket launcher for helicopters

Hispano Oerlikon 80 mm SURA rockets on BAC Strikemaster

1269.303
OERLIKON 30 mm GUN TYPE KCA 304RK

DESCRIPTION:

The aircraft gun type KCA is of 30 mm calibre and has been developed by Oerlikon, Switzerland. The weapon is a further example of the development of the Mauser revolver principle which has been almost universally adopted for single barrel aircraft cannon since the end of World War II.

The KCA differs, however, from almost all comparable guns in the present generation in using a new design of ammunition in which the ratio of propellant charge to projectile weight is over 2 : 1 whereas in most other guns, the ratio is likely to be 3 : 2. In addition the KCA ammunition has a higher projectile weight than other 30 mm types.

As a result of these factors and lightweight design of the moving parts of the weapons a firing rate of 1,350 rounds per minute is obtained and a muzzle velocity of over 1,000 metres per second. The weapon is therefore well suited to ground attack as well as air-to-air engagements, and for the former role a long gun range is required to give the attacker a wide firing bracket.

The Oerlikon KCA has a four chamber revolver mechanism so that before firing the gun mechanism has to be cycled three times to charge all chambers. This can be done in the air by electrically fired pyrotechnic cartridges. A total of 12 of these cartridges is provided and the remainder can be used to clear stoppages should they occur.

Ammunition for the KCA is available in a range of types, TP, HEI, SAPHEI and AP. Both steel and aluminium cased shells have been developed.

CHARACTERISTICS:

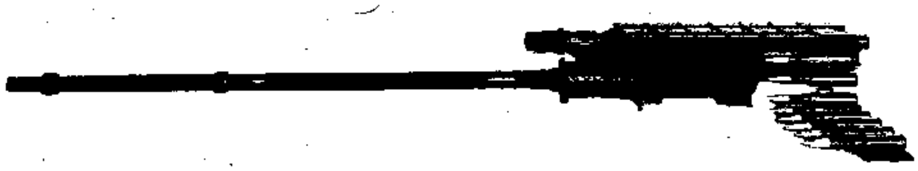
Calibre: 30 mm
Gun weight: 125 kg
Muzzle velocity: 1,050 metres/sec
Rate of fire: 1,350 rounds/minute
Accuracy: 50% rounds inside 5 mils
Length of gun: 2,690 mm
Round weight: 0.700 kg
Projectile weight: 0.360 kg
Range*: over 2,000 metres
*gun stationary

STATUS:

The Oerlikon KCA is in pre-series production, and is under consideration for various aircraft.

MANUFACTURER:

Machine Tool Works Oerlikon-Bührle Ltd, CH 8050, Zürich, Switzerland.



Oerlikon Type KCA 30 mm aircraft gun

1272.303
HISPANO OERLIKON 20 mm TACTICAL AIR ARMAMENT

DESCRIPTION:

Two types of 20 mm calibre aircraft cannon were manufactured by Hispano Suiza in Switzerland and by their UK company, British Manufacture and Research Co Ltd of Grantham, Lincolnshire. Both types, the 20 mm Mk 5 and 20 mm Mk 2* are similar and are derived from the original Hispano type 404 weapon. The Mk 5 model is lighter in weight than the Mk 2* and has a higher rate of fire. Although no longer part of the Company's programme, this weapon remains in extensive service in many parts of the world.

A wide range of 20 mm ammunition types is available including armour piercing, tracer, ball and HE incendiary. Different types of fuses are also available. The round has a brass case and is percussion fired. Ammunition is normally supplied in 60 round belts or as individually packed rounds.

A wide variety of tools and accessories are available for 20 mm Mk 2* and Mk 5 guns.

Specification: 20 mm Mk 5 gun
Calibre: 20 mm
Gun weight with feed: 42 kg
Muzzle velocity: 850 metres/sec
Rate of fire: 580-640 rounds/minute
Length of gun: 2,052 mm
Round weight: .1367 kg
Projectile weight: .138 kg
Range*: 1,600 metres to velocity 300 metres sec
*gun stationary

STATUS:

Hispano 20 mm aircraft cannon are in service with the Royal Air Force, Royal Navy and over 30 other air forces. RAF Canberra and Shackleton aircraft have Hispano 20 mm armament. Over 98,000 20 mm guns of all types have been made in the UK alone.

MANUFACTURERS:

Machine Tool Works, Oerlikon-Bührle Ltd, CH 8050, Zürich, Switzerland.

THE UNITED KINGDOM

1277.303
CLUSTER BOMB NO. 1 Mk 1 (BL 755)
DESCRIPTION:

BL 755 has been developed to meet a requirement for a weapon that will yield a high kill probability against a range of small hard and soft targets encountered in the battlefield and immediate tactical area. Because of the efficiency of modern surface-to-air weapon systems it is operationally necessary for air-to-ground attacks in support of ground forces to be carried out at very low level. Any other form of attack necessitates prolonged exposure to the enemy ground defences and negates any element of surprise. This will result in unacceptable losses to the attacking aircraft.

To compensate for the aiming errors inherent in low level attack, BL 755 covers the target area with a pattern of bomblets, the dimensions of which are proportional to the aiming errors. The dual function bomblets are effective against armoured and soft-skinned vehicles, parked aircraft and personnel and are distributed evenly within the pattern.

BL 755 is compatible with current and future strike aircraft. It can be carried in a bomb-bay or externally with twin 14 inch or single suspension. It can be delivered using a simple or sophisticated sighting system. It is immune from electronic countermeasures and incorporates a safety mechanism which provides protection for the aircraft during carriage and release and the deployment of bomblets.

Studies and evaluations have shown that BL 755 is many times more effective against typical battlefield targets than either single or small sticks of high explosive bombs.

CHARACTERISTICS:
Weight: 272 kg
Length: 2,436 mm
Diameter: 419 mm
Fin span: 566 mm
Suspension: Twin lug at 356 mm spacing or single lug

STATUS:
The Cluster Bomb (BL 755) is in service with the Royal Air Force and is being supplied to at least five countries within NATO

MANUFACTURERS:
Co-ordinating Design Authority:
Hunting Engineering Ltd, Reddings Wood, Ampthill, Bedfordshire

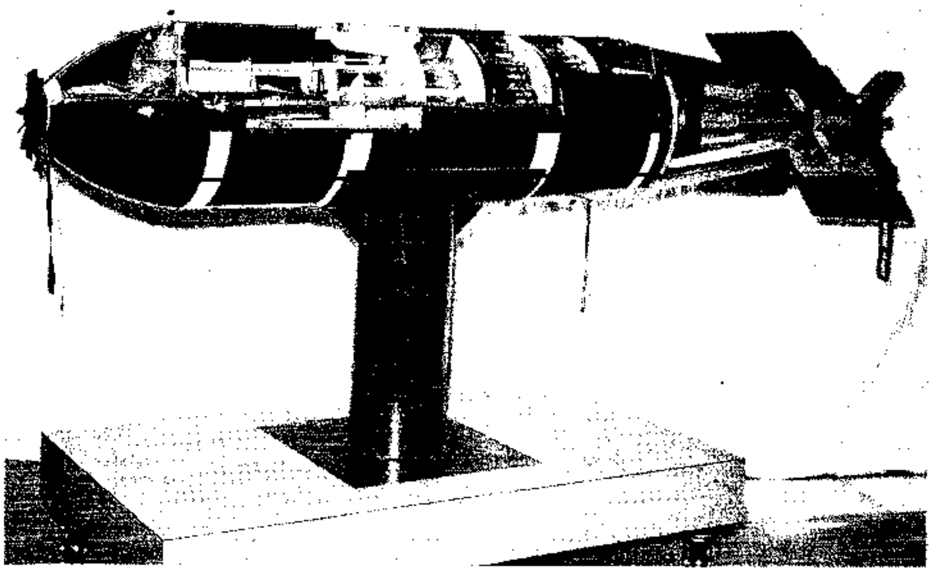
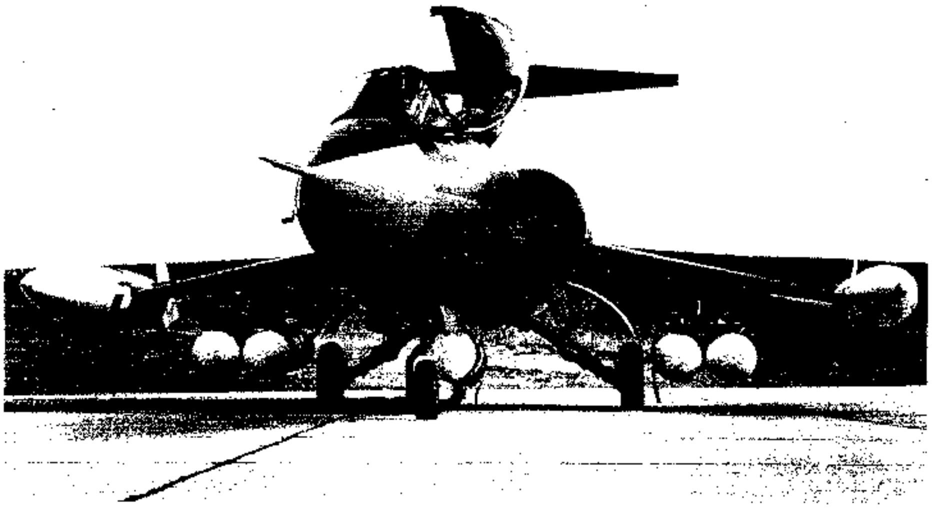
Directorate of Ammunition Production, Ministry of Defence.



Cutaway view of the 600 lb No 1 Mk 1 Cluster Bomb, BL 755. At the front is the air arming vane. In the nose cone are the Safety Arming and Functioning Unit and the breech assembly for initiating the gas system used for skin stripping and bomblet ejection. The central section houses the payload of 147 bomblets



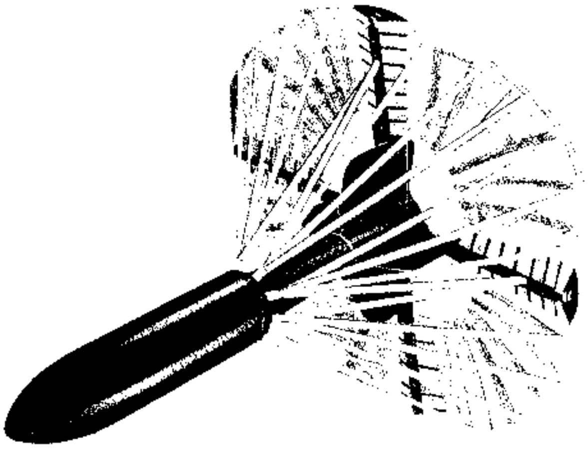
F-104 Starfighter armed with five BL 755 cluster bombs

1267.393
BRITISH BOMB RETARDING SYSTEM
DESCRIPTION:

The British bomb retarding system was developed in UK by Hunting Engineering Ltd. The retarder is incorporated in a special bomb-tail assembly which can be readily applied to a wide range of existing ballistic bombs.

The Retarding Tail with its associated fuse has been designed to overcome the problem of low altitude attack. If a conventional bomb is used from low altitudes it is likely that the separation of the attacking aircraft from the bursting of the bomb will be small enough to endanger the attacking aircraft. The purpose of the Retarding Tail is to decelerate or retard the bomb after release, and allow the aircraft to reach a safe separation distance before the bomb impacts and explodes. Conventional delayed action bombs, if used in this way, are liable to ricochet and to miss their targets.

The Retarding Tail utilises a combination of a ribbon parachute and air brakes retarder arms formed from the structure of the tail. This technique has the advantages of providing very high



Hunting Engineering Bomb Retarder fully deployed drag after a closely predictable time delay, essential for accurate control of bomb stick spacing leading to improved probability of target destruction.

The basic structure of the retarder tail consists of a base ring made in forged steel in which are incorporated eight securing pads for attaching the tail to the bomb. The steel inner cone is welded to the base ring and at the aft end carries the one-piece fin casting in light alloy. This casting is riveted to the steel inner cone. The four retarder arms consist of spines carrying the outer skin sections. The spines pivot at the root of the fins and when extended form four airbrakes. When closed the skin sections form the tail cone.

The design incorporates various safety measures which ensure that at no time does the bomb constitute an unacceptable hazard to the aircraft during carriage or after release.

A timer mechanism which controls the operation of the unit is housed within the inner cone. As the bomb is released from the aircraft this timer is initiated by a lanyard. After a short interval to allow the bomb to fall clear of the aircraft the timer triggers the release of the retarder arms. These arms are forced into the airstream by a spring and then aerodynamic forces extend them to the fully open position. The energy released in this operation is absorbed by a tear-webbing shock absorbing device.

At the base of the tail couplings are provided to connect with the tail fuse of the bomb, so that the arming of the latter is controlled by the action of the retarding tail mechanism.

While being carried aboard the aircraft Retarding Tail bombs resemble conventional fixed fin types. The fins are provided to stabilise the bomb aerodynamically immediately after release. In the event of the bomb being jettisoned the retarding tail is not operated and neither is the fuse armed. Retarded bombs can be carried externally or internally in subsonic or supersonic aircraft.

SPECIFICATIONS:

Bomb Retarder Tail Type 117

This tail is 1,003 mm long and 584 mm span. It was developed initially for use with British 1,000 lb HE medium capacity Mk 6 and 9 19 series bombs. Two types of tail – Mk 3 and Mk 4 are available. The Mk 3 with a tail fin span of 584 mm is suitable for external carriage whilst the Mk 4 with a tail fin span of 419 mm is suitable for both external and internal bomb carriage.

Bomb Retarder Tail Type 118

This tail is 970 mm long and 465 mm span. It was originally designed for use with the British 540 lb HE medium capacity bomb.

Adaptors are available to couple type 117 and 118 retarding tails to many other types of HE bombs, including the principal US types such as Mk 82 and 83, M.64, M.65 and M.117 types.

Both types of retarder are designed for a shelf life of at least 5 years without attention.

STATUS:

The Retarding System is in service with the Royal Air Force and is being supplied to air forces overseas.

Hunting Engineering Ltd, Reddings Wood, Ampthill, Bedfordshire, England.

1845.393 WESTLAND/FRAZER NASH HIGH STRENGTH MACE

DESCRIPTION.

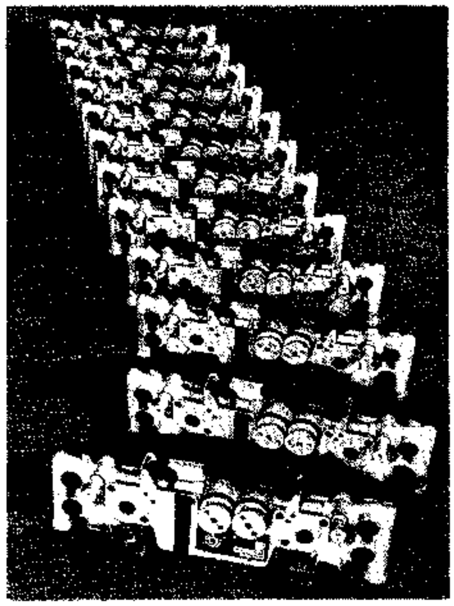
The Ejector Release Unit (ERU) is in the form of a beam with the operating mechanism, breech etc. sandwiched between a pair of sideplates, one a baseplate and the other a closure plate. Their sideplates terminate in two identical gas operated ejector ram assemblies which also carry the store retaining jaws and also incorporate integral wedge systems conforming to the crutchless form of store retention.

The jaws are designed to suit the recommended STANAG saddle lugs which are mounted on the store at 14 inch (355.6 mm) centres. The jaws are connected to the locking wedges by spring links so that when the jaws are engaged with the saddles the wedges are forced into the clearance between the abutments on the ram cases and the surface of the saddle lugs. This effectively "locks" the store to the ERU preventing any sway or pitch. Spigots are incorporated in the base of both ram case forgings to control yaw and fore and aft movement of the store.

The jaws are linked by connecting rods to a central operating toggle which, when turned on its axis, withdraws or engages the jaws. The linkage forms a geometric lock comprising an "over-centre" system which is maintained in both and locked and unlocked positions by a compression spring coaxial with a rod suspended between a projection on the breech and one arm of the linkage. In the locked position this rod is at the limit of its travel and so maintains the overcentre attitude, thus preventing the toggle turning. The release is achieved by a gas operated plunger which drives the toggle round so that the line of action of the spring, on its rod, now swings above the toggle pivot, reversing the sense of the geometric lock and maintaining it in the unlocked position with the jaws retracted from the bomb lugs. The design of the mechanism is such that the weight of the store tends to intensify the geometric lock in the loaded position, and, when released, to contribute a positive force to open the mechanism and prevent any possible "hang-up".

The plunger which operates the mechanism is housed in a cylinder bored in the breech block which forms the central unit of the gas system. The plunger is held in position by a screw cap and a spring. In operation the gases enter the cylinder at the upper end, via internal porting leading from the combustion chambers, and forces the plunger down against the spring, tripping the geometric lock and retracting the jaws. The combustion chambers are twin receptacles bored in the breech block and threaded to receive the cartridge holders. These are inter-connected internally such that they both feed the gas system to ensure that if only one cartridge fires from electrical initiation the other will ignite sympathetically.

Internal ports lead from the combustion chambers fore and aft to the gas tubes which conduct the gases, on firing, to the ejector ram assemblies via interchangeable throttles housed in the inlets to the ram cylinders. These throttles are "plug-in" units drilled with a gas port of some pre-determined diameter to govern the amount of gas entering the ram. By interchanging throttles with different orifice diameters the thrust of the rams can be adjusted to suit a limiting aircraft reaction, or by installing throttles of differing bore sizes at the forward and aft rams a differential thrust can be obtained to vary the attitude of launching of the store. These throttles can also be supplied with ports drilled to exhaust the gas directly to atmosphere so that the rams are inoperative when a free-fall gravity drop is required.



High-strength 14-in MACE ejector release units for the MRCA

STATUS:

Following the Panavia 'Intent to Purchase' notification issued in March 1973, development testing continued through 1973 to qualification of units to production standard in early 1974. Design was in accordance with a Panavia Specification to meet the requirements of the Multi-Role Combat Aircraft for which the unit will be produced.

1604.393 ML CARRIER BOMB LIGHT STORES NO. 200

DESCRIPTION:

The ML Aviation Carrier Bomb Light Stores No. 200 (CBLS 200) is an aerodynamically faired Carrier combining maximum strength and stiffness with minimum weight. It was developed from experience gained with the earlier CBLS 100. Carrier to aircraft suspension is via lug pockets for single NATO twin 14 inch and NATO twin 30 inch suspension. CBLS 200 is equipped with four ML ERU 122 EX permitting the carriage of four stores each up to 103 mm diameter and 750 mm long. All stores are ejected vertically. CBLS 200 has the facility to accept clip on side pannier rocket launchers for four SNEB 68 mm or FFAR 2.75 inch rockets.

Specifications:

Overall length: 2,464 mm

Diameter: 423 mm

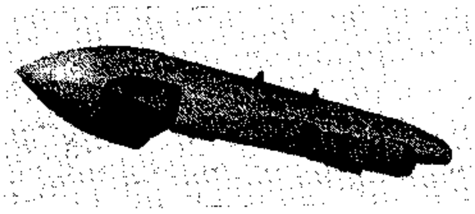
Weight less Stores and Rocket Panniers: 53.5 kg

Weight with Rocket Panniers but less Stores and Rockets: 78.0 kg

Suspension: (a) Single Lug. (b) Twin Lugs at 14 inches (NATO). (c) Twin Lugs at 30 inches (NATO).

STATUS:

CBLS 200 is in production for seven Air Forces for use on a large number of in-service aircraft types ranging from Hunter to Phantom. It has also been adopted for aircraft now under development both in the UK and overseas.



ML Carrier bomb light stores No 200 with rocket panniers

MANUFACTURER:

ML Aviation Company Limited, White Waltham Aerodrome, Maidenhead, Berkshire, England.

1264.393
ML AVIATION LIGHT WEIGHT LOW-DRAG TWIN STORE CARRIER

DESCRIPTION:

This carrier is designed to increase the capacity of a normal single external weapon station so that two stores can be carried. It is designed for use on wing or fuselage stations and incorporates two ML Ejector Release Units No 119 Mk 1. All the necessary fusing services for a full range of modern conventional stores are incorporated in the carrier which can be supplied with auto-selection or pilot selection electrical wiring according to requirements. Typical weapons used with this carrier are 250 kg HE bombs or rocket launchers.

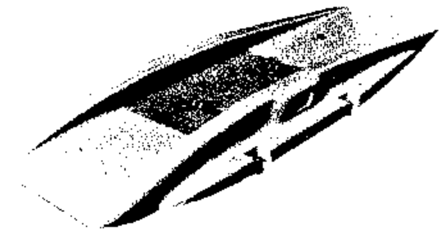
The carrier consists basically of a main spar and baseplate machined from stretched light alloy plate. Raised lugs on the sides of the main spar form the attachment points for the two ejector release units. Lightweight fairings are fitted over the main structure to minimise the aerodynamic drag of the carrier.

Twin lugs at the standard 14-inch (355.6 mm) centres are provided for mounting the carrier on any standard weapon pylon. If desired the carrier suspension can be offset from the centre line by 57 mm to either side, to adjust rolling moments or to increase store-to-aircraft clearance. Adaptors are available to use this carrier with single lug type store suspension or to the 762 mm centres type.

STATUS:

The ML lightweight low drag twin store carrier is in production for Harrier, F.104 and Hunter aircraft

Specification:
Carrier weight, including 2 × ERU 119: 37 kg
Length overall: 1,638 mm
Width overall: 655 mm
Depth overall: 146 mm



ML aviation light weight low drag twin store carrier

Max store diameter: 420 mm
Max store weight: 500 kg
Max speed: Mach 0.95

MANUFACTURER:

ML Aviation Co Ltd, White Waltham Aerodrome, Maidenhead, Berkshire, England.

1515.393
ML LIGHTWEIGHT TWINSTORE CARRIER (HIGH STRENGTH)

DESCRIPTION:

The High Strength Two Store Carrier is a direct development of the Lightweight Low Drag twin store carrier. It has been introduced to cater for the increased aerodynamic loads on new aircraft. It is mechanically, electrically and operationally interchangeable with the earlier model.

High strength version of ML lightweight twin store carrier

1282.393
ML BOMB CARRIER UNIVERSAL TWO STORE

DESCRIPTION:

The ML Bomb Carrier Universal Two Store is designed for internal installation in Canberra aircraft. It is specially suitable for the carriage of retarded or conventional bombs. The basic structure comprises a single central spine of light alloy tube with outriggers to support the two release units. A stressed base plate carries the auto-selector and other electrical services.

In its standard form the carrier is provided with two ML Ejector Release Units No 119 Mk 1 which mate with any store having twin suspension lugs at the standard NATO spacing of 356 mm.

The carrier will accept a wide range of conventional stores in current use. Adaptors are available to extend the role of the carrier to carry single lug bombs such as the UK 1,000 lb Mk 6, 9, 11 and 12. Aerodynamic fairings are also available for external fitting of the carrier to a standard weapon pylon.

STATUS:

The Carrier Universal is in service with the Royal Air Force and with overseas Air Forces. It is in production.

Specification:

Overall dimensions of the ML Carrier Universal Two Store with Canberra adaptors:

Length: 818 mm
Width: 610 mm
Depth: 265 mm
Maximum store diameter: 420 mm
Store centre to centre spacing: 445 mm
Typical store load: 2 × 1,000 lb HE bomb Mk 10

MANUFACTURER:

ML Aviation Company Limited, White Waltham Aerodrome, Maidenhead, Berkshire, England.

7513.393
EJECTOR RELEASE UNIT No 119

DESCRIPTION:

A double-hook, positive lock release mechanism and two cartridge operated variable thrust ejector rams enable the thrust and pitch attitude of ejection to be adjusted to suit the store. This small, lightweight release is designed for suspension between two sideplates, as in a wing pylon, for use with conventional stores. The locking and release mechanism is mounted between two identical forged steel ejector ram barrels incorporating crutching arms and mounting lugs. The cartridges are housed in a central breech and, when fired, the gases are transmitted to the two ejectors. Readily interchangeable throttles enable the ram characteristics to be adapted to the role.

EJECTOR RELEASE UNIT No. 119 JN

A further development of the ERU No. 119 has been developed designated the ERU No. 119 JN. This has been delivered to the Japan Self Defence Force for use on their new XT2 aircraft. This variant is stronger than the ERU No. 119 and gives the following performance:

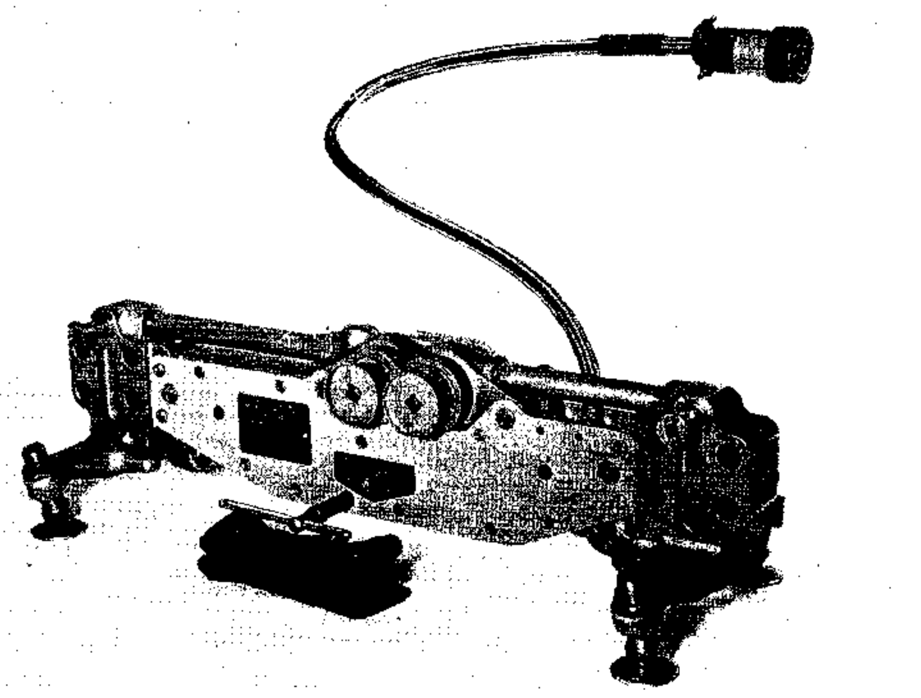
Ultimate Hook Load 13,608 kg
Ultimate Crutch Arm Load 7,711 kg
Ultimate Yaw Moment 2,560 kg/m

Mechanically the ERU No. 119 JN is interchangeable with the other models in the series.

EJECTOR RELEASE UNIT No. 119 SN:

This is a modified version of the ERU No. 119 Mk 1 and is designed to take increased loading. It differs from the standard unit in three ways:

1. Strengthened barrel and crutch arm assembly end forgings provided with larger diameter mounting holes to take larger bolts.
2. Strengthened hooks, connecting rods and pivot pins.



Ejector Release Unit No. 119 SN, specially developed by ML Aviation Company for the Royal Danish Air Force, Draken Aircraft

3. Rad-haz filters deleted from the firing circuit. All electrical connections through a single connector terminating in standard 11 pin plug (MS 3116-1811P).

In all other respects the ERU 119 SN is identical with the ERU 119 Mk 1.

EJECTOR RELEASE UNIT 120 Mk 1:

This has been designed to carry the latest stores and multi-weapon carriers on the latest types of aircraft and is suitable for suspension in a wing pylon or a bomb bay. It is provided with two sets of suspension hooks to accommodate stores fitted with bomb lugs at either 14-inch centres or at 30-inch centres. The positive lock and release mechanism for both pairs of hooks are mounted between two forged steel ejector ram barrels incorporating crutching arms and mounting holes.

The unit is operated by gas pressure from a central breech containing two cartridges. When fired the rapidly expanding gases are transmitted to an actuator piston which first unlocks the hook mechanism and thence, via a variable throttle system, to each of the ejector rams which thrust the store off. Readily interchangeable throttles enable the ram characteristics to be adapted to the role.

STATUS:

Aircraft using the ERU No. 119 include Harrier, Lightning Mk 53, BAC Strikemaster, Phantoms, and Jaguars, export Canberras, Drakens, XT2, and F-104. It is used by 18 nations, and the production rate has recently been increased.

Performance:

Typical performance at 15°C with 1 g assisting:

With reaction limited to 4,540 kg:

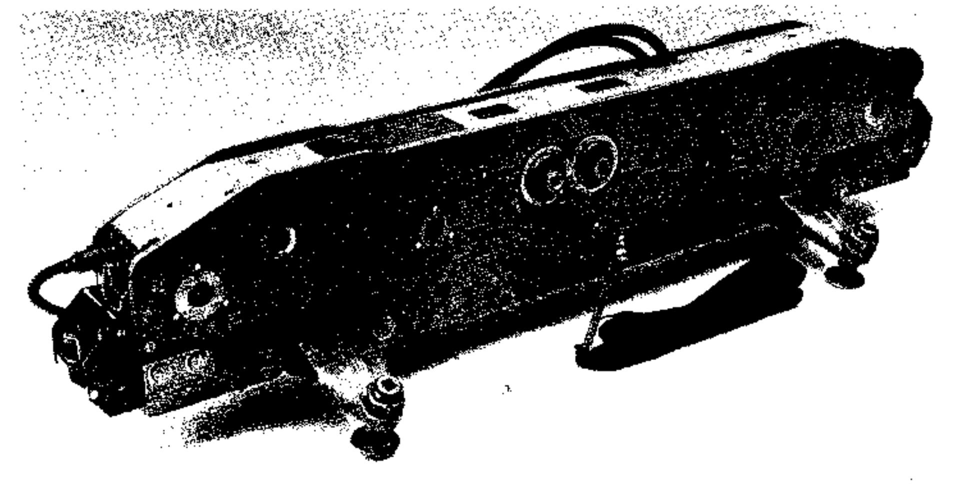
Store weight 952 kg, Ejected velocity 8.4 metres/sec

Store weight 454 kg, Ejected Velocity 3.0 metres/sec

Store weight 66 kg, Ejected velocity 8.0 metres/sec

With reaction limited to 2,380 kg:

Store weight 286 kg, Ejected velocity 3.0 metres/sec



ML Aviation Ejector Release Unit No. 120, Mk 1. The Unit is provided with two sets of suspension hooks to accommodate stores fitted with bomb lugs at either 14 in (35.6 cm) or 30 in (76.2 cm) inch centres

Temperature range (without cartridge): −60°C to +150°C

Strength Data:

Ultimate hook load: 10,900 kg per hook

Ultimate crutch arm load: 6,350 kg per crutch arm

Ultimate yaw moment: 2,040 kg/metres

Weight of unit complete with cartridge holders and throttles: 7½ kg

MANUFACTURERS:

ML Aviation, White Waltham Aerodrome, Maidenhead, Berks, England.

1516.393

ML No 123 ERU MACE

DESCRIPTION:

Ejector Release Unit MACE (Minimum Area Crutchless Ejector) has been developed and introduced to eliminate the drag effects of the sway brace method of carrying aircraft stores on pylon and multi-store carrier installations. It eliminates the necessity to torque-tighten the sway brace screws, thereby reducing aircraft reloading time.

Two double hooks engage NATO saddle adaptors attached to each of the standard 14 inch NATO lug pockets. The hooks are operated and locked by a simple toggle mechanism similar to that used on other ML Ejector Release Units. Spring-loaded devices housed at each side of the end barrel forgings, engage with the upper surface of the saddle adaptors and automatically take up all clearance as the hooks close, when loading the store.

This combination gives complete structural integrity for flight carriage of the stores. Down loads are taken by the hooks, and up loads, due to rolling moments, are taken by compression across the saddle. Yaw moments, and fore and aft loads are taken by spigots engaging the saddle adaptors. The geometry of the design ensures that both 'up' and 'down' loads are spaced at similar distances to those used in the conventional sway brace method, and the total system is designed to give a greater rigidity of carriage.

The ejector system is similar to the ML Ejector Release No. 119 Mk 1 and uses two standard NATO cartridges.

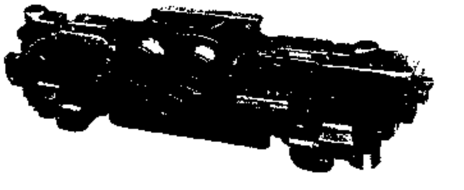
Performance:

With reaction limited to 44.5 KN (10,000 lb.f).

Store weight: 535 kg (1,180 lb) Ejected velocity 3.3 m/s (10.8 ft/s)

Temperature range (without cartridge): −60°C to +150°C

Weight: Unit complete with cartridge holders and throttles 8.2 kg (18.1 lb)



ML Ejector Release Unit MACE

Main Dimensions:

Overall Length: 428 mm (16.85 in)

Overall Height: 135 mm (5.31 in)

Overall Width: 78 mm (3.07 in)

Mounting Width: 50 mm (1.97 in)

MANUFACTURER:

ML Aviation Company Limited, White Waltham Aerodrome, Maidenhead, Berkshire, England.

1680.393

MILES FREE FALL MACE

DESCRIPTION:

The Minimum Area Crutchless Equipment (MACE) is the modern method of carrying and releasing weapons and other stores from aircraft. It is used with a new type of lug on the weapon and, by providing what is effectively four-point suspension, eliminates the need for conventional crutches (sway braces) and provides a light, compact unit.

The unit consists of two dual (two-tongued) pivotted hooks controlled by a simple linkage mechanism. The weapon is raised to the unit locked in place by a single operation of a cocking tool (which also cocks the release actuator) and is maintained there by a release lever. A ground safety pin is provided.

The actuator is a well proven, electrically operated, spring stored energy device which provides a powerful thrust on initiation to trip the release lever and release the mechanism under all conditions. Duplication is provided to meet Service requirements.

Spring loaded wedges interposed between the store lug and the Release Unit base plate provide automatic and progressive take-up of tolerance in the attachment of the store to the unit without inhibiting store release in any way.

A bomb Release Safety Lock can be provided within the overall envelope of the unit if required. The complete equipment has been designed to meet the very difficult environment of naval helicopter operation.

Specification:

Length: 417 mm

Width: 80 mm

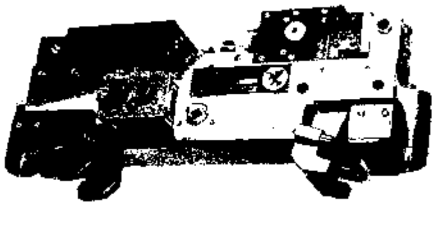
Depth: 150 mm

Total weight: Without BRSL 6.8 kg. With BRSL 7.8 kg

Operating voltage: 18 V to 28.5 V dc pulse not less than 14 ms

Maximum Store Weight: In excess of 450 kg

Ambient Temperature Range: −60°C to +135°C



Miles Free fall MACE

STATUS:

In development for UK Ministry of Defence.

MANUFACTURER:

F. G. Miles Engineering Ltd, Old Shoreham Road, Shoreham-by-Sea, Sussex BN4 5FL, England.

1681.393

MILES CARRIER BOMB LIGHT STORES

DESCRIPTION:

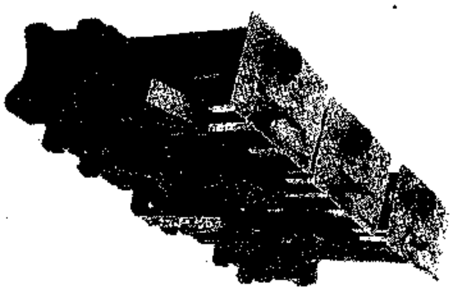
The crutchless principle for carriage and release of stores is also the basis of a new generation of Light Stores Carriers produced by Miles. The basis is a free fall modular release unit, EMRU No 21, which is so designed that by combining units together 3 store carriers, CBLS No 105, and 4-store carriers, CBLS No 104, or other combinations can be built up. Provision is made for unit selection, fusing and store-on-station indication.

The units are designed for current and future flares, markers and other light stores of up to 22.7 kg in weight, 914 mm in length and diameter varying between 77 and 127 mm. They will carry and release, or jettison, stores at all heights up to 4,570 metres, at speeds of 0 to 250 kts and function within the temperature range −60°C to +90°C.

The EMRU is operated electrically by the same Stored Energy Actuator (SEA) which is used on the EMRU No 22. Stores, for carriage on this unit, need a special lug which is simply attached to existing stores by bands. Four hooks engage with this lug and a spring loaded wedge system provides automatic and progressive take up of any tolerance in attachment of the store without inhibiting its release.

Loading of stores on to the carrier is quick and simple. The unit is cocked by means of a cocking lever at the rear of the unit, the store is raised against the unit and pressed against a small platform between the hooks which then close over the lug. A Safety Pin and Manual Release are provided for use on the ground.

SPECIFICATION FOR THE EMRU No 21:
Length: 280 mm
Width: 197 mm
Depth: 113 mm
Weight: 3.5 kg
Operating Voltage: 18 V to 28.5 V DC continuous or pulsed (14 m Sec Min)
Maximum Store Weight: 22.7 kg
Maximum Store Size: Length 914 mm, Diameter 77 to 127 mm
Operating Temperature Range: −60°C to +90°C
STATUS:
In development for UK Ministry of Defence.
MANUFACTURER:
F. G. Miles Engineering Ltd, Riverbank Works, Old Shoreham Road, Shoreham-by-Sea, Sussex, BN4 5FL, England.



Carrier Bomb Light Stores No 104

1266.393
MILES WEAPON RELEASE EQUIPMENT
EMRU No 20 Mks 1-4

The Miles Electro Magnetic Release Units (EMRU) No 20 were designed basically for free fall release and electro-mechanical operation. They are twin hook types with suspension centres at the NATO Standard of 14 ins (356 mm). The normal method of release is through an electrically operated spring stored energy unit, Solenoid Unit Type 1000, but a Cartridge Unit Type 2000 can be fitted in its place if cartridge operation is desired.

The system is intrinsically safe and reliable but for some applications an independent Bomb Release Safety Lock (BRSL) may be called for. The requirement is met by fitting a Miles Actuator MAL 19. When these are fitted a store-on-station switch is also used to indicate when a weapon is in place.

Two basic types of EMRU No 20 are manufactured – one type having a stainless steel body and the other, a lightweight version, with aluminium alloy body. All units are similar in appearance and have the same dimensions.

In operation, each suspension hook is independently latched; thus meeting NATO requirements. When the unit is cocked the hooks are closed and held so by a linkage mechanism consisting of a system of jointed struts maintained by a sear in a near straight condition. The sear is released by the action of the solenoid or cartridge, the strut system collapses and the hooks open. The possibility of a hang-up is eliminated by positive displacement of a strut joint when the sear is released.

Although basically free fall units a bolt-on ejector pack has been developed.

STATUS:
EMRU No 20 is in production. The Mk 1 and Mk 2 units are used on Nimrod aircraft, whilst the Mks 3 and 4 are in service on Wessex, Wasp and Sea King Naval Helicopters.
MANUFACTURER:
F. G. Miles Engineering Ltd, Riverbank Works, Old Shoreham Road, Shoreham-by-Sea, Sussex, BN4 5FL, England.

SPECIFICATION:

Release Unit Designation:	**EMRU** No. 20 Mks 1 & 2	**EMRU** No. 20 Mks 3 & 4
Normal Store Weight:	680 kg	454 kg
Ultimate Load:	27,700 kg	11,350 kg
Body Material:	Stainless Steel	Aluminium Alloy
Weight:	8 kg (Mk 2)	4.7 kg (Mk 4)
Bomb Release Safety Lock:	MAL 19 (Mk 1 only)	MAL 19 (Mk 3 only)
Length:	All types	542 mm
Width:		71 mm (no BRSL)
Depth:		138 mm (no BRSL)
Store Suspension Centres:	All types	355.6 mm (14 in)
Operating Voltage Range:	18V to 28.5V DC continuous or pulsed (14 mSec min)	
Operating Temperature Range:	All types	−60°C to +150°C

Miles EMRU No 20 Mk 3 fitted with MAL 19 actuator store-on-station switch

1844.393
EMRU No 22
DESCRIPTION:

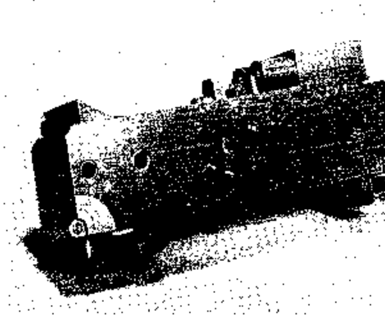
The Miles EMRU No 22 is the first of the new generation of free-fall crutchless release unit for the carriage and release of weapons and other stores from aircraft. The unit requires a new type of lug on the weapon and, by providing what is effectively self-adjusting four point suspension, the need for conventional crutches (sway braces) is eliminated. There is an overall weight saving in installation and the loading of stores is easier and quicker.

The EMRU is operated electrically by a well proven spring Stored Energy Actuator (SEA). This is a hermetically sealed device consisting of a spring loaded plunger held, when cocked, in a compressed state by a rotary solenoid operated lock unaffected by mechanical forces and responding only to a specific voltage. Duplication is provided to meet Service requirements.

The EMRU No 22 consists of two dual (two tongued) pivotted hooks in a frame controlled by a simple linkage mechanism. The mechanism and SEA are cocked by turning a cocking tool anticlockwise, the weapon is raised to the cocked unit and locked into place by turning the cocking tool clockwise. The mechanism is held mechanically in place by a release lever and a safety pin is provided to meet ground safety requirements. Spring loaded wedges in the base of the unit provide automatic and progressive take up of any tolerance in the attachment of the store without inhibiting store release in any way.

A Bomb Release Safety Lock (BRSL) can be provided within the overall envelope of the unit, if required. This is the Miles Actuator MAL 19. The complete equipment has been designed to meet the very difficult environment of naval helicopter operations.

Specification:
Length: 420 mm
Width: 80 mm
Depth: 164 mm
Total Weight: 7.25 kg without BRSL
8.07 kg with BRSL
Operating Voltage Range: 18V to 28.5V DC continuous or pulsed (14 m Sec min)
Maximum Store weight: In excess of 450 kg



Miles EMRU No 22

Ambient Temperature Range: −60°C to −135°C
STATUS:
In development for UK Ministry of Defence.
MANUFACTURER:
F. G. Miles Engineering Ltd, Riverbank Works, Old Shoreham Road, Shoreham-by-Sea, Sussex, BN4 5FL, England.

1265.393
ML CARRIER BOMB LIGHT STORES No 100
DESCRIPTION

The ML Carrier Bomb Light Stores No 100 is a streamlined faired carrier for adapting standard weapon pylons to the carriage of light stores such as practice bombs. The carrier is provided with pockets for NATO standard twin lugs at 356 mm (14 in) spacing, or UK 30 in spacing lugs or single lug suspension. It enables a maximum of four light stores, to a maximum weight each of 18 kg, to be carried. Each store is suspended from an Ejector Release Unit No 122. Typical loads are four 4 lb (1.8 kg) retarded practice bombs, or two 127 mm (5 in) flares, or two 12.7 kg practice bombs. All stores are ejected vertically by an explosive cartridge contained in the ejector release units.

STATUS:

The Carrier Bomb Light Stores is in production and on order by the Royal Air Force and other Air Forces. It is used with a variety of aircraft including Jaguar, Buccaneer, Harrier, Strikemaster, Hunter, Lightning Mk 53, Phantom and Canberra.

Specification:

Overall length: 2,300 mm

Diameter: 419 mm

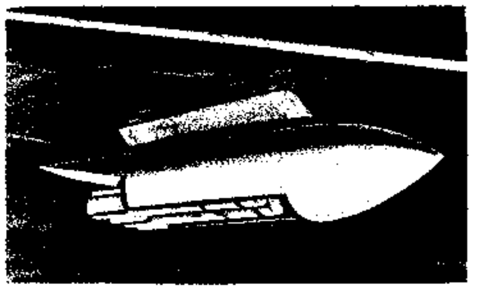
Weight less stores: 34.6 kg

Suspension:

(a) single lug
(b) twin lugs at 356 mm (NATO)
(c) twin lugs at 762 mm

MANUFACTURER:

ML Aviation Co Ltd, White Waltham Aerodrome, Maidenhead, Berkshire, England.



Drawing of ML Carrier Bomb Light Stores No 100 with two 5 in flares loaded

1280.393
ML AVIATION EJECTOR RELEASE UNIT No 122

DESCRIPTION:

The ML Aviation Ejector Release Unit No 122 Mk 2 is designed for use with smaller diameter stores of lightweight such as practice bombs and some types of flares.

The ERU No 122 Mk 2 will accept stores up to a maximum diameter of 127 mm and maximum weight of 25 kg. The store is gripped between jaws and no store suspension lugs are required. The release unit is fired by a single small explosive cartridge: radiation hazard protection is built into the firing circuits. The release unit is fired by a single explosive cartridge. Two versions of the ERU 122 are available.

ERU 122 Mk 2 uses UK cartridge ejector release unit CERU 200.

ERU 122 Ex uses UK CERU 201 or US ARD 863 or similar NATO types.

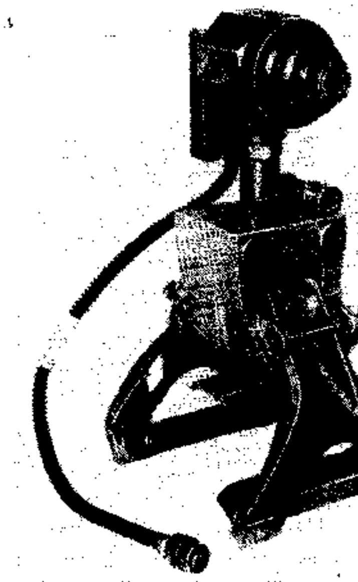
ERU 122 is normally part of the equipment supplied with Carrier Bomb Light Stores No 100 and No 200.

STATUS:

In production for the Royal Air Force, the Royal Navy and eleven overseas countries.

MANUFACTURER:

ML Aviation Co Ltd, White Waltham Aerodrome, Maidenhead, Berks, England.



ML Aviation ejector release unit No 122

1679.393
ML TRIPLE STORE CARRIER

DESCRIPTION:

This carrier is mechanically and electrically interchangeable with the American Triple Ejector Rack (TER) currently used on many aircraft throughout the world.

The ML Triple Store Carrier (TSC) is fitted with three ML ERU 119 thus giving improved ejection velocity, pitch control of stores at release, twin cartridge reliability and increased bomb release speeds. An international range of stores can be carried and released – flares, rocket launchers and bombs (including the Matra type retarded bombs for which reaction points are provided). Full fusing is available for all stores and modern electrical systems are installed.

The ML TSC can be supplied either as new build or, if desired, can be produced by conversion of customer's existing USA TERs.

STATUS:

In production for Phantom and other aircraft.

Specification:

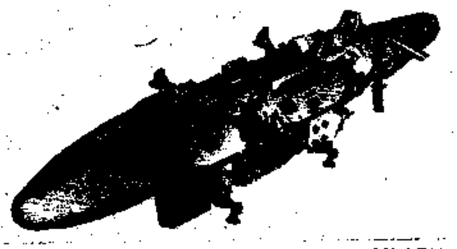
Overall length: 1,697 mm (66.8 inches)

Overall Height: 383.5 (15.14 inches)

Weight (less stores): 68 kg (150 lbs)

MANUFACTURER:

ML Aviation Co Ltd, White Waltham Aerodrome, Maidenhead, Berkshire, England.



ML Triple Stores Carrier fitted with three ML LRU 119

THE UNITED STATES OF AMERICA

1847.303
FUEL-AIR EXPLOSIVE WEAPONS

DESCRIPTION:

Each of the arms of the US Forces, Army, Air Force, Navy, and Marine Corps, is pursuing its own programme of research and development of Fuel-Air Explosive (FAE) munitions of varying types and sizes for differing operational roles. The basic principle consists of creating an aerosol cloud of a fuel-air mixture which is then detonated to achieve an explosive effect as compared with the fire effect produced by Napalm. Specific areas of R and D are concerned with such aspects as ensuring consistency in the size and mixture of the aerosol, means of delivery, and precise control of detonation. Other work is concerned with establishing the best means of achieving different operational objectives. Most of the applications under study are for battlefield operations, two typical examples being the use of FAE weapons against bunkers, fox-holes and similar emplacements, and as a means of explosively clearing mines. Both helicopter launched and high-speed aircraft compatible weapons are being studied, and surface-launched FAE weapons also have been tested.

CBU-55B:

This weapon was used to a relatively limited extent in Vietnam by the US Navy, mostly for defoliation and mine clearance, and is a free-fall cluster-bomb munition. It was deployed on both helicopters and low speed range fixed-wing aircraft. The CBU-55B is in the 500 lb (226 kg) class and each bomb has three 100 lb (45 kg) canisters 53 cm long and 35 cm in diameter. Each canister contains about 72 lb (33 kg) of fuel, and after release from the aircraft the individual canisters separate and are retarded by drogue parachutes as they approach the target. The cloud of fuel/air mixture produced is about 15 metres in diameter and 2.4 metres thick, and blast overpressures of up to 300 psi (210 kg/cm^2) are reported.

The US Army is interested in adapting one of the CUB-55B bomblets, the Blue 73 FAE warhead as the basis of a surface-to-surface FAE weapon for clearing minefields. The vehicle used is the Zuni rocket, a number of which are ripple-fired from a truck-mounted launcher rack. A modified FAU-83 standard mechanical fuse is used to produce varying delays in deployment of the warhead parachutes to achieve an area coverage pattern of FAE detonations.

CBU-72:

The CBU-72 resulted from US Navy modifications to the CBU-55B to suit it for dropping from high-speed jet aircraft. Specific types with which the CBU-72 was used successfully were the A-4 and A-7. Drogue parachutes to retard the individual cannisters were retained and the development of FAE weapons for use with high-speed aircraft, and without parachutes, is a separate project.

HSF-1:

HSF-1 is the designation of the smaller of two high-speed FAE bomb projects being carried out by the USAF. The HSF-1 is a weapon in the 500 lb (226 kg) class while the HSF-II is in the 2000 lb (900 kg) category. The former is projected as an unguided bomb of low cost and intended for carriage on conventional bomb-racks. Specified by USAF Tactical Air Command, the HSF-1 is due to complete advanced development by the end of 1974. If air drops of these models prove successful, full development will then be started.

HSF-II:

HSF-II is the 2000 lb (900 kg) class FAE weapon under development by the USAF. It is intended for use against targets such as parked aircraft, radar vans and similar light, high-value targets. Full-scale dynamic testing was in progress by early 1974 at the US Atomic Energy Commission's Sandia Corporation facility in New Mexico. These tests were concerned with factors such as evaluation of aerosol growth-rates, burst-height requirements, and assessment of the basic efficacy. Full-scale testing is planned for 1975. Guided and un-guided versions of HSF-II may be developed.

MAD FAE:

The US Marine Corps has its own programme for the development of a helicopter-deployed fuel/air explosive system, known as Mass Air Delivery FAE. Aluminium dispenser racks, each holding 12 FAE warheads weighing 136 lb (61.7 kg) each, are hooked to a helicopter's freight hook. Stabilising surfaces are provided to prevent twisting or oscillation of the racks. Single or salvo release of the FAE bombs is possible. Tests have been carried out with CH-46, CH-53, and UH 1 helicopters.

Fuels:

Various fuels have been employed, including ethylene oxide, liquid petroleum, propylene oxide, and methylacetylene propadiene-propane plus butane (MAPP).

DEVELOPMENT:

USN design work on FAE weapons under a government Research, Development, Test and Evaluation programme began in 1966 at China Lake, but this was pre-dated by some six years when the USN exploded its first FAE device at the same site. Navy interest continued from then until the formal programme of 1966. By 1967 there was also USAF and USMC activity, the former service carrying out tests of a 2500 lb (1134 kg) weapon developed under the **Pave Pat** programme. Two versions evolved, Blue 72 and Blue 76 for dropping by A-1 and F-4 aircraft types, respectively. Parachute retarding techniques prevented attainment of the required accuracy, however. The Blue 73 canister used in the CBU-55B had its origins as a ground deployed weapon, when in 1967 they were placed at the edges of minefields and then detonated by remote control for mine clearance. The first USN air-dropped operational FAE weapons (500 lb/226 kg class) were ready in October 1970 and were deployed in Vietnam.

1849.303
GATOR ANTI-TANK WEAPON

DESCRIPTION:

Gator is the designation of a project being conducted by the USAF Armament Development and Test Centre on behalf of the US Army, Navy and Air Force for the development of an air-deliverable anti-tank and anti-personnel mine system. Initial operational capability is planned for 1979. Different types of dispenser to permit delivery by fixed-wing aircraft and helicopters are being evolved, and in early 1974 the ASP (All-altitude Spin Projectile) was under consideration as the main USAF technique for use with fixed-wing aircraft. The US Navy's planned delivery system is known as the Mk 7, and a rotary wing dispenser is being developed for Army helicopters. The mine itself is aerodynamically shaped to spin to aid dispersion and it contains a focused charge intended to penetrate the underside of a tank. It will also have provision for self-destruction after a predetermined interval after deployment to allow friendly forces to pass over seeded areas.

1848.303
HSM – HARD STRUCTURE MUNITIONS

DESCRIPTION:

HSM (Hard Structure Munitions) is the title of a highly classified USAF Armament Development and Test Centre programme directed towards the development of new weapons capable of dealing with difficult hardened targets such as bunkers and command-and-control centres. Among the requirements are low-cost high penetration before release of main energy, high resistance to ricochet, and low-cost (non-nuclear) warhead. The new weapon will also be compatible with USAF standard guidance kits. ADTC hopes to reach the engineering development stage during 1975.

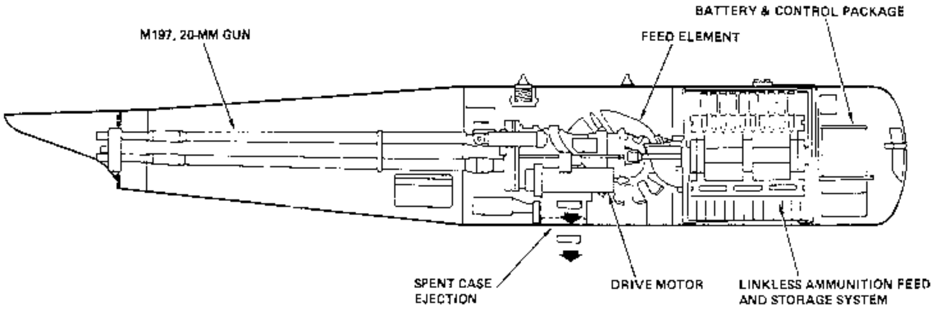
1678.303
GPU-2/A 20 mm LIGHTWEIGHT GUN POD

DESCRIPTION:

The GPU-2/A, 20-mm pod is a lightweight self-contained gun system requiring only a trigger signal from the aircraft. This pod can be mounted on a wide variety of existing helicopters and fixed-wing aircraft by using standard suspension racks. The total system weight when loaded with 300 rounds is less than 600 pounds.

General Electric Company has designed and produced a quantity of prototype GPU-2/A pods for the United States Navy. These systems use the three barrel M197, 20-mm gun which has been in military inventory since 1969. The firing rate for the GPU-2/A is selected at either 750 or 1,500 shots-per-minute. Rounds are fed to the gun through a linkless ammunition storage and feed system. This system maintains positive round control throughout all storage and feed operations.

The design concept of this system has been proven by combat experience with the SUU-11/A Minigun pods. Power for the system is provided by a 32V DC rechargeable nickel cadmium battery located in the aft section. This battery will fire up to three ammunition complements without a recharge. If the aircraft has sufficient power available, provision is made to trickle charge during operation of the aircraft.



GPU-2/A 20 mm lightweight gun pod mechanical arrangement diagram

The pod can be loaded with ammunition while suspended from the aircraft. The storage drum is made accessible by simply removing the aft fairing and swinging the hinged electrical package to one side. A belt of ammunition is attached to a loader mechanism which strips the links and feeds rounds into the storage drum in the proper attitude.

The first maintenance required for the GPU-2/A is at 15,000 rounds. At this time the front track bolts on the gun rotor are retorqued. Barrel life is 15,000 rounds; however, the barrels can be changed within 2 minutes while the pod is still suspended from the aircraft. No special tools are required for maintenance.

CHARACTERISTICS:

Weight: Approx 270 kg
Length: 304 cm
Diameter: 48 cm
Ammunition Capacity: 300 rounds
Rate(s) of fire: 750 or 1,500 shots per min
Gun: 20 mm M197

STATUS:

The GPU-2/A is under evaluation for the US Navy and 21 pods were delivered by early 1973.

MANUFACTURERS:

Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.

1287.303
VULCAN GUN PODS SUU 16/A & SUU 23/A

DESCRIPTION:

These gun pods are of identical size and weight and both incorporate 6-barrel Vulcan 20 mm cannon and ammunition. Designed for installation on standard external store pylons, these pods provide a ready means of greatly increasing the cannon fire power of subsonic and supersonic fighter and ground attack aircraft. The pod mounted Vulcan gun is particularly well suited to the engagement of ground targets from ranges of 700 metres or more. The pods are of aerodynamic shape and attachment to the aircraft is by bomb lugs at standard 760 mm centres (30 in).

Both pods are of similar internal layout, a cylindrical ammunition drum containing 1,200 rounds occupying the rear portion of the pod. A linkless feed system couples this to the gun.

SUU/23A Vulcan 20 mm gun pod with forward fairing removed to show gun installation

The pods differ in the type of Vulcan gun fitted but their performance and hitting power are identical. In the earlier SUU 16/A design the cannon is the standard M61A1 mechanically driven by a ram air turbine. This turbine is mounted on a hinged skin panel of the pod and is lowered into the airstream prior to firing. The use of a ram air turbine restricts the rate of fire at aircraft speeds below 350 knots (650 km/hr). A further consequence of the turbine is that pod drag is somewhat greater than for the SUU 23/A pod in which a self-powered GAU-4 model Vulcan is used. For initial rotation of the GAU-4 gun in the SUU 23/A pod an electric inertia starter is provided.

In operation Vulcan gun pods are aimed using a gunsight or fire control system. During firing spent cartridge cases are ejected overboard and not retained. The gun is cleared automatically after the firing button has been released so that 'cock-off' is eliminated. During the clearing process a small number of live rounds are ejected.

A number of accessories are available to simplify loading, maintenance and testing of the pods.

CHARACTERISTICS:

	Pod SUU 16/A	Pod SUU 23/A
Length:	5.05 m	
Diameter:	560 mm	
Weight with 1,200 rounds:	780 kg	785 kg
Weight empty:	484 kg	489 kg
Boresight adjustment		
Elevation:	± 1 deg	± 1 deg
Azimuth:	± 0.5 deg	± 1 deg

Accuracy: 80% shots inside 8 mil
Rate of fire: 6,000 rounds per minute
Ammunition: 20 mm M 50 series
Power input from aircraft:

at 208 volts 400 Hz		
3 ph	7 amps	10 amps
at 28 volts DC	—	3 amps

STATUS:
Both SUU 16/A and 23/A pods are in service with US forces. They are compatible with a wide range of tactical aircraft including F-100, F-105, F 4, A-4D and F-111. The SUU 23/A pod is in service on Royal Air Force McDonnell Douglas Phantoms.

Aircraft Equipment Division, General Electric, Burlington, Vermont 05401, USA.

1270.303
GENERAL ELECTRIC VULCAN 20 mm AIRCRAFT GUN AND LINKLESS FEED SYSTEM

DESCRIPTION

The General Electric M61A1 Vulcan aircraft cannon is of 20 mm calibre and employs the multi-barrel principle first used by Dr Gatling. The Vulcan is the standard USAF aircraft gun and is increasingly being used by the USN.

The gun has a rotary action and in the M61A1 is externally powered from the aircraft hydraulic or electric supply. A self-powered version, the GAU 4 is similar in all respects except that barrel rotation and operation of the action is derived from gun gas bled from four of the six barrels.

The outstanding features of the Vulcan are its high rate of fire, normally 6,000 rounds per minute, the high muzzle velocity of about 1,036 metres per second and the exceptional reliability by comparison with more conventional weapons.

Ammunition linked into belts has been used with Vulcan guns but feed reliability was poor at the high rates of fire characteristic of the weapon. There are also problems of link disposal. For these reasons in the majority of applications Vulcan cannon are associated with a linkless feed system. There are considerable variations in the detailed layout of gun and feed systems in service as each is tailored to the particular requirements of the aircraft installation. The essential elements are the M61A1 or GAU 4 gun, the linkless feed ammunition chutes which contain the ammunition conveyor, the cylindrical ammunition cannister and the drive power coupling between the gun and the ammunition drum.

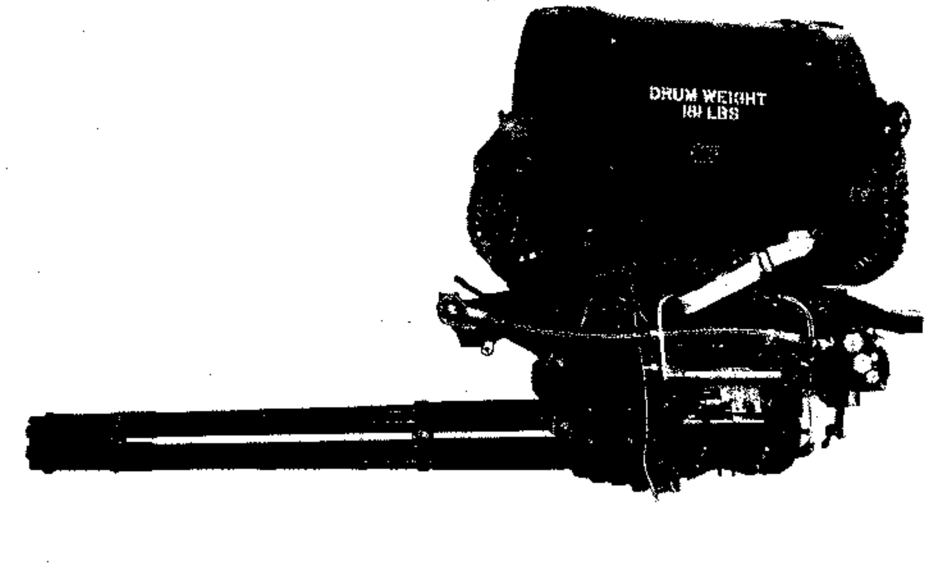
THE GUN:

The Vulcan gun has six rifled barrels and is externally powered. All barrels are rigidly clamped together and attached to the forward end of the breech rotor which rotates in a stationary housing. The rotor revolves anti-clockwise looking in the direction of fire. Cam followers operate the bolt for each barrel successively chambering, firing and extracting the rounds as the gun rotates. The linear actions needed for these operations are imparted to the followers by an elliptical slot machined in the rotor housing.

The multi-barrel design gives long weapon life by reducing heat dissipation and barrel erosion. A variety of barrel muzzle clamps are available to give different shot dispersion patterns. When the minimum dispersion clamp is in use 80% of shots are within an 8 mil cone.

Standard M 50 series electrically primed ammunition is used which is available in a variety of types – incendiary, armour piercing with and without tracer etc.

The preferred drive source is hydraulic power but drives accepting electrical and mechanical inputs have been developed. At full rate of fire about 20 hp is needed to drive the gun and its associated linkless feed system. In the self-powered variant, the GAU 4, gun gas is bled from four of the six barrels to operate the mechanism by means of a gas piston and drive which is mounted between the barrels ahead of the gun action. The GAU 4 develops sufficient power to operate the feed system. The gun is initiated by an electrically operated inertia starter.



Linkless ammunition feed system and 20 mm M61A1 Vulcan gun for F-4E aircraft

LINKLESS FEED SYSTEM:

Typically the linkless feed ammunition drum carries about 1,000 rounds although smaller drums are used in some installations. Linking the drum to the gun is a single or twin ammunition conveyor belt contained in flexible chuting. With a single link the spent cases are ejected overboard, but in many installations a return conveyor for spent cartridge cases is provided.

The ammunition drum carries the rounds stored between radial partitions. A central rotor in the form of a helical archimedean screw then moves the rounds from the drum into the conveyor in a multi-stage operation.

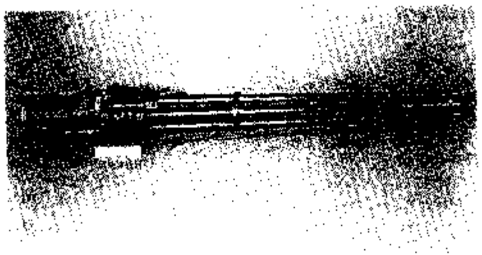
Many accessories and special tools are available for loading and maintaining Vulcan cannon and their feed systems.

Specification:

The self-powered GAU 4 variant of the basic M61A1 Vulcan cannon has virtually identical performance and characteristics, except that it is approximately 5 kg heavier.

Calibre: 20 mm
Weight: 120 kg
Length: 1,875 mm
Recoil Travel: ± 6 mm
Average recoil Force: 1,810 kg
Maximum rate of fire: 6,600 rounds per minute
Time to max rate: 0.3 sec
Stopping time: 0.5 sec
Ammunition: M53, M55AZ, M56A3, etc
Muzzle velocity: 1,036 metres per sec
Round Weight: 0.25 kg
Projectile weight: 0.1 kg
20 mm Linkless Feed System:

The exact specification for the 20 mm linkless feed depends upon aircraft design considerations.



M61A1 Vulcan gun

The data below relates to the installation on the Ling Temco Vought A-7D aircraft which is typical:
Ammunition capacity: 1,020 rounds
Firing rate: 6,000 or 4,000 rounds per minute
Ammunition weight: 114 kg
Feed system weight (less ammunition): 190 kg
Drive system: Shaft coupling to gun hydraulic motor
System type: Double ended – cases retained in drum
Total ammunition chuting length: 4.57 metres

STATUS:

The M61A1 and GAU 4 20 mm Vulcan guns with their associated linkless feed systems are in service with the USAF, the Royal Air Force and with other Air Forces operating F-104 and F-4 aircraft. The weapon and its associated feed are in service on A-7, F-104, F-4, F-111, F-105 and other aircraft. Podded installations are also available and are in service. The Vulcan gun is in production and will be fitted to the F-14 and F-15.

MANUFACTURER:

Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.

1118.303
XM35 ARMAMENT SUBSYSTEM

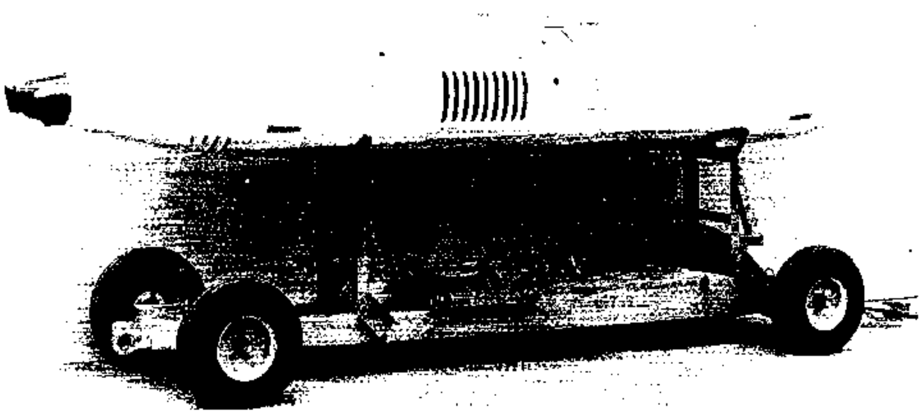
DESCRIPTION:

The XM35 is a fixed mounted armament subsystem located under the left weapon sponson on an AH-1G Helicopter. The system carries one 20 mm automatic gun XM195 a Vulcan type with six barrels. This is a modified M61A1 gun with blast deflectors on the end of 102.6 cm barrels. The 20 mm ammunition is link-fed to the right side of the gun from ammo-containers mounted on the left and right sides of the helicopter outside the aircraft. The weight of the system with ammunition is 530 kg, without ammunition 245 kg. The system carries approximately 950 rounds of ammunition

with a firing rate of 750 ± 100 SPM.
DEVELOPMENT:
The XM35 system was developed by the US Army Weapons Command and the General Electric Company. A production contract was awarded to the General Electric Company in 1968.
STATUS:
US Forces.

1182.303
MK 4 MOD 0 GUN POD

DESCRIPTION:
The Mk 4 Mod 0 Gun Pod is a self-contained and self-powered 20 mm gun system. The pod contains a twin-barrelled 20 mm Mk 11 Mod 5 Gun. The container is a low-drag cylindrical shape with detachable nose and tail cones, that is designed for supersonic flight in fighter and attack type jet and propeller aircraft. Belted ammunition is carried forward from the rotary magazine through dual feed chutes. Expended cases and links are ejected downward from the bottom of the pod at a velocity of 75 feet per second. A salient feature of the gun pod is the instantaneous full rate-of-fire. The pod is equipped with mounting provisions for both 30 inch and 14 inch suspension systems and is normally attached to the aircraft on a standard ejector rack such as the Aero 7A, Aero 27, MAU 9A/A, etc.



Hughes Mk 4 Gun Pod

CHARACTERISTICS:
Primary kill mechanism: Blast fragments, or penetration (depending on whether HEI or API ammunition is used)
Weapon type: Anti-material and anti-personnel
Payload fusing: Contact
Range: 950 m
Firing rate (rpm): 700 or 4,200
Delivery: Strafe
Weight:
Total, loaded: 630 kg
Total, empty: 357 kg
Payload (750 pounds): 269 kg
OPERATION:
The Mk 4 Gun Pod is aimed with either a fixed sight or a fire control system. It is fired by pressing the control stick trigger. Gun reaction time is instantaneous. Delivery is normally made in a shallow dive, 5-30°. Slant range for a "point" target should be 900 m or less. Area targets may be profitably attacked from a longer range because accuracy is not of primary importance. Normal delivery speed is 400 knots but may be at any speed within the performance limits of the aircraft.
STATUS:
The Mk 4 Gun Pod has been flown and fired from the following aircraft: A-4 (1, 2 and 3 pods), F-4 (1 and 3 pods), A-7 (1 and 2 pods), A-6 (1, 2, 3 and 4 pods), OV-10A (1 pod), F-100 (1 and 2 pods), HUS-1 (1 pod).
It entered service in Jan 1966 with the US Navy, for whom it was developed by Hughes. It is also used by the US Marine Corps. Production ceased in 1968 after about 800 units had been delivered. Internal installation of the Mk 11 gun and advanced pod designs are under consideration.
MANUFACTURERS:
Hughes Tool Company, Aircraft Division, Centinela and Teale Streets, Culver City, California 90230, USA.

1183.303
MK 11 MOD 5 GUN

DESCRIPTION:
This weapon is intended for aircraft air-to-ground, air-to-air and ground vehicle installation. Each installation consists of a 20 mm Mk 11 Mod 5 Gun Mechanism and a Mk 2 Mod 1 Loader. The gun mechanism consists of the following major components: receiver assembly, breech assembly, revolver cylinder assembly, and one each Mk 19 Mod 3 and Mk 20 Mod 3 barrel.
The Mk 11 Mod 5 Gun is a twin-barrel, air-cooled, belt-fed, combination gun-gas and recoil-operated automatic weapon firing electrically primed ammunition from an eight-chamber revolver cylinder. The gun is fed by two belts of Mk 6 Links which enter the mechanism on opposite sides of the loader. Belts are simultaneously advanced by a single sprocket within the loader which is driven by the revolver cylinder shaft. The mechanism simultaneously rams two cartridges, fires two cartridges, and ejects two cases which are relinked and ejected from the gun at approximately 100 feet per second.

Mk 11 Mod 5 20 mm gun

CHARACTERISTICS:
General:
Gun Length:
with loader: 199 cm
without loader: 179 cm
Gun Weight:
Gun mechanism: 65.3 kg
Barrels: 23.1 kg
Loader: 20.4 kg
Rate of fire: 4,200 rounds/minute or 700 rounds/minute (other rates available)
Time to rate: Instantaneous (0.003 sec)
Chamber pressure: 4,077 kg/sq cm
System of operation: Recoil, gun-gas boosted
System of locking: Fixed breech revolver principle
System of feeding: Self-feeding through gun-driven sprockets
Method of loading: Gun-gas powered dual rammers
Location of feed opening: Left and right side of loader, 2 belts (top and bottom feed optional)
Location of ejection opening: Rear of loader, 2 openings
Method of charging: Integral, air operated valve
Method of cooling: Air
Recoil distance: 28.5 mm
Distance between barrels: 104.7 mm
Number of chambers in revolver: 8
Belt velocity, average: 1.5 m/sec (each belt)
Ignition system: 120 V – 400 Hz
Barrel length: 143.5 cm
Actual length: 143.5 cm
Effective length: 161.3 cm (including revolver)
Barrel removal: Quick disconnect lever, 60° interrupted threads
Rifling:
Barrel: None (smoothbore system)
Revolver: 8 rifled, replaceable inserts
Number of grooves: 9
Twist: 26°, right hand
Recoil:
Average: 1,134 kg
Peak: Recoil, 3,628 kg. Counter-recoil 2,268 kg
Ammunition: 20 mm Mk 100 series, 20 mm M-50 series
STATUS:
Entered into service with US Navy and US Marine Corps in January 1966. Of 1,600 ordered, 1,270 had been produced at May 1969. It is part of the armament of numerous types of American aircraft.
MANUFACTURERS
Hughes Tool Company, Aircraft Division, Centinela and Teale Streets, Culver City, California 90230, USA.

1119.303
XM156 ARMAMENT MOUNT

DESCRIPTION:
The XM156 multipurpose armament mount is a pair of rack and support assemblies which carry and fire the new, larger capacity XM159C rocket launchers from each side of the UH-1B/C helicopter. Each launcher pod is armed with nineteen 2.75-inch folding-fin aerial rockets. The mount can also accommodate external stores on 14-inch (35.56 cm) bomb rack suspension up to 245 kg on each side. Used with the XM159C rocket launcher the mount has fixed elevation and traverse and is aimed through a fixed reflex type sight. The XM156 can be mounted along with the M5 subsystem on the same aircraft.
STATUS:
US Forces.

1285.303
XM 188 30 mm THREE BARREL AIRCRAFT GUN

DESCRIPTION:

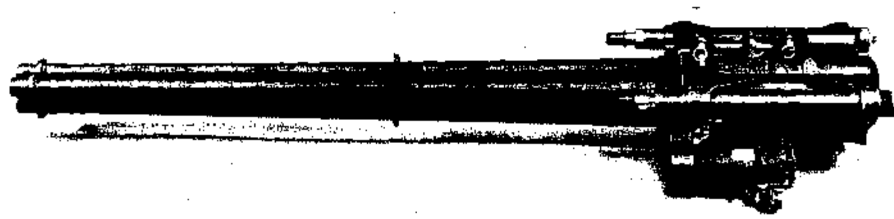
This is a lightweight 30 mm 3-barrel variant of the basic General Electric 20 mm M61A1 Vulcan design.

The gun fires the XM 552 30 mm HEDP round. The firing rate is variable up to 2,000 rounds per minute and ammunition feed is linked by belt or linkless feed system.

In common with other Gatling gun derivatives of the Vulcan series, the 30 mm weapon is externally powered. Hydraulic or electric drives are available. A self-powered variant has been developed.

CHARACTERISTICS:

Calibre: 30 mm
Rate of fire: Up to 2,000 rounds/minute



XM 188 30 mm three barrel aircraft gun

Muzzle velocity: 670 m/sec
No. of barrels: 3
Weight: 68 kg
Length: 1,473 mm
Average recoil force: 605 kg
Accuracy: 80% shots inside 8 mils (1.76 rms)

STATUS:

In prototype development, the gun is used as part of the 20/30 mm Flexible Weapon System.

MANUFACTURERS:

Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.

1120.303
XM140 AUTOMATIC GUN

DESCRIPTION:

The lightweight electrically driven XM140 30 mm automatic gun is specifically designed for attack helicopter gunships. The low recoil force and directional capability of blast diffusion provides feasibility of turret or wing stores mounting peculiar in the US Army's current inventory. The stand-off range of over 3,000 metres, together with the increased kill potential of the dual purpose shape charge, reduces aircraft vulnerability and enhances the operational characteristics against hard and soft targets beyond other weapons now available.

STATUS:

US Army.

1288.303
20/30 mm FLEXIBLE WEAPON SYSTEM

DESCRIPTION:

The General Electric 20/30 mm flexible weapon system has been designed and developed for the Bell Cobra helicopter. It consists of a lightweight turret designed for belly or chin mounting which can be fitted with the GE M 197 20 mm lightweight 3-barrel gun or the equivalent 30 mm gun, GE type XM 188. The turret is interchangeable with the XM 28 turret fitted to the Cobras now in service.

The 20/30 mm turret system consists of a turret, with gun, mounted beneath the nose of the AH-1 helicopter. The sighting station and the controls for aiming and firing the gun are located in the helicopter within easy reach of the gunner. A wide range of gun motion is provided. The gunner directs the gun independently of helicopter altitude, firing from the trigger switches at the sighting station.

If required the gun may be stowed in a pre-set fixed position and used as a fixed aircraft gun, fired by the pilot or co-pilot.

The power controls for training the gun are contained within the turret and operate from the 28 volt DC supply on the helicopter.

The gun servo error signals are processed to give constant overall servo gain throughout the elevation and azimuth angle range.

The optical sight is of the reflector type with the reticle focused at infinity. It is not gyro stabilised. The sighting head is flexibly mounted using a parallel arm linkage. In use it is hand-held and has built-in jump and lead angle compensation.

Ammunition is stored as standard linked belts in three bays. The capacity is 750 rounds of 20 mm or 500 rounds of 30 mm. An electrically powered belt booster is provided to reduce the belt-pull which would otherwise have to be provided by the gun itself. The ammunition is fed to the gun along flexible chutes.

Specification:
Total system weight: about 450 kg
Gun turret mounted: 20 mm M 197 or 30 mm XM 188

20/30 mm Flexible Weapon System installed in helicopter

Azimuth freedom: ± 113 deg
Elevation freedom: + 23 deg to −50 deg
Slewing rates – azimuth: greater than 80 deg/sec
Slewing rates – elevation: greater than 60 deg/sec
Ammunition capacity: 750 rounds 20 mm 500 rounds 30 mm
Reload turn round time: 15 minutes

STATUS:

In 20 mm form the GE Flexible Weapon System is installed and in service with US Marine Corps AH-1J Sea Cobra attack helicopter. The Imperial Iranian Army has ordered an advanced version of the AH 1J fitted with this armament system.

MANUFACTURER:

Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.

1286.303
M 197 20 mm THREE BARREL AIRCRAFT GUN

DESCRIPTION:

The M 197 aircraft gun is a 3-barrel fully automatic gun. It is a lightweight derivation of the 20 mm Vulcan M61A1 six barrelled weapon. The M 197 utilises many of the M61A1 components and has a rate of fire from 400 to 1,500 shots per minute.

Like other guns in the Vulcan series the M 197 needs external power – about 3 hp – for its operation.

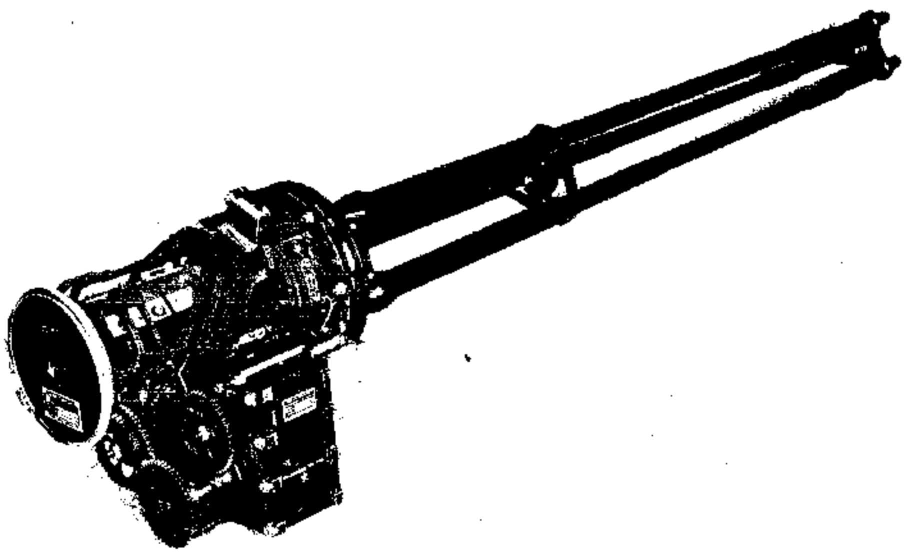
The M 197 fires standard US 20 mm ammunition of the M.50 series. Ammunition can be fed to the gun as a standard linked belt or by a linkless feed system.

Specification:
Calibre: 20 mm
Rate of fire: 400 to 1,500 rounds/minute
Muzzle velocity: 1,036 m/sec
No. of barrels: 3
Weight: 66 kg
Length: 1,892 mm
Average recoil force: 68 kg (at 1,500 rpm)

STATUS:

In production since October 1969 and in service on the USMC Sea Cobra attack helicopter AH-1J and the OV-10A aircraft. The M 197 forms part of the GE Flexible Weapon System and is

used in the GE lightweight gun pod.
MANUFACTURER:
Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.



M 197 20 mm three barrel aircraft gun

1112.303
M21 AIRCRAFT ARMAMENT SYSTEM
DESCRIPTION:
The M21 aircraft armament system is made up of two 7.62 mm M134 machine guns (miniguns) and two M158 pods with seven 2.75-in folding fin rockets each. The system can fire six pairs of rockets in one second or 4,800 rounds of 7.62 mm ammunition a minute. The rocket pods are aimed by manoeuvring the aircraft to which they are fixed. The machine guns, however, traverse 12 degrees inboard to 70 degrees outboard and plus 10 to minus 85 degrees in elevation and depression. When the guns traverse inboard to 12 degrees they operate a limit switch that stops the firing on the inboard pointing gun. The gun on the opposite side then increases its rate of fire from 2,400 to 4,000 SPM, compensating for the non-firing gun. This allows a heavy volume of fire to be placed on the target. Emerson Electric Company is the prime contractor.
STATUS:
American and Italian Forces.

1116.303
XM28 ARMAMENT SYSTEM
DESCRIPTION:
The XM28 armament system includes two M134 7.62 mm machine guns or two XM129 40 mm grenade launchers or one of each, mounted in a powered chin turret under the front of the AH-1G Huey Cobra helicopter. Ammunition is in a special compartment in the forward part of the aircraft and moves to the turret through fixed and flexible chuting. The sight and control panel at the gunner-co-pilot station allows him to train guns or launchers, or both, plus or minus 110 degrees in azimuth and plus 20 degrees to minus 50 degrees of elevation. The pilot can fire weapons in the stowed position. With a full load of ammunition the system weighs from 390 to 395 kg depending upon the combination of weapons carried. Capacity is 4,000 rounds for each machine gun and 300 rounds for each grenade launcher. The system can select 2,000 or 4,000 rounds a minute for the gun and 400 rounds a minute for the launcher. Emerson Electric Company is the prime contractor.
DEVELOPMENT:
Development was carried out jointly by the US Army Weapons Command and Emerson Electric. The latter company is producing the system.
STATUS:
US Forces.

1117.303
XM28E1 ARMAMENT SUBSYSTEM
DESCRIPTION:
The Armament Subsystem XM28E1 is similar to the XM28 except for minor changes in the drive motor, which is a motor with two distinct speeds as opposed to a motor which produces two speeds through use of a control resistor.
STATUS:
US Forces.

1836.303
XM30 AIRCRAFT ARMAMENT SUBSYSTEM
DESCRIPTION:
The XM30 subsystem is a two-gun installation of XM140 30 mm guns, one on each side of the UH-1B helicopter. Ammunition is stored inside the aircraft. The subsystem weighs approx. 1800 pounds (816 kg) when fully loaded. It is capable of firing at a combined rate of approx. 850 rounds per minute.
The guns are remotely controlled and may be fired by the copilot. The pilot can also fire the guns when they are in the fixed forward (stow) position.

1837.303
XM-41 ARMAMENT SUBSYSTEM
DESCRIPTION:
The XM-41 includes an M-60D machine gun, link and brass retainer, ammunition box, and safety harness for the gunner. The system is utilized on the rear ramp of the CH-47 Chinook helicopter. Mechanical stops limit the elevation, depression, and azimuth of the machine gun.

1838.303
XM-59 ARMAMENT SUBSYSTEM
DESCRIPTION.
The XM-59 is basically the M23 pintle mount armament subsystem with the added provision for substituting the AN M2 calibre .50 machine gun for either of the M-60D 7.62 mm machine guns in the left or right cargo compartment doorway of the UH-1D or UH-1H helicopters. The machine guns have a capability of 88° front or backward travel, with 6½° up or 80° downward travel.

1121.303
XM93/XM94 ARMAMENT SUBSYSTEMS
DESCRIPTION:
The XM93 and the XM94 are two similar aircraft armament subsystems employing a common basic mount design to provide pintle-mounted weaponry in the cargo compartment doorways of the UH-1N helicopter. The XM93 designates a GAU 2B/A high rate machine gun subsystem with a 2,000 4,000 SPM rate of fire and controlled from the cockpit only 2,000 SPM rate of fire. The XM94 designates an XM129 40 mm grenade launcher subsystem with a 400 SPM rate of fire. Each subsystem provides two identical pintle installations which can be interchangeably mounted in either the right or left cargo doorway. The system has an elevation of 5.5 degrees, a depression of 70 degrees and an azimuth of 90 degrees forward 70 degrees aft. The weapon can be hand controlled as a flexible pintle installation fixed in a forward attitude and remotely fired by the pilot, or vertically pivoted to a stow position completely inside the aircraft. The system can still fire, even with the engine stopped. The subsystem and individual components are capable of simple, rapid installation or removal. Principal components comprising each subsystem are two each GAU-2B/A or XM129 weapons, pintle mount assemblies, ammunition container and feed assemblies and electrical control boxes. Total weight of the system is 535 kg with a full complement of ammunition.
STATUS:
US Forces.

1111.303
XM18E1 ARMAMENT POD

DESCRIPTION

The Armament Pod XM18E1 is a fixed pod mounted under the weapon sponsons on the AH-1G Huey-Cobra helicopter. It consists of a 7.62 mm machine gun M134 with a 1,500-round, electric driven link ess feed loading system. Gun firing is electrically controlled The 145 kg pod fires at selective rates of 2,000 or 4,000 SPM, powered by a battery and control assembly in the aft portion of pod. This pod is the same as the XM18 except for its redesigned battery and control assembly. It will accept a modification which lets the pod use AC or DC from the aircraft. The pod is 216 cm long, 30.5 cm in diameter and mounts on standard 14-inch (35.36 cm) suspension lugs.

STATUS:
US Forces.

1268.303
MINIGUN POD TYPE SUU 11B/A

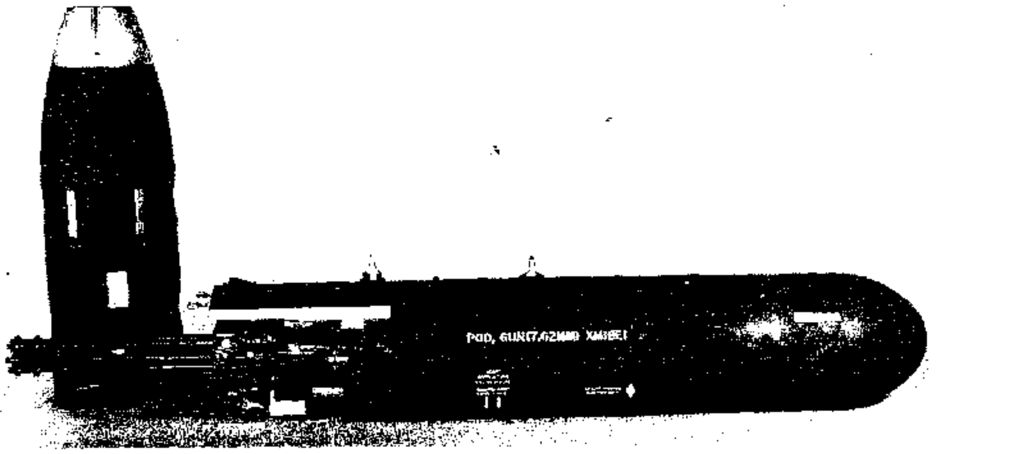
DESCRIPTION:

The General Electric M134/GAU 2B/A Minigun is a 7.62 calibre development of the 20 mm M61 series of "Vulcan" cannons. It has outstanding firepower and the SUU 11B/A pod provides a convenient means of giving its power to any tactical aircraft. The pod is light in weight and small in size and is equipped with standard bomb lugs for attachment to the weapon pylon. The pod can be carried on a wide range of aircraft up to a maximum speed of Mach 1.2.

The gun is mounted in the forward half of the pod and fires through the stainless steel nosecap. The centre section of the pod contains the linkless ammunition feed system. A drum magazine is employed containing 1,500 rounds of standard NATO 7.62 mm ammunition Type M 59, M 80 or M 60. In the rear of the pod is the electrical control package. The linkless feed system is essentially the same as the larger scale one already developed for the Vulcan. In the Minigun pods the feed is single ended and spent cartridge cases are ejected overboard through a port on the bottom of the pod. The ammunition is conveniently loaded from standard belted ammunition using a hand operated de linking loader.

Provision for gun harmonisation is built in to the gun mounting. A screw adjustment provides movement of the gun line through approximately ± ¾ degree. Shot dispersion can be varied to suit operating conditions and target characteristics. At minimum dispersion 80% of shots are within a 6.5 m... included angle.

A similar pod to the SUU 11B/A is used by the US Army under the designation XM 18 E1. This differs only in the power supply requirements and the rates of fire pre-set into the pod.



SUU 11B/a Minigun pod

Specification:
Designation: USAF Minigun Pod SUU 11B/A. US Army Minigun Pod XM 18 E1
Gun: 7.62 Minigun M 134/GAU 2/A
Feed: Linkless type MAU 7
Drive: SUU 11B/A Electric, AC or DC: 28 V at 15 amps or 208 V AC 400 Hz 3-phase 2 amps per phase. XM 18 E1 Electric, 28 V DC 15 amps only
Length: 2,159 mm
Diameter: 305 mm
Weight loaded: 147 kg
Weight empty: 11? kg
Ammunition capacity: 1,500 rounds
Rate of fire: SUU 11B/A 3,000 or 6,000 per minute. XM 18 E1 2,000 or 4,000 rounds per minute
Average recoil force: 136 kg at 6,000 rounds per minute

STATUS:
In production and in service with US and foreign forces.

MANUFACTURER:
Aircraft Equipment Division, General Electric Company, Burlington, Vermont, USA.

1592.303
EMERSON TACTICAL ARMAMENT TURRETS (TAT)

DESCRIPTION:

The Emerson Electric Company developed and manufactures several turret weapon systems which have been used particularly on US helicopters. With the exception of the low-cost, lightweight MINI-TAT version, they are hydraulically powered. TAT 101 has two M60C 7.62 mm MGs, each with a 600 rounds/min firing rate, and the link-belt feed system is within the turret. The fire control system consists of a gunner's sighting station for pointing and tracking the weapons, and a panel containing circuits and controls. The weapons are remotely charged hydraulically. Elevation limits are −15°, −45° and azimuth ± 115° (± 180° modified), both having slew rates of 45°/sec. TAT 102 is of similar type but is for a single M134 7.62 mm lightweight MG. Azimuth coverage is ± 115° (± 180° modified) and elevation + 25°, −50° (−90° modified). Slew rates are higher, azimuth 80°/sec and elevation 60°/sec. Several versions of TAT 102 have been made, the largest and heaviest for the Huey-Cobra helicopter at an overall weight of 115 kg without ammunition.

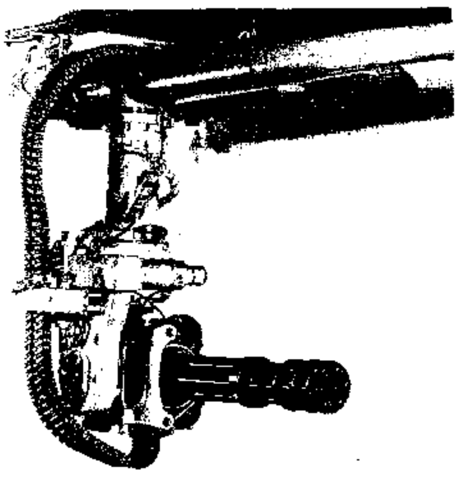
TAT 140 (XM-120) system uses the XM140 30 mm automatic and has similar characteristics to the TAT 102. Overall unloaded weight is 190 kg. TAT 161 20 mm system is intended for M61 type weapons, including M61A1; XM 188 and XM197. Its characteristics are the same as for TAT 101.

EMERSON MINI-TAT

MINI-TAT is a lightweight 7.62 mm weapon system developed to provide flexible, defensive fire for light observation and transport helicopters. Electrically operated on 28 V DC power. Overall weight of the system with US Minigun, minus ammunition, is 86 kg. Fields of fire are + 180° in azimuth and + 6°, −70° in elevation, with high slew rates of 80°/sec in azimuth and elevation.

STATUS:
TAT systems are in service with US Forces. MINI-TAT systems are being supplied to Canada, France and Iran.

MANUFACTURER:
Emerson Electric Co. St Louis, Missouri, USA.



Emerson Electric MINI-TAT with 7.62 mm gun

1115.303
XM27E1 ARMAMENT SYSTEM

DESCRIPTION

The XM27E1 armament subsystem consists of an M134 machine gun (minigun) mounted outside an OH-6A Cayuse helicopter. The gun projects outboard on the left side at the water line and on the centre of gravity. A 2,000 round-load is stored in a single ammunition container and fed to the gun through fixed and flexible chuting. The gun, fixed in azimuth, allows a depression angle of 24 degrees and an elevation angle of 10 degrees. Elevation depression and firing are electrically controlled from the cockpit by the pilot. The sight is an optical beam-splitter type, mechanically linked to the system. Range can be set and changed by the pilot during flight. A two-speed electric motor fires the minigun at 2,000 or 4,000 rounds a minute. The Armament Subsystem XM27E1 is also mounted on the OH-58A helicopter. The only significant difference is the change in elevation and depression angles, which are plus 5½ degrees and minus 20 degrees. Hughes Tool Company is the prime contractor.

STATUS:
US Forces.

1108.303
M5 AIRCRAFT ARMAMENT SYSTEM
DESCRIPTION:

The M5 aircraft armament system is a nose turret mounted M75 40 mm grenade launcher that provides the UH 1B/C helicopter with a limited degree of suppressive fire against ground troops. The system fires 230 rounds per minute with an effective range of 1,500 metres. Capacity is either 150 or 315 rounds, and ammunition is fed through flexible chuting from behind the pilot to the turret. Ball turret mounting allows the launcher a +15 to a −35 degree elevation and a 60 degree right and left traverse. The co-pilot/gunner aims through a reflex type sight. In June 1969 the release for the MWO Kit on the M5 was received. The kit included a lead angle compensator and a rotary ammo-can.

STATUS:
US Forces.

1109.303
XM8 ARMAMENT SUBSYSTEM
DESCRIPTION:

The Armament Subsystem XM8 mounts a 40 mm Grenade Launcher XM129 on the left side below and behind the co-pilot on an OH-6A Helicopter. The system carries 156 rounds (max) of linked 40 mm cartridges. These cartridges are stored in an ammo-container located behind the pilot's seat on top of the subsystem's torque tube assembly. The armament subsystem has a fire rate of 300-450 spm. It weighs 53 kg without ammunition and 107 kg with ammunition. The elevation limits are +10 degrees in elevation and −24 degrees in depression with an elevation control rate of 15-30 degrees per second. The pilot aims the grenade launcher in azimuth by controlling the helicopter.

STATUS:
US Forces.

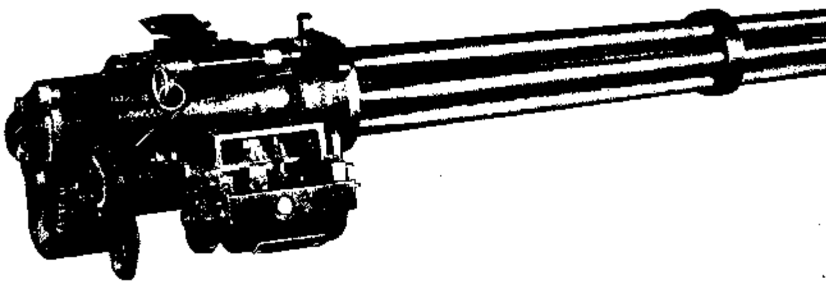
1284.303
XM-214 5.56 mm AUTOMATIC GUN
DESCRIPTION:

The General Electric Company has designed and developed a 5.56 mm automatic gun. The gun design is based on the proven principles of the operational M61A1 20 mm Vulcan Gun and the GAU-2B/A 7.62 mm Minigun. Selectable firing rates are available within the range of 400 to 6,000 shots per minute, permitting optimum engagement of a variety of targets. As few as three rounds to as many as 1,500 rounds can be fired in a single burst. The weapon is a multi-barrelled machine gun externally powered and suitable for aircraft, helicopter or ground vehicle installation. The 5.56 mm M193 (M196 Tracer) round weight is approximately half that of the 7.62 mm round and is the same as is used in the M-16 rifle.

A single, rugged main spring is used for actuation of the firing pins. Elimination of the springs from the individual bolts allows the bolts and entire gun to be simpler, smaller, and lighter.

A de-linking feeder provides a declutching action, which, when the trigger is released, immediately stops the feeding of rounds. The gun continues to fire for a fraction of a second, firing out remaining rounds. This operation automatically clears and 'safes' the gun at the end of each burst. A combination access handle and safing lever separates the main spring from the six gun bolts and provides a positive visual verification of the safe position.

A side-stripping feeder strips and disposes the ammunition links and feeds rounds to the gun.



XM-214 5.56 automatic gun

This feeder permits rapid installation of flexible ammunition belts or ammunition cans. The gun's access cover, bolts and feeder can be removed and installed without tools or timing procedures. Reliability and maintainability of the 5.56 mm gun are expected to be equal to or better than that of the 7.62 mm Minigun.

The power input needed by the gun varies between 0.75 and 3.2 hp according to rate of fire selected. Electric or hydraulic motor drives are available for this purpose. A self-powered propellant gas-driven variant of the minigun has also been developed. For the electric drive a range of nickel-cadmium batteries is available giving a duration of fire up to 80,000 rounds at 1,000 rounds per minute.

Specification:
Calibre: 5.56 mm
Muzzle Velocity: 990 m/sec
Rate of fire: Up to 10,000 rounds/minute
Dispersion: 80% shots within 4 mils
Length: 686 mm
Weight (gun and drive): 15 kg
Recoil force, average: 110 kg (at 10,000 rounds/min)

STATUS:
The XM214 is in prototype development. An XM214 pod has also been designed for aircraft applications.

MANUFACTURERS:
Aircraft Equipment Division, General Electric, Burlington, Vermont, USA.

1846.303
XM230 30 mm CHAIN GUN
DESCRIPTION:

The XM230, also known as the Chain Gun, is a single barrel, externally powered weapon which incorporates a rotating bolt mechanism driven by a simple and reliable chain drive. The entire gun weighs less than 100 pounds (45.3 kg) and will achieve firing rates of 100 to 1,000 shots per minute with minimal design variation. The chain mechanism, together with simplified feeder design and 100 per cent positive round control, assures high reliability at these low and medium rates of fire. Bolt action is such that the gun will handle brass, steel, or aluminium-cased ammunition with equal facility.

The chain drive concept permits a simplified gun cycle which operates safely from an open bolt without requirement for chargers, declutching feeders, or other special devices. Because of its simplicity (180 parts including 52 for recoil adapters), the production cost of the XM230 is expected to be less than half that of competitive weapons.

With the advent of the Advanced Attack Helicopter programme, Hughes considered the 30 mm alternatives which would meet the Army's criteria for performance, reliability, and combat effectiveness yet be consistent with the cost and weight constraints of a lightweight, high-performance helicopter, and initiated development of an externally powered weapon based on state-of-the-art principles. The Chain Gun fired its first shot in April 1973, and in July, the US Army

The Hughes AAH (Advanced Attack Helicopter) includes in its armament the 30 mm Chain Gun. Other features are TOW anti-tank missiles, 2.75 in rockets and Forward Looking Infra-red systems

Armaments Command sponsored a 2,500-round feasibility firing test programme which was successfully completed with the prototype (A Model) gun that September. Although minor mechanical problems were experienced early in this test, the final 1,000 rounds were fired without a stoppage or malfunction. Almost 90 per cent of these last rounds were aluminium cased thereby establishing compatibility of the Chain Gun mechanism with this advanced round of "WECOM 30" ammunition. During subsequent firing tests, the A Model gun demonstrated its capability to fire in any attitude, to fire single shot, and to burst-fire up to 100 rounds at rates approaching 500 shots per minute.

Hughes went on to fabrication of the B Model which incorporates a simplified gearing arrangement which will reduce the total number of gun parts from 128 to 97 and ensure even higher reliability and maintainability. Present plans call for the firing of 50,000 rounds at design rate (500 to 750 SPM) prior to 30 June 1974 in accordance with the Hughes AAH programme schedule.

MANUFACTURER:

Hughes Helicopters and Ordnance Systems, Culver City, California 90230, USA.

1110.303
M16 ARMAMENT SUBSYSTEM

DESCRIPTION:

Armament Sub-system M16 contains two 7.62 mm M60CAL machine guns on each side, also dual, seven round fixed mounted M158 2.5 inch rocket launchers mounted on a UH-1B/C helicopter. Each set of guns is flexible in both elevation and azimuth. Capacity for the machine guns is 6,000 rounds which is link-fed to the left side of each gun. The machine guns shoot 2,000 to 2,600 SPM with a maximum effective range of 1,000 metres. Elevation of the guns is from +11 degrees to −63 degrees while traverse ranges from 12 degrees inboard to 70 degrees outboard. Machine gun firing cuts off electrically or mechanically when guns on a given side of helicopter are in danger of firing into the aircraft.

The rocket launchers M158 have an effective range of 3,000 metres. The pilot aims through a manual reflex sight for both machine guns and rockets. The co-pilot uses a flexible reflex sight for machine guns only. Machine guns cut off while rockets fire.

STATUS:

US Forces.

1113.303
M23 ARMAMENT SUBSYSTEM

DESCRIPTION:

The M23 armament subsystem mounts two M60D machine guns (one in each cargo door) in a UH-1D helicopter to provide suppressive fire against ground troops. The subsystem weighs 95 kg with ammunition. It fires up to a maximum effective range of 1,000 metres through ring sights on the guns. Capacity per gun is 600 rounds and cyclic rate per gun is 550 to 600 rounds a minute. Each gun allows elevation of plus 3.5 degrees forward and plus 6.5 degrees aft and a depression of minus 82 degrees.

STATUS:

US Forces.

1114.303
M24 ARMAMENT SUBSYSTEM

DESCRIPTION:

The Armament Subsystem M24 is similar to Armament Subsystem M23 except that it is mounted on the CH-47A Helicopter and carries 200-round ammunition boxes. One machine gun mounts in the left forward escape hatch, the other across the right forward door.

STATUS:

US Forces.

GROUND RADAR

CHINA (PEOPLE'S REPUBLIC)

2019.153
CHINESE MILITARY RADAR

Little is known of Chinese activities in the military radar field. As with many other military systems the Chinese were almost certainly for many years largely dependent on Russian radar equipment: certainly there can have been little in the way of a legacy from the war years in this area; and with Russian equipment fairly readily available – obsolescent though the available equipment very probably was – it would have been only reasonable for the Chinese to have concentrated their attention on other problems.

Although there is almost certainly still a good deal of operational Russian radar in China, however, it is now believed that they have a substantial radar development programme in hand. It is known that they have constructed a missile early warning system (see also entry **2052.181**); and with respect to these and other radar developments some code names are beginning to emerge from American sources. One of these is the name "Cross Legs" given to a surveillance radar working in the 1,250 MHz band with p.r.f.'s of 300 and 600 Hz – suggesting a maximum range capability of something under 500 km. Another name is "Thin Skin" which is applied to a heightfinder working in the 6,500 MHz band. (H-band in the American military frequency band scale.) Apparently other radars are known to be operating in the American military I-band – i.e. around 9 GHz.

It is perhaps worth noting that these frequency bands are if anything rather more popular for surveillance and height-finding in Western countries than they are in Russia. It would be rash to draw any conclusions from such slender evidence: but it will be interesting to examine this thought in the light of further information which – now that a trickle has occurred – may be expected to be available in quantity before long.

DENMARK

1573.153
POINTER-PORTABLE INDEPENDENT TERMA RADAR

Description:

Pointer is an X-band, light portable surveillance radar offering good accuracy and range performance. It is basically evolved from the smallest of the Terma series of marine navigational radars. It has a number of operational applications, one being as a gap-filler in radar warning systems of countries with extensive coastlines. The manufacturers also produce a PCM (Pulse Coded Modulation) microwave data link system which permits the transmission of radar data in video format from several portable radar sites to a remote central operation centre. The designation of this system is TERALI (Terma Radio Link), and the operating frequency is in the 2.3 to 2.5 GHz band.

The Pointer system consists of three main units: Transmitter/receiver, Display unit, Scanner assembly and radome. The equipment is built and tested to full military specifications for a battlefield environment. It can be prepared for operation by a crew of three in less than 10 minutes.

Characteristics

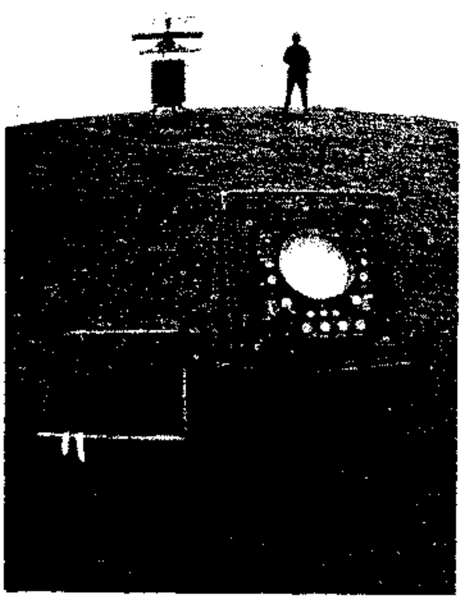
Scanner Unit:
Type: 1.2 metre slotted waveguide.
Horizontal beamwidth: 1.8 deg (3dB)
Vertical beamwidth: 20 deg (3dB)
Gain: 30dB
Transmitter/Receiver:
Frequency: Fixed, 9375 + 30 MHz
Peak Power (nominal): 9kW
IF: 30 MHz
Noise figure: 10 dB
Bandwidth: 3 + 0.5 and 20 – MHz
PRF: 1300 and 2600 Hz
Pulse length: 0.6 and 0.06 microsec.
Display Unit:
CRT Size: 23 cm diameter
Range scales: 5, 10, 20, and 50 km. Variable range marker.

Status:

Development was undertaken in collaboration with the Swedish Army and was completed in 1968. Now in series production. Pointer has been supplied to Sweden, Norway, Finland and Israel.

Manufacturer:

Terma Elektronisk Industri A/S, Finlandsgade 12, 8200 Arhus N, Denmark.



Terma pointer radar system

1574.153
TERMA SPLASH SPOTTING RADAR

Description.

The Terma splash spotting radar is a portable radar designed to indicate the impact or splash of projectiles, such as shells or air-dropped mines.

Tests carried out in co-operation with the Danish Army have indicated the accuracy of the radar to be within +4 metres (distance) and +0.114 degrees in azimuth. Other applications include use as:

(1) Surveillance radar
(2) Radar with Manual Tracking (hand controlled)
(3) Radar with Auto Tracking-Sector Scanning.

The system consists of the following units: Scanner Unit, Receiver-Transmitter Unit, Display Unit, Power Unit, and Control Unit.

Ranges against splash (within the radar horizon):

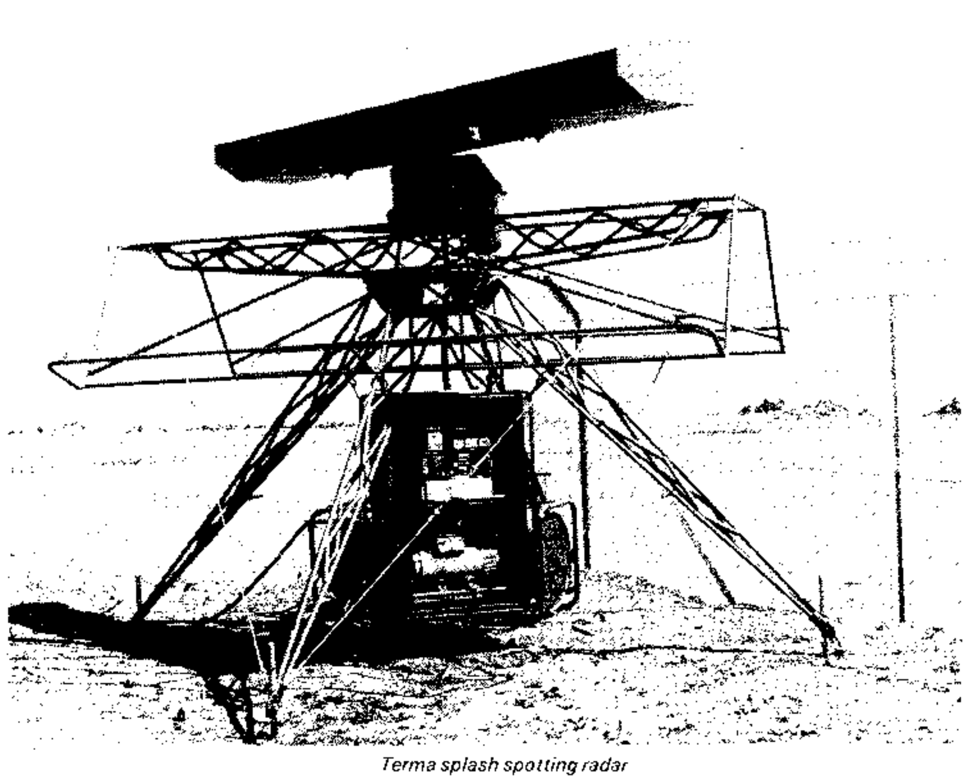
Conventional cylindrical splash:

Diameter	Height	Max. range
0.5m	1 m	10,000 m
1 m	5 m	13,000 m
2 m	7.5 m	16,000 m

Characteristics:

Scanner Unit:
Antenna element: 2.1 m slotted waveguide
Rotation: The scanner is mounted with synchros for the following purposes:

(1) 10 RPM (continuous)
(2) sector scanning 10 degress/sec.
(3) manual operation



Terma splash spotting radar

Horizontal beamwidth: 1 degree (3dB)
Vertical beamwidth: 20 degrees (3dB)
Standing wave ratio: Less than 1.2
Gain: 34dB
Receiver Transmitter Unit:
Transmitter frequency: Fixed within 9375 ± 30 MHz
PRF: 1000 and 2000 Hz
Pulse length: 0.6 and 0.06 microsec
Peak power: 20 KwkW
Bandwidth: 3 ± 0.5 MHz and 20 + 1 MHz
IF centre frequency: 30 MHz
Noise figure: Less than 11 dB
Display Unit:
Picture size: 30 cm diameter CRT
Range and range rings (km):

Range	1	2.5	5	10	20	40	80
Rings	0.5	0.5	1	2	4	8	10

Accuracy of range rings: Less than 1.5 per cent of range in use
Sweep linearity: Better than 1 per cent
Control Unit:
Digital variable range marker:
A crystal controlled variable range marker generator produces a marker pulse in the range 20 m to 9999 m with a resolution of 10 m. The range marker can also generate a marker of ± 100 m relative to the centre marker. The range is displayed on four digital displays.
A/R Indicator:
The A-indicator is able to display the total radar range selected on an A-sweep selector switch. On the R-indicator a certain area of the total sweep may be selected by means of a delayed sweep which is controlled with a 10-turn potentiometer. The two sweeps are presented on a 13 cm CRT.
B-Indicator:
Range: Following the R-sweep on the A/R indicator
Bearing accuracy of transmission: Better than 0.5 degree
Sector scanning: ± 5 degrees (with linear scanning within ± 3 degrees)
CRT:
10 × 8 inches with internal graticule which is divided into 1-inch squares with 0.2 inch super divisions on the major axes. The CRT can be supplied with amber filter, daylight filter and camera.
STATUS:
The development was completed in 1968 and the splash spotting radar has been delivered to the Swedish armed forces.
MANUFACTURERS:
Terma Elektronisk Industri A/S, Finlandsgade 12, 8200 Arhus N, Denmark.

1577.153
M/532 DOPPLER RADAR:
DESCRIPTION:
The doppler radar M/532 is a CW radar system which includes advanced data processing facilities for continuous velocity measurement of projectiles and rockets. The velocity range is 50-1600 m/sec.
This equipment is particularly well suited for research and development work on shooting ranges.
The doppler radar set consists of: Antenna Unit (Horn Antenna), Transmitter Unit, Data Unit, Test Unit, and Control Unit.
The antenna unit and the transmitter unit are of extremely solid construction, allowing them to be placed where even very high blast conditions arise. The antenna unit includes a transmitting and a receiving antenna, each with a gain greater than 21 dB and a half power beam greater than 12 degrees. This means that the antenna unit is suitable for measurements where the angle between target trajectory and antenna direction changes. Furthermore, it is suitable for measurements with very low antenna elevation because the receiver is equipped with a phase and amplitude correction network for cancellation of reflections from nearby objects on the ground.
The transmitter unit is placed together with the antenna unit so that they look like one unit. The two units can be separated very easily so that it is possible to use the transmitter unit together with a 4.5 degree beamwidth antenna unit.
The transmitting element is a magnetron working at 2.45 GHz and stabilised by a external cavity and by temperature controlling elements. The data unit handles the video signal from the receiver in two filter systems. One processes a certain velocity range, the other is able to follow the target in speed. Then the signal is processed both in analogue and digitally. The digital measurement ensures the highest accuracy. For later data handling the video signal is stored by means of an analogue tape recorder. The output signals from the filters are converted by means of frequency-to-voltage converters in the Analogue Measurement Assembly.
The analogue measurements are recorded by a fast response-UV-recorder. The digital results being a 5-digit velocity and a 6-digit reference time, are fed to a solid-state memory. This type of memory has been chosen for high reliability, speed, and read-in-speed flexibility.
The capacity of the standard memory is 512 measurements, which can be extended to 1024 and further to 2048 measurements. The stored measurements are punched on tape for further data handling in a computer. It is possible to connect a calculating system directly to the memory output and use it together with the tape puncher.
STATUS:
The first M/532 doppler radar was delivered to Norway in 1961. Since then slightly different versions have been delivered to West Germany, Spain, Switzerland, Norway, and Sweden.

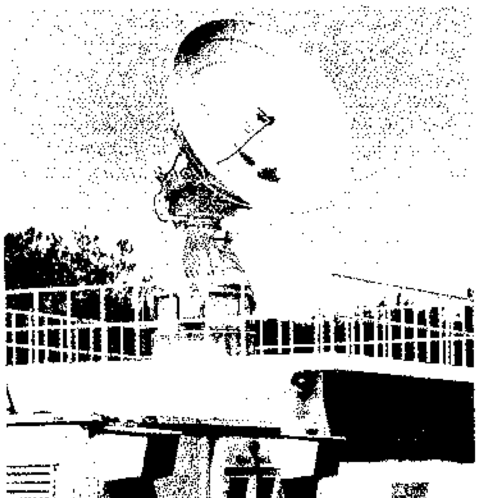
ADOUR TRACKING RADAR
DESCRIPTION:
ADOUR (TH.D 1215) is a C-band tracking radar using the conical scanning principle. It is intended for acquisition and automatic tracking and is specifically designed for making measurements in –
1. Flight test centres, for the calibration and evaluation of prototype aircraft, of airborne equipment such as altimeters and autopilots and of ground equipment such as surveillance radar.
2. Rocket and missile test centres and launching centres for measurements relating to missile, sounding rockets and satellite launchers.
In addition, the radar is used at such centres for windfinding and similar measurements.
The turret aerial is of Cassegrain design. Standard polarization is vertical but other polarizations are available. The standard transmitter has a peak power output of 250 kW and is tunable in the band 5450-5825 MHz. The console is large, but can comfortably be operated by one man. Range measurement is digital.
DEVELOPMENT:
Development of this radar followed that of the Aquitaine (**2062.153**) and Béarn (**2065.153**) radars by the same manufacturer. The first set was delivered in 1967.
It is at present installed on French, Swiss, Australian and Brazilian firing test ranges and quantity production has started to meet French needs for export.

CHARACTERISTICS:
Aerial:
Diameter: 3 m
Aerial gain: 42dB
3 dB beamwidth: 1.3°
Sidelobe level: —20 dB
Polarization: Vertical
Optional 3 position polarizer: Vertical, clockwise circular, counterclock-wise circular
Turret and Servos:
Azimuth rotation: Unlimited
Elevation rotation: —15° to +185°
Azimuth servos:
Speed: 1 rd/sec
Acceleration: 4 rd/sec²
Elevation servos:
Speed: 0.6 rd/sec
Acceleration: 3 rd/sec²
Transmitter:
Magnetron tuning range: 5,450-5,825 MHz
Pulse length: 1.7 microsec
Peak power: 250 kW
Optional:
Codable transmitter: Pulse train length variable from 0.25 to 1.7 microsec
Receiver:
Operation modes: 4 (radar; transponder; mixed with radar priority; mixed with transponder priority)
Overall noise figure: (6 dB + 1.5 dB losses) 7.5 dB
Sensitivity (S/N = 0 dB): 136 dB



Adour Tracking Radar TH.D. 1215

Digital Range Measurement:
Maximum Tracking Rate: Better than 14,000 m/sec
Range capability: 4,096
Digital Data Outputs:
Range definition: 2 m (21 digits)
Angular definition: 0.1 mrd (16 digits)
Performance:
Detection range:
On 1 m^2 target (S/N = 0 dB): 170 km
On 50W transponder (aerial gain 0 dB): 9,000 km
Tracking accuracy: (S/N = 20 dB)
Range: 3 m rms
Elevation and azimuth: 0.2 mrd rms (40 sec of arc)
STATUS:
In production
MANUFACTURER:
Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

2060.153
ANTARES HEIGHT-FINDING RADAR

DESCRIPTION:
Under the code name ANTARES (for Antenna Tracking Altitude, Azimuth and Range by Electronic Scan) Thomson-CSF has developed a height-finding radar operating in S-band that can be used for air defence and civil air traffic control purposes. This system is designed mainly to measure the altitude of targets tracked by a 2-D search radar which is associated with it, with a very high accuracy and a high data renewal rate. Antares is an automated system, and all its input or output data are controlled or generated by an automatic digital processing unit. This feature, together with the utilization of electronic scanning in elevation enables the system to satisfy a practically unlimited number of altitude requests.

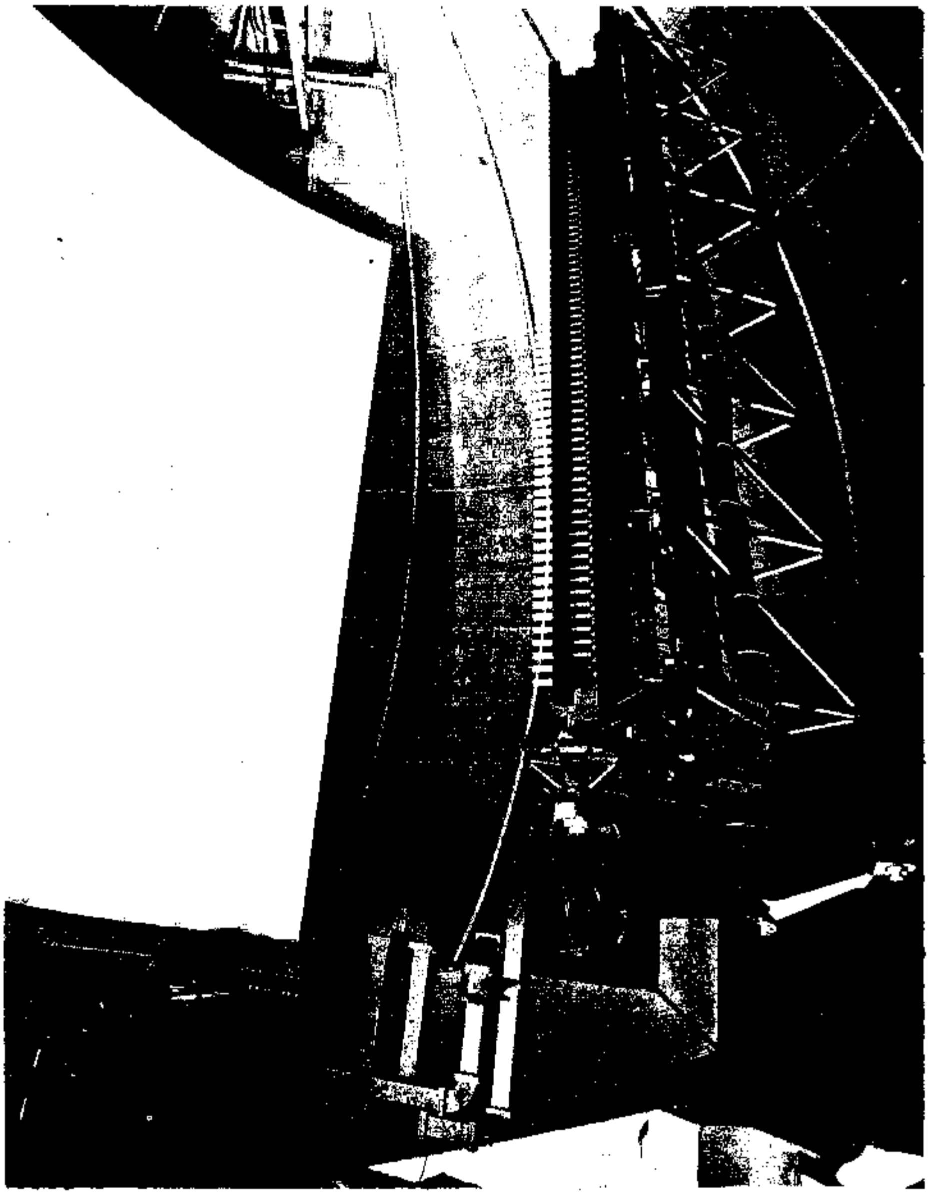
The Antares system consists of a height-finding radar and a processing unit. Principal units of the radar are an antenna under a radome, a servo system for slaving the rotation of the antenna to that of the associated plan radar antenna, three transmitters, three conventional receivers and one angular error measuring receiver.

The antenna is made up of a cylindro-parabolic reflector and a primary feed in the form of an array of elementary feeds radiating circularly polarized waves. The feed is coupled with two waveguides by means of directive couplers which allow mono-pulse operation for angle error measurements. Digital electronic phase-shift networks placed between the elementary feeds and the corresponding directive couplers control the aiming direction of the beams, while focusing in elevation is achieved by the feed array. Owing to the dispersive character of the feed, the use of three different frequencies produces three stacked elevation beams. An antenna computer determines the values of the elementary phase shifts corresponding to the elevation angle ordered by the processing unit.

The transmitter receiver assembly comprises three TH.D.047 transmitter-receivers coupled with the antenna by a single waveguide and one monopulse angle error measurement receiver. The TH.D.047 units are S-band magnetron transmitters delivering a power of 1 MW (peak) – 1 kW (mean). They are modern equipments, fully transistorised (except for the microwave tubes), of small size, and highly reliable. The receiver chains are of the anti-jamming type. The angle error receiver utilizes the phase-comparison amplitude monopulse technique.

The processing unit is a digital computer which controls the beam direction (elevation order sent to the antenna computer), handles the altitude requests coming from the external operations centre, and performs altitude computations.

OPERATION:
Altitude requests from an operations centre outside the system are classified by the processing unit. From the plan-radar data an azimuth-range gate is generated, inside which the height-finding radar performs an elevation search. This search goes on until a "coarse" measurement is obtained (using the three beams). The centre beam is then aimed at the acquired target, and a "fine" measure obtained; the computer converts this elevation value into an altitude and sends the results to the operation centre with the other two target co-ordinates.



Antares aerial inside radome

When no altitude is requested, the Antares automatically performs long-range surveillance at low elevations, thus considerably augmenting the low cover at the surveillance radar with which it is integrated.

TEST EEQUIPMENT:
Included in the equipment is a control and monitoring panel. This is an elaborate system that not only enables the operator to locate failures but also enables him to differentiate between failures that will adversely affect performance and require immediate action and those for which action can be postponed.

CHARACTERISTICS:
Type: Automatic height-finding radar system (with low-elevation long-range surveillance capability)
Frequency: S-band
Coverage (90% detection probability):
Altitude: at least 30,000 metres
Elevation: −2 deg to +35 deg
Azimuth: 360 deg
Altitude Accuracy: +300 metres to 150 nm
Capacity: More than 100 targets/min
Data Renewal Rate: 10 sec
Radome Diameter: 18 metres
Reflector Size: 9 metres × 8 metres
Gain: 45 dB
Polarization: Circular
Peak Power: 1 MW
Mean Power: 1 kW (for each transmitter)
Noise Figure: 3.5 dB with parametric amplifier
STATUS:
In production
MANUFACTURER:
Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

AQUITAINE II TRACKING RADAR

DESCRIPTION:
Aquitaine II (TH.D 1804) is a modernised version of the earliest of the Thomson-CSF range of tracking radars and is a very high precision equipment designed for trajectography and satellite tracking.

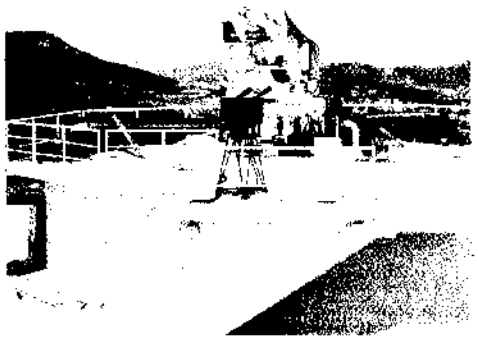
A monopulse C-band radar, automatically tracks radar echoes or transponder signals at distances up to about 4,000 km. The equipment comprises an aerial turret, with which are associated the RF and IF receiver circuits, a 1 MW peak transmitter, codable and tunable from 5,450 to 5,825 MHz, an operating console, a coding and interconnection cabinet and a power supply cabinet. The range-finding unit – in the console – is fitted with a synchronising device that allows the radar to be used in series with other tracking radars of the same or different types.

DEVELOPMENT:

Originally developed by CFTH-HB – now Thomson-CSF – the earlier Aquitaine radar incorporated much of the design experience gained with the Cotal radars that the company had been working on since 1950. The first Aquitaine (TH.D 1800) was delivered in 1963 and the first of the modernised Aquitaine II radars was delivered in 1967. Seven sets have entered service on French firing ranges.

CHARACTERISTICS:

Turret:
Accuracy of the rotation axis: 3×10^{-5} rd
Accuracy of analysis axis: 3×10^{-5} rd
Natural frequency: 20 Hz
Aerial:
Cassegrain type with polarization reversion:
Diameter: 3 m
Polarization: Vertical
Gain: 42dB
Beamwidth: 1.3°
Receiver:
Monopulse:
Tunnel-diode RF amplifiers:
Stability of the zero ecartometry: $+3 \times 10^{-5}$ rd
AFC for transmission and reception:
Transmitter:
1-MW magnetron, codable and tunable over a range of: 5,450-5,825 MHz
Transmitter frequency controlled by a high-precision standard cavity:
Range Finding Unit:
Arithmetic range finding with automatic lock-on and ambiguity cancellation:
Tracking speed: 14,000 m/sec
Quantum: 2 m
Nominal range detection: 4,000 km
Turret Servomechanisms:
Control by thyristor and electromagnetic couplers:
Automatic bandwidth changeover:
Maximum speed:
Azimuth: 0.6 rd/sec
Elevation: 0.45 rd/sec
Acceleration (azimuth and elevation): 4.5 rd/sec²
Digital Data Outputs:
Angular definition (precision in coder): 2 seconds of arc
Range definition (arithmetic range-finding): 2 m
Performance:
Tracking accuracy:



Aquitane II Tracking Radar

Angular: 0.03 mrd (6 seconds of arc)
Range: 2 m
Range detection possibility:
On radar echo of 1 m² (S/N = 0 dB): 300 km
On 500 W transponder (S/N = 20 dB): 4,000 km

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France

2066.153
ARABELLE PORTABLE TRANSPONDER

DESCRIPTION:

Arabelle is an X-band/VHF secondary radar transponder designed for use as a means of locating and identifying troops or vehicles in a battle area. It operates in conjunction with a surveillance radar but is secure against hostile radars: when interrogated by a friendly X-band radar it responds with a coded VHF signal that can be identified by a responsor at the friendly radar station. Of general use in battlefield conditions, the equipment is obviously particularly useful in poor visibility conditions.

In its portable version, the equipment is in the form of a rifle consisting of a double barrel, the walls of which function as a VHF dipole radiator. The components are housed inside the barrel and consist of the control unit, the transmitter-receiver, the coding circuits and the battery compartment. The power supply is provided by dry cells or by rechargeable cadmium-nickel batteries, both options being available without modifying the equipment. The transponder is normally carried slung over the shoulder, and can be used in that position without prior setting up. It can also be used in a stationary position, mounted on a built-in tripod stand. Its weight is less than 5 kg, including batteries. Operation is either fully automatic or manually controlled. A robust and weather-proof instrument, it operates automatically in any position, without impairing the operator's freedom of movement.

The vehicular variant consists of a single unit of compact size easily installable in any vehicle, and an antenna. The power supply is provided by the vehicular battery.

CHARACTERISTICS:

Receiver frequency: X-band
Transmitter frequency: 3 pre-set frequencies
VHF peak power: 15 watts
Response code: 16 separate combinations (VHF)
Range: Same as interrogator radar range
Weight: 5 kg
Power Supply: 8.4 V built-in batteries. Continuous service: 10 hours. 24 V vehicular batteries, through converter
Power consumption: 5 watts with built-in batteries

MANUFACTURER:

Electronique Marcel Dassault, 55 Quai Carnot-92-Saint Cloud, France.

2063.153
ARTOIS TRACKING RADAR

DESCRIPTION:

The Artois now being developed by Thomson-CSF is an electronic-scan multi-target tracking radar designed to perform highly accurate differential trajectory measurements.

The principal features of this radar are electronic scanning in a cone having a vertex angle of 10° minimum, instantaneous deflection from pulse to pulse and multi-target tracking with controlled variable interlace.

CHARACTERISTICS:

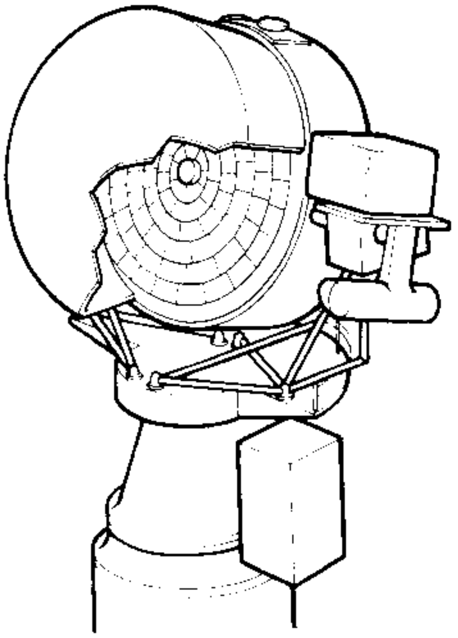
Type: Monopulse tracking radar
Frequency: C-band
Beam control: Electronic scanning in two dimensions
Peak power: 1 MW
Pulse duration: 0.3 microsec or less
Read-out: Numerical
Simultaneous tracking: 3 targets on skin echo or on transponder (range: 4,000 km)

STATUS:

Under development

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.



Artois Aerial

2121.153
ATC APPROACH RADAR TRS 2060

DESCRIPTION:

The TRS 2060 radar station is an improved version of the THD 1098 (described under this entry number in previous editions while it was still in development), which can be supplied with an integrated IFF aerial and is now available as either a mobile or a static installation. It has been designed for easy transport and setting up, and is capable of being used in a variety of operational conditions. Both its mobility and its performance make it well suited for use as an autonomous surveillance station, or for complementing or locally enlarging the coverage of a long-range radar (gap filler) role for example in an air defence system.

TRS 2060 is housed in and mounted on a cabin made of plastic material and comprises, as basic equipment:

(a) a single-beam antenna, with sharp beam and remotely controlled linear/circular polarization, fixed directly on the cabin roof;
(b) an S band transmitter receiver (1 MW peak, 2 kW average), entirely transistorised, of small

size, reliable and easy to maintain;
(c) an operator position with PPI display.

In addition, there can be added – to increase system reliability and versatility – a second transmitter-receiver with a microwave coupling device permitting diversity operation and a digital MTI processing rack. Remoting equipment can also be added – up to about 3 km by cable link or tens of kilometres by microwave link.

DIGITAL MTI (phase-coding):

Digital computer techniques are used to determine the phase variations of received echoes and compare them with a threshold which represents the boundary between fixed and moving targets. The result of this process is a series of blanking signals that are used to inhibit the normal radar video in the presence of clutter. This form of MTI operation eliminates the velocity response effect which produces target fading in delay-line MTI equipments.

TRANSPORT:

The cabin can be transported either by a conventional truck or by cargo aircraft. The station's standard equipment includes handling means. The aerial divides into three sections which are transported in special frames made of light material.

DEPLOYMENT:

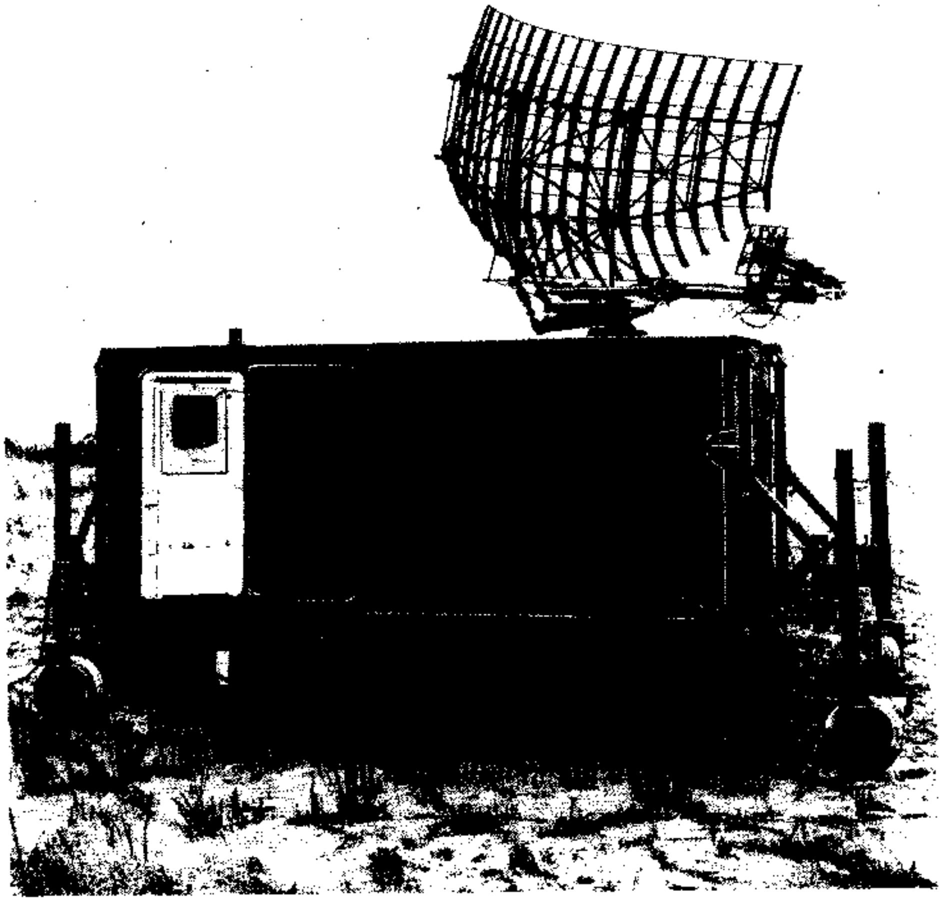
A 4-man crew installs the TRS 2060 station in less than two hours.

CHARACTERISTICS:
Antenna:
Type: AC316
Polarization: Linear/circular
Reflector dimensions: 5 × 2.3 m
Horizontal beamwidth (3 dB): 1.4° + 10%
Cosecanted pattern: In excess of 40°
Gain: 34 dB
Rotation speed: 7.5/15 rev/min
Transmitter-Receiver:
Type: TH.D.047
Frequency range (covered with 2 tunable magnetrons): 2,990-3,200 MHz
Peak power: 1 MW
Average power: 2 kW
Pulse duration: 4 microsecs 2 microsecs
P.R.F.: 500 Hz; 1,000 Hz
Receiver:
Parametric amplifier incorporated
Noise figure: Less than 5 dB
Reception chains: Log with differentiation/expansion and CFA chain
Digital MTI (phase-coding):
Double canceller loop 3 PRFs: sub-clutter visibility: 25 dB
Power supply: 220/380 V, 50 Hz, 20 kVA
Performance:
Detection range: 70 nm (130 km) on modern fighter, for a detection probability of 80% with single T/R unit

STATUS:
In production.

MANUFACTURER:
Thomson-CSF-Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

Interior of the TRS 2060 operational cabin



TRS 2060 surveillance radar – mobile version

2059.153
ATC APPROACH RADAR TRS 2065

DESCRIPTION:

Designed to provide surveillance in the terminal areas of civil and military airports, TRS 2065 is an S-band radar of modular design which can be developed from a basic station to match increasing operational requirements.

The special requirements of terminal area surveillance are met by an aerial of computer-aided design. The double curvature reflector produces a cosecant-squared pattern, the cosecant being accentuated at high elevations to increase the target signal to ground-clutter signal ratio at close range. The pattern has a sharp cut-off at low elevations to provide good protection against fixed echoes.

The 1.5° horizontal aperture ensures satisfactory functioning of the MTI while allowing a high data renewal rate (rotation speed : 15 rev/min). Atmospheric interference is reduced by circular polarization.

Depending on the option, the equipment comprises one or two independent chains for frequency diversity operation.

The transmitters are fully transistorised except for the magnetron and one thyratron. The repetition frequency is modulated to cancel the blind speeds of the MTI system.

The receiver is entirely solid-state and its modular design permits a wide range of physical configurations. The MTI system utilises digital techniques for the measurement of echo phase variations. The signal processing system includes an automatic dense area detector and an interference suppressor.

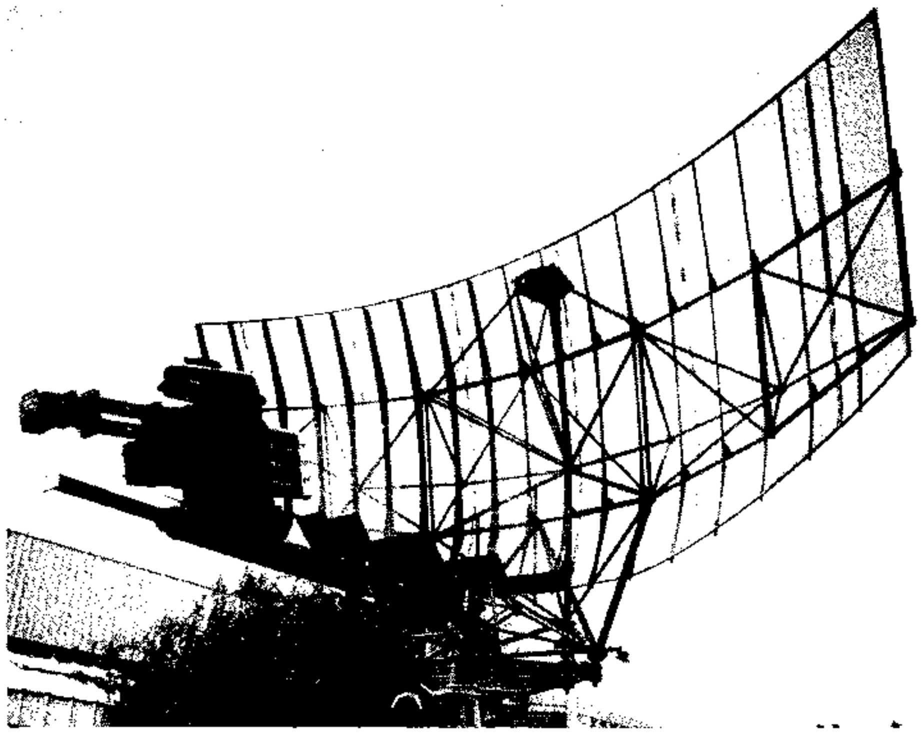
The equipment can be remotely controlled.

CHARACTERISTICS:
Coverage: (90% detection probability on a 2-m² fluctuating target), 50 nautical miles.
SCV: Better than 25 dB
Blind speeds: First blind speed higher than 1,000 knots.
Frequency: S-band
Aerial: Azimuth beamwidth: 1.5°. Gain 34 dB. Switchable circular/linear polarization. Rotation speed: 15 rev/min.

Transmitter: Peak power: 650 kW. Pulse duration: 0.75 microsec. PRF: 1,000 Hz.
Receiver: Noise figure: 2.5 dB.

STATUS:
In quantity production

MANUFACTURERS:
Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222 Bagneux, France.



Aerial of the TRS 2065 ATC radar

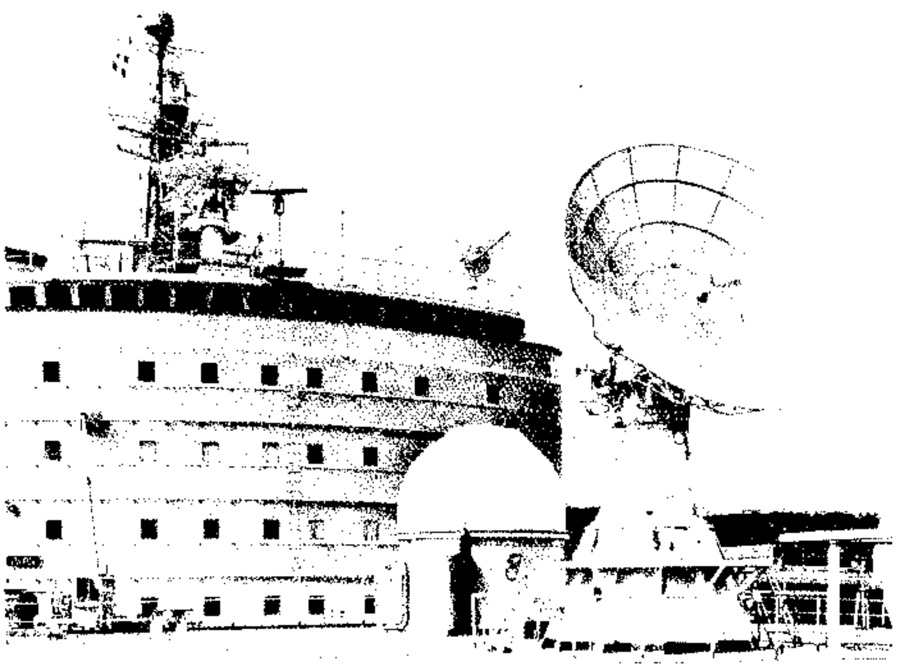
2065.153
BEARN TRACKING RADAR
DESCRIPTION

Béarn (TH.D 1216) is a high-precision C-band automatic tracking radar designed for the trajectory of high-speed missiles at long range.

Facilities offered by the radar include manual or automatic acquisition of a target dynamically or statically designated by the rendezvous method, automatic tracking of radar echoes or transponder signals up to 4,000 km; elevation, azimuth and range co-ordinate read-out as numerical data in real time; automatic change-over to memory tracking in case of loss of signal; polarization switching without interruption of tracking; synchronization of a chain of radars interrogating the same transponder; and, for shipborne installations, autonomous and automatic stabilisation of the pointing axis.

DEVELOPMENT:

Béarn was developed by Thomson-CSF and the first installation was made on the missile recovery ship Henri Poincaré in 1966. Since then, a dozen sets have been installed or are being delivered to meet the needs of the French firing ranges, both in France and overseas.



Naval installation of Béarn Tracking Radar

CHARACTERISTICS:
Aerial:
Cassegrain feed system:
Diameter: 4 m
Antenna gain: 44 dB
Beamwidth at 3 dB: 0.9°
Sidelobe level: 19 dB
Polarization: 3 (at operator's choice)
Turret and Servos:
Azimuth rotation: non limited
Elevation rotation: −15° to +195°
Total accuracy of the axis analysis: 0.1 mrd rms or better
Azimuth servomechanism:
Speed: 1 rd/sec
Acceleration: 2 rd/sec²
Elevation servomechanism:
Speed: 0.5 rd/sec
Acceleration: 2 rd/sec²
Transmitter:
Magnetron (TV 313) tunable in the band of: 5,450-5,825 MHz
Peak power: 1 MW
Pulse length: 1.7 microsec
PRF: 585.5 Hz
Receiver:
Overall noise figure (including duplexer and RF head): 6.5 dB or better
Sensitivity (S/N = 0 dB): 136 dB
Logarithmic IF amplifier:
AFC by receiving and transmission:
Operation modes: 4 (radar, transponder, combined with radar priority, combined with transponder priority)
Tracking modes: 2 (radar, DF)
Digital Range Measurement Unit:
Range possibility: More than 4,000 km
Maximum tracking speed: More than 14,000 m/sec
Maximum tracking acceleration: More than 30,000 m/sec²
Automatic acquisition:
Automatic ambiguity cancellation:
Instantaneous gathering:
Digital Data Outputs:
Range discrimination: 2 m
Angular discrimination: 0.05 mrd
Performance:
Range detection possibility:
On radar echo of 1 m² (S/N = 0 dB): 300 km
On 50W transponder (aerial gain 0 dB): 4,000 km
Tracking accuracy:
In range: 3 m rms
In elevation and azimuth: 0.1 mrd rms (20 sec of arc)

MANUFACTURER:
Thomson-CSF Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France

2083.153
DOMINO 30
DESCRIPTION:

Domino 30 is a search and target designation radar to be used against low and very low-flying targets. Separable into loads of small volumes and weights, it can be mounted on a carrier (armoured or not), in a cabin or at a fixed site.

The principal operational use is as a central radar in a defence system, performing surveillance target designation for several fire positions which may be either anti-aircraft guns or short range missiles. Owing to the radar's range, the spacing between the fire positions and the radar may reach several kilometres. In such a system, the radar can provide omnidirectional search with a high data renewal rate (45/minute), an audible alarm when a target is detected and bearing and range designation of selected targets by means of electronic markers. An automatic track-while-scan system can also be added.

Domino 30 is a crystal-controlled, coherent pulse doppler radar, with a moving target sub-clutter visibility of at least 60 dB. The detection volume is delimited by a range of 30 km and an altitude of 15,000 ft, with a vertex angle of 35°. The domain of detected radial speeds ranges from 30 to 500 m/s. The radar is both reliable and rugged thanks to extensive use of solid-state components; the only vacuum tube being the triode transmitter valve.

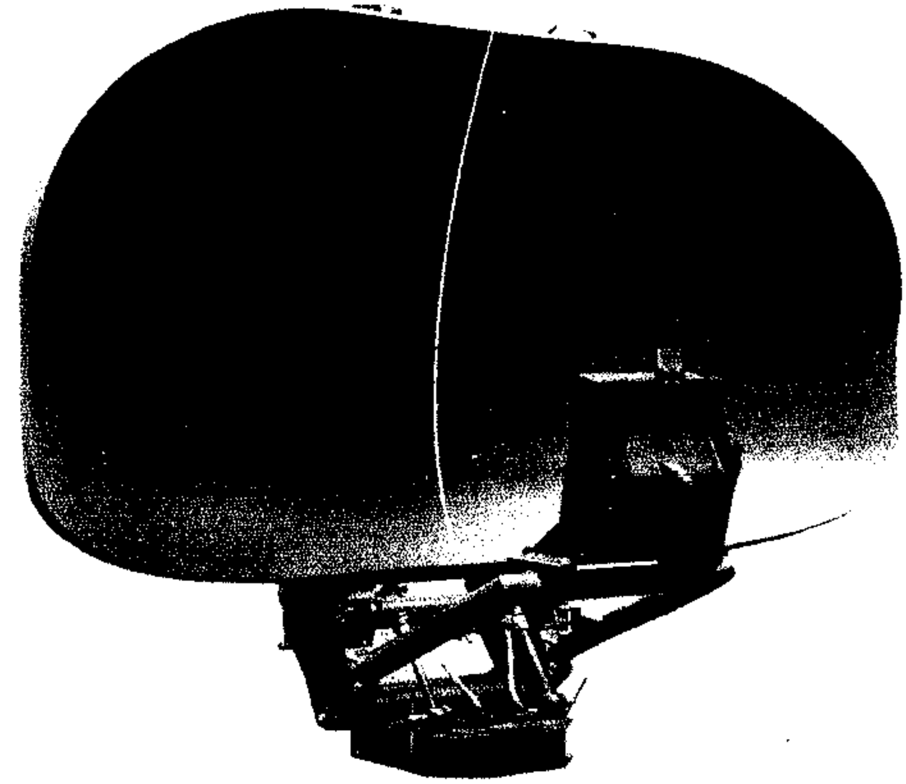
Six sub-units make up the complete basic radar – the aerial system, the transmitter-receiver cabinet, the signal processing cabinet, a converter unit, a control box and a set of connecting cables. Provision is made for adding an IFF interrogator and aerial to the primary radar.

CHARACTERISTICS:

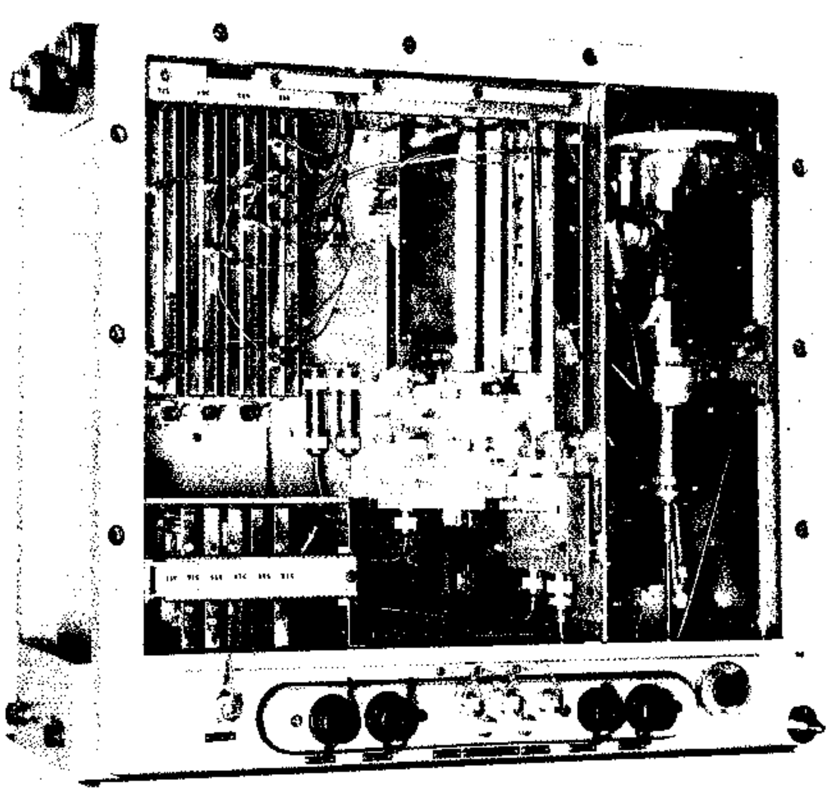
Frequency band: L-band
Peak power: 1 kW
Average power: 45 W
Azimuth beamwidth: 6.5°
Elevation pattern: Cosecant squared, aperture 35°
Rotation speed: 45 rev/min
Radial speed range: 30-500 m/s
Range resolution: 1,500 m
Detection range: 30 km on modern fighter
Accuracy of bearing designation: 1.5° (rms)
Accuracy of range designation: 400 m (rms)
ECCM devices: CFAR receiver strobe on jammer
Subclutter visibility: 60 dB or better
Compatible with IFF:
Climate conditions: −50° to +55°C
Consumption: About 5 kW
Weights:
aerial system: 190 kg
transmitter-receiver cabinet: 75 kg
signal processing cabinet: 70 kg
converter unit: 20 kg
control box: 5 kg

STATUS:
In quantity production since the beginning of 1969 under a NATO-member country's contract.

MANUFACTURER:
Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.



Domino 30 Aerial



Domino 30 Transmitter-Receiver

2157.153
GROUND-BASED IFF INTERROGATOR

DESCRIPTION:

The equipment described below can be used to make any of three types of IFF ground interrogation equipment.

Heart of the system is the transmitter-receiver (interrogator-responsor) ER-116-A which, but for one tube, is a fully solid-state unit making extensive use of digital integrated circuits. The sub-assemblies of this unit are pluggable and are common with the airborne and shipborne versions and also with other specialised systems such as that for the Crotale weapon system (**2074.131**).

By itself the ER-116-A constitutes a single locally-controlled interrogator-responsor. If this is added to a BC-361-A control box it becomes the NR-S1-1-A locally or remotely-controlled single interrogator-responder. Addition of a further ER-116-A and a switching unit TK-256-A converts the system to the NR-S1-1-A dual interrogator-responsor with local or remote control.

CHARACTERISTICS:

Transmitter receiver ER-116-A
incorporates a coder, a transmitter and one or two receivers
Peak radiated power: Selectable: 0.5, 1 or 2 kW
Transmission Frequency: 1,030+0.5 Mc/s (0.2 optional)
Receiver Sensitivity: −83dBm
Receiver Frequency: 1,090 Mc/s
Double receiver: for side lobe suppression (optional)
Possible modes: 1, 2, 3/A and C – mode 4 with associated equipments
Interlacing facilities: 3 modes out of 4, with changing selections each rotation of the antenna. Permanent self monitoring of all operational characteristics. Antenna switch for side lobe suppression at the interrogation (optional)
Size: two units of a standard 19'' rack
Power supply: 220 V 50 c/s, 120 W
Switching supply: TK-256-A
Enables ground based installations to operate with two transmitter receivers ER-116-A with automatic switch over in the event of failure of one of the equipments
Size: Two units of a standard 19'' rack
Control box BC-361-A
Allows the remote control of a single ER-116-A, or of two of them associated with a switching unit TK-256-A

LONG RANGE RADAR LP 23 (TRS 2050)
DESCRIPTION:

LP 23 (TRS 2050) is a long-range L-band surveillance radar intended for air defence detection networks and air traffic control applications. Its modular design features advanced digital signal processing specially intended to facilitate the plot extraction and narrow-band data transmission which are essential to modern automated air-defence systems.

Aerial:

The double curvature reflector produces a cosecanted elevation pattern and a steep slope on the ground side for minimum ground illumination. The double-horn primary feed permits use of the signals received from high and low coverage. This double-beam technique considerably reduces parasitic signals due to angles, rain or ground clutter. Circular polarization is used for rain effect rejection.

The antenna accepts an on-mounted IFF aerial (alternatively, an IFF aerial can be integrated with the primary radar aerial if required).

Transmitter:

The TRS 2050 radar is fitted with two ER 720 transmitters operating in frequency diversity. The ER 720 solid-state transmitter, built according to military standards, uses a 2.2 MW Liquid-cooled magnetron under-run for long life (15000 hours typical). A special EHV transistorised regulation device is included for high frequency stability and high MTI performance.

Receiver:

Modular design allows selection from a wide range of modes of operation with dual coverage. The all-solid-state receiver features a low-noise parametric amplifier, a stable local oscillator with AFC and a wide dynamic range logarithmic amplifier.

Digital Signal Processing:

The MTI operation consists essentially in a comparison of the pulse-to-pulse phase variation with respect to a reference. This is achieved by phase measurement, storage, integration and threshold detection processes carried out with digital logic circuitry.

Interference from other radars, second-time-around returns and some kinds of jamming are eliminated by video quantization and correlation techniques.

CHARACTERISTICS:

Aerial:

Gain: 36 dB (main beam) : 35.5 dB (auxiliary beam)
Polarization: Circular
Vertical pattern: Cosecant-squared to +40°
Horizontal aperture: 1.2° at −3 dB
Height: 9 m
Span: 13 m
Rotation speed: 6 rev/min

Transmitter:

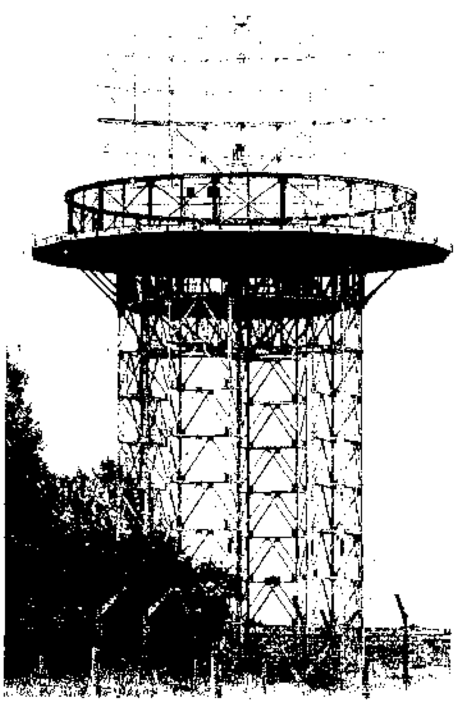
Operating frequency: L band (1250-1350 MHz)
Peak power: 2.2 MW
Standard PRF pulse durations: 250 Hz — 4 microsec/375 Hz — 3 microsec.
Dimensions: 1.77 m × 1.41 m × 0.91 m
Power supply: 220/380 V — 50 Hz 15 kVA

Receiver:

Noise figure: Less than 3 dB (with parametric amplifier)
Log. amplifier dynamic range: 70 dB
Dimensions: 1.71 m × 0.58 m × 0.84 m
Power supply: 220 V — 50 Hz — 1 kVA
M.T.I.:
Sub-clutter visibility: 25 dB

DEVELOPMENT:

Design and development of the LP 23 were carried out under the sponsorship of the French Administration. The first prototype was completed in 1969. More than 10 sets have been delivered in France and elsewhere.



LP 23 long-range radar aerial

2102.153
MATADOR 3-D RADAR TRS 2210
DESCRIPTION:

Under the code name Matador (for Mobile And Three-dimensional Air Defence Operations Radar), Thomson-CSF has developed a three-dimensional S-band radar, which when associated with a mobile operations centre, provides three-dimensional coverage, very high accuracy of height-finding and a high data renewal rate.

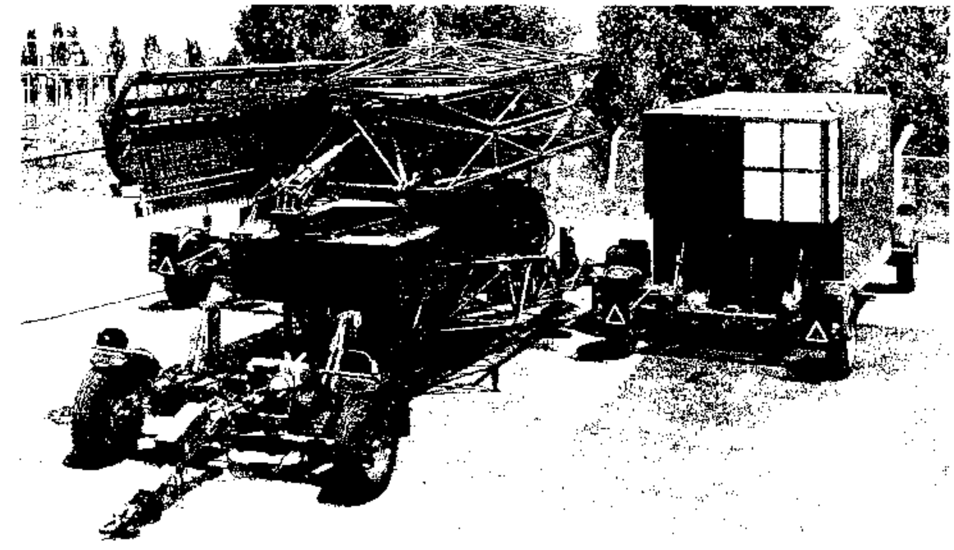
This equipment is designed with a view to extreme mobility and great rapidity of deployment: and it is primarily intended to be used in mobile air defence stations.

The radar is transportable by road, rail, aircraft Transall C 130 (or equivalent) or helicopter (Super-Frelon or equivalent). The installation time is less than one hour. The radar is intended to be utilised either as a "gap filler" station with automatic remoting of data to an operations centre, or in conjunction with a mobile operations centre (e.g. Midas **2106.151**) to constitute an autonomous mobile air defence station.

Use of elevation electronic scanning makes it easy to adapt the mode of operation to suit particular conditions; choices include general 3-D surveillance, surveillance restricted to a selected elevation sector (low-elevation surveillance) and accurate measurement of altitude by pointing the radiated beam at specific targets.

Matador comprises a platform supporting an antenna (foldable for transit), a transmission cabin and a receiver cabin.

The antenna is a cylindro-parabolic reflector whose reflecting surface is made of folding sections made from square mesh (circular polarization operation). Azimuthal scanning is obtained by rotating the antenna continuously about a vertical axis. The primary feed is a linear array of elementary feeds, radiating circularly polarized waves, coupled with two waveguides through directive couplers. The two waveguides allow monopulse operation to perform the height-finding function. Digital electronic phase-shift networks inserted between the elementary feeds and the corresponding directive couplers control the pointing of the beams. Owing to the dispersive character of the feed, the use of three different frequencies produces the radiation of three stacked beams. These three beams constitute a geometric figure whose shape cannot be altered, which is moved as a whole through the action of the phase shifters controlled by an antenna pointing device. In order to minimise losses and also the degradation of monopulse measurements, some reception components (receiver protecting circuits, parametric amplifiers, mixers and IF pre-amplifiers) are grouped in a casing located just below the rotating joints. IFF is provided for in the design of the antenna.



Matador units in travelling position

The transmission cabin comprises mainly three S-band magnetron transmitters, each delivering a mean power of 2kW, the outputs of which are grouped in a single waveguide by means of a triplexer, a device which requires no adjustment in case of operating frequency change (anti-jamming). These transmitters are modern equipments, fully transistorised except for the microwave tubes. They are of small size, highly reliable, and their maintenance is facilitated by the integration of numerous test points. They use modern ECCM and anti-clutter techniques.

The receiver cabin groups the receivers, the MTI cabinet, the extractor, the plot processing and altitude computing equipment, the control device for the tilting of the antenna according to the mode of operation imposed and the monitoring desk.

The receiver circuits comprise the anti-jamming chains and three angle error chains. The MTI device processes the signals received from the lower beams. The extractor performs the extraction of primary and secondary plots and allows them to be associated together. It is followed by a plot processing equipment which cancels fixed or slowly moving plots, computes altitude, and permits a precise measurement of the altitude of designated targets. The device generates the data in a digital form permitting the transmission of plots to a remote centre.

The monitoring desk groups the monitor controls of the station's operation. This most complete system enables the operator to locate failures and to determine when intervention is necessary; postponed intervention when the failure does not interrupt the operation of the station, or immediate intervention.

CHARACTERISTICS:

Operational performance:

General surveillance: Elevation scanning through 24° with initial elevation adjustable

Fine altitude measurement: For elevations ranging from −5° to about +30°

Detection range: 130 nm on modern fighter (Pd = 80%)

Fine altitude accuracy: Better than + 2.5 mr

Data renewal rate: 12 s

Antenna Characteristics:

Gain: 40 dB

3 dB apertures: azimuth: 1.5°

elevation: 1.9°

Polarization: Circular fixed

Rotation speed: 5 rev/min

Transmission Characteristics:

For each of three transmitters

Peak power: 0.6 MW

Average power: 2 kW

Pulse duration: 5.8 microsec

PRF: 500 Hz

Reception Characteristics:

Intermediate frequency: 30 MHz

Noise figure: 3.5 dB (with parametric amplifier)

Bandwidth: 250 kHz

MTI subclutter visibility: 30 dB

Environmental Conditions:

Temperature ranges:

Operating: −25°C to +50°C

Storage: −40°C + 70°C

Wind speeds:

Operating: 100 km/h (non-iced)

STATUS:

In production

2104.153
MEDIUM RANGE RADAR TA 23 (TRS 2055)

DESCRIPTION:

TA 23 (TRS 2055) is a high-power radar operating at L-band, used in air defence and for terminal area applications.

Main features are:

- *dual-channel operation* (frequency diversity) allowing automatic stand-by, enhancement of coverage and anti-jamming capabilities.
- *use of digital MTI processing*, with dense area detector and interference processor.
- *double-beam antenna*, making it possible to divide the volume of detection into high and low coverage, and to use alternately the signals received from the two coverages. This technique considerably reduces parasitic signals. The antenna structure includes a support frame for an on-mounted IFF aerial.

Transmitter:

This is a solid-state ER 720 type transmitter, built to military standards. Only two types of tubes are used: magnetron and thyratron. The rugged, liquid-cooled magnetron is under-run and has proved to have a life time in excess of 15,000 hours. Special EHV-regulation transistorized circuits assure a high stability of the interpulse transmitted frequency, for high MTI performance with staggered p.r.f.

Receiver:

Fully solid-state, the RR 700 receiver has a low-noise parametric amplifier with a highly stabilized local oscillator. Reception includes a logarithmic channel with a wide dynamic range.

MTI processing:

The MTI uses digital techniques. It operates by measurement of the phase variation between the transmitted pulse and the successive received pulses. Phase variations are applied to a comparator with a threshold, which blanks out the video signal in the presence of fixed echoes.

CHARACTERISTICS:

Aerial:

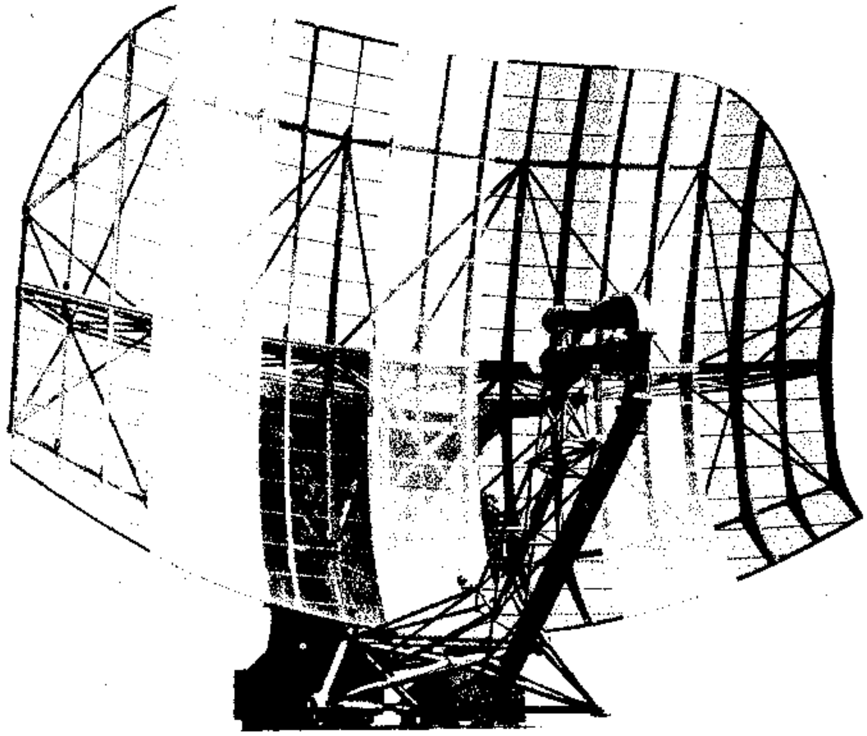
Gain: 32 dB

Polarization: Linear or circular (switchable)

Vertical pattern: Cosecant to 45°

Horizontal beamwidth: 2.3° at −3 dB

Reflector height: 5 m



Aerial of the TRS 2055 medium-range radar

Reflector span: 7 m

Rotation speed: 7.5 and 15 rpm

Transmitter:

Operating frequency: fixed in the 1,250-1,350 MHz range

Peak power: 2.2 MW

Standard prf/pulse durations: 500 Hz-2 microsec; 750 Hz-1.5 microsec; 1,000 Hz-1 microsec.

Dimensions: 1.77 × 1.41 × 0.91 m

Power supply: 220/380 V-50 Hz-15 kVA

Receiver:

Noise figure: 3 dB (with parametric amplifier)

Log. amplifier dynamic range 70 dB

Dimensions: 1.71 × 0.58 × 0.84 m

Power supply: 220 V, 50 Hz, 1 kVA

Sub-clutter visibility: 25 dB

DEVELOPMENT:

The design and development of TA 23 (TRS 2055) were carried out under the sponsorship of the French Administration. The first prototype was completed in 1969.

TRS 2055 is now in production. More than 20 sets have been delivered in France and elsewhere.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.

2117.153
MIRADOR II

DESCRIPTION:

Mirador II is a search and target designation radar designed for use against low and very low flying targets. It is primarily intended to operate for the benefit of anti aircraft systems for point defence. These systems may be "clear-weather" (optical or TV tracking) or "all-weather", that is, fitted with tracking radars; they may utilize guns or missiles. The radar can provide such system with:

omnidirectional search with a high data renewal rate (60 revolutions per minute).

audible alarm if a target is detected.

bearing, elevation and range designation of targets to several fire positions.

evaluation of the threat presented by detected targets on a 4-degree priority basis.

The evaluation of the threat is based on the radial speed/range pair. The coding of the echoes on the PPI enables the operator to estimate the danger presented by the different targets over one antenna scan (1 second), thus giving a fast reaction time for the system. A track-while-scan device can be added to the radar providing an automatic tracking facility.

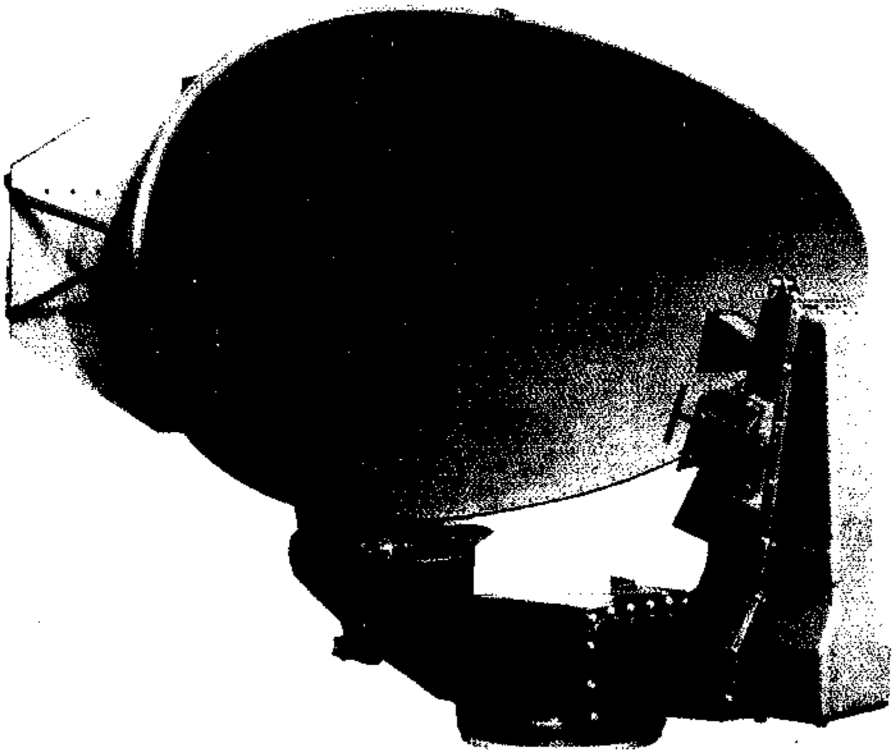
An important current use of Mirador II is as the surveillance element of Crotale (**2074.131**). Generally, however it is a lightweight radar, which can be divided into containers, easily transportable by trucks or helicopters. It can be installed in a vehicle, a cabin, or a hard building, within a very short deployment time.

The Mirador II is a coherent-pulse doppler radar with a high sub-clutter visibility. It operates in S-band, which affords a good bearing resolving power with a relatively small antenna size.

The antenna is a parabolic reflector illuminated by a feed which produces two stacked beams thus providing an elevation assessment for detected targets. The transmitter valve is an air-cooled triode, the rest of the radar being fully transistorised. Signal processing is carried out on nine 2-km channels, the maximum detection range of the radar being 18 km. Processing circuits include anti-clutter filtering and velocity filters. Anti-jamming protection is ensured by the constant-false-alarm-rate (CFAR) receiver. Strobe on jammer is performed on the last range channel.

CHARACTERISTICS:
Frequency: S-band
Peak power: 270 W approx
Average power: 30 W approx
Azimuth beamwidth: 4°
Elevation beamwidth: 13° cosecanted up to 20°
Antenna rotation speed: 60 rev/min
Radial speed range: 45-420 m/s
Range: 17 km on 1 m^2 target (11 km on 0.1 m^2 target)
Accuracy of bearing designation: 0.75° (rms)
Accuracy of range designation:
400 m (rms) without track-while-scan
200 m (rms) with track-while-scan
Subclutter visibility: at least 55 dB
Climatic conditions: −30° to +55°
ECCM devices: CFAR receiver strobe on jammer
Compatible with IFF:
Consumption: 1.5 kW approx

STATUS:
In quantity production since 1969.



Mirador II Aerial

MANUFACTURER:
Thomson-CSF, 1 rue des Mathurins, 92222-Bagneux, France.

2129.153
OEIL NOIR 1
DESCRIPTION:

The Oeil Noir 1 radar is designed for surveillance and acquisition of low-flying air targets within the framework of a mobile defence system. Normally associated with a twin 30-mm gun in an armoured turret, it can also be used with any other anti-aircraft gun system for the engagement of low flying aircraft.

Oeil Noir 1 is a coherent-pulse Doppler radar providing a high sub-clutter visibility of moving targets. Entirely solid-state except for the transmitter tube, it has the reliability and ruggedness required for use on a battlefield. Use of L-band makes it possible to extract the radial velocity of the target without ambiguity. The radar discriminates between approaching and receding targets, and between slow and fast targets. This is the basis of the threat evaluation process that makes the reaction time of the weapon system short.

OPERATION:
Omnidirectional Search:
This is performed by the radar operator with a PPI display installed in the turret. A high data renewal rate is ensured by a rapid rotation of the antenna (60 rev/min). Codification of targets is used for threat evaluation.
Bearing Acquisition:
The operator uses an electronic alidade inscribed on the PPI screen. Making it coincide with the target's direction, brings the turret and guns to bear in the right direction.
Range Finding:
After acquisition of the target in bearing by the radar and in elevation by an optical unit, the antenna is locked in the direction of the target and the radar operates as a range-finder, providing an accurate measurement of the range.
DEVELOPMENT:
Developed on a French Government's order (Direction Technique des Armements Terrestres), has been equipping the anti-aircraft tanks of the French Army armoured divisions since 1967. (See entry **2138.131**).

AMX-30 tank with S.A.M.M. turret equipped with Oeil Noir radar

CHARACTERISTICS:
Frequency band: L band
Peak Power: 120W
Average power: 24 W
Azimuth beamwidth: 10°
Elevation pattern: Cosecant squared, aperture 35°
Rotation speed: 60 rpm
Radial speed ranges: 50 to 160 m/s for slow targets 160 to 300 m/s for fast targets
Range: 15 km on modern fighter
Range-finding accuracy: +50 m (between 3,800 and 15,000 m)
Subclutter visibility: At least 50 dB
Temperature range: −40°C to +55°C
Consumption: About 1 kW, fed from 24 V d-c
Weights:
Antenna: 65 kg
Transmitter cabinet: 50 kg
Receiver cabinet: 50 kg
PPI: 15 kg
Control box: 5 kg
Junction box: 20 kg
MANUFACTURERS:
Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

2131.153
OLIFANT

DESCRIPTION:

Olifant is a man-portable CW/FM patrol radar designed primarily for use by infantry operating in insecure areas. The radar proper weighs only 4 kg and can therefore readily be hand operated. Batteries, which weigh about 7 kg, are carried in a shoulder pack: there is also a tripod that can be used when the radar is controlled by a sentry.

Azimuth scanning is performed by manual pointing and range scanning is by a single control directly calibrated in metres. The presence of a moving target is indicated by an identifiable sound on the operator's earphones. Range on a moving man is about 1,600 metres and on a vehicle it is about 2,200 metres.

CHARACTERISTICS:

Operating mode: CW-FM
Operating frequency: X-band
Range: 1,600 m walking target; 2,200 m vehicle target
Accuracy of range measurement: 30 to 50 metres approximately
Speed of detected targets: 4 to 30 km/hr
Power supply: built-in 24 V battery, continuous service 12 hours
Power consumption: 14 watts
Weight:
Patrol version: 11.7 kg
Sentry version: 15.4 kg

MANUFACTURER:

Electronique Marcel Dassault, 55 Quai Carnot-92-Saint-Cloud, France.

Olifant man-portable CW/FM patrol radar

2132.153
OLIFANT II (DR-PT-6)

DESCRIPTION:

Olifant II is a Ku-band coherent pulse-Doppler patrol radar designed to detect, locate and identify moving targets at very short range.

A light and rugged device the radar can be carried and operated by one man; and, worn on the chest, it can be used immediately the operator stops moving. When on patrol, therefore, all he has to do is to halt facing in the right direction and switch on the radar. If there is a moving object within range in the direction in which the radar is pointing the operator will hear an identifiable signal in his headphones.

The complete portable equipment weighs only 9 kg including a battery that will give 12 hours continuous service. For sentry duty a tripod is available: it weighs only another 3 kg. Detection range is about 1,000 metres on a moving man; on a moving quarter-ton vehicle it is more than 2,000 metres.

STATUS:

Mass production

MANUFACTURER:

Thomson-CSF, Division Equipements Avioniques et Spatiaux, 175 boulevard Gabriel-Péri, 92-Malakoff, France.

Olifant II radar

2120.153
PERCEVAL HELICOPTER RECOVERY RADAR

DESCRIPTION:

Perceval is a highly mobile helicopter recovery radar station. Its functions include early warning (secondary radar), approach and recovery (primary radar), and landing. All these functions can be carried out simultaneously.

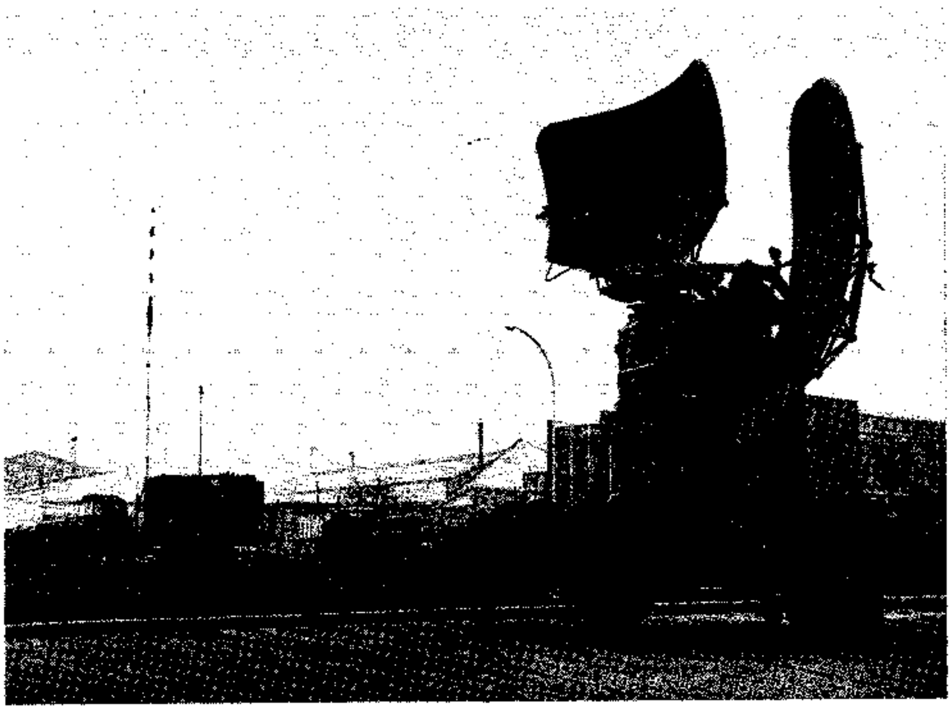
The station comprises a lightweight trailer supporting the radar transmitter-receiver unit, the IFF interrogator and the aerials, a cabin housing two displays, associated means of telecommunication, an MTI device and a passive decoding system, and a trailer carrying a power generating set.

The aerial system comprises an azimuth aerial which can rotate continuously and an elevation aerial which scans in the vertical plane. The IFF aerial is integrated with the primary radar aerial.

The transmitter and the receiver operate in X-band and are transistorised and miniaturised. The MTI is a digital phase-threshold system.

CHARACTERISTICS:

Primary radar:
Transmitter: Operating frequency band: X band. Peak power: 200 kW (magnetron output). Pulse duration: 0.7 us. Pulse repetition frequency 1,400 Hz (staggered)
Receiver: Intermediate frequency 30 MHz. Noise figure not more than 8.5 dB. Reception chain



Perceval radar station

logarithmic characteristic with differentiation/expansion. Fixed echo cancellation phase-comparison, digital MTI double cancellation and staggered PRF

Aerials: Azimuth reflector dimensions 2 × 1.2 m, beamwidth 1.1°, cosecanted up to +25°, gain 38dB. Polarization circular, fixed. Scanning range −15° to +15°. Integrated IFF aerial. Elevation reflector dimensions 2.25 × 0.95 m beamwidth (in vertical plane) 0.95°. Gain more than 37 dB. Polarization circular, fixed. Scanning range −2° to +15°

Range capability: (PD = 80%, target 5 m^2). Coverage of the azimuth aerial (surveillance and landing) maximum range: 75 km, altitude: 3,000 m. Detection in the elevation plane (elevation aerial): 70 km

STATUS:

Production

MANUFACTURERS:

Thomson/CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.

2119.153
PICADOR MOBILE 3-D RADAR

DESCRIPTION:

PICADOR TRS 2200 is a mobile air defence radar station operating in S-band. This station combines in a single equipment the radar functions of three-dimensional surveillance, height-finding and low-altitude surveillance. Designed to be transportable and capable of being deployed rapidly, it can be used for surveillance and interception control either as an autonomous station or as a gapfiller integrated into a large Air Defence system.

The complete station comprises an equipment cabin, an operations cabin and power generators.

Equipment Cabin:

On the reinforced roof of this cabin is fixed the aerial system which comprises a single reflector and three primary feeds. One of these is for 3D search and height finding coverage and is an electro-mechanical rapid scan feed; a second is for low-altitude plan coverage; and the third is for IFF coverage (with a supplementary omnidirectional aerial for the ISLS function).

The following units are grouped inside the equipment cabin:

- two transmitter-receivers, respectively feeding the 3-D cover aerial and the low cover aerial. Each transmitter is equipped with a magnetron which is continuously tunable by means of a single knob control. The receiver is fitted with a low noise parametric amplifier and comprises CFAR chains for ECCM purposes,
- an RF switch whereby coverage can be maintained in case of failure of either transmitter-receiver,
- a signal processing equipment with a digital MTI and an extractor,
- an IFF interrogator,
- a drive assembly for continuous or programmed rotation of the aerial.

Operations Cabin:

In this cabin are the display units and associated operational controls. Three positions are provided:

- master controller position with a 405mm PPI, passive and active IFF decoding facilities, aerial servo controls and telecommunication equipment control (VHF-UHF-SSB),
- intercept operator position with a 405mm PPI, altitude computer and automatic altitude read-out device and operational controls (both PPI displays receive video signals corresponding both to the 3-D and to the low altitude plan coverages),
- height finding position with an RHI display which is at the disposal of either operator for manual height measurement.

CHARACTERISTICS:

Operational performances:

Detection range: 200 km on a 2 m^2 fluctuating target (Pd = 80%)

Altitude coverage: No practical ceiling with a maximum elevation angle of 16°

Mobility: Transportable by truck or cargo aircraft

Antenna characteristics:

Antenna size: 3.4 × 3.7 m

Gain: 37dB

Beamwidth: 2° × 2°

Rotation speed: 5 rev/min (with a reduced speed over a sector in the programmed rotation mode)

Polarisation: Linear/circular

Transmitter-receiver (Type Th.D 047):

Magnetron: tunable 150 MHz in S-band

Peak power: 1 MW

Pulse duration and PRF: 4 microseconds-500 Hz

Noise figure: 4.5 dB

Subclutter visibility: 30 dB

Power supply:

220/380 V three-phase 50 Hz

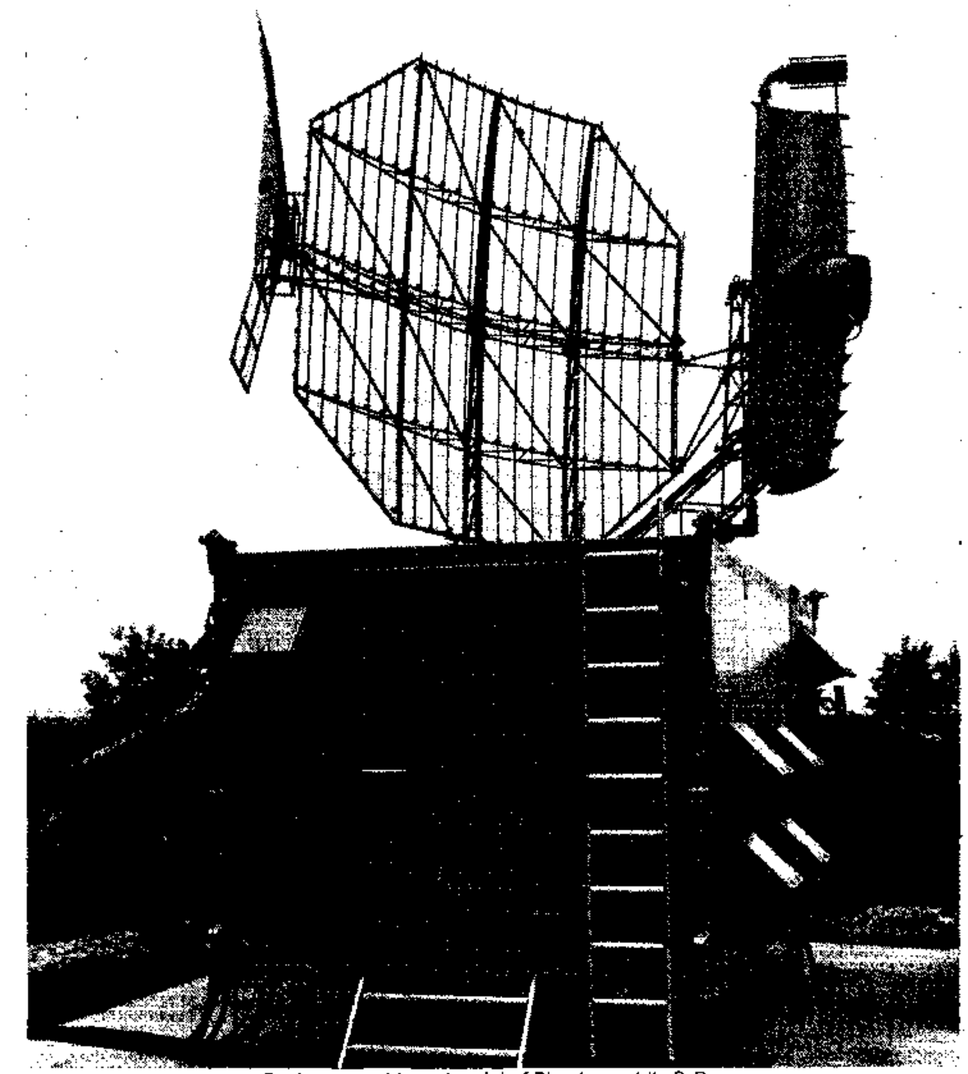
Consumption: 25 KVA

STATUS:

First prototype of the RST 2200 was completed in 1968. Now in series production.

MANUFACTURERS:

Thomson-CSF— Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.



Equipment cabin and aerial of Picador mobile 3-D radar

2133.153
PRECISION APPROACH RADAR TH.D.1012

DESCRIPTION:

This PAR is a recent Thomson - CSF development of compact design. Solid-state circuitry has been used wherever possible to reduce weight while at the same time permitting the incorporation of a stand-by transmitter. Careful design and construction of the two aerial reflectors and feeds produces signals that result in a display presentation of high quality; and provision for changing the orientation of these aerials makes it possible for a single installation to be used to control landings on two runways (4 QFVs).

The complete radar comprises an aerial assembly, two transmitter-receivers, a display assembly with two indicators and junction boxes. The azimuth and elevation aerial reflectors are identical in design and are fed with RF power through a chopper which supplies power to the two aerials alternately. Polarisation can be varied from linear to circular to suit meteorological conditions. The two rotating aerial assemblies are mounted on a rigid frame which can be orientated in any one of four positions.

Two identical transmitter-receivers are provided, only one of which is operational while the other is at stand-by. To ensure immediate availability of the stand-by equipment arrangements are made for it to transmit into a dummy load.

The two indicators also are identical both in design and in presentation so that one can be used to carry out the complete approach operation in the event of failure of the other. For added clarity of presentation the measured elevation and azimuth angles are exaggerated in the display.

CHARACTERISTICS:

Antennae:

High definition beam: 0.5° at −3 dB

Low definition beam: 2.7° at −3 dB

Gain: 42 dB

Attenuation of the first sidelobe: At least 25 dB

Frequency band: From 9,000 to 9,200 MHz

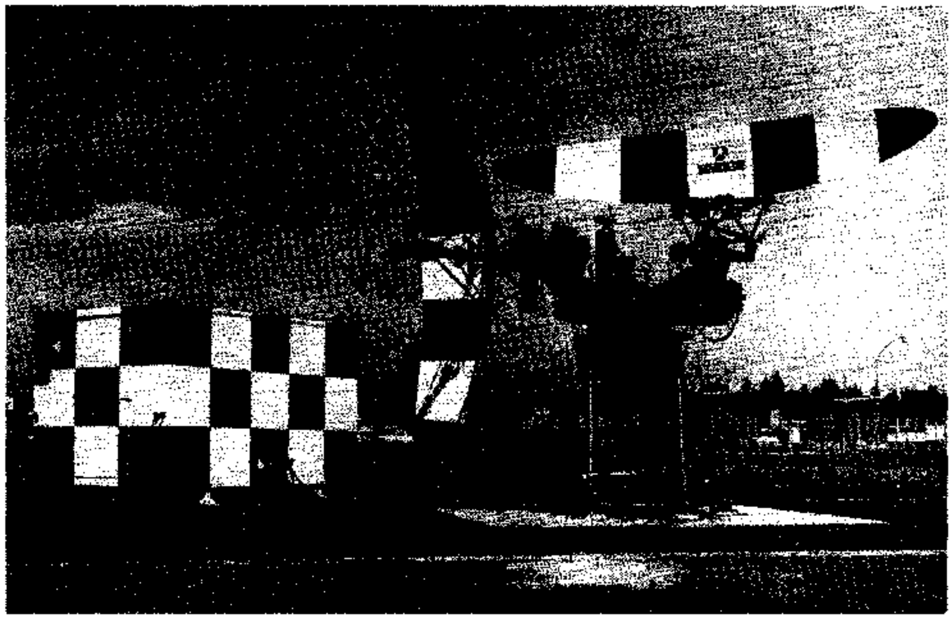
Ellipticity ratio in circular polarization: At least 0.9

Transmitter:

Frequency band: 8,500 to 9,600 MHz

Peak power: 40/200 kW

Pulse length: 0.5 microsecs
PRF: 2,000 Hz +1%
Receiver:
IF: 30 MHz
Bandwidth: 8 MHz +2 MHz
Noise figure: About 10 dB
Range: 18 nm on 2 sq m target
Information rate: On azimuth and elevation picture every half second
Azimuth scanning: —5° to +15°
Elevation scanning: —1° to +6°
Screen diameter: 40 cm
Range scales: 0/5 km - 0/20 km
MANUFACTURER:
Thomson-CSF, Parc de Rocquencourt, B.P. 2000, 78 Versailles, France.



TH.D 1012 PAR installation

2152.153
RALF LOW-ALTITUDE ACQUISITION RADAR

DESCRIPTION:

RALF (Radar Acquisition of Low Flyers) is a light-weight radar designed for surveillance and acquisition of low flyers in a heavy environment of ground or sea clutter. It is highly mobile, modular and flexible and can thus be installed in shelters or in vehicles such as armoured transport. Efficient digital MTI and ECCM circuits provide a very low false alarm rate. The radar is thus easy to operate: it may also be remotely controlled. It is compatible with other air surveillance radars for gap-filler applications and may be fitted with IFF equipment.

Using an advanced technique of non-recurrent pulsed Doppler radar (RACINE process), RALF avoids blind speeds, in spite of the short transmitted wave length, while keeping the high subclutter visibility factor of the pulsed coherent radars. This means that it can detect targets with radial velocities ranging from 10 to 2,000 knots without losses due either to velocity ambiguities or to heavy clutter.

The transmitter uses a low cost magnetron and an improved coherent receiver allowing for a high subclutter visibility factor. Signal processing and data extraction are performed digitally. Data processing and display are either a SINTRA console for fire control systems or a SINTRA "Ministrada" centre (**2115.151**) for air space surveillance and air defence detection.

CHARACTERISTICS:
Antenna:
Horizontal beam width: 1.5°
Vertical beam width: cosecanted
Side lobe level: —20 dB or less
Polarization: vertical or circular
Rotation speed: 20 rev/min
Transceiver:
Average transmitted power: 200 W
Frequency: X-band (variable)
Pulse repetition frequency: Random
Receiver noise figure: 8 dB
Rain clutter attenuation: more than 20 dB
Signal Processing: Digital MTI and extractor
Sub clutter-visibility factor: at least 40 dB (antenna rotating)
Range resolution: 75 m
Weight: 160 kg plus data processing and display units
Power consumption: 1.5 kVA at 220 V/400 Hz

STATUS:
A model was field tested in 1971. Airborne tests have been carried out for AEW evaluation.

2137.153
RAPACE AFV SURVEILLANCE RADAR

RAPACE is a surveillance radar designed for AFV use to detect moving targets – especially in conditions of poor visibility.

DESCRIPTION:

The equipment is a pulse-Doppler radar consisting of two main units, one mounted on the outside of the vehicle and the other mounted inside. The external unit is a Ku-band radar with a sector-scanning antenna whose azimuth rotation axis is automatically vertically stabilised up to ± 15° in roll or pitch. Azimuth scanning is ± 60° at 20°/sec and elevation scanning is ± 20°.

Inside the vehicle is a display and control box. Range and bearing of targets are automatically displayed on this, the synthetic display being of the mosaic type in which the lighting of one of an array of luminous points informs the operator of the intensity of the echo and its azimuth and range. After initial detection in this way the data can be refined by means of an electronic magnifier that 'multiplies' the display by six in each direction; and further tracking and target identification is achieved by the use of the operator's earphones.

The equipment is rugged and can withstand the shocks both of vehicle manoeuvres and of its own gunfire. Since the radar is intended to be used only when the vehicle is stationary, however, the antenna is folded for protection while the vehicle is on the move.

Detection range is from at least 1.5 km (pedestrian) to at least 5 km (tank) and the localisation accuracy is ± 25 metres in range and ± 10 mils in azimuth. Targets travelling at between 3 km/h and 50 km/h can be detected.

CHARACTERISTICS:
Operating frequency: Ku-band
Peak power: 2 W
Antenna gain: 32 dB
Beamwidth (3 dB):
Azimuth: 3.5°. Elevation: 3.5°
Area scanned:
Azimuth: ± 60°, Elevation: ± 10°
Scanning speed: 20°/sec
Noise factor: Better than 7 dB
Range: Pedestrian: better than 1.5 km. Tank: better than 5 km
Measurement accuracy: Azimuth: ±10 mils, Elevation: ± 10 mils, Range: ± 22 m
Power supply: Vehicle battery
Power consumption: Less than 100 W
Operating temperature: —40°C to +55°C
Weight: 20 kg

STATUS:
Prototypes.

MANUFACTURER:
Electronique Marcel Dassault, 55 Quai Carnot, 92-Saint-Cloud, France.

2141.153
RASIT 72A/RAPIERE BATTLEFIELD SURVEILLANCE RADAR

DESCRIPTION:

RASIT 72A/Rapiere is a long range (20 km) battlefield surveillance radar, for the detection, acquisition, localisation and recognition of moving targets, either on or near the ground in all weather conditions.

The equipment is a pulse Doppler radar. It operates in X-band and uses a coherent receiver and multiple range gates and filters designed for a high probability of detection.

Echoes detected over the surveyed zone are displayed on a B-scope daylight display, connected to an electronic memory.

For each target acquired, the polar and UTM coordinates are displayed on the B-scope and the Doppler tone is transmitted to the operator either by loudspeaker or by ear-phone. The operator is thus able to recognize pedestrians, wheeled and tracked vehicles, aircraft and helicopters.

An automatic system can be arranged to trigger an acoustic alarm as soon as a target enters the surveyed zone. The operator can select the width of the surveyed zone from 30° to 120° and can choose the length surveyed by operating in either of two modes –

NORMAL: over-all radar range of 20 km

MAGNIFIER: any zone 2.5 km long within the total range.

The equipment can be operated by a single inexperienced operator in a variety of conditions. Typical operating times are 10 seconds to survey a zone 100° wide and 20 km long, and 30 seconds to acquire a target.

The antenna beam can automatically sweep a sector or can be stopped and then oriented towards a target. The antenna is equipped with a polarizer making the radar insensitive to atmospheric perturbations. The radar also has very effective ECCM capabilities.

The RF unit can be mounted on a tripod with the control cabinet 50 metres away. Alternatively it can be mounted on any of a variety of military vehicles, such as the Berliet VXB 170A (**5059.102**) or the Alvis-British Leyland Spartan (**5040.102**), with the control cabinet inside the vehicle.

CHARACTERISTICS:

Operating frequency: X-band (200 MHz range)
Peak power: 3 KW
Polarization: Linear or circular
Range: (Probability of detection: 90%)
Pedestrian 14 km
Vehicle More than 20 km
Helicopter 15-20 km
Range reduction: (4 mm/h rain) Less than 10%
Accuracy: azimuth ± 8 milliradians. range ± 10 m
Subclutter visibility: More than 45 dB
Display: B-type daylight oscilloscope, numerical display of polar and UTM coordinates, Doppler tone, automatic acoustic alarm
Power drain: 150 W (28 V)
Temperature range: −40°C to +55°C
Reliability: Computed MTBF higher than 1,000 hours
Over-all weight: 70 kg
Number of loads: 4
Weight of the heaviest load: 25 kg
Distance between radar head and operator unit: 50 m max
Provision for target data transmission
Built-in tests

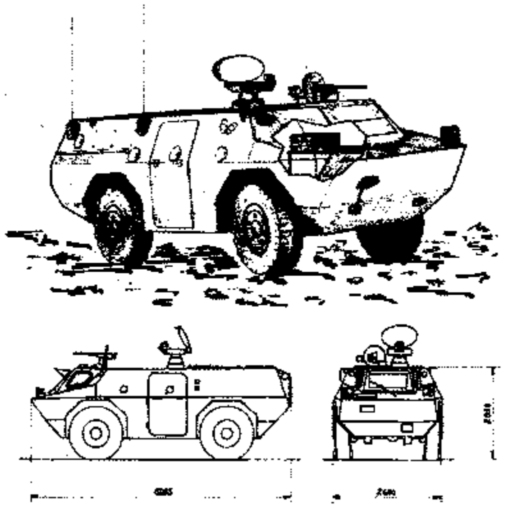
OPTIONS:

Remote slave TV monitor; Automatic range tracking; Remote control of antenna elevation; Automatic surveillance over 360°.

STATUS:

Preproduction. Prototypes under test by the French Army and by three other European armies.

RASIT 72A battlefield surveillance radar



RASIT 72A – impression of mounting on Berliet VXB 170A

MANUFACTURER:

Laboratoire Central de Télécommunications, 18-20 rue Grange-Dame-Rose, 78140-Vélizy-Villacoublay, France.

2153.153
RASIT 72/B BATTLEFIELD SURVEILLANCE RADAR

DESCRIPTION:

RASIT 72/B, a lightened version of RASIT 72/A Rapiére (**2142.153**), has the radar head fastened on the operating unit. The antenna orientation is controlled by hand.

CHARACTERISTICS:

Similar to a RASIT 72A/RAPIERE, except for:
Display: Linear (versus range) solid state display, numerical display of range, azimuth scale on the antenna
Power drain: 100 W (28 V)
Over-all weight: 50 kg
Radar head and operating unit are fastened together:

STATUS:

Similar to RASIT 72A/Rapiere.

MANUFACTURER:

Laboratoire Central de Télécommunications (LCT), 18-20 rue Grange-Dame-Rose, 78140-Vélizy-Villacoublay, France.

2154.153
RASIT 72 C BATTLEFIELD SURVEILLANCE RADAR

DESCRIPTION:

RASIT 72 C is a shorter range (10 km) version derived from RASIT 72A/Rapiere.

The computer for polar/UTM coordinates conversion is offered only as an option and the equipment power drain does not exceed 120 W (28 V).

STATUS:

Not definitely known but believed to be preproduction.

MANUFACTURER:

Laboratoire Central de Télécommunications (LCT), 18-20 rue Grange-Dame-Rose, 78140-Vélizy-Villacoublay, France.

2143.153
RASURA BATTLEFIELD SURVEILLANCE RADAR

Rasura is available as either a portable or a vehicle-mounted equipment and is designed to detect the presence of moving targets in a battlefield or curfew area. Any pedestrian or vehicular movement within an area several miles in radius is detected and located with sufficient accuracy in bearing and range for it to be engaged.

DESCRIPTION:

Rasura is a Doppler autocoherent pulse radar operating in X-band. Detected targets are indicated to the operator by a sound signal in his headphones. Distance and bearing are displayed directly on the equipment indicator.

Azimuth scanning is either manual or by 4 degree sections: range scanning can be either manual or automatic. Typically the equipment will be set to scan automatically in range while the operator monitors the azimuth data. When a target is audibly detected the operator can stop the range scanning and lock the equipment manually on target: the characteristics of the audible signal will then enable him to identify the nature of the target.

Reliable range is about 2 km on crawling targets and 5 km on pedestrians or vehicles, but targets may be detected at greater ranges and the equipment may usefully be set for a range of 7-10 km, since vehicles may be detected at 10 km and pedestrians at 7 km. Location accuracy is 25 m in range and less than 17 mils in azimuth. It takes about 18 seconds to scan a sector 5 km deep and subtending an angle of 70 mils.

The portable version consists of three harness loads of 20 kg each and is powered by nickel-cadmium batteries. The vehicle-mounted version has a converter unit in place of the batteries and the equipment is powered by the vehicle supplies.

CHARACTERISTICS:

Operating frequency: X-band
Peak power: 2-3 kW
Over-all noise factor: Better than 9 dB
Pulse width: 0.5 microsec
Antenna gain: 29 dB
Beamwidth (3 dB):
Azimuth: 4°. Elevation: 8°
Sensitivity: —128 dB/W
Sub-clutter visibility: 40 dB
Detected target speed: Fast 12-60 km/h, Slow 4-15 km/h
Range: Vehicles: at least 5 km. Walkers: at least 5 km. Crawlers: at least 2 km
Range accuracy: +25 m
Azimuth accuracy: Better than 17 mils
Power supply: Cadmium-nickel battery or converter
Power consumption: 60W
Operating temperature: —25°C to +50°C
Weight: 3 × 20 kg packs for portable versions

STATUS:

In quantity production. Supplied at least to the armed forces of France, Germany and the Netherlands.

MANUFACTURER:

Electronique Marcel Dassault, 55 Quai Carnot, 92-Saint-Cloud, France.

Rasura battlefield radar

2155.153
THREE-DIMENSIONAL RADAR TH.D.1955

The TH.D.1955 is a long-range three-dimensional S-band air defence radar. The successor to the Palmier radar it ranks among the most powerful radars of its type in the world.

DESCRIPTION:

Major features of this radar are its high-power (20 MW peak) transmitter, its elaborate acrial structure and its range of ECCM facilities that enable it to function satisfactorily in an ECM environment. The equipment is transistorised to the maximum extent possible, is of modular construction and has built-in test facilities. Major components are

a multibeam antenna, the large size of which ensures a high gain and a great sharpness of beam in both elevation and azimuth;
a high-power transmitter with amplifier chain, compatible with modern anti-jamming techniques (random-frequency transmission, pulse compression, etc.);
a multibeam reception system ensuring the accurate measurement of the elevation of any target, and the regulation of the false alarm rate;
the system includes numerous devices for fighting active and passive jamming as well as natural parasitic echoes; a non-saturable automatic extractor device.

PERFORMANCE:

Range capability of the TH.D.1955 is better than 400 km on fighter aircraft – there being no practical altitude limitation. Elevation measurement accuracy at long range is from 2 to 4 milliradians. The data renewal rate is 6/minute.

DEVELOPMENT:

The design and development of the station were carried out under a contract of the Service Technique des Télécommunications de l'Air.

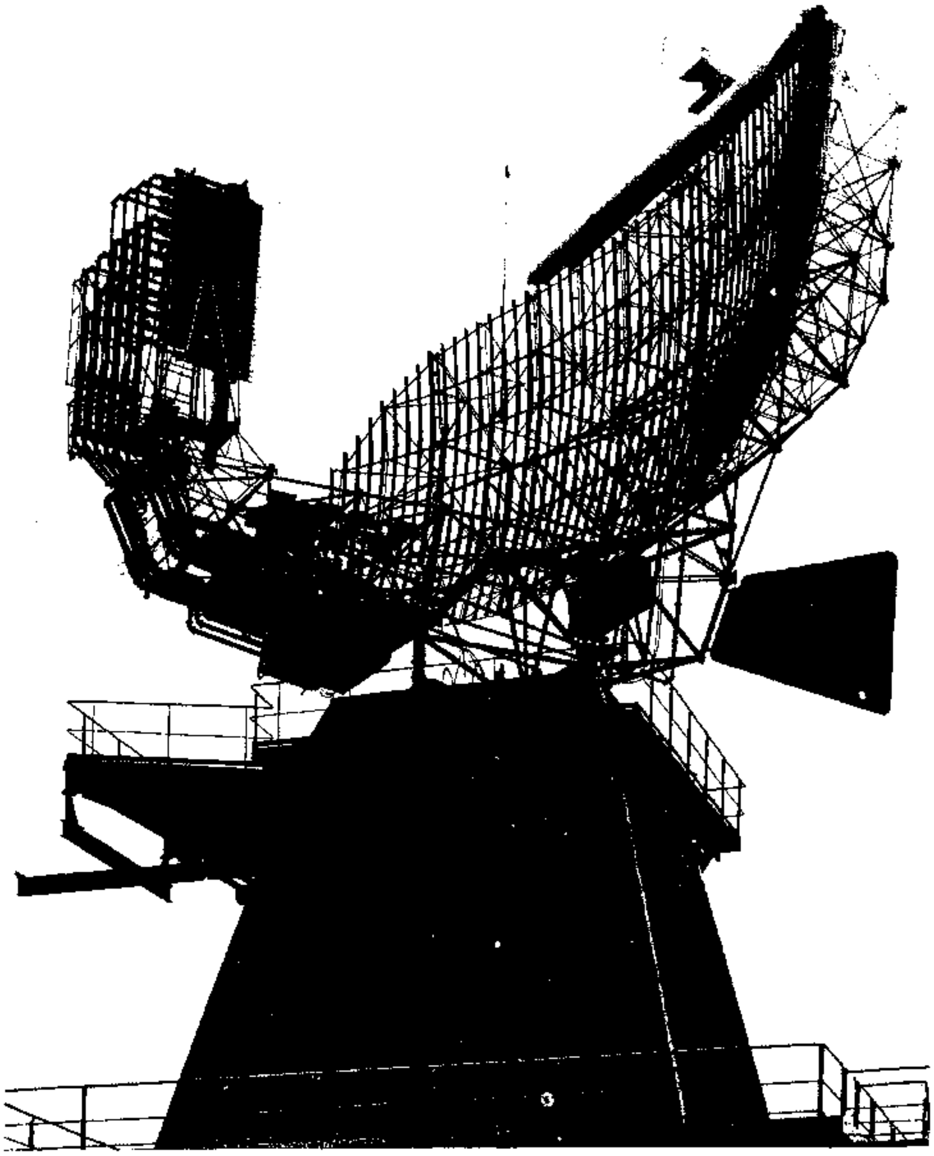
The first feasibility studies date back to 1955 and the contract for the final version was awarded in 1963.

CHARACTERISTICS:

Operating frequency band: S-band
Antenna dimensions: 16 × 6 m
Gain: 46 dB
Polarization: At the operator's discretion
Peak power transmitted: 20 MW
Elevation: To over 20°
Range: More than 400 km on fighter aircraft
Data renewal rate: 6/minute

STATUS:

The equipment is in production and more than 20 sets have been constructed. Besides France, several countries have been, or are being, equipped with TH.D.1955 stations and the equipment has been selected by NATO as the main feature of its new radar coverage (NADGE plan – see section 1 D 2a 1181.181)



TH.D.1955 Long-range 3-D radar aerial

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222 Bagneux, France.

2156.153
TIGER RADAR TRS 2100

Under the code name TIGER (for Terrifically Insensive to Ground Effect Radar), Thomson-CSF has developed a lightweight high-performance radar for the detection of low-flying aircraft. Good performance in severe clutter conditions is achieved by the simultaneous use of moving target indicator circuits based on Doppler frequency filtering and of pulse compression to limit the volume in which clutter echoes can mix with useful echoes. The radar can be used either as an autonomous detection centre, with local exploitation of radar data, or as a gap-filler station linked to an Air Defence network.

DESCRIPTION:

The use of S-band makes it possible to have an aerial with a high gain and high angular resolution but with a relatively small reflector (5 × 2.3 m). The reflector profile is C-shaped with double curvature and the vertical pattern has a steep slope at low elevations and is supercosecanted at high elevations. This arrangement leads to good sub-clutter visibility and detection capability both at low incidences and at close ranges. Circular polarisation is used to improve detection characteristics in bad weather. The antenna rotates at 15 rev/min thus providing data renewal every 4 seconds.

The transmitter uses a coherent amplifier chain. The transmission frequency is obtained from a highly stabilised crystal oscillator; and for frequency agility purposes transmission is carried out at different frequencies distributed at random over 200 MHz. The output power is provided by three successive amplifier stages (two TWT stages and one CFA stage). The phase stability of this chain is such as to ensure good clutter rejection performance. Pulse compression is achieved by incorporating crystal dispersive networks, the propagation time of which varies with the frequency in the transmit and receive circuits.

The receiver is preceded by a wide band, low noise-parametric amplifier. Rejection of fixed echoes is obtained by a digital linear MTI. A constant false-alarm rate chain operates in parallel with the MTI processing chain.

A set of logic circuits and signal lamps is incorporated in each part of the equipment in order to monitor the principal performance figures and to locate a possible faulty function.

An IFF sub-system is incorporated in the radar.

OPERATION:

The radar is transportable by a light helicopter (loads of less than 560 kg) or by conventional truck or cargo aircraft. The equipment can be cabin-mounted. Deployment can be performed in less than 60 minutes with a team of four men.

CHARACTERISTICS:

Operational performance: on a 2 m^2 (fluctuating target) with Pd = 80%

Tiger TRS 2100 radar aerial

Detection range: 100 km
Altitude detection: Greater than 4,500 m
Elevation pattern: Cosecanted up to 45°
Sub-clutter visibility: Greater than 40 dB
First blind speed: Greater than 1,500 knots
Antenna characteristics:
Antenna size: 5 × 2.3 m. IFF antenna integrated with the primary radar antenna
Gain: Greater than 34 dB
Polarisation: Circular, fixed
Rotation speed: 15 rpm
Transmitter-receiver characteristics:
Frequency range: 200 MHz in S-band
Main power: 450 W
Over-all receiver noise figure: Less than 4.5 dB

STATUS:

Evaluation tests of the first prototype have been carried out. Now in pre-production.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

2160.153
VOLEX III 3-D RADAR

Volex III is a fixed, S-band, three-dimensional surveillance radar providing continuously and simultaneously the azimuth, range and altitude of any target within its cover volume; it may be used either as 3-D air-defence station or as a height-finder.

DESCRIPTION:

The equipment consists, in the main, of an aerial system and dual transmitter-receivers. The aerial system comprises two aerials mounted side by side on a common turntable. Both are equipped with a Robinson elevation rapid scan primary feed.

Two TH.D.047 transmitter-receivers are coupled to the aerial system through a rotating joint fitted with two high-power channels.

The radar can be associated with an automatic data processing system providing three-dimensional extraction of all the plots pertaining to the targets flying within the detection volume.

Reliability and maintainability are provided for by the mechanical design of the aerial system and use of transistorised circuits and plug-in interchangeable chassis.

Altitude measurement accuracy is better than 600 metres on a modern fighter aircraft at a range of 100 nm (185 km). Coverage is ensured within the volume defined by a range of 150 nm (280 km) an elevation angle of 22° and the full 360° of azimuth. The 3-D data renewal rate is 3/minute.

CHARACTERISTICS:

Aerial system:	VT 359 (lower elevations)	VT 150 (higher elevations)
Span of reflector:	3.3 m	3.8 m
Height of reflector:	6.8 m	3.4 m
Weight:	900 kg	350 kg
Beamwidth:	azimuth: 2° elevation: 1°	azimuth: 2° elevation: 2°
Nominal gain:	40 dB	37 dB
Polarization:	linear + circular (optional)	linear + circular (optional)

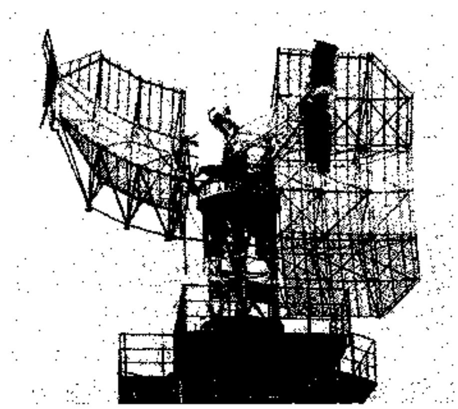
Transmitter (TH.D.047):
Frequency: Tunable through 300 MHz in S-band (with 2 magnetrons)
Peak power: 1 MW
Average power: 2 KW
Pulse duration: 4 microsec
PRF: 500 Hz
Receiver: Low noise, wide-band parametric amplifier (noise figure less than 4 dB). Two reception chains with automatic selection: Lin/IAGC chain; CFAR chain (+ logarithmic chain with anticlutter devices, optionally). Single-knob frequency control

STATUS:

First production set delivered in 1963.

Ten sets already in service in France and a foreign country (Air Defence).

MANUFACTURER:
Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.



Volex III aeriel

INTERNATIONAL

1528.153
RATAC BATTLEFIELD RADAR
DESCRIPTION:
Ratac (Radar de tir pour l'artillerie de campagne) is a lightweight (about 35 kg) battlefield radar providing for detection, acquisition, identification, location and tracking of surface targets such as troops, tanks, vehicles, and low flying helicopters and light aircraft. Other operational functions include artillery direction, surveillance of own forces, and helicopter control. It is comprised of six units and is designed for vehicle mounting. Pulse-doppler, and it is believed, monopulse, techniques are employed, and the operating frequency is in the 5 cm wavelength region. A highly effective fixed target cancellation system is stated to make it possible to locate very slow moving targets with a small radar cross-section, such as a single man. Detection ranges are reported to be 20 km against vehicle targets and 10 km against troops. Good all-weather performance is claimed.

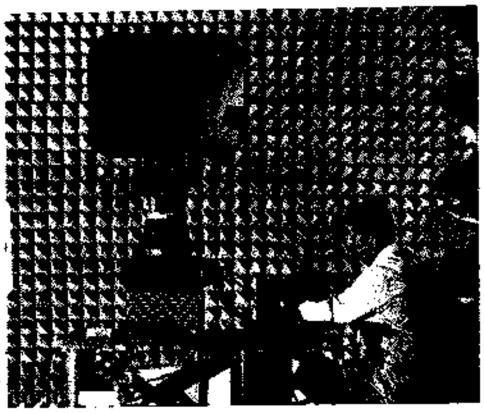
The system incorporates its own computer, and target data can be presented in terms of either polar or grid co-ordinates. An optional plotting-board unit permits target positions and movements to be recorded. A loudspeaker is provided to aid target identification by listening to the doppler characteristics of targets. Automatic target tracking facilities are included, and there are provisions for the transmission of data to own artillery. Operation with vehicle installed IFF is a possible option.

DEVELOPMENT:
Development of Ratac was undertaken by LCT (Laboratoire Central de Telecommunications) under the direction of the French military authority, in 1966. A subsequent agreement between the French and West German Governments provided for joint procurement and production for the armies of both countries. Tests were later carried out by the US Army at Fort Sill.

Ratac radar development installation mounted on M-113

STATUS:
Production in quantity had been commenced by 1972 in French and German companies of the ITT organisation, LMT and SEL, respectively. In May 1972 it was stated that large quantities have been ordered by France, West Germany and the USA. Production for the last of these three is probably being undertaken by the Gilfillan subsidiary of ITT.

MANUFACTURERS:
Le Materiél Téléphonique, 46, quai A. Le Gallo, 92-Boulogne-Billancourt, France.
Standard Elektrik Lorenz AG, 7 Stuttgart 40, Hellmuth-Hirthstrasse 42, West Germany.



Ratac antenna under laboratory test

ITALY

2291.153
INDIGO FIRE CONTROL CENTRE (CT40-GM)
DESCRIPTION:
The CT40-GM is the Italian-built radar and command system based on the Swiss Superfledermaus (**2376.151**) and used with the Indigo surface-to-air missile system (**2235.181**).

As can be seen the system comprises a tracking radar, an infra-red tracker (the white device mounted to the right of the radar aerial) and a command transmitter (the small dark aerial below the infra-red tracker) all mounted on the tracking pedestal.

In the equipment bay in the trailer and protectable by a screen (folded back) are the missile control panel (the lowest of the stack of four units to the left of centre) and the engagement computer display oscilloscope.

MANUFACTURER:
Contraves Italiana SpA, Via Tiburtina, 965-00156 Rome, Italy.

1529.153
LPD-20 SEARCH RADAR

DESCRIPTION:

The LPD-20 is a search and acquisition radar intended for use as a "gap-filler", to counter air threats from low and very low level targets in the region below the useful coverage of other radars. It was developed for use as an autonomous search unit, and it can also be readily fitted into the Contraves Superfledermaus family of fire control systems. The simplest arrangement of this kind employs the same PPI as the fire control system, so that the search radar is unattended and a single operator is able to control the complete radar system for both search and tracking of targets. The standard version is a trailer-mounted equipment, but a truck-mounted model has also been developed.

The main parts of the radar are:

(1) a rotating section, comprising antenna, transmitter/receiver, signal processor, and modulator.
(2) turning gear.
(3) a cabin containing power supplies and operational controls, and
(4) trailer chassis.

System weight (trailer version) is 2,500 kg.

The LPD-20 is a fully coherent pulse-doppler radar. An MTI improvement factor of better than 50 dB is claimed, together with a detection range of about 20 km on targets travelling at speeds between 20 and 410 m/sec at heights up to 4,000 m. Angular resolution is of the order of 1.4 degrees and range resolution about 500 m. Rapid reaction to sudden low-level threats is aided by a high data rate, the use of a common PPI for search and fire control system, accurate target range and azimuth designation data, and transfer from search radar to fire control radar in two to three seconds. Provision is made for the incorporation of IFF Mk 10/SIF facilities into the basic LPD-20 radar.

Typical deployment of Super Fledermaus fire control system with LPD-20 radar

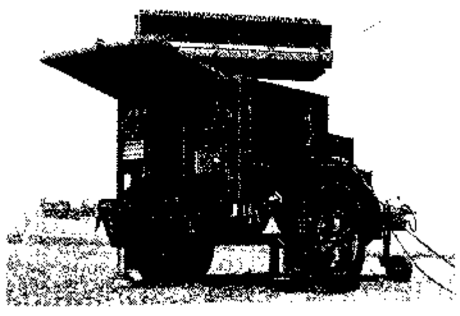
STATUS:

The radar has undergone rigorous field tests in Italy and elsewhere and is now in series production.

Current production of the Superfledermaus fire control system (**2376.151**) incorporates modifications to enable it to be associated with the LPD-20.

MANUFACTURER:

Contraves Italiana SpA, Via Tiburtina, 965-Roma, Italy.



Contraves LPD-20 search and acquisition radar

2243.153
RAT-6L SHORT-RANGE LOW ALTITUDE COVERAGE RADAR

DESCRIPTION:

RAT-6L is a short-range acquisition radar operating in L-band. It has been designed primarily for AA target acquisition for tactical weapon systems and is particularly suitable for operation in a mountainous environment.

A solid-state, coherent L-band transmitter is used in conjunction with two coherent (COHO-STALO) receiver channels with a quadrature phase detector and a sophisticated digital filtering system. This combination gives an overall clutter cancellation (with the antenna rotating) of 60 dB.

Special features of the system include image frequency rejection, radio frequency agility, pulse compression, limiting and doppler filtering and CFAR circuits.

DEVELOPMENT:

The development of this equipment has formed part of a major programme of work on sophisticated modern radars undertaken by Selenia.

CHARACTERISTICS:

Radio frequency: L Band
Maximum range: (1 sq m target): 20 km
Height coverage: 3,000 m
Range resolution: 450 m
Azimuth resolution: 6 deg
Data rate: 60 rev/min
Clutter cancellation: (antenna rotating): 60 dB

STATUS:

In production. Deliveries expected to start in 1972.

MANUFACTURER:

Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12400, 00131 Rome, Italy.

2282.153
RAT-7S LOW COVERAGE RADAR

DESCRIPTION:

RAT-7S is an S-band radar designed to acquire and engage low flying targets in the presence of heavy and extended clutter.

The radar is composed of a single or dual channel transmitter receiver, and a digital processor, housed in a standard shelter. Radar data are displayed on two digital 16 inch (406 mm) displays, contained in an operational room shelter.

Optionally, the radar can be provided with a semi-automated system for the automatic transmission of filtered air situations to an Air Defence Centre.

Antenna Group

The antenna group consists of a mesh covered reflector, a feed, a turntable with rotary joint, and an optional circular polarizer.

The shaped reflector provides a radiated pattern of 2 degrees in the horizontal plane and cosecant squared in the vertical plane.

The two-channel rotary joint is standard in order to allow integration with IFF aerial. The reflector and feed can be folded during transport.

Transmitter

The transmitter unit contains the high voltage power supply, the modulator and the magnetron.

The magnetron used is tunable, and allows an average output power of approximately 450 W.

The PRF is staggered with an average value of 1,000 pps.

Single knob tuning of the transmitter frequency can be provided in the single channel version, and permits selection by push-button of six preset frequencies.

Receiver

The receiver system is housed in a well shielded cabinet, and contains a solid state parametric amplifier, a constant-false-alarm-rate (CFAR) channel, and a pseudo-non-coherent receiver.

An interference sensor automatically selects the most suitable receiver channel for feeding the radar displays.

The sensor is also used to insert an adaptive circuit to normalise, in the ground clutter area, the pseudo-non-coherent video signal in the presence of interference. In this way, it is possible to achieve simultaneous protection against clutter and intentional jamming.

Digital Processor

To extract moving target information, the video signals are processed in a dual digital canceller which uses integrated MOS memories. Such a digital processor, and in particular the digital MTI and the video integrator, has many advantages, e.g.

- no alignment or adjustment is required
- complete independence of PRF
- greatly improved reliability and maintainability.

Display System

The IDM-7 16-inch (406 mm) digital indicator displays radar and synthetic information. It is driven by a radar central unit or a synthetic central unit, or both.

The digital technique provides an unlimited expansion capability, so that additional units can be added when required.

The RAT 7S can be integrated into an air defence network by means of a semi-automated tracking system. This system can be used to bring filtered air situation data to the attention of higher command by automatic, digital transmission of messages.

The system allows the rate aided manual tracking of 20 radar tracks, and the generation of synthetic symbols and video maps (three IDM-7 displays). It includes a rugged, compact digital computer and associated back up units.

The functions integrated in the system are:

- manual initiation and associated manual tracking
- symbol track and synthetic map visualisation
- operator orders and track ball management
- height measurement
- message formatting and modulators management
- on-line diagnostic

OPTIONS:

Dual Frequency Diversity

RAT-7S can be operated in dual frequency mode to increase the maximum range capability and improve ECCM performance.

Transmitter:
Operating frequency: S-band
Antenna:
Dimensions: 380 × 220 mm
3 dB horizontal beamwidth: 2°
Vertical pattern: cosecant squared up to 40°
Gain: 32 dB
Rotation: 10 and 20 rpm
Transmitter:
Type: tunable magnetron
Average power: 450 W

Pulse width: 1 sec
PRF: 1,000 pps staggered
Receiver:
Noise figure: 4.5 dB
MTI receiver: pseudo-non coho/non-coho with digital cancellers
MTI improvement factor on ground clutter: better than 40 dB
CFAR receiver
IDM-7 Display:
CRT: 16" electrostatic focus and electromagnetic deflection
Resolution: 1,000 lines/diameter
Linearity: 22% of diameter
Power requirements: Three phase, 220/380V, 50 Hz power, 9 KVA single channel, 14KVA dual channel
Environmental conditions:
Temperature range (operating): 0° to +50°C (indoor units) – 20° to + 70°C (outdoor units)
Wind: 60 Kts (operating; 100 Kts (not operating)
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, 00131 Rome, Italy.

2237.153
RAT-10S COASTAL SURVEILLANCE RADAR

DESCRIPTION:

The RAT-10S is an S-band radar designed for surveillance of the surface of the sea and of the air space above it up to 3,000 metres. Continuous scanning in azimuth is possible and, for coastal defence operations, sector scanning is also available.

The antenna features extremely low side lobes, which is of extreme importance in a coastal installation when the radar is normally flanked by rugged terrain. The antenna unit is constructed of light alloy and the reflector employs slats for the reflecting surface to reduce weight and wind resistance. The RF generator is a tunable magnetron and the receiver uses a parametric amplifier. A number of countermeasures are added to the basic receiver processing circuitry and the most suitable ECCM circuit is selected automatically. With the exception of a few special tubes solid-state circuitry is used throughout.

The radar set contains a monitoring tube for checking waveforms. Built-in cabling and wandering leads permit rapid checking of significant waveforms. A performance monitor is also available.

Electronic equipment is housed in three compact cabinets (transmitter, receiver and antenna servo control), whilst the entire antenna group is capable of being fitted into a 34 feet diameter radome.

Two PPIs and an "A" type indicator are provided as standard.

DEVELOPMENT:

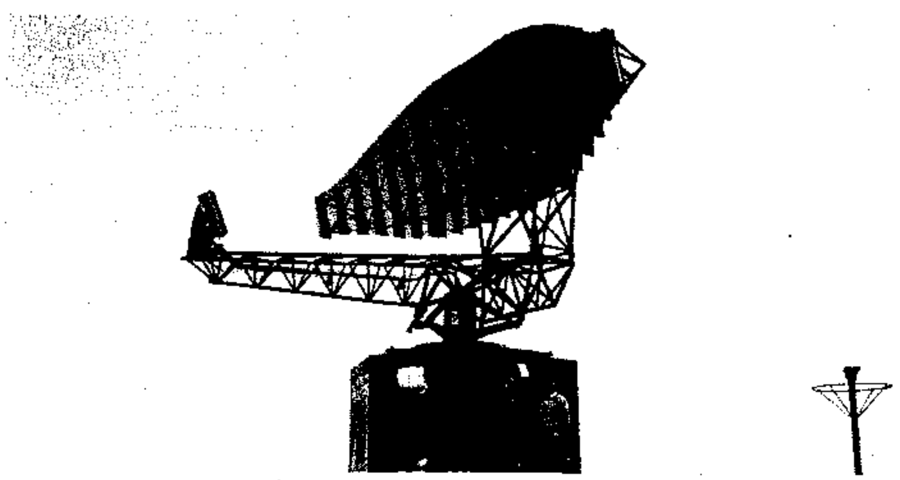
Independent development was started in 1966 and successive modifications have been introduced on account of differing operational requirements. As a result, several optional variants are available to give optimum performance in a particular environment and operational role.

STATUS:

The radar is in production and is in service with coastal radar stations in many countries.

MANUFACTURER:

Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, 00131 Rome, Italy.



Argos RAT 10S Coastal Surveillance Radar

2281.153
RAT-20L LONG-RANGE SURVEILLANCE RADAR

DESCRIPTION:

RAT-20L is an L-band search radar specifically designed for long range surveillance in the presence of heavy clutter in an ECM environment. In order to counteract clutter and ECM disturbances, the radar transmits code modulated pulses.

Particular attention has been paid to choice of the transmitter waveform in order to obtain good anti-clutter and anti-chaff performance even when using frequency agility. The use of frequency agility also contributes, by its ECCM ability, to improving performance. Furthermore, it is possible to achieve good anti-clutter performance by use of the phase-quadrature MTI and frequency agility every "n" pulses. In all cases, regardless of the ECM, clutter, chaff or rain combination encountered, the output processed video is CFAR.

The radar incorporates primary and secondary video extractor.

Aerial

RAT-20L can be fitted with two antennas (see also entry **2248.153**):

G-7 antenna for medium range application or for transportable version.

High gain G-14 antenna for long-range capability in fixed installation.

The antennas are equipped with double-horns for enhancing ground clutter and angle rejection. Circular polarisation is employed for improved weather clutter protection.

Transmitter

The transmitter employs a coherent chain with solid state crystal controlled driver and programmer.

Receiver

The receiver features a solid state RF amplifier and two IF amplifiers. The digital processor is all solid state and employs a phase-quadrature MTI, a coherent limiter and code-matched filter techniques.

CHARACTERISTICS.

Coverage: in excess of 200 nm on 2 sq m. target with Pd = 80% and Pfo = 10-6
Antenna gain (G-14): 36 dB
3 dB beamwidth: azimuth 1.2°, elevation 4° cosecant squared up to 40°
Data rate: 6 rev/min
Peak power: 150 kW
Improvement factor: 36 dB

STATUS:

Prototype tested.

MANUFACTURERER:

Selenia Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, 00131 Rome, Italy.

2280.153
RAT-21C LOW-ALTITUDE SURVEILLANCE RADAR

DESCRIPTION:

RAT-21C is a C-band high power search radar designed to detect low-flying targets in heavy clutter environments. It can be used either as an autonomous radar station or as a gap-filler linked to an air defence centre.

Use of C-band makes possible an antenna system with limited weights and dimensions and good angular resolution. It also allows the lobing effect in the presence of flat reflecting surfaces to be avoided.

RAT-21C has been designed to meet the following operational requirements:

range and height coverage of approximately 90 nm and 3,000 m on a modern fighter;
very good low angle detection of targets over heavy clutter areas;
ability to provide accurate acquisition data;
dual channel transmitter and receiver;
advanced ECCM facilities including frequency agility;
installation in standard shelter;
ease of operation and maintenance.

STATUS:

Prototype tested.

MANUFACTURER:

RIS-3E MONOPULSE TRACKING RADAR

DESCRIPTION:

The RIS-3E is a monopulse radar of the amplitude comparison type: tracking errors are obtained from information provided by a single pulse, so that conical scanning of the antenna by feed rotation is unnecessary. Apart from the inherent precision of monopulse, the absence of rotating parts guarantees a high precision and stability both in feed positioning and also in the antenna boresight axis alignment. The hydraulic servo system gives a particularly smooth tracking characteristic, allowing the radar to track a great variety of targets, ranging from earth satellites to missiles. Controls and monitoring instruments for the complete system are located in the operating console. In this way the operator can easily monitor the correct functioning of the apparatus and observe the signals displayed on the CRT. Acquisition of a target is initiated by making use of target coordinate data supplied either by other radars or by an optical director. As an alternative method, the radar can search for the target by scanning in both angular axes.

Upon acquisition of the target, either automatically or with hand control, the automatic tracking mode is initiated. Special "coast" circuits provide for velocity memory in order that smooth tracking can be achieved even during particularly unfavourable conditions such as when target fading occurs. The operator can select either skin or beacon tracking, without even momentary loss of the target, even during tracking. The beacon can be interrogated by a pulse position code, so that the same target can be illuminated simultaneously by several radars without the possibility of a false reply from the beacon.

CHARACTERISTICS:

RIS-3E Characteristics:

Antenna:

Reflector diameter: 3.6 metres

Gain (one way): 42 dB

Transmitter:

Frequency tunable: 5,450-5,825 MHz

Magnetron power output: 250 kW peak

Pulse width: 0.5 or 2 microsecs

Code: 2 pulses, 0.5 microsecs duration with 2 microsecs minimum separation

Pulse repetition frequency: 1,640 or 410 Hz

Receiver:

Tuning range: 5,400-5,900 MHz

Noise figure: 10 dB

IF bandwidth: 4 or 0.8 MHz

Antenna Rotation:

Azimuth Coverage: 360° continuous

Elevation Coverage: −10°, +190°

Max angular speed (both axes): 45°/sec

Range gate performance:

Coverage: Up to 350 km

Max speed: 18,000 m/sec

Tracking capabilities:

Max range-tracking rate: 6,000 m/sec

Max range-tracking acceleration: 20 kg

Max angle-tracking rate: 30°/sec

Max angle-tracking acceleration: 20 kg

System performance:

Max angular error: 0.2 mil

Max range error: 3 metres

Environmental conditions:

Ambient temperature (outdoor units): −15°C to +50°C

Ambient temperature (indoor units): 0° to 50°C

Wind load (not operating): 150 km/h (82 knots)

Power requirements:

Supply voltage: 220/380V ± 2%, 50 or 60 Hz

Power drain: 30 kVA

STATUS:

Production.

MANUFACTURER:

Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, Rome, Italy.

2245.153

RIS-4C/A TRACKING RADAR

DESCRIPTION:

The Selenia RIS-4C/A is a C-band pulsed instrumentation tracking radar, for automatic tracking of active and passive targets. Circuits are nearly completely transistorised.

Its principal employment is at missile and space test ranges where precise trajectory mapping is required. Features are included in the design and construction which give the radar those operational characteristics required for high precision tracking of fast targets, and for recording and display of their trajectories.

The RIS-4C/A is a conical scan radar. The deviation of the radiated beam is obtained by rotating the subreflector which is mounted slightly offset' in a Cassegrain antenna geometry. The range tracking system is digital, thus avoiding the use of electro-mechanical components. This results in a good dynamic response and virtually eliminates the need for frequent calibration.

The angle servo system, which is one of the Ward Leonard type with silicon controlled rectifier driving circuits, gives a smooth tracking characteristic over a wide range of angular velocities of the antenna axes, thus enabling the radar to track with great accuracy a wide variety of targets ranging from earth satellites to missiles.

Controls and monitoring instruments for the complete system are located in the operating console. This arrangement allows the operator to monitor the correct functioning of the apparatus and simultaneously observe the signals displayed on the CRTs.

Acquisition of the target is initiated by making use of target co-ordinate data supplied by other radars, by a computer or by an optical director. As an alternative method, the radar can search for the target by scanning about a given position in space. After acquisition of the target either automatically or in manual control, the automatic tracking mode is initiated.

Special "coast" circuits provide for velocity memory, so that smooth tracking is ensured even during particularly unfavourable conditions such as when target fading occurs.

The operator can select either a skin or a beacon tracking mode, without momentary loss of the target, even during tracking. The skin and beacon return signals are displayed on two separate CRT's with "A" and "R" presentations. Since a hard tube modulator is used, the beacon can be interrogated by a pulse position code so that the same target can be illuminated simultaneously by several radars without the possibility of a false reply from the beacon.

Whilst range data is directly available from the range tracking unit in digital form, angle data is digitised by means of encoders. This output data is in the most suitable form for processing, either locally or for transmission to a remote site. A digital computer can be incorporated in the system for data handling for recording and/or co-ordinate conversion into cartesian form to display target trajectories on plotting boards.

ANTENNA SYSTEM:

Reflector. The system employs Cassegrain geometry with one horn feed, placed at the centre of the parabolic reflector, and a hyperbolic subreflector. The subreflector is rotated by a motor to perform the conical scan of the beam; the generator of the reference signal is coaxial with the motor. The assembly is carefully balanced for vibration-free rotation. The pencil-beam pattern has a beamwidth of 1.25° for good angular resolution. The polarisation of the radiation can be vertical, horizontal or circular, CW or CCW, selectable by the operator.

Pedestal. Backlash eccentricity and errors due to mechanical and thermal deformation have been reduced to negligible values. Facilities are incorporated for the adjustment and optimisation of levelling and of the orthogonality of the azimuth to the elevation axis.

Antenna Rotation. The antenna system is of the elevation-over-azimuth type. The performance of the servo system allows rotation of both antenna axes at very high speed and acceleration, and the low speed performance is extremely stable. The servo system has an inherently wide dynamic range and two separate Ward Leonard groups are used for the two rotation axes in order to avoid any dynamic cross interference.

TRANSMITTER:

Hard Tube Modulator. A hard tube modulator-transmitter has been used in the RIS-4C/A to provide good stability in pulse timing, duration and shape, thereby assuring a high intrinsic accuracy for the range measuring system. Such a modulator also gives the possibility of radiating at a high PRF to track targets unambiguously out to 1,280 km using an nth-time-round system.

Modes of Operation. The transmitter is able to radiate RF pulses of 1.0 microsecond duration for normal tracking of passive targets. The use of a hard tube type of modulator also makes possible the generation of pulse trains, and this advantage is used to provide a beacon interrogation mode of operation. In this mode, the transmitter sends out two pulses, each of 0.5 microsecond duration, and having a spacing which is continuously variable between 2 and 10 microseconds. Four different PRF values are possible in order to solve the ambiguities resulting from the nth-time-round returns. After acquisition of the target the ambiguities are solved automatically.

Magnetron. The standard transmitter uses a 250 kW tunable magnetron (type RK 7156) which gives the flexibility of operating the radar at the most convenient frequency, and also of interrogating a beacon whose receiver frequency falls within its tuning range. Forced-air cooling is provided for the magnetron and other power tubes.

A 1 MW transmitter is also available (optional) to improve the overall system performance. A convenient soft tube modulator can be provided if the beacon code interrogation mode is not required.

RECEIVER:

A dual channel receiver is provided for the simultaneous reception and display of skin and beacon returns. The klystron local oscillators are duplicated so that tuning of the two receivers at different frequencies is possible. Both the skin and beacon loops are provided with AFC and a special drift-free circuit is used in the beacon channel for a positive tuning of the receiver even when the beacon signal is not present and the loop is open.

The skin signal receiver incorporates a parametric amplifier for high sensitivity and tracking accuracy. STC for attenuation of strong close echoes, and FTC for echo discrimination are provided.

TRACKING SYSTEM:

Range tracking is achieved by employing a completely digital technique, thus removing any rotating part, or electromechanical components and enhancing accuracy, dynamic response and reliability. Additionally, range data is directly available in digital form for processing.

Targets moving with velocities up to 10,000 m/sec and with accelerations up to 50 g, can be tracked. Actual tests on static targets yield accuracies in range measurement of better than 2 metres and angle measurement of better than 0.15 mil.

Angular tracking is performed through a Ward-Leonard servo system which allows angular speed up to 35°/sec and angular accelerations up to 30°/sec².

DATA OUTPUT:

Target co-ordinates are displayed in digital form on the master console, right above the CRTs so that the operator has all the elements necessary for monitoring the tracking.

Angle data is available in analogue form, from coarse-fine synchros, and in digital form from encoders. Range data is available in analogue form as d.c. voltage increasing linearly with range. Digital range data is supplied by the tracking unit.

Range and angular automatic tracking error voltages are available in d.c. form, together with AGC voltage and other analogue data relative to the radar status.

DATA PROCESSING AND DISPLAY.

Tracking data is processed by a digital computer to organise it in suitable form for recording on magnetic or paper tape. In this way, a permanent record for trajectory reconstruction is obtained.

Simultaneously, spherical co-ordinates are converted and the target trajectory is displayed on one or more two-pen plotting boards in cartesian co-ordinates.

STATUS.

Production.

MANUFACTURER.

2246.153
RIS-5X DRONE TRACKING RADAR
DESCRIPTION:
RIS-5X is a radar specifically designed for tracking drones for the purpose of controlling them when they are out of sight. It is capable of automatically tracking such a drone, either by skin tracking or by beacon tracking up to a maximum range of 274 km.
The projection of the drone trajectory in the horizontal plane is traced on a plotting board which has a selection of range scales which can be chosen for accuracy or convenience as required. The height of the drone is presented to the operator on a coarse-fine dial system, the coarse dial having a maximum reading of 108,000 feet (about 33,000 metres) and the fine dial reading 3,000 feet (about 914 metres) per revolution.
CHARACTERISTICS:
Antenna unit:
Reflector paraboloid: 2 m dia
Gain: 40 dB min
Transmitter:
Output peak power: 2.00 kW ± 10%
Frequency: 9,375 ± 30 MHz
Pulse length: 0.5 and 3.0 microsec ± 10%
Pulse repetition frequency: 1,200 and 240 Hz ± 10%
Receiver:
Noise figure (skin and beacon): 10 dB (when skin tracking, beacon receiver NF is 24 dB approximately
IF bandwidth: 0.65 and 4.0 MHz ± 20% (skin) 7 MHz (beacon) approx
AVC (skin only): FTC and STC
Characteristic: linear or logarithmic (switchable)
Display console:
Max beacon delay: adj: 0.35 microsecs
PPI, RHI, REI presentations ranges: 10-20-50 100-250 nm
RHI presentation: height scale from 0 to 10 nm
A/R scope: sweep lengths 4, 20 and 250 nm
Data presentation unit:
Slant range: Coarse 0 to 300,000 yds fine 0 to 10,000 yds (approx 274 km and 9.14 km)
Ground range: Coarse 0 to 300,000 yds fine 0 to 10,000 yds
Elevation: Coarse −20° to 100° fine 0 to 10°
Azimuth: Coarse 0 to 360° fine 0 to 10°
Height: Coarse 0 to 108,000 ft fine 0 to 3,000 ft
Plotting board:
Paper size: 30 × 30 inches (762 × 762 mm)
Range scales: 30,000, 60,000 and 300,000 yds (approx 27, 55 and 274 km)
Trace accuracy: Better than 0.02 inch (0.5 mm)'

Tracking performance:
Max range velocity: 1,000 m/sec
Max angle speed: 20°/sec
Range error: 20 m
Angle error: 0.05°
STATUS:
In production.

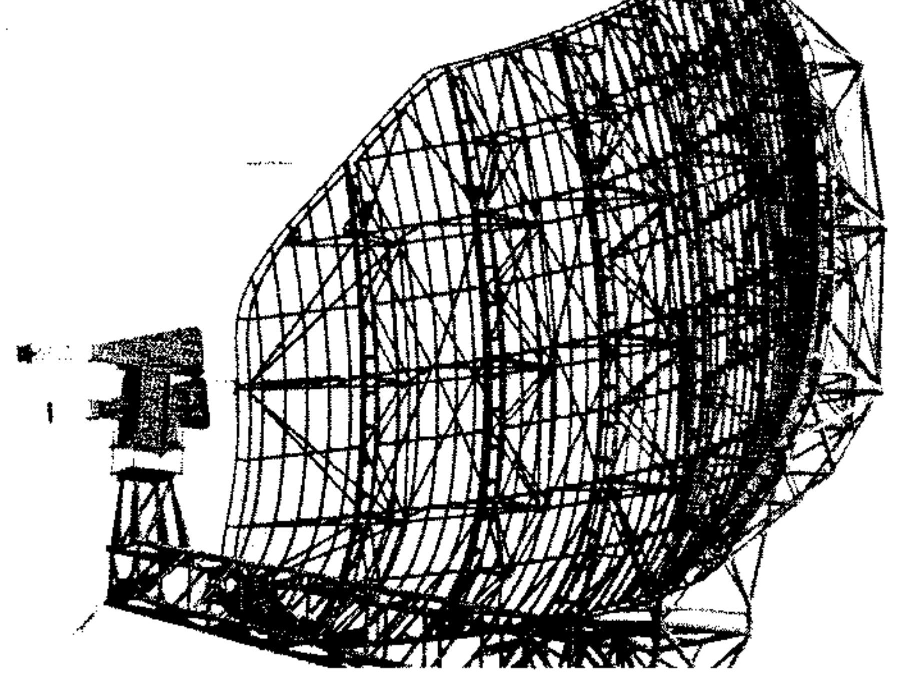
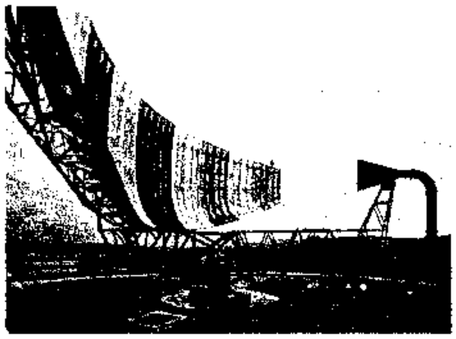
2248.153
SELENIA CIVIL/MILITARY ATC RADARS
The Selenia series of Air Traffic Control radars comprises three basic equipments:
—The ATCR-2T a high power L-band radar
—The ATCR-3T a medium power S-band radar
—The ATCR-4T a medium power L-band radar.
All three equipments can be furnished in single or dual channel configurations, with frequency diversity if desired, are fully solid state and use dentical Digital Processors which include digital MTI-video integrators. The range was introduced in 1968.
ATCR-2T
ATCR-2T is a 23 cm L-band high power radar. Full use has been made of the latest advances in micrologics and integrated circuits. Two antennae are available, the G-7 and the G-14, both having dual beams with switchable linear to circular polarisation. The G-14 is designed to give extra long-range where this is a requirement.
The radar can be supplied either in single channel version or the dual channel configuration in which case it can be operated in diversity or use the second transmitter as a hot stand-by.
A tunable vapour cooled magnetron with a peak power of 1.8 MW is employed and the P.R.F. is triple staggered to give a first true blind speed well outside the speed capabilities of modern aircraft. High stability of the transmitted pulses is achieved by transistorisation of the modulator circuits and the regulated EHV supply.
The receiver has a broadband parametric amplifier using a solid state pump oscillator, resulting in a low noise figure. A digital processor is included which incorporates a fully digital double canceller MTI and video integrator resulting in a high improvement factor and a clean PPI display.
A clutter mapper is also provided: this device defines areas in which MTI video is desired by switching out normal radar video in the presence of clutter, but in other areas raw video is automatically displayed. A video correlator eliminates "second time round" echoes and rejects non synchronous returns and noise.
Provision for on-mounting SSR is standard and the antenna has a triple channel rotating joint.
The ATCR-2T can be controlled and checked out remotely. A performance monitor continuously monitors noise figure, transmitted and received power. Alarms are initiated (remotely, if required) when these pass a preset threshold.
CHARACTERISTICS:
G-14 Antenna:
Main Beam:
3 dB horizontal beamwidth: 1.2° ± 0.12°
3 dB vertical beamwidth: 4°
Vertical pattern: Cosecant squared up to more than 40°
Antenna gain: 36 dB
Sidelobe levels: −26 dB
Integrated cancellation ratio: 25 dB
Auxiliary Beam:
3 dB horizontal beamwidth: 1.25° ± 0.15°



The G-14 Antenna of the Selenia ATCR-2T and ATCR-4T radars

3 dB vertical beamwidth: 4° ± 0.4°
Antenna gain: 35 dB
Sidelobe levels: −25 dB
G-7 Antenna:
Main Beam:
3 dB horizontal beamwidth: 1.25° ± 0.15°
3 dB vertical beamwidth: 7.5° ± 1°
Vertical pattern: Modified cosecant squared with added high angle coverage
Antenna gain: 32.5 dB
Sidelobe levels: −23 dB
Integrated cancellation ratio: 20 dB
Auxiliary Beam:
3 dB horizontal beamwidth: 1.3° ± 0.3°
3 dB vertical beamwidth: 7.5° ± 1°
Antenna gain: 31 dB
Sidelobe levels: −22 dB
Squint angle between main and auxiliary beam: 8°
Antenna tilt: +1° to +6°, manually adjusted
Antenna Group:
Operating frequency: 1,250 to 1,350 MHz
Polarisation: Horizontal and circular (switchable)
Turning rate: Standard turning rates are 5 and 10 rev/min or 6 and 12 rev/min (other speeds are available)
Transmitter:
Magnetron (vapour cooled): M5051 (1,205 to 1,310 MHz) or M5052 (1,305 to 1,355 MHz)
Peak power: 1.8 MW



The G-7 antenna

Average power: 2,300 W
PRF (average): 300 to 800 Hz
Receiver DMTI:
Parametric amplifier:
Bandwidth: 1,250 1,355 MHz
Noise figure: 2.5 dB
Dynamic range: 1 dB compression at − 30 dBM
Preselector filter:
Bandwidth: 7 ± 1.5 MHz
Image rejection: 60 dB
IF centre frequency: 30 ± 0.5 MHz
Receiver features: AFC, STC, DMTI, video integration, video correlation, and clutter mapper
DMTI: Coherent, dual canceller with selectable

feedback using asynchronous memory
Cancellation ratio (rack): 40 dB
Overall cancellation ratio: 33 dB
Environmental conditions:
Indoor units:
Operating temperature: 0° to 50°C
Antenna group:
Operating temperature: —40° to +70°C
Wind load: 110 knots – G-7 antenna, the G-14 is designed to operate under a radome

ATCR-3T

This equipment is an S-band 10 cm medium power radar suitable for approach or GCA surveillance.

The aerial turns at 7.5/15 rev/min (switchable) or if desired at 10/20 rev/min (switchable). With the aerial turning at 15 rev/min and with the transmitter operating at 1,000 pps the coverage achieved on a small jet aircraft with the single channel ATCR-3T is about 45 nautical miles and over 6,000 metres. Short range low cover properties make the radar extremely suitable for fighter recovery

CHARACTERISTICS:
Antenna group:
3 dB horizontal beamwidth: 1.5 + 0.15°
3 dB vertical beamwidth: About 5°
Vertical pattern: Modified cosecant squared with added high angle coverage
Antenna gain: 33 dB
Sidelobe levels: —26 dB
Polarisation: Horizontal and circular (switchable)
Integrated cancellation ratio: 20 dB typical
Antenna tilt: —2° to +8°, manually adjusted
Turning rate: 7.5 and 15 rev/min (switchable)
Rotary joint: 2 RF channels
Transmitter:
Magnetron (air cooled): RK 5586
Tuning range: 2,700 to 2,900 MHz
Peak power: Up to 800 kW
Average power: 450 W
PRF: Up to 1,000 Hz
Receiver-DMTI:
Parametric amplifier:
Bandwidth: 2,700 to 2,900 MHz
Noise figure: 3 dB maximum
Preselected filter:
Bandwidth: 20 + 4 MHz
Image rejection: 50 dB
IF centre frequency: 30 + 0.5 MHz
Receiver features and DMTI: As for ATCR-2T
Over-all cancellation ratio: 30 dB
Environmental conditions:
Indoor units: Operating temperature 0° to 50°C
Antenna Group:
Operating temperature: —30° to +50°C
Wind load: Up to 130 km/h (turning at 15 rev/min)

ATCR-4T

This radar is a medium-powered version of the ATCR-2T employing a peak power of 500 kW and is especially suitable as an approach radar or for GCA surveillance. Either the G-7 or the G-14 antenna can be utilised according to operational requirements.

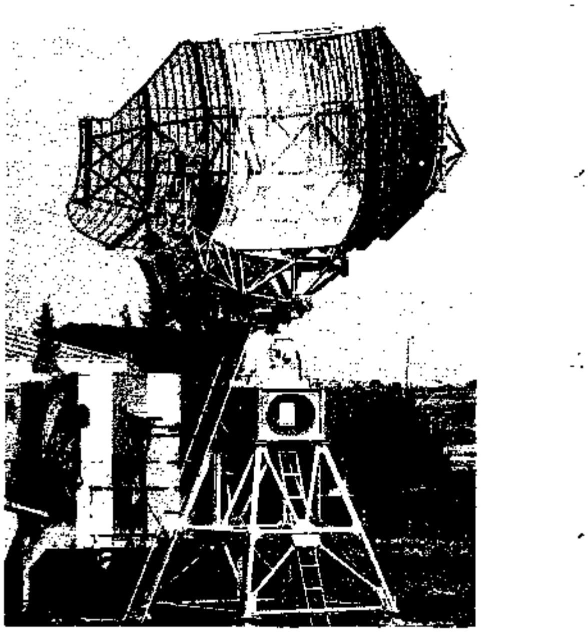
With the antenna rotating at 15 rev/min the range coverage of the ATCR-4T on a small jet aircraft is over 60 nautical miles in single channel, with a height coverage of over 9,000 metres. In dual diversity the range coverage on a small jet aircraft is over 75 nautical miles, with a height coverage of over 12,000 metres.

In its normal version, the radar has a PRF of 1,000 pps with a pulse width of 1 microsecond, giving an average power output of 500 W. The pulsed magnetron is tunable over the frequency band 1280-1350 MHz.

The receiver/MTI chain is identical to that of the ACTR-2T and features the same digital processor resulting in a system which is flexible, reliable and easier to maintain.

The shape of the MTI velocity response curve can be varied whilst the radar is operating. This allows the operator to control the MTI response to slowly moving targets such as cars, birds, small aircraft etc.

As with the ATCR-2T, a clutter mapper is provided to delineate segments in which MTI video is desired; in all other segments the video is normal. Video correlator and video integrator are also identical to those of the higher powered radar.



The Selenia ATCR-3T radar

CHARACTERISTICS:
Antennae: As for ATCR-2T
Transmitter:
Magnetron (air cooled): 5J26
Tuning range: 1,280-1,350 MHz
Peak power: 0.5 MW
Average power: 500 W
PRF: Up to 1,000 Hz
Receiver-DMTI: As for ATCR-2T
Environmental conditions: As for ATCR-2T

STATUS:
All three radars are in current production. The ATCR-2T was developed in 1969-70 as a result of orders from the Swedish Air Force and Telecommunications Board.

MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina Km 12,400, Rome, Italy.

2249.153
SENTINEL RQT-9X PORTABLE INFANTRY RADAR

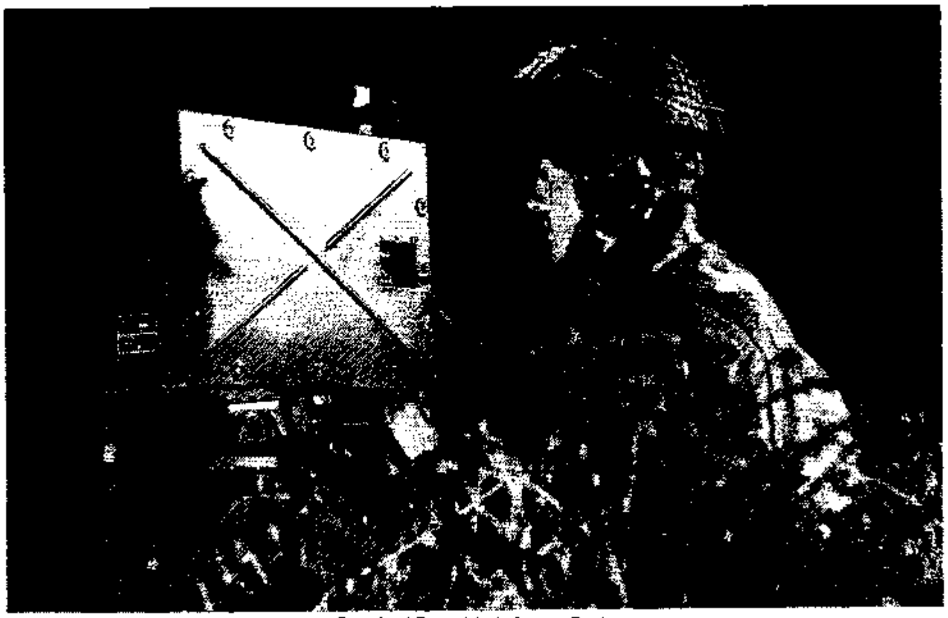
DESCRIPTION:
The Sentinel RQT-9X is a lightweight, man-portable battlefield surveillance radar. It provides instantaneous detection and location of any moving target at ranges from zero up to 3.8 km.

The radar design, with the exception of the transmitting tube, is all solid state and is based upon the technique of transmitting a continuous wave radiofrequency signal for search in azimuth (Surveillance Mode) and a continuous wave with 0-180° phase modulation according to a pseudo-random code for ranging (Ranging Mode). In both cases frequency modulation of the transmitted signal is added to achieve better performance. Change over from Surveillance to Ranging Mode is obtained simply by operating a switch.

In the Surveillance Mode the radar receives all targets within the range coverage of the equipment and therefore provides panoramic surveillance of the ground. The presence of moving targets, such as single men, troops, vehicles, etc is given to the operator by a warning sound signal. Its intensity, pitch and rhythm enable the operator to identify the type of the detected target.

In the Ranging Mode the radar receives only target echoes present in the selected range gate and is able to measure the range. To that purpose the range knob is operated until a signal is heard in the earphone. By the use of the "pseudo-random" code, the acoustic signal of the target echo has a very sharp peak and the operator is able to obtain an accurate range measurement.

DEVELOPMENT:
Started in 1962 on behalf of the Italian Army. In 1966 the equipment was successfully tested by the NATO M.O. and is now in general operational use.



Sentinel Portable Infantry Radar

CHARACTERISTICS:
Antenna System:
Polarisation: Vertical
Azimuth beamwidth (3 dB): 4°
Elevation beamwidth (3 dB): 12°
Gain: 26 dB
Transmitter:
Klystron: VA 210 B modified
Power output: 40 mW
Type of emission: CW-FM with 0-180° phase modulation by a pseudo-random code
Code element width: 0.4 microsec
Receiver:
Noise figure: 16 dB
Display: Aural
Detection frequency bandwidth: 50-1,530 Hz

STATUS:
The equipment was type approved by the Italian Army in 1970. It is in service with the Italian infantry and has been supplied to the armies of other countries.

MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, Rome, Italy.

JAPAN

2297.153
AIR TRAFFIC CONTROL RADARS

DESCRIPTION:

A range of radars covering most aspects of civil aircraft movement is made by the Nippon Electric Company Ltd. These radars are made primarily to comply with ICAO and other civil aviation specifications: however, some of them have been supplied to the Japanese Defence Agency (JDA) and these are briefly described below.

Airport Surveillance Radar (ASR)

S-band surveillance radar for use in terminal area air traffic control. Two versions exist – the NPG-360 which has a range of 60 nm on small commercial aircraft and the NPG-460 which has a range of 80 nm on a jet fighter. About 20 dual installations of one or other or both of these radars have been supplied to the JDA. Both radars have beam widths of 1.2°, data renewal rates of 15 rev/min and digital MTI. NPG-310 has a 500 kw transmitter and a transistor RF amplifier giving an over-all noise figure of 6 dB; NPG-460 has a 3.5 MW transmitter and a parametric amplifier receiver giving a noise figure of only 3 dB.

Precision Approach Radar (PAR)

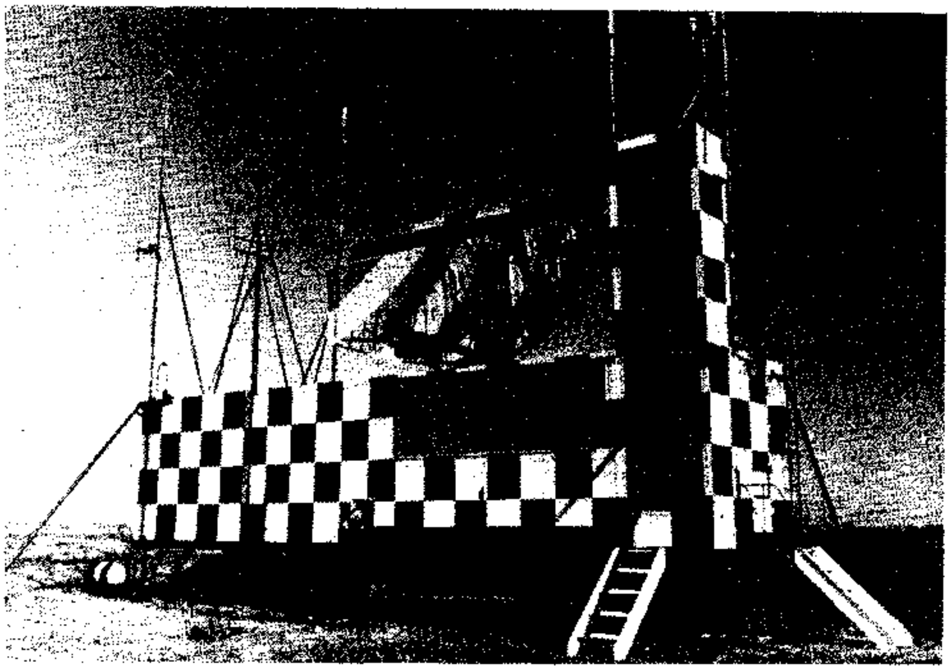
NPG-435 is a precision approach radar which has been deliberately built to a standard above the ICAO requirement so that it can be used on fighter airfields. Detection range is more than 10 nm. A dozen dual installations have been supplied to the JDA.

Secondary Surveillance Radar (SSR/SIF)

NPG-542 is a complete ICAO-specification SSR system with interrogator/responsor decoder and deprinter and with SIF capability. About fifty of these systems have been supplied to the Japanese military and civil aviation authorities.

Ground Controlled Approach Radar (GCA)

NPM-454 is the system number given to an integrated installation comprising ASR, PAR and SSR/SIF elements together with communications sub-systems. The component elements are eventually those described above but slightly reconfigured to suit the integrated installation. The secondary radar aerial is a linear array mounted on the primary radar aerial. Five of these systems have been supplied to the JDA.



NPM-554 mobile GCA system

Automated ATC System

Nippon Electric have developed a sophisticated ATC automation system for the Civil Aviation Bureau (JCAB) and semi-automated air warning and control systems to the JDA. No details are available.

STATUS:

All the above are believed to be operational with the JDA. Two other radars developed by Nippon Electric are the high-power NPG-434 Air Route Surveillance Radar (ARSR), which is believed to have been brought by the JCAB only, and the NPM-510 mobile 3-D radar described in entry **2298.153**.

MANUFACTURER:

Nippon Electric Company Ltd, NEC Building, 33-1, Shiba-Gochome, Minato-ku, Tokyo 108, Japan.

2298.153
MOBILE THREE-DIMENSIONAL RADAR NPM-10

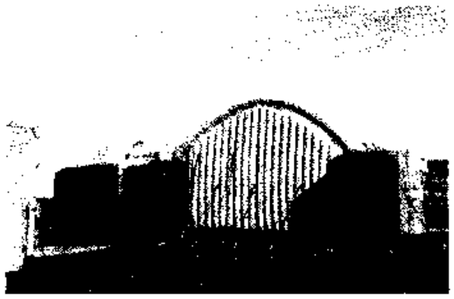
DESCRIPTION:

The NEC NPM-510 three-dimensional radar is a highly mobile equipment with several novel features. Among these may be mentioned the aerial system, which is rotated in azimuth but electronically scanned in elevation and which consists mainly of a planar array that can be folded for transport, and the rapidly erected inflatable equipment shelter.

A compact and light system relying extensively on solid-state technology the radar is also claimed to be highly reliable. Salient features of the circuitry are a CFA transmitter chain, chirp pulse compression, digital MTI and automatic target detection, tracking and altitude computation.

STATUS:

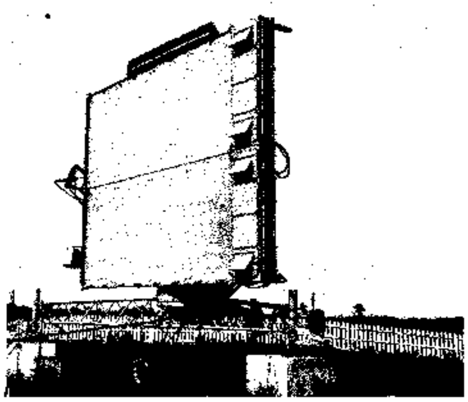
The radar has been supplied to the Japanese Defence Agency but other details are not known.



Inflatable operations centre for the NEC radar

MANUFACTURER:

Nippon Electric Company Ltd, NEC Building, Shiba-Gochome, Minato-ku, Tokyo 108, Japan.



Planar aerial of the NEC mobile 3-D radar

2302.153
INTEGRATED RADAR SYSTEM FOR 35 mm AA TANK

DESCRIPTION:

One of the 35 mm anti-tank tank systems described in Part 1 Section A2b of this book (**2370.131**) contains an integrated radar system designed and manufactured by N.V. Hollandse Signaalapparaten.

The radar system has been designed to detect and identify aircraft at very low to medium altitudes and to track them automatically. It has the following important features:

- integrating all-weather search and tracking systems with a very short reaction time;
- search while tracking through 360°;
- search on the move, with compensation for vehicle's speed;
- good performance in clutter and ECM environment;
- compact rugged design and module concept to facilitate maintenance;
- auto-alarm, alerting the operator when a target is detected outside a preset range.

CHARACTERISTICS:

Antenna System:

Search antenna: Slotted waveguide type

Length: 1.50 metres

Horizontal beamwidth: 1.4°

Vertical beamwidth: 30°

Polarisation: Horizontal or vertical

Rotational Speed: 60 rpm

Tracking antenna: Parabolic with cassegrain reflector and monopulse feedhorn

Diameter: 0.6 m

Beamwidth: 4.2°

Transmitter/Receiver:

Transmitter power: 160 W average

Frequency: X-band

Search channel: MTI with double canceller (digital)

Tracking channel: Pulse doppler

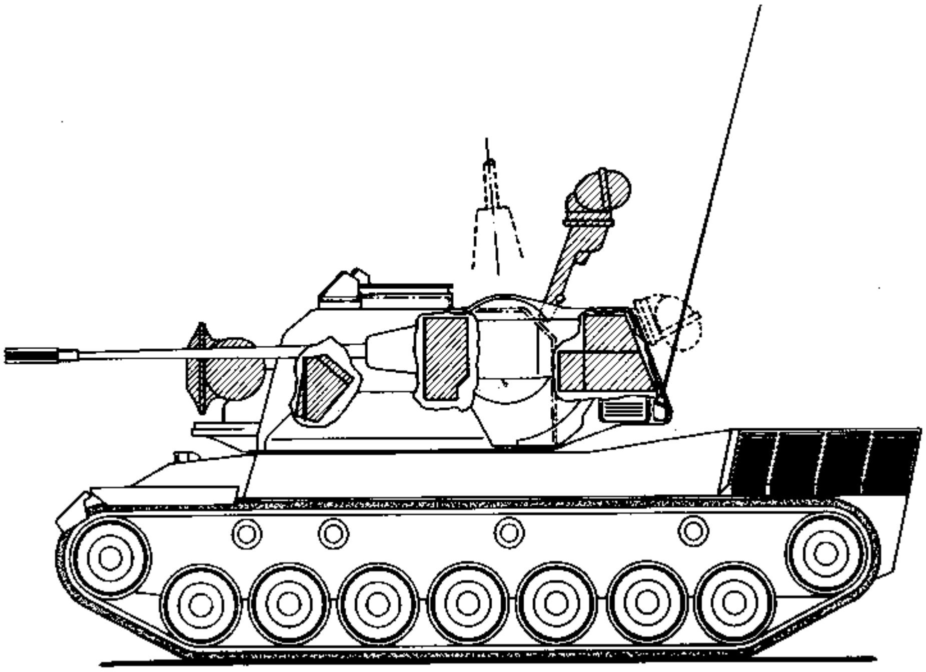
ECCM: Digital video correlator (ISU), pulse-length discriminator (PLD). Passive tracking in X-band, PRF stagger

Noise figures: Search receiver 7 dB, tracking receiver 9 dB

Radar Display and Control Panels:

PPI: Diameter 25 cm, north oriented clutterfree picture, compensated for vehicle's speed. Arrangement of controls to high standard of human engineering. IFF completely integrated

with the search system
Power: Power consumption of the radar equipment: 200 V 380 Hz approx 2 kVA.
MANUFACTURER:
N.V. Hollandse Signaalapparaten, Hengelo, Netherlands.



The disposition of radar system units in the 35 mm AA tank

1557.153
SLAM – SIGNAAL LOW AIR-DEFENCE MODULE

DESCRIPTION:

SLAM is a compact, mobile lightweight forward area air defence radar unit, suitable for either land transport on a two-wheeled trailer or by helicopter airlift. Tactical applications include air target detection and identification, target tracking and designation for low-level air defence; and also surface target detection in the presence of natural clutter and ECM. It is designed for one-man remote operation, and integration into systems for area or point defence, and coastal defence. Provision is made for the incorporation of IFF/SIF, including dipoles embodied in the antenna housing.

The operating frequency is in the X-band, and low-level air search facilities are provided to ranges up to 30 km. Operating features of SLAM include: coherent doppler MTI (digital) with complete clutter elimination; accurate determination of track positions in range and bearing; high resolution; auto-alarm facility to alert operator when a new target is detected. ECCM provisions include: interference suppressions unit, based on video correlation techniques; pulse length discrimination; PRF stagger.

SLAM Specification:
Antenna:
Type: Parabolic cosecant-squared
Span: 1.6 m
Horizontal beamwidth: 1.4 degrees
Vertical beamwidth: 12 degrees
Polarisation: Horizontal
Rotation rate: 40 rpm
Sidelobe level: −22 dB
Resolution: 25 mils - azimuth, 40 m — range
Transmitter/Receiver:
Power: 200 W average
Frequency: X-band
Pulse length: 0.25 microsec
PRF: 4000 pulse/sec, random jumping
Receiver channel: Linear
Receiver noise: 7 dB
Weights:
Basic radar set: 950 kg
Wheeltrain: 450 kg
Total: 1400 kg

STAR – SIGNAAL TERMINAL AREA RADAR

DESCRIPTION:

STAR is an S-band air surveillance radar suitable for airfield and terminal area control applications. The system is available in four configurations: (a) single transmitter – single beam, (b) dual (diversity) transmitter – single beam, (c) single transmitter – high and low cover beams, (d) dual (diversity) transmitter – high and low cover beams. Two rates of rotation are available for the stainless steel scanner, which has provision for an on-mounted secondary surveillance radar antenna. The low-noise receiver incorporates a parametric amplifier, and other features of the system are circular polarisation; digital MTI; logarithmic receiver with FTC; and STC, adjustable in slope and amplitude. Transmitter peak pulse power is 750 kW and the operating frequency band 2,700-2,900 MHz – Pulse length of 0.5 or 2 microseconds are available with PRFs of 1,000 or 250 pulse/sec (staggered) may be used.

MANUFACTURER:
Hollandse Signaalapparaten, Hengelo, Netherlands.

POLISH RADAR

Little information is available on Polish radar developments. It is known, however, that the Industrial Institute of Telecommunications in Warsaw has for many years been working on radar developments and some definite information has been made available on the radars that have been developed for civil ATC purposes.

As an illustration of radar capability, therefore, it may be of interest to note a few details concerning one of these radars, the Avia B L-band airways surveillance radar.

Avia B is a 23 cm wavelength radar using high-power magnetron transmitters and a low-noise parametric amplifier in the receiver. Operating in frequency diversity it has two 1.5 MW peak power transmitters. The parametric amplifier used in the receiver is an original Polish development. The radar has an MTI system, and staggered PRF is used to eliminate blind speeds in the practical range of aircraft performance. The polarisation of the transmitted radiation may be varied from linear to circular.

Maximum range on a 15 sq m target with 90% detection probability is 240 km with a ceiling of 26,000 metres.

AVIA B Characteristics:

Operating frequency: 1,310 and 1,346.2 MHz
Peak Power output: 2 × 15 MW (frequency diversity)
Pulse repetition frequency: 400 Hz mean (recurrence 7:8)
Pulse length: 3 microseconds
Noise Factor: 3.5 dB
Fixed Echo Suppression: 30 dB
Antenna Rotation speeds: 5 or 10 rev/min
Antenna Gain: 32 dB
Horizontal Beamwidth: 1.3°
Vertical beamwidth: 40°
Polarisation: Variable from linear to circular

SWEDEN

2329.153
C-BAND SEARCH RADAR TYPE PS 70/R

DESCRIPTION:

This is a new mobile search radar system carried in an air-conditioned cabin mounted on a standard truck. The system is primarily intended for a new Swedish anti-aircraft missile system but can be used advantageously wherever a modern search radar is desirable.

PS 70/R is a C-band fully coherent pulse doppler radar with range coverage 40 km. The antenna, which is mounted on a folding mast, is raised 12 m above ground during operation. A hydraulic system is used for levelling the radar as well as for the erection of the antenna mast. The system has a built-in power generator enabling it to be self-supporting.

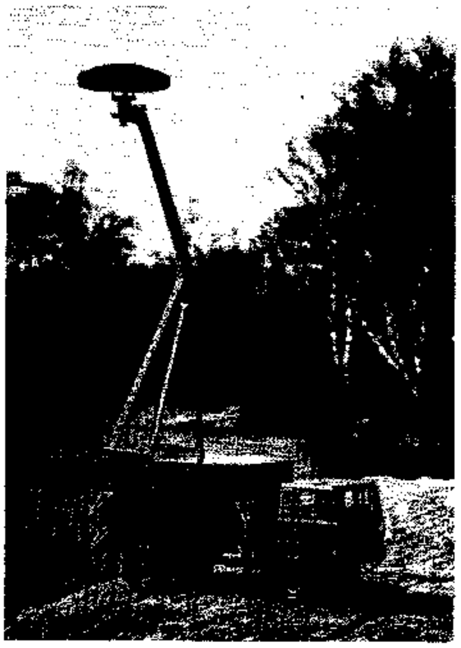
A target data transmitter is incorporated and can feed information on target coordinates, speed and direction to fire control units.

STATUS:

In production.

MANUFACTURER:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-43120, Mölndal, Sweden.



PS 70/R radar system

PEDER II COHERENT-ON-RECEIVE FIRE CONTROL RADAR

This is a Ku-band monopulse tracking radar designed for use in fire control applications where the multipath problems associated with lower frequency radars seeking to achieve the same data-renewal rate are troublesome.

STATUS:

Field tested by the Swedish Army.

MANUFACTURER:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-43120, Mölndal, Sweden.

2481.153
ISIDOR PORTABLE INTRUSION RADAR

DESCRIPTION:

Isidor is a small portable CW radar which gives a visible and audible indication of the presence of men or moving vehicles within a range of some 300 metres for men and at least 1 km for moving vehicles. The main electronics unit is mounted on a tripod and can either be left to guard a particular line of approach or rotated by hand to survey an area. Presence of a target is indicated by a lamp and headphones can be used to monitor and interpret the signal. Several radars can be coupled to one remote control unit which has a lamp display for each radar and can be used to couple the headphones to any radar.

The transmitter emits a narrow pencil beam with low sidelobes – thereby making the radar difficult to detect.

CHARACTERISTICS:
Frequency: 10.5 GHz
Transmitter Power: 10 mW
Range Capability:
Against walking man 300 m
Against moving vehicle 1,000-2,000 m
Antenna:
Beam width 11°
First side-lobe level better than —23 dB
Wide angle side-lobe level better than —40 dB
Power Supply: 10-30 V DC (0.2 A at 12 V)
Weight (excl. battery): 2.5 kg
Dimensions:
Width and height: 20 cm
Depth: 10 cm

MANUFACTURER:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-431 20 Mölndal, Sweden.

2325.153
PE-48/T AA FIRE CONTROL RADAR

DESCRIPTION:

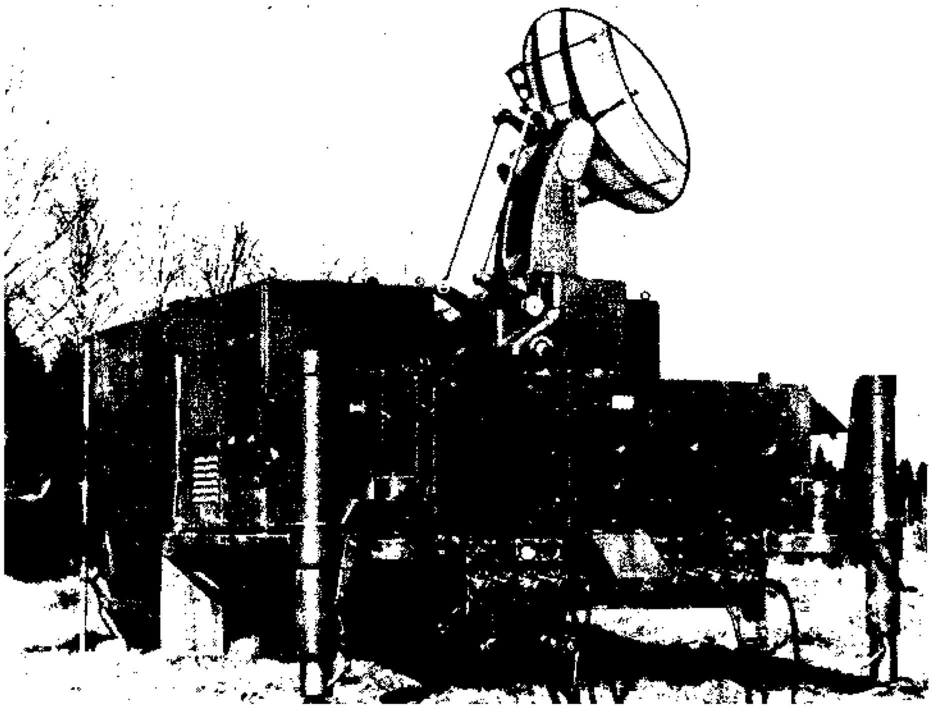
PE-48/T is a mobile range and angular tracking X-band anti-aircraft fire control radar which can also be used as a search radar. As can be seen in the accompanying picture, the radar antenna pedestal is mounted on a levelled platform which is the upper surface of the equipment container. Within this container is a fire control computer made by Arenco Aectronics, and this is used to compute firing data for transmission to the two 40 mm or 57 mm Bofors AA guns which the radar is used to control.

STATUS:

Operational but no longer in production. Final delivery to the Swedish Army was made in 1967.

MANUFACTURER:

Telefonaktiebolaget L.M. Ericsson, MI Division, S-43120 Mölndal, Sweden.



PE-48/T radar mounted on an Arenco computer

2327.153
PE-452/T AA FIRE CONTROL RADAR

DESCRIPTION:

PE-452/T is a mobile X-band range-measuring anti-aircraft fire control radar manufactured by L.M. Ericsson in Sweden under licence from CSF (now Thomson-CSF), France.

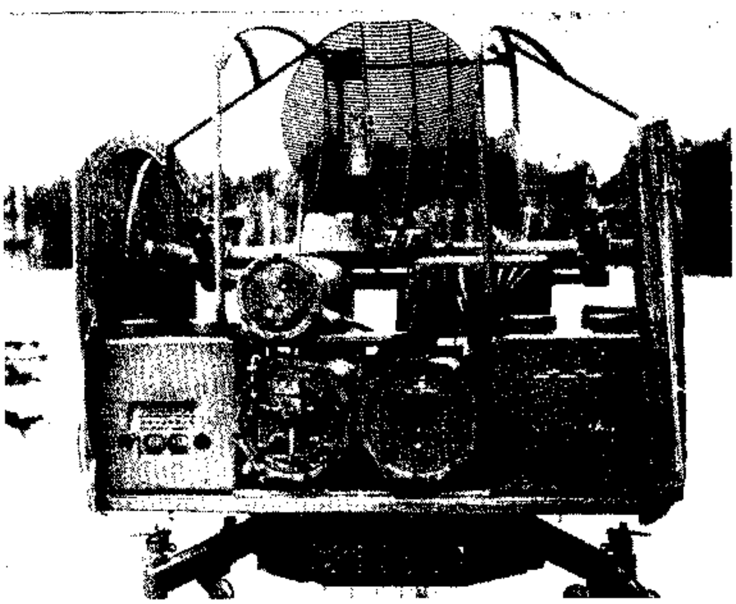
The radar is mounted on a fire control unit (with optical angular tracking) manufactured by Contraves AG, Switzerland. The latter unit also contains a fire control computer which calculates and supplies firing data to two 40 mm Bofors AA guns.

STATUS:

Operational but no longer in production. Final delivery to Swedish Army made in 1967.

MANUFACTURER:

Telefonaktiebolaget L.M. Ericsson, S-43120 Mölndal, Sweden.



PE-452/T radar mounted on a Contraves FC computer

2328.153
PE-453/T AA FIRE CONTROL RADAR

DESCRIPTION:

PE-453/T is a mobile X-band anti-aircraft fire control radar developed in Sweden by L.M. Ericsson by modifying the PE-451 range-measuring radar made by CSF (now Thomson-CSF) in France.

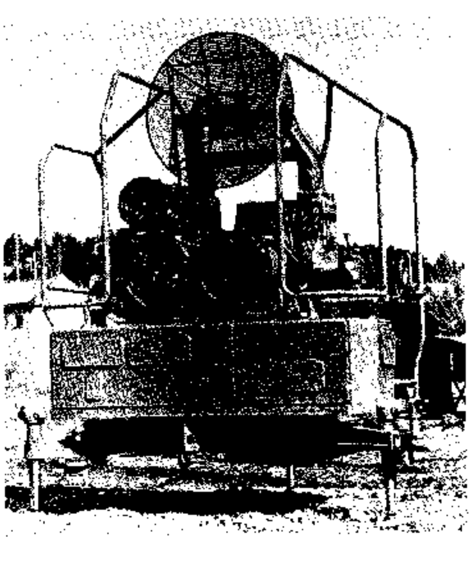
The PE-453/T provides range and angular tracking and operates in conjunction with a fire control computer, made by Contraves AG, Switzerland, and housed in the cabinet on which the fire control radar is mounted. Outputs from the computer are used for the control of two 40 mm Bofors AA guns.

STATUS:

Operational but no longer in production. Final delivery to Swedish Army made in 1967.

MANUFACTURER:

Telefonaktiebolaget L.M. Ericsson, S-43120 Mölndal, Sweden.



PE 453/T radar mounted on a Contraves FC computer

2326.153
PS-171/R AA SEARCH RADAR

DESCRIPTION:

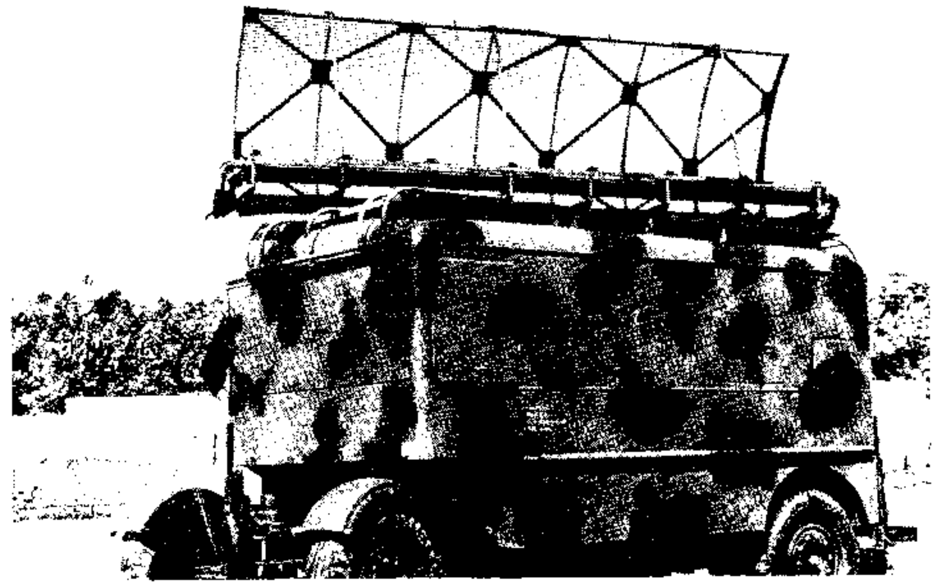
PS-171/R is a mobile, trailer-mounted, S-band search radar which is used as the early warning element in some Swedish anti-aircraft fire control systems.

It was manufactured by L.M. Ericsson under licence from CSF (now Thomson-CSF), France. Modifications to the original design were developed by LME to make it possible to use electronic components available in Sweden at the time. The transmitter and modulator was also designed to operate with the PS-17 radar which was manufactured in its entirety by CSF.

STATUS:

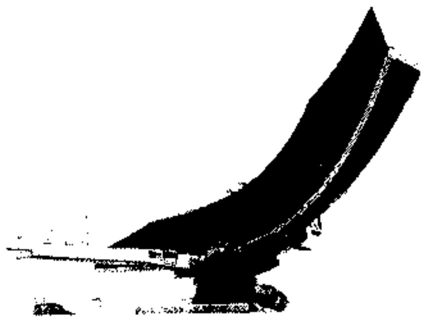
Operational but no longer in production. Final delivery to Swedish Army made in 1955.

MANUFACTURER:
Telefonaktiebolaget L.M. Ericsson, S-43120 Mölnda, Sweden.



PS 171/R Search Radar

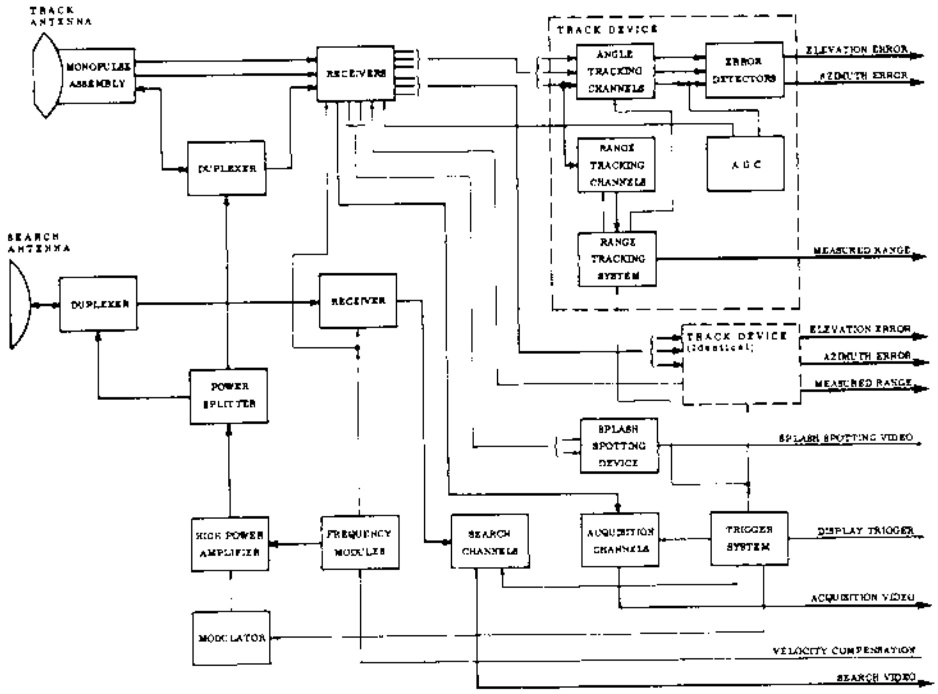
1549.153
PHILIPS 9 GR 600 RADAR
DESCRIPTION:
The designation 9 GR 600 applies to the X-band, frequency-agile radar transmitter/receiver which forms the basis of Swedish military radar and fire control systems for both land and naval uses. Used with the 9 GA 205 antenna, it forms the main sensor of the 9 KA 400 (Mareld) coastal artillery fire control system (Entry No. **1548.181**). The only other known applications are ship-borne, and further entries will be found in the appropriate sections.
CHARACTERISTICS:
Transmitter:
Frequency range: Random pulse-to-pulse frequency shift up to 450 MHz in the band 8700-9500 MHz
Pulse peak power: 200 kW
PRF: 2000-3000 Hz
Pulse width: 0.2 to 1.5 microseconds
Output valve(s): One or two spin-tuned magnetrons
Receiver:
Frequency range: 8500-9600 MHz
Bandwidth: 3 and 8 MHz, matched to pulse length
Noise: 10 dB average, 8 dB with low-noise preamp
Receiver characteristics: Lin and log, log/lin STC
Optional features: Image rejection mixer pre-amplifier; Dicke-fix receiver; pulse-length discriminator; IAGC; narrow-band jamming suppression; spectrum analyser; passive ECM mode; frequency programming
Antenna: 9 GA 205
Type: Parabolic
Frequency band: 8.3-9.6 GHz
Rotation: Up to 40 rpm
Beamwidth: Horizontal 0.6 deg, Vertical 4.5 deg
Gain: 40 dB
Sidelobes: 28 dB
Aperture: 4500 × 625 mm
Weight: 225 kg



Philips 9 GR 600 radar

STATUS:
In service.
MANUFACTURER:
Philips Teleindustri AB, Fack, S-175-20, Järfälla-1, Sweden.

2357.153
UAR 1021 COMBINED SEARCH & TRACK PULSE DOPPLER RADAR
This combined fully coherent search and track pulse-Doppler radar is derived from the earlier ECSTRA I equipment. It employs a single X-band transmitter which feeds the independent search and track antenna by way of a power splitter. The tracking sub-system uses a monopulse technique with a Cassegrain antenna; the search system uses a cheese antenna.
Important features of the equipment are the high clutter attenuation resulting from the coherent pulse Doppler-system, the ECCM capability resulting from the broad band system (900 MHz) and the possibility of operating either on a fixed frequency (chosen from five with a change time of less than 10 milliseconds) in the pulse-Doppler mode or with random pulse to-pulse frequency



Block schematic of UAR 1021 combined search and track radar

UAR 1021 combined search and track radar in Contraves Skyguard system agility within 900 MHz in the non-Doppler mode; the monopulse angular tracking system; and the digital range tracking system.

CHARACTERISTICS:
Frequency: 8.6-9.5 GHz
MTI improvement factor: 45 dB
Peak power: 26 kW
Noise factor: 12 dB
Pulse repetition frequencies: Three different triplets in the interval 4.8-8.1 KHz with rapid cyclic switching
Pulse width: 1.5/0.5 microsec selectable
Antenna Gain: 36 dB
Antenna Diameter: 1 m
Range coverage: PD-Mode: 0.3-18 km, FA-Mode: 0.3-25 km
Acquisition interval: 1,120 m
Velocity window: 22-385 m/sec
Angle tracking accuracy: 1 mrad
Range tracking accuracy: 8 m +0.0002.R

STATUS:
In production for the Contraves Skyguard system (**2377.151**).

MANUFACTURER:
Telefonaktiebolaget L. M. Ericsson, MI Division, S-43120, Mölndal, Sweden.

2356.153
UAR 1022 TRACK ONLY RADAR

DESCRIPTION:
This radar is essentially the tracking sub-system of the UAR 1021 combined search and track radar (**2357.153**) but is offered as a separate radar for application where either the tracking function is the only one required or where it is desired to associate an X-band tracker with a search radar operating in a different frequency band.

MANUFACTURER:
Telefonaktiebolaget L. M. Ericsson, MI Division, S-43120, Mölndal, Sweden.

SWITZERLAND

2551.153
CONAR ARTILLERY RADAR FIRE CONTROL SYSTEM

DESCRIPTION:
Only limited information on this system has so far been made available. It comprises a conical-scanning lock-follow tracking radar, the aerial pedestal of which can be retracted inside the cabin in which the system is transported, and a CORA II digital computer.

In operation the radar tracks a projectile fired by an associated weapon system and the measured co-ordinates are used by the computer, which is programmed with the appropriate ballistics, to predict the fall of shot, and compute appropriate corrections.

Conar is intended primarily for use with two major Swiss artillery weapon systems, the DIRA rocket system (**2386.103**) and the M-109U 155 mm SP Howitzer (**2998.103**).

MANUFACTURER:
Contraves AG, Schaffhauserstrasse 590, 8052 Zürich, Switzerland.

CONAR Artillery FC system

THE UNITED KINGDOM

1018.153
CYMBELINE MORTAR LOCATING RADAR

DESCRIPTION:
Cymbeline (British Army nomenclature: Radar FA No 15 Mk 1) is an extremely rugged self-contained radar (including power supply) with a detachable display unit. The radar is mounted on a four-legged structure supported on screw jacks fitted with hydraulic absorbers.

The equipment is transported either on a two-wheeled trailer or on a FV432 armoured personnel carrier (**5007.102**). In the latter mode the screw jacks are replaced by an automatic hydraulic levelling system.

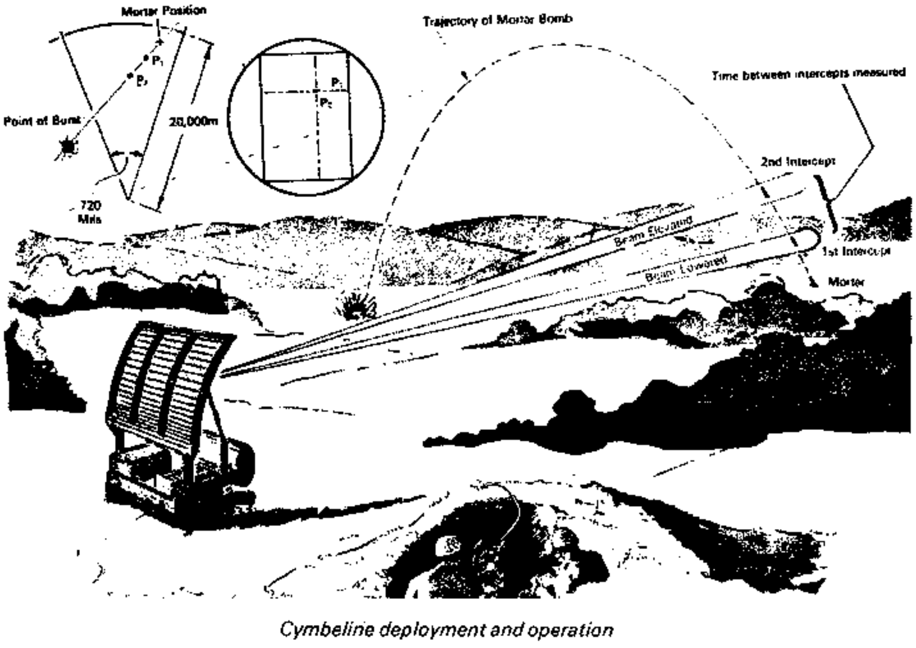
The antenna system consists of a Foster Scanner which illuminates a parabolic cylinder reflector and produces a pencil beam scanning in azimuth. The complete radar head can be rapidly rotated to cover any required sector; for example, 180° rotation in 15 seconds. When in transit the reflector folds down.

Below the antenna is an equipment box which houses the Main Electronics Unit, the Power Unit and the Display Unit during transit.

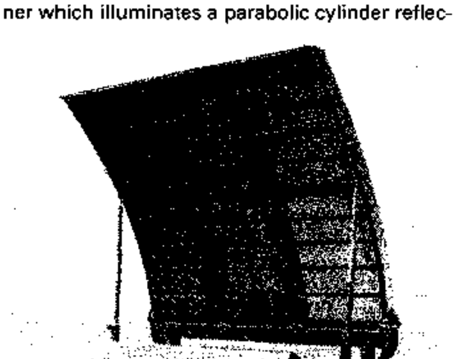
The Main Electronics Unit contains the Transmitter/Receiver and the radar timing and computer modules.

The Display Unit can be removed from the equipment box for remote operation for distances up to 15 metres. It consists of a short-persistence 'B' scope on which the radar returns are displayed. It also carries all the controls necessary for the operation of the radar. The mortar co-ordinates are shown on another unit which is detached and can be used at distances up to 2 metres from the display.

The radar is normally operated from a Wankel gasoline engine/generator set, mounted on the



Cymbeline deployment and operation



Cymbeline mortar locating radar

equipment, which provides 1.5kW at 28V d.c. Alternative sources providing 1.5kW at a voltage between 22V and 30V d.c. can be used.

The equipment is suitable for air transport up to heights of 12,800 m. All units are sealed, and as the mounting feet have integral hydraulic shock absorbers, the equipment is suitable for transportation by helicopter as an underslung load.

OPERATION:

The radar enables the operator to plot two points in the bomb trajectory, and to measure the slant range and bearing to each of these positions. The time taken for the bomb to travel between the two points is also measured and the computer uses this information together with the pre-set elevation angles to determine the firing position of the mortar. This entire process takes place in about half a minute.

Additional facilities have been provided to ensure the maximum accuracy of location and ease of operation over a wide range of operational conditions. For maximum range performance a switched single beam is used, and an additional beam position is available to alert the operator for making the first intercept. For short range working a double-beam mode of operation may be selected to obviate operator reaction time errors. This facility also improves the multiple target capability.

Provision has also been made for the internal fitting of an optional digital data storage module. This enables the radar returns to be stored to provide a long-persistence display so that operator concentration can be reduced while improving the marking accuracy. Data storage also improves multiple handling capability.

Two operators are normally required, but in an emergency one will suffice.

The 13 cm 'B-scope' CRT display, which incorporates a fibre-optics faceplate for daylight viewing, presents the full azimuth cover of the radar at all times, but range coverage can be displayed in zones of 4,000 m or 8,000 m. Counters on the unit permit the co-ordinates of the radar to be set in, and those of a located mortar to be read out.

Cymbeline can also be used for the adjustment of 'own' artillery fire by determining the co-ordinates of the target position. Other applications include local surveillance and control of helicopters and light aircraft.

TEST AND TRAINING EQUIPMENT:

Maintenance is usually by isolation and removal of a complete unit. Built-in test equipment enables an operator quickly to isolate a fault to a particular unit and replacement of a faulty unit by a spare unit enables the operator to bring the radar back into service with a minimum of time out of action.

A faulty unit is withdrawn to a Repair Vehicle for servicing. This vehicle comprises an air-portable container body mounted on a suitable wheeled carrier. The vehicle is an air conditioned unit, containing a complete slave radar and fully equipped with repair and test facilities for the servicing of units.

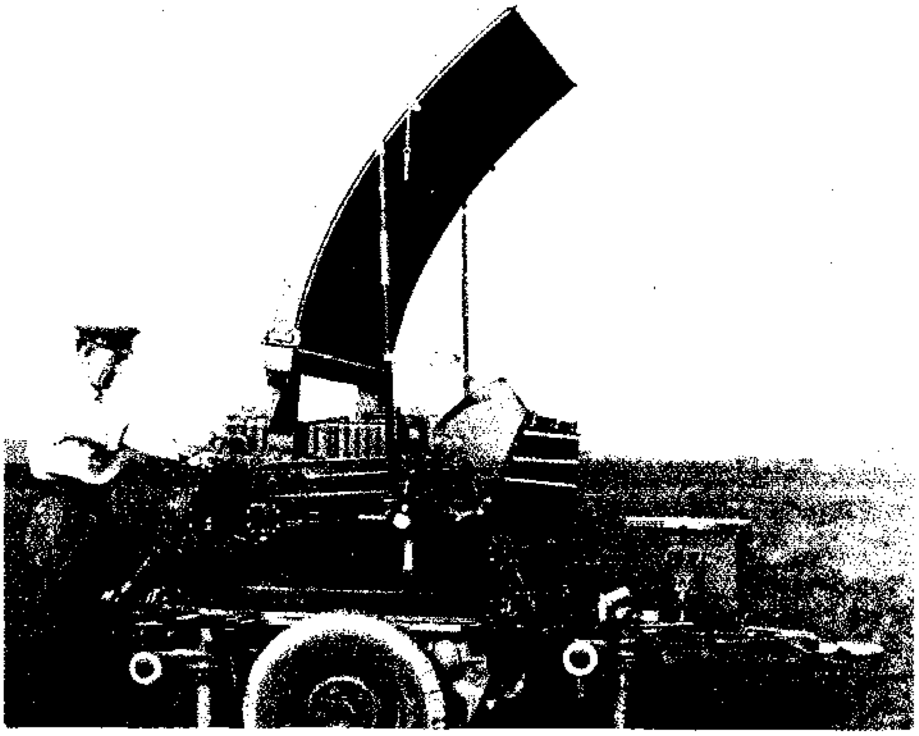
A simulator, built into the Display Unit, provides realistic synthesised waveforms at the CRT to represent intercepts of mortar bombs for operator training.

DEVELOPMENT:

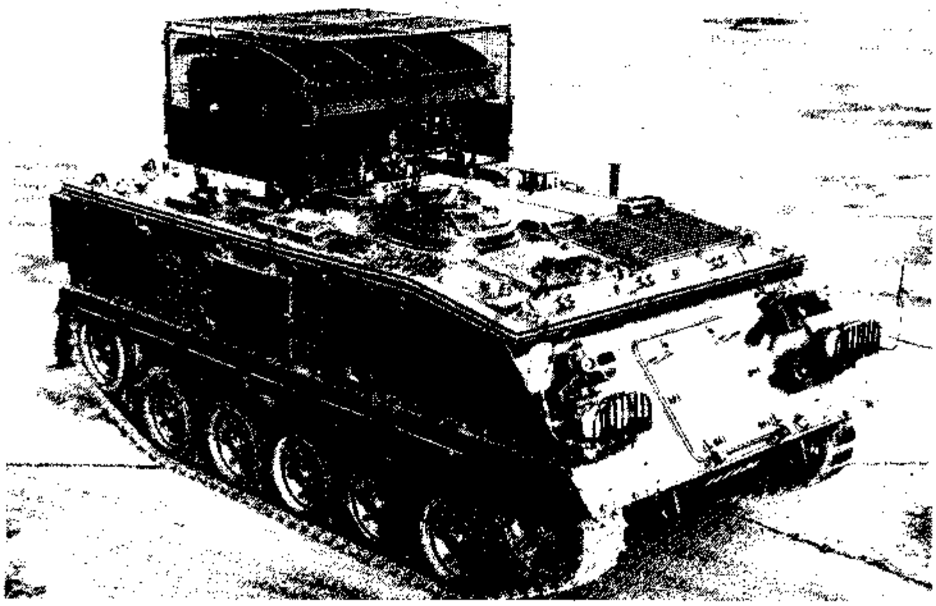
Cymbeline was developed as a lighter, more mobile, successor to the Green Archer mortar locating radar. Partners in the programme were EMI Electronics, the UK Ministry of Technology (mainly the Royal Radar Establishment), and the British Army.

CHARACTERISTICS:

Weight of radar: 300 kg
Weight of power supply: 85 kg
Height (stowed): 1.07 m
Height (operational): 2.29 m (when removed from trailer)



Cymebline mortar locating radar ready for use on trailer mounting



Cymbeline mounted on FV432 (reflector folded for transit)

Length: 1.50 m (when removed from trailer)
Width: 1.70 m (when removed from trailer)
Frequency: X-band
Peak power: 100 kW
Aerial: Foster Scanner with reflector
Sector scan: 720 mils
Bearing limits: 12,000 mils total rotation
Speed of Rotation: 200 mils per second
Presentation: 'B' type display with displayed 0 – 20,000 m and selected 4,000 m and 8,000 m zones
Minimum range: 1,000 m
Maximum displayed range: 20,000 m
Radar reliability: 200 hours MTBF (excluding power source)
Electronic units: Fully sealed and desiccated with air to air heat exchanger
Power Requirements:
Supply: 22V to 30V dc 1.2 kW mean, 1.35 kW peak
Generator: Wankel (Silenced). Weight: 85 kg. Reliability: 200 hours MTBF
Operating Limits:
Temperature: −32 to +52 deg C
Altitude: Sea level to 3,000 m
Wind conditions: No loss of accuracy up to 90 km/h

STATUS:

Deliveries to the British Army commenced in mid-1973.

MANUFACTURERS:

EMI Electronics Ltd, Hayes, Middlesex.

2413.153
FIRELIGHT TARGET ILLUMINATING RADAR

DESCRIPTION:

Firelight is a Target Illuminating Radar (TIR) for use with the Bloodhound and Thunderbird Surface-to-air guided missile systems. The equipment is land mobile and air-transportable and the complete radar is housed in a single trailer.

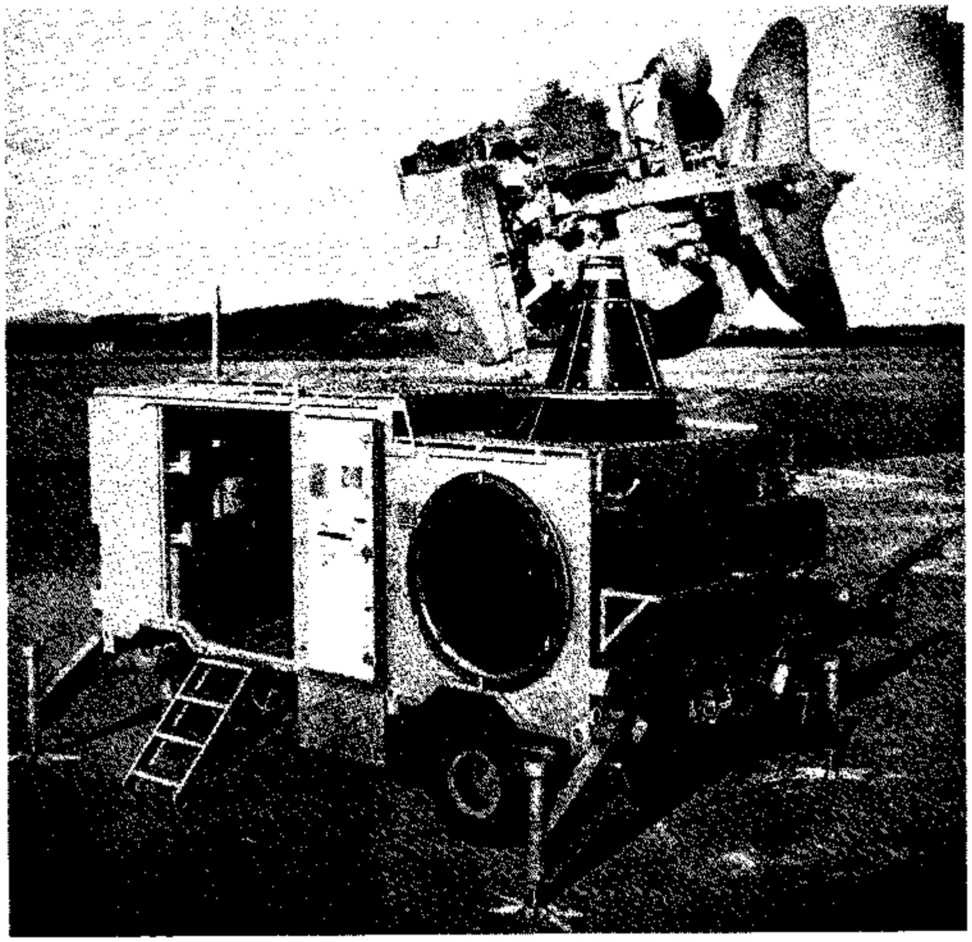
Basically an X-band CW Doppler auto-follow radar, the equipment also performs the function of illuminating the target and thereby providing the reflected radiation to activate the semi-active homing system of the Bloodhound and Thunderbird missiles. In addition it has a limited target search facility and is equipped for target identification.

In its normal operational role the TIR is supplied with target range and bearing information from a surveillance radar associated with the missile system. After appropriate co-ordinate transformation this data will define the target's position in a region bounded by bearing and elevation arcs which may be further restricted if information from a height-finding radar is also available. The TIR aerial system is so arranged that it can search the region thus defined and locate the target, whereafter it is locked on and follows the target automatically. Simultaneously a positive identification process is initiated resulting in a decision – made by the Engagement Controller in the Launch Control Post (LCP) – whether or not to engage the target.

When following a target the radar supplies angular position and velocity co-ordinates to the LCP. When a missile has been launched, the TIR continues to track the target, and the reflected signal is used by the homing equipment in the nose of the missile to bring it close enough to the target for the proximity fuse to detonate the missile warhead.

A CW system was chosen for this radar because of its good performance in the presence of natural or ECM interference. The use of X-band radiation makes possible a reasonable degree of angular accuracy with an aerial system that is small enough to be retracted within the radar trailer for transportation.

The whole of the main equipment (excluding power supplies) is housed in a single trailer which is jacked up on site. This trailer contains the transmitter receiver, servo systems, aerials and built-in protection and checking capability. The whole unit may be transported by air and is proofed against rain, snow, ice, sea spray and wind-driven sand.



Ferranti Firelight Target Illuminating Radar

Development History:

Development commenced on a British Government contract in December 1957, the manufacturers, Ferranti Ltd, having already been co-operating with the Bristol Aeroplane Co Ltd (and subsequently with the British Aircraft Corporation) on the development of the Bloodhound guided missile system. The first prototype was completed in November 1960 and the equipment went into service with the Royal Air Force (with Bloodhound) in December 1962 and the British Army (with Thunderbird) in May 1963.

Characteristics:

Type: Mobile CW Doppler auto-follow radar
Frequency: X-band
Main aerial: 2.1 m diameter
Mobility: Land-mobile. Air-transportable
Facilities: Search and follow. Target identification. Built-in self-testing capability
Associated systems: Bloodhound and Thunderbird SAGW systems

Manufacturer:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

2412.153
GREEN ARCHER MORTAR LOCATING RADAR

Description:

Green Archer (British Army nomenclature Radar F.A. No. 8) is a radar and computer system designed for the rapid location of enemy mortar positions and for observation and correction of friendly counterfire. It can also be used for air burst and trajectory ranging of artillery fire and for other surveillance purposes.

Two men only are required to operate the equipment, which will locate mortars of 75 mm calibre with great accuracy at ranges up to 8 km and larger mortars at greater ranges with little loss of accuracy.

The system comprises an X-band sector-scanning radar, an analogue computer and ancillary equipment. There are two standard versions: FA No. 8 Mk I is mounted on a 4-wheeled trailer; FA No. 8 Mk II is mounted on a self-propelled vehicle – either the armoured personnel carrier type M 113 or FV 436.

Function:

A mortar is located by measuring the coordinates of a mortar projectile at two points on its ballistic trajectory, measuring the time of flight between these two points and computing the origin of the trajectory – and hence the location of the mortar – from these measurements.

To obtain the required measurement accuracy a radar beam that is narrow both in azimuth and in elevation is necessary, and that of Green Archer is approximately 2 degrees. Because of this, if targets are not to be missed, the sector scan must be executed at such a speed that a complete cycle takes no longer than it will take a mortar projectile at minimum range to pass through the beam. A Foster scanner is used for this purpose.

The radar beam is switchable in elevation so that when a target has been detected at low elevation the sector scan can immediately be transferred to a greater elevation to obtain the second measurement. Target information is presented on a B-scope display for the measurement of range and bearing (elevation being predetermined for both lower and upper scan); and the display covers a sector some 40 degrees wide and 17 km long or, by switching, any 4 km part of this zone from 0 to 16 km.

Measured and predetermined coordinates of the target's position on lower and upper scans are fed into the analogue computer and from these, and the measured time interval between the two sightings, the computer calculates the Cartesian coordinates of the position of the mortar and presents them to the operator.

Power Supply:

Power for the equipment is provided by a 4.5 KVA 200 V 400 Hz 3-phase diesel-engined generator. Since Green Archer will often be operated in forward areas there is a danger that the noise made by a generator may give away the position of the radar. The generator is heavily silenced, therefore, and is located well away from the remainder of the equipment. It is designed to be inaudible at 200 metres on a still night.

Development:

Development of this system was initiated by the British authorities and was under the technical supervision of the Royal Radar Establishment with E.M.I. as prime contractor. The development contract was awarded in 1955; trials of prototype equipment took place in 1958 and 1959; and the equipment went into service with the British and Swedish armies in 1962.

Status:

Obsolescent. No longer in production and being superseded in the British Army and others by Cymbeline (**1018.153**). Still in service in the Argentine, Denmark, India, Israel, South Africa, Switzerland and West Germany.

Manufacturer:

Prime contractor: EMI Electronics Ltd, Hayes, Middlesex.

2483.153
INFANTRY COMBAT RADAR GS No 18 Mk 1

Description:

Little information on this development had been received by press date, but it is understood that this radar has been jointly developed by Marconi Radar Systems and the UK MoD Procurement Executive (the technical establishment is not known – but see **2482.153**) to meet the requirements of the British armed forces for a portable battlefield surveillance radar – presumably as a successor to the GS No 14 Mk 1 listed here under its commercial designation of ZB298.

The radar is understood to work in J band and to have separate search and discrete ranging modes covering distances up to 2 km. All-up weight is believed to be 8.0 kg while in infantry-portable form this weight can be reduced to about 4.5 kg.

STATUS:
Not definitely known but presumably advanced development.

MANUFACTURER:
Marconi Radar Systems Ltd, Marconi House, Chelmsford, Essex.

2457.153
MARCONI HIGH-POWER STATIC RADARS

Marconi Radar Systems now incorporates, as part of GEC-Marconi Electronics, the radar activities of the former AEI organisations; which in turn inherited the Metropolitan-Vickers radar interests which extended back to the first British radar development work before the Second World War.

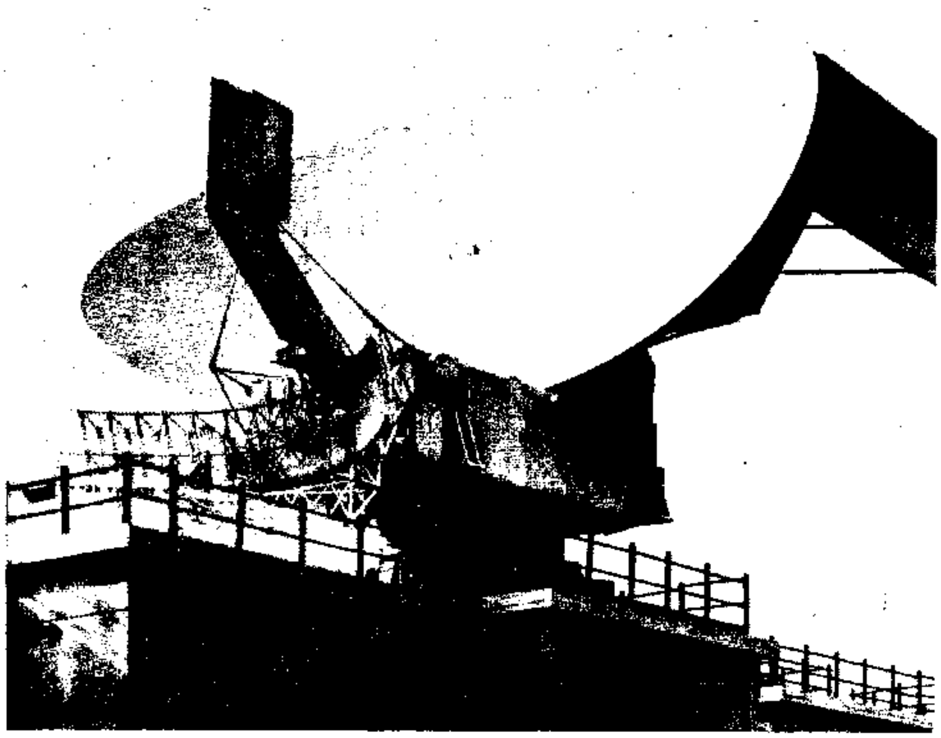
The present Marconi Radar Systems organisation thus numbers among those of its former products which are still in service a number of high-power static radar systems used for defence purposes, some of which are volumetric radars. Information relating to these radars is still largely subject to security restrictions; and it is possible here to give only typical characteristics which do not necessarily correspond with the characteristics of any one radar.

Illustrated here is one of the volumetric radars, the **Type 85**: this is a high-power stacked-beam equipment which is used in the UK air defence system (**2443.181**). The 40-series volumetric radar (**2478.153** and see also **2429.181**) can to some extent be regarded as a derivative of this radar. Other large static radars still in operational use are:

Type 82 – an S-band volumetric radar having a single curvature reflector with a linear feed.

Type 84 – a high-power L-band surveillance radar with anti-jamming facilities. It has a paraboloid reflector fed by a hornstack.

MANUFACTURER:
Marconi Radar Systems Ltd, Chelmsford, Essex, England.



Type 85 radar

2458.153
MARCONI HIGH-POWER STATIC SURVEILLANCE RADARS (LINEAR FED)

DESCRIPTION:

Included among the range of high-power static radars referred to generally in entry **2457.153** is a family of surveillance radars using single curvature reflectors illuminated by linear feeds. The aerial system may comprise single or back-to-back dual reflectors operating in S-band or L-band. The later aerials feature a squintless feed (see entry **1168.153**). A range of transmitter/receivers can be operated singly or in diversity.

Members of this family believed still to be operational are:

Types S247, S266: S- and L-band back-to-back aerials Type SA116, 45 ft (13.72 m) aperture. Transmitter/receivers SR1000 2.5 MW S-band; SR1020 2¼ MW L-band.

Type S647: S- and L-band back-to-back aerials Type SA116 45 ft (13.72 m) aperture. Transmitter/receivers S2012 2¼ MW S-band; S2011 2 MW L-band.

Type S631: S- and L-band back-to-back aerials Type S1011 and S1014 with squintless feeds, 45 ft (13.72 m) aperture. Transmitter/receivers in diversity 2 × S2012 2¼ MW S-band; 2 × S2011 2 MW L-band.

S-band aerials for all the above have a parabolic section while the L-band aerials are cosecanted.

Other radars in the earlier series which were specified but are not known to be operational were:

S255: Single 45 ft (13.72 m) L-band cosecanted aerial.

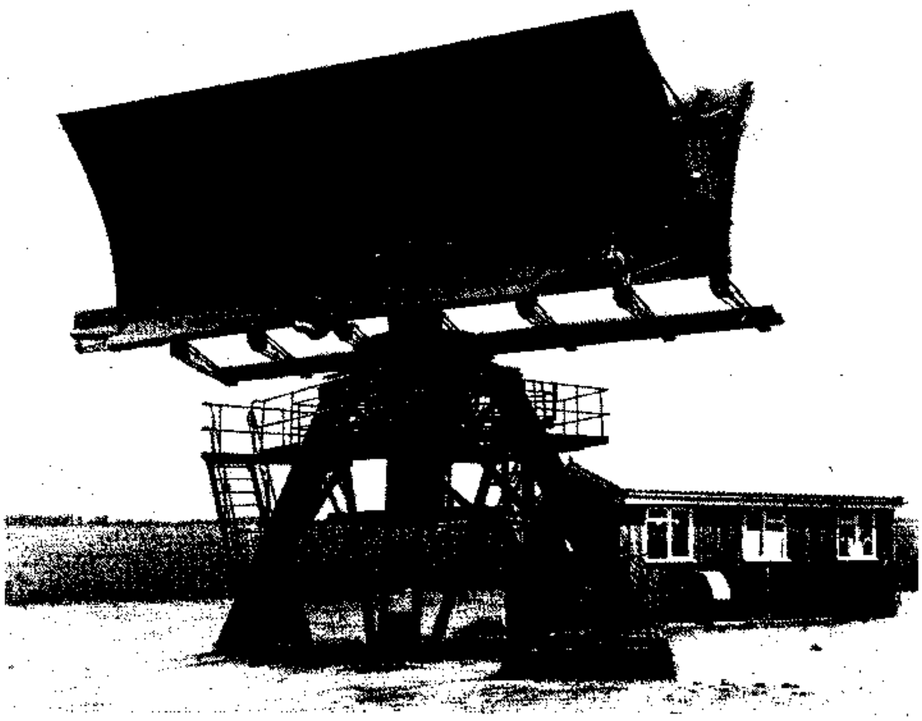
S265: Back-to-back 45 ft (13.72 m) S-band parabolic and cosecanted aerials.

S300: Back-to-back 45 ft (13.72 m) L-band parabolic and 60 ft (18.29 m) L-band cosecanted aerials.

S316: Back-to-back 60 ft (18.29 m) L-band and 45 ft (13.72 m) S-band cosecanted aerials.

S319: Single 60 ft (18.29 m) L-band cosecanted aerial

S320: Back-to-back 45 ft (13.72 m) L-band parabolic and cosecanted aerials.



Back-to-back L-band (front) and S-band aerials with squintless linear feeds

Transmitters having peak powers of at least 2¼ MW were specified for use with all these radars.

The achievable ranges are in excess of 500 km (300 nautical miles). Single curvature reflectors and squintless linear feeds give both low sidelobe level and diversity capability. These features, together with two-band working and ECCM receivers, ensure very high resistance to jamming. Extremely stable transmitters and digital signal processing enable the radar to maintain a high data rate with good clutter supression. Plot extraction and narrow band transmission facilities, track extraction with manual or automatic initiation and comprehensive display facilities allow integration with a wide range of defence systems.

CHARACTERISTICS:

	S-band	L-band
Aerial:		
Gain	45 dB	37 dB
Beamwidth:	0.5°	1.2°
Sidelobes:	Both –28 dB	
Polarisation:	Both horizontal (circular)	
Max rotation rate:	8 rev/min	

Transmitter:
Peak power: 2.25 MW 2 MW
Pulse length: 2.5/50 microsec
PRF: 300/600
Receiver:
Noise figure: 3.8 dB 2.8 dB
Signal Processor:
Stagger: Six period or random
Cancellation ratio: 40 dB static
Max MTI range: More than 120 nautical miles.

Some further information on Marconi static air defence radars will be found in entry **2429.181**.

MARCONI 40-SERIES VOLUMETRIC RADAR

DESCRIPTION:

The Marconi 40 Series S-band defence radar provides plan position and height data covering a range of 400 km (220 nautical miles) and a height of 30,500 m (100,000 ft) on targets of not less than 4 square metres. A computer obtains height data automatically each aerial revolution on every target detected within the radar cover.

Anti-jamming is achieved by the use of a stacked beam aerial system with a separate receiver for each beam, wide frequency diversity, high mean transmitted power, pulse compression techniques and a combination of special Electronic Counter Counter Measures (ECCM) receivers and compatible Moving Target Indication (MTI). These features, together with circular polarization also make the radar highly resistant to interference from ground clutter and rain.

Aerial System

The aerial consists of a reflector and hornstack in a stacked beam system. The reflector is paraboloidal in contour and measures 12.2 m (40 ft) across by 4.67 m (15 ft 4 in) high. When transmitting, the transmitter power is divided in the waveguide system and fed to twelve horns. The relative phase of r.f. energy at each horn is such that co-phasing is achieved in the far field. The beamwidths of the lower beams are 0.62 degree horizontal by 1.25 degrees vertical. The maximum gain of the aerial is 44.5 dB with azimuth side lobes 27 dB down on the peak of the main beam. When receiving, each horn feeds its own receiving system. Elevation coverage provided by the common transmitter/receiver system is continuous up to 30 degrees. Circular polarisation of the bottom four beams can be employed to give improved performance in rain and is controlled from the radar supervisor's console. An IFF aerial is mounted on the radar aerial and produces a beam aligned in azimuth with the radar aerial beams.

Twelve waveguides connect the r.f. slipring stack to the horn feeds in the hornstack, rising through the aerial turntable into and along the aerial baseframe and finally up the hornstack itself. Flexible sections are included to allow for thermal expansion, and the lengths of the runs contained in the baseframe are arranged as part of the co-phasing system.

The high power waveguide system is contained in three racks fulfilling the functions of combination of power from the two transmitters, splitting the combined power, establishment of the correct phase relationship between the twelve channels, duplexing and monitoring. Sections of the waveguide system are pressurised where necessary.

Transmitter

Two transmitters are provided, each operating over two frequency bands, each band being 50 MHz wide. Thus a total bandwidth of 200 MHz is employed within a total bandspread of 450 MHz. Frequency diversity within each band is employed, selection being at random.

MTI is obtained by operating the transmitter at the same frequency on successive pulses before randomly selecting a different frequency pair. The pulse spacing between frequency pairs can be optimised for ground clutter or chaff.

For the purposes of surveillance of military and civil aircraft in peace time, performance is such that only one transmitter need be operated, with the advantage of more economical running of the radar and protection of security. The unused transmitter can be run up and operated into an r.f. dummy load for testing.

Each transmitter output stage consists of a high power amplifier of the hybrid t.w.t./klystron type, delivering an S-band pulse of peak power 3 megawatts typical, with a pulse length of 10 microseconds. Each pulse is frequency modulated over 2 MHz as required for pulse compression. A stage of amplification is provided in each transmitter by a t.w.t. amplifier to raise the exciter input to a level suitable for the output amplifier. Each stage individually and in combination provides an output constant in amplitude over the full operating bandwidth.

Buffer alternators are provided between each transmitter power supply and the primary input supply to ensure that electrical interference is eliminated from other radar circuits and associated equipments used in the overall system.

Exciter

The exciter generates the r.f. signal which, after mixing with the swept frequency i.f. pulses, is fed to the transmitter for amplification. Eight oscillators provide the frequency diversity feature of the radar and these are selected and timed from controlled input signals. Outputs from the exciter provide the local oscillator frequencies for the receiver. Another output provides r.f. pulses for injecting into the receiver waveguide for test purposes. The design of the microwave circuits has been realized almost entirely in printed circuit stripline.

Receiver Waveguide

The outputs from the twelve duplexers in the high power waveguide system are fed to low noise t.w.t. amplifiers in the receiver racks through waveguide containing a gas discharge tube to attenuate transmitter breakthrough, and to a directional coupler through which r.f. test pulses are injected from the exciter system.

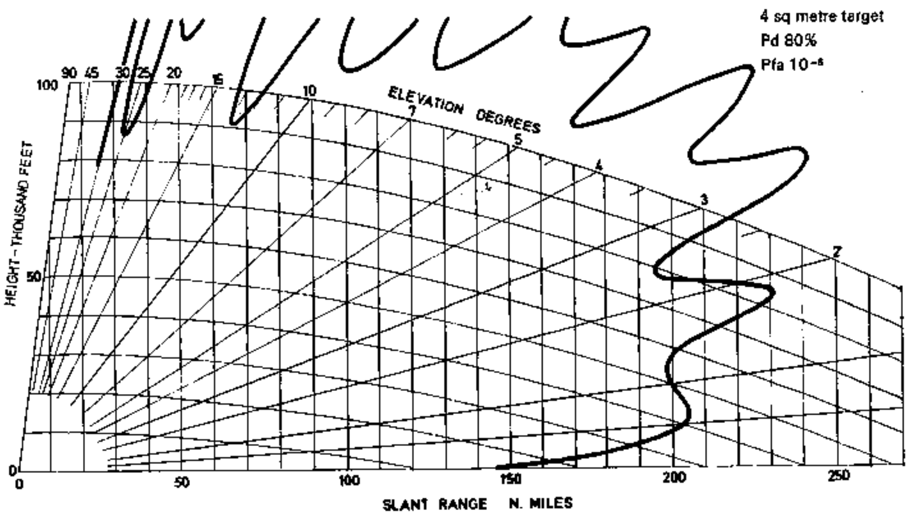
R.F. Receivers

Signals from the twelve receiver waveguides are passed to twelve identical receiver systems, the first units of which are t.w.t. radio frequency amplifiers. In each system, a switched filter passes the amplified signal to mixers, the output from which is at the first intermediate frequency of 148.5 MHz.

After amplification in a wide band amplifier the signal is divided into two and is further processed in two different i.f. receiver channels.

Log Receivers

One part of the amplified signal at 148.5 MHz is used to provide amplitude information for height finding. This is accomplished by reducing the signal to 13.5 MHz second i.f. and after passing through a dispersive network, the compressed signal is fed to the log amplifier. R.F. signals injected simultaneously into each receiver channel are used to ensure that the characteristics of each are identical, this being required for height computation.



40-Series radar coverage

ECCM Receivers

The other part of the amplified signal at 148.5 MHz is used to feed the ECCM receiver system, the outputs of which, after further processing, constitute the input to the display and data handling system. This receiver channel has a characteristic providing a constant false alarm rate output without limiting, even though the jamming signal may fluctuate. After being reduced to the second i.f. of 13.5 MHz in a mixer, the signal passes through a dispersive network and the compressed signal is fed to the MTI and video processing system.

I.F. Oscillator and Distribution

The swept frequency i.f. pulses for the exciter are generated passively by means of an impulsed dispersive delay line system and after conversion to 148.5 MHz are passed to the exciter system. All the intermediate frequencies in the radar are harmonically related to 13.5 MHz. The output of a basic 13.5 MHz crystal oscillator is multiplied by 12 to provide a 162 MHz signal. This signal is split to provide twenty-four independent 162 MHz second Local Oscillator signals.

MTI

The method used is to transmit two pulses on the same frequency and split the output of the ECCM receivers into amplitude and phase channels before and after a delay equal to the pulse spacing. The phase channel provides the velocity information relative to a weighted mean of clutter, chaff and other targets on the same bearing. The amplitude channel is used to amplify and detect the i.f. and after gain equalisation to combine the two signals in an AND-gate (the latter function provides a means of p.r.f. discrimination). Analogue multiplication of the instantaneous amplitude with the appropriate function of phase gives the output of the MTI system. The radar can be operated in three different modes, namely: non-MTI, MTI Mode 1 and MTI Mode 2. Non-MTI mode is used when neither clutter nor chaff is present in sufficient quantity to limit the performance of the radar. MTI Mode 1 is used to combat ground clutter out to a maximum range of 360 km (194 nautical miles). MTI Mode 2 is used to combat both ground clutter and chaff out to a maximum range of 180 km (97 nautical miles). In each case MTI can be terminated before the maximum range; thereafter returns are processed, without MTI cancellation, out to the maximum range of the radar.

Video Processing

The various video processing circuits are used to generate a Constant False Alarm Rate (CFAR) output under conditions of clutter, chaff, rain, jamming etc, as well as receiver noise. This is achieved by the use of an automatic clutter gating system which normally selects the non-MTI output for processing. When the presence of clutter or chaff is detected, the MTI output is selected and the clutter or chaff is cancelled before processing. Fast automatic gain controls are provided on the MTI and Non-MTI output to bring the mean level of the noise to a predetermined upper limit. After the appropriate CFAR output has been chosen, video pulses wider than 0.75 microsecond (6 dB point) are rejected by a pulse length discriminator. This circuit is useful in rejecting interference from other radars, impulse jamming and partially cancelled ground clutter.

The signal is then sent along two paths. One is for the PPI via a mixer and a spurious target cancellation system used to remove ambiguities due to split pulse working. The other is for the height computer via a video digitiser which produces a 6-volt pulse for every signal passing the detection threshold.

Auto Height Computer

The digitised video output from the video processing circuits in each beam is used to gate into a peak reading store the required pulses existing at that time in the log channels. The highest pair of adjacent outputs gives the approximate height of the target by defining the nearest cross-over. To find the fine increment of height, these two outputs are subtracted and compared with the calibration curve for this cross-over of elevation against log difference. Multiplication by the range then provides the height increment. The coarse and fine heights are added so that a pulse output proportional to the height of the target is provided for every detected target.

On demand, the set of signal strengths in a pulse packet for a given target are compared in an analogue store and the height corresponding to the strongest return is converted into an eight-digit binary code and passed to the data handling computer.

Two manually interchangeable height computers are provided for reliability.

CHARACTERISTICS:

Transmitters: Two klystron amplifiers each delivering a peak power of 3 MW (typical). Transmitter 1/2 operates on eight frequencies selected within two bands. Transmitter 4/5 operates in eight frequencies selected within another two bands. The bands are separated to give a frequency diversity covering more than 450 MHz

Pulse recurrence frequency: With no MTI the p.r.f. is 323 pulses/sec. With short pulse spacing MTI the p.r.f. is 233 pulse pairs/sec. With long pulse spacing MTI the p.r.f. is 182 pulse pairs/sec

Pulse length: 10 microseconds frequency modulated for pulse compression

Receivers: Separate receiver systems fitted in each beam provide outputs for height finding and ECCM.

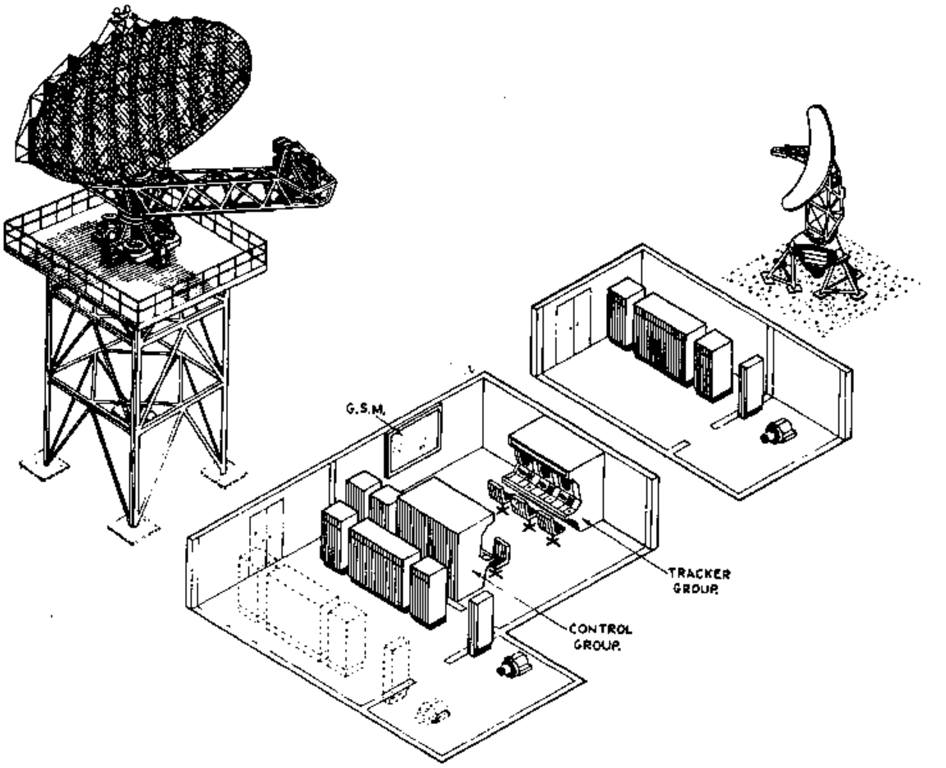
Circuits in each receiver provide pulse compression from the radiated 10 microsec pulses to 0.5 microsec pulses. Swept gain is independently applied to each ECCM receiver. The dynamic range of each receiver is 70 dB

MTI: Two models of MTI are provided. Mode 1: Ground clutter – MTI to range of 360 km (194 nm). Mode 2: Chaff and ground clutter – MTI to range of 180 km (97 nm)

Video processing: Pulse length discrimination, pulse repetion frequency discrimination and wind speed correction associated with MTI and fast acting gain control are applied to each beam

Automatic height finding: Heights of all aircraft detected within the cover are automatically computed every revolution of the aerial and are available for feeding to a computer or display

Environmental conditions: The equipment will operate at full performance over a wide range of climatic conditions. It is protected against rain, salt, water spray, wind blown sand, snow, ice and electric storms.



Arrangement of a control and reporting station

Exposed parts operate satisfactorily within a shade air temperature range of —10 to +50°C with a maximum difference between the sunlit and shade air temperatures of 25°C.

Maximum wind speed for operation is 150 km/h (80 knots). The structure will withstand windspeeds of up to 227 km/h (120 knots) without damage

Air conditioning and equipment cooling air: Plant installed in the building provides an environment of 25°C at an r.h. of 50% with two air changes per hour, and also provides equipment cooling facilities

Equipment cooling (water): The water cooling system extracts surplus heat from the two transmitters and their associated waveguide loads, and rejects this heat to the airconditioning plant via a water/water heat-exchanger

A.C. Power Supply: Primary AC power is derived from an external source. The incoming three-phase supply is switched and metered in the radar building. The AC power required is 415V+5%, 3-phase, 4-wire, 50 Hz+2% at approximately 250 kVA.

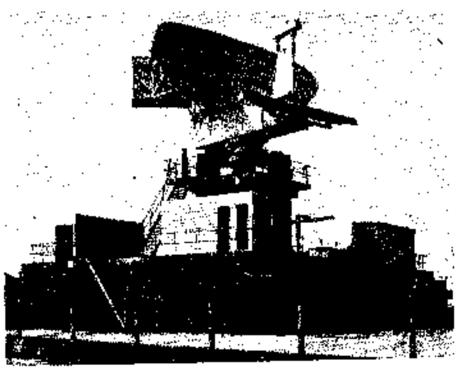
Coverage: Basic radar performance is shown in the Coverage Diagram.

The coverage is modified with the application of MTI and depends on the Mode employed, the beam in which the target is present, and whether or not the target is within a clutter gated area.

The effect of using a single transmitter only is to reduce the noise limited range performance by 16% and within the clutter gated areas to increase the velocity band in which detectability is reduced

Relative height accuracy: At a range of 185 km (100 nm) the relative height between two 4m^2 targets at similar plan positions and between altitudes of 4,575 m (15 000 ft) and at least 18,300 m (60 000 ft) is measured with a root mean square (r.m.s.) accuracy of 366 m (1 200 ft). This relative height accuracy is maintained so long as the two targets are not separated in elevation by more than one beamwidth, i.e. approx 4,270 m (14 000 ft) vertical separation at 185 km (100 nm) range

Absolute height accuracy: Height is measured with an absolute accuracy of 457.5 m (1 500 ft) r.m.s. on target of 4m^2 at 12 200 m (40 000 ft) at 185 km (1)) nm) range. (Allowance has been made for the effect of a 129 km/h (70 knot) wind on the aerial, but not for local atmospheric anomalies.)



40-series volumetric radar for static air defence systems

Effect of ground clutter on height accuracy: The foregoing figures for height accuracy are degraded for any measurement in which ground clutter is detected at exactly the same plan position as the target.

Except in the case of very severe clutter the degradation is only of significance when beam 1 is involved in the computation

Plan position accuracy and discrimination: The accuracy with which a target track is maintained and the power of the over-all system to resolve two closely spaced targets is dependent on the display and rate-aided tracking system as well as on the radar itself.

In the following characteristics the accuracy and discrimination are therefore quoted simply as limited by the parameters of the radar

Radar range accuracy: 100 m r.m.s.

Radar range discrimination: Two similar sized aircraft on the same bearing and separated by 100 m in range are recognizable as separate aircraft on a suitably expanded display.

This power of range discrimination is not of operational value and is purposely degraded by pulse stretching at the video output in order to obtain a brighter display of aircraft echoes

Radar bearing accuracy (beams 1-8): 0.2° r.m.s.

Radar bearing discrimination (beams 1-8): Two similar sized targets at the same range, but separated in bearing by 0.8° are recognized as separate targets

Radar bearing accuracy and discrimination (beams 9-12): In beams 9-12 the bearing accuracy and discrimination are scaled in accordance with the increased azimuth beamwidth.

In the case of targets at 12,200 m (40,000 ft) the tangential plan position accuracy is better than 450 m and the tangential plan-position discrimination is better than 1,800 m.

MANUFACTURER:
Marconi Radar Systems Ltd, Chelmsford, Essex, England.

2459.153
MARCONI L-BAND SURVEILLANCE RADAR TYPE S654

DESCRIPTION:
This is an L-band radar particularly designed to provide airways surveillance and TMA/approach control facilities for military air traffic control. The dual-beam, high rotation rate aerial, stabilised transmitter, low-noise receiver and digital signal processing provide continuous cover of the smallest fighters in the most adverse clutter conditions. Integrated plot extraction and display facilities provide varied operational systems.

CHARACTERISTICS:
Aerial:
Gain: 33 dB main, 30 dB auxiliary
Beamwidth: 1.7°
Sidelobes: −23 dB
Polarisation: Switched linear/circular
Max rotation rate: 15 rev/min
Transmitter:
Peak power: 2 MW or 800 kW
Pulse length: 2/5 microsec
PRF: 220/850
Receiver:
Noise figure: 2.8 dB
Signal processor:
Stagger: Six period or random
Cancellation ratio: 40 dB static
Max MTI range: Better than 120 nautical miles
MANUFACTURER:
Marconi Radar Systems Ltd, Chelmsford, Essex, England.

2462.153
MARCONI LONG-RANGE HEIGHTFINDING RADAR TYPE 669

DESCRIPTION:
This is a long range S-band height finder radar capable of providing at least 17 heights per minute with an overall accuracy of ±457 m (1,500 feet) at 280 km (150 nautical miles). Discrimination at this range is better than 247 m (900 feet). Modes of operation are single shot, automatic or manual searchlight, burn-through, volumetric and sector scan. The single curvature linear fed aerial has very low sidelobes and is hydraulically driven for minimum response times. Either manual or automatic height extraction is available.

This radar is a derivation from the S269 radar, fourteen of which are used in the NADGE chain stretching 3,000 miles from Norway to Turkey, itself a derivation from the S244.

CHARACTERISTICS:
Aerial:
Gain: 40 dB
Vertical beamwidth: 0.6°
Sidelobes: −20 dB
Nod duration: 2 sec
Slew rate: 90° in 2.5 sec
Transmitter:
Peak power: 2.52 MW
Pulse length: 2.5/5 microsec
PRF: 300/600
Receiver:
Noise figures: 3.8 dB

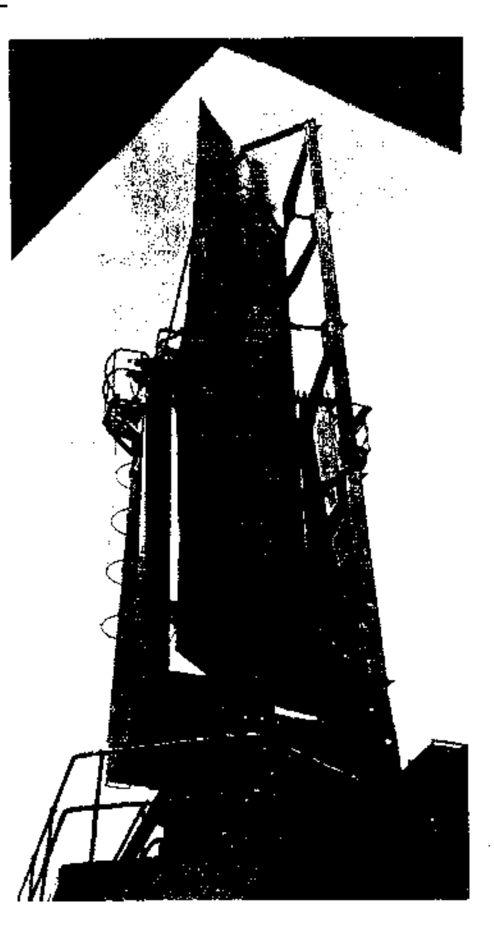
Marconi Radar Systems Ltd, Chelmsford, Essex, England.



Heightfinding radar type 669

2463.153
MARCONI MOBILE AND TRANSPORTABLE TACTICAL CONTROL RADARS

DESCRIPTION:
This entry relates to a pair of radars, Types S330 and S404, developed on a British defence contract for use with the Thunderbird guided weapon System (**2460.131**).

Little information concerning these radars is available for publication. The S330 is a surveillance radar with back to back aerials working in S band and L-band; the S404 is a heightfinder working in C band. In operation these radars are used for tactical control in association with a sophisticated display and data processing system such as Nomad (**2421.181**). Further details of methods of operational use can be found in the entries for Thunderbird and Nomad and in that for

Thunderbird 22 (**2461.181**).

Both radars are fully mobile and air-transportable. They are not, however, the only mobile and transportable Marconi radars and attention is drawn to entry **1168.153** which deals with the S600 series.

MANUFACTURER:

Marconi Radar Systems Ltd, Chelmsford, Essex, England.

2480.153
MARCONI TRANSPORTABLE TACTICAL RADAR TYPE S259

DESCRIPTION:

Type S259 is an air-transportable L-band tactical radar with limited ground mobility. It comprises a demountable aerial, a 2 MW transmitter and sophisticated receiver, signal processing and display equipment, all units except the aerial (which is pallet-mounted for transport together with sundry ancillary equipment) being contained in two container cabins.

The aerial has a light tubular and mesh reflector, of modified parabolic shape, which divides into three sections. This reflector is illuminated by a boom-mounted feed horn to give horizontal and vertical beamwidths of 3.8° and 10°, the pointing angle in the vertical plane being adjustable from −2° to +5°. The feed horn incorporates an IFF dipole which produces an IFF radiation pattern coincident with the primary pattern.

A 2 MW transmitter-receiver from the S600 series (Type S2011 – see **1168.153**) is used. This generates a 5 microsecond radiated pulse and provides received echoes in the form of linear and logarithmic pulse-length discriminated (PLD) video. The linear output can be processed by a double-cancellation MTI system and MTI or PLD outputs can be selected at will. The signal processing sub-system also includes provision for pulse recurrence frequency discrimination (PRFD) and double p.r.f. stagger (PRFS). Controls are provided to enable PRFD and PRFS to be switched in or out and to adjust the MTI range. Transmitter run-up and frequency changing can also be controlled remotely from the display cabin as also can the IFF system.

A single 12-inch autonomous display unit is supplied as standard with provision for a second unit. Provision is made for two primary radar video outputs and one IFF output. A passive IFF decoder is incorporated. Cabin air-conditioning and wave-guide dry air supply equipment is mounted on the transport pallet for the aerial.

CHARACTERISTICS:

Transmitter peak power: 2 MW
Receiver noise factor: 4.5 dB
Beamwidth: Horizontal 3.8°. Vertical 10°
Sidelobes: Horizontal: −26 dB with respect to main lobe. Vertical: −20 dB with respect to main lobe
Gain: Greater than 27 dB
Rotation rate: 0-15 rev/min. variable
Tilt: −2° to +5° manual adjustable
Aerial dimensions: Horizontal: 4.88 m (16 ft). Vertical: 1.45 m (4 ft 9 in)
Cabin dimensions: Height 1.91 m (6 ft 3 in). Depth: 1.93 m (6 ft 4 in). Width: 3 m (9 ft 10 in)
Insulation factor: U=0.15
Pallet dimensions (loaded): Height: 2.43 m (7 ft 8 in). Dpeth: 2.9 m (9 ft 6 in). Width: 3.5 m (11 ft 6 in). Weight: 1800 kg (4000 lb)

MANUFACTURER:

Marconi Radar Systems Ltd, Chelmsford, Essex, England.

1168.153
MARCONI S600 SERIES RADARS

DESCRIPTION:

The S600 range of radar equipment incorporates 13 different types of aerial heads, five different transmitters and a wide range of signal processing equipment built in modular form. Marconi Myriad Computers can be integrated with this basic equipment together with data displays, to provide advanced data handling facilities for any system. IFF secondary radar can be incorporated, the aerials fitting onto any of the surveillance radar heads.

Different combinations of the equipment can be used to form radar systems covering any of the following functions – ground control of interceptors (GCI), tactical control for weapon systems, early warning and reporting, general air surveillance, military or civil air traffic control, coast watching etc.

TRANSPORTABLE INSTALLATIONS:

A number of the radar heads in the S600 series have been specially designed for rapid transportation. Complete aerials, built onto wheeled chassis have been designed with sections of the aerial folding away to form a compact package which can be stowed in most of the military transport aircraft currently in use. The electronics can be built into mobile containers with removable wheel units for stowing in an aircraft. All the units are sufficiently compact and light to be lifted by existing military helicopters.

The containers which house the electronic equipment will take any two S600 transmitter/receivers and associated signal processing equipment. Alternatively with only one transmitter, a single container can house data handling and display equipment.

TRANSPORTABLE SURVEILLANCE AERIALS:

Type S1015: 5.49 × 1.83 m parabolic S-band
Type S1010: 5.49 × 1.83 m cosec^2 S-band
Type S1016: 5.49 × 1.83 m cosec^2 L-band

TRANSPORTABLE HEIGHT-FINDER AERIAL:

Type S1017: 4.27 × 1.3 m C-band aerial

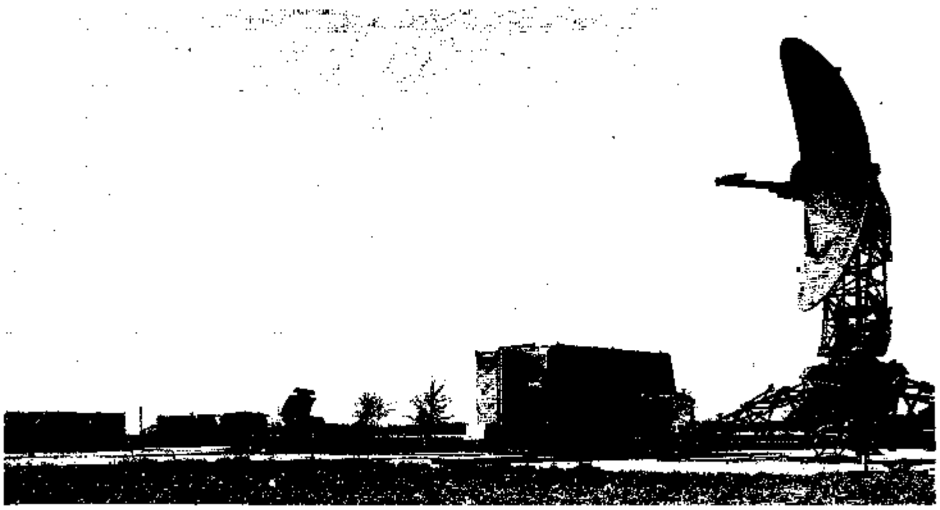
STATIC SURVEILLANCE AERIALS:

Type S1011: 13.72 × 4.57 m parabolic S-band
Type S1012: 13.72 × 4.57 m cosec^2 S-band
Type S1013: 13.72 × 4.57 m parabolic L-band
Type S1014: 13.17 × 4.57 m cosec^2 L-band

Back-to-back combined L-band and S-band aerials having the characteristics of either S1011 or S1012 combined with those of S1013 or S1014 (four combinations in all) can be constructed (see, for example, Type S631 in entry **2458.153**).

STATIC HEIGHT-FINDING AERIALS:

Type S1006: 12.19 × 2.13 m S-band aerial (wavelength 10 cm)



S600 units deployed

AERIAL FEEDS:

The S600 surveillance aerials are a new range having single curvature reflectors. An advanced type of feed system is employed, (known as a "squintless feed") which provides accurate distribution of the radar signal over the surface of the aerial reflector. Operated in conjunction with a suitable multiplexer, up to five transmitters can be operated simultaneously into one aerial.

TRANSMITTER/RECEIVERS:

The S600 Series uses five transmitter units whih can provide signals for any of the combinations of radar heads.

Except for thyratrons and RF output valves, solid-state techniques are employed throughout; microelectronic circuits are used where they enhance the equipment's performance, or represent an over-all saving in cost. The transmitters are:

Type S2010: 1 MW S-band
Type S2011: 2 MW L-band
Type S2012: 2.25 MW S-band
Type S2013: 1 MW C-band
Type S2021: 800 kw L-band

Each of these transmitter units has three separate sections, one containing the modulation equipment, another the output stage and radio frequency equipment and the third, control equipment, automatic frequency control, trigger circuits, the receiver circuits and the first stages of the radio frequency circuits. In addition, there are integrated test facilities to maintain an almost continuous check on the important parts of the equipment. A performance monitor is also available, as a separate unit, to provide data on the equipment; it can be used to measure the performance of a number of transmitters where multiple transmitters are employed for diversity operation.

Interior of a typical cabin

DIVERSITY OPERATION:

This technique of combining the outputs of more than one transmitter into a single aerial gives the operational advantage of wider frequency coverage, higher total power and diversity reception, thus considerably enhancing over-all performance. A sharp cut-off multiplexer enables up to five separate transmitters to be operated simultaneously, within a region which is 10% of the frequency band.

SIGNAL PROCESSING:

The S600 Series employs a number of sophisticated signal processing techniques all of which are built in solid state. The suppression of clutter using this signal processing equipment is claimed to be superior to that of any previous radar system of comparable cost. The basic receiver system has a parametric amplifier input and linear or logarithmic PLD video output; and provision is made for the incorporation of a full ECCM receiver system. A double-cancellation MTI system is incorporated and PRF stagger or PRF discrimination can be added.

ADDITIONAL FACILITIES:

Additional facilities giving more specialised signal processing have been developed by Marconi. One of these techniques is called doppler cancellation which allows slowly moving localised clutter to be eliminated. Clutter of this type can be caused by the weather or by radar blocking devices such as chaff.

DEVELOPMENT:

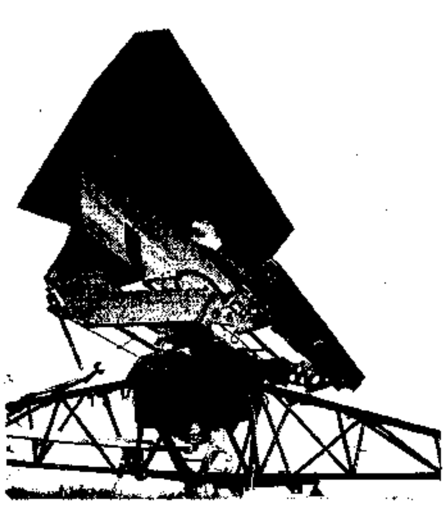
The S600 Series was developed by Marconi as a private venture and was first revealed in late 1967. Some of the radars in the series are identified in the following list which incorporates some cross-references to other entries.

S600-S613	All transportable/mobile radars (S600-605 are surveillance radars)
S600	S-band IMW with parabolic aerial
S600H	As S600 with cosecanted aerial
S604H	L-band 2 MW with cosecanted aerial
S605H	As S604H with second (diversity) transmitter
S613	C-band heightfinder (**2479.153**)
S614-S6—9	All static radars
S614L	S-band IMW low-cover
S630	Back-to-back S-band and L-band with two pairs of transmitters in frequency diversity
S631	Back-to-back S-band and L-band with high-power transmitters in multiple diversity (**2458.153**)
S635	S-band IMW with parabolic aerial
S635H	As S635 with cosecanted aerial
S637	C-band IMW heightfinder
S638	L-band 2 MW with cosecanted aerial
S647	Back-to-back S-band and L-band with high-power transmitters (**2458.153**)
S654	Back-to-back L-band 2 MW. Special aerial (**2459.153**)
S669	S-band high-power heightfinder (**2462.153**)

CHARACTERISTICS:

Typical characteristics of the main range of surveillance radars are:

	S-band	L-band
Aerial:		
Gain:	37 dB	28 dB
Beamwidth:	1.4°	3.2°
Sidelobes:	Both horizontal/circular	
Max. rotation rate:	15 rpm	
Transmitter:		
Peak power:	1 MW	2 MWW
Pulse length:	2.5/50 microsec	
PRF:	300/600	
Receiver:		
Noise figure:	3.8 dB	2.8 dB
Signal Processor:		
Stagger:	Six period or random	
Cancellation ratio:	40 db static	
MAX. MTI range:	120 nautical miles	



S600 Series transportable surveillance radar deployed for use

STATUS.

Various radars from this series have been supplied to the UK Government, NATO, and several other countries.

MARCONI S613 HEIGHTFINDING RADAR

DESCRIPTION:

This is a mobile/transportable heightfinder radar working at C-band. It integrates with any of the surveillance radars in the S600 to S605 range, utilising the same form of construction. The digitally controlled aerial is capable of providing 22 heights a minute and the height is automatically extracted, a unique facility in mobile systems. Modes of operation are normal, sector scan and volumetric scan.

TYPICAL CHARACTERISTICS:

Aerial:

Gain: 39.5 dB

Vertical beamwidth: 0.9°

Sidelobes: —25 dB

Nod duration: 2 sec

Slew rate: 180° in 2 secs

Transmitter:

Peak power: 1 MW

Pulse length: 2/5 microsec

PRF: 300

Receiver:

Noise figure: 4.5 dB

MANUFACTURER:

Marconi Radar Systems Ltd, Chelmsford, Essex, England.

Marconi S613 height finder radar

MARCONI 800 SERIES RADARS (LAND-BASED)

DESCRIPTION:

The Marconi 800 series of surveillance and tracking radars was introduced in 1972. The early members of the series (type numbers in the range 801-839) are all naval radars and are described in the next section of the book. Type numbers in the ranges 840-849 and 850 onwards have been allocated to coastal defence radars and land-based weapon radars respectively. Several radars of these types have so far been announced and are briefly described below.

Type S841 is a mobile coastal defence surveillance radar which provides and continuously updates accurate range and bearing co-ordinates on surface targets for weapon fire control systems.

The radar operates at a fixed frequency, selected in the band 9.3 to 9.5 GHz; it incorporates track-while-scan, digital range and bearing data extraction and has an autonomous fixed coil display. The aerial is a 2.44 m (8 ft) linear array with a parabolic reflector.

Greater operational flexibility is achieved by Type S842, which is similar to Type S841, except that a broader band squintless feed aerial system is used and the transmitter is tunable over the frequency range 8.6 to 9.5 GHz.

The ST850 target tracking radar and television system has been designed, in co-operation with Short Bros. and Harland, as an integral part of the Tigercat weapon system (**2465.131**) to improve its performance in conditions of poor visibility by giving a dark fire capability.

The ST850 is contained in a mobile air conditioned cabin with the radar director on its roof. The system is simple to use, is flexible in operation and can be speedily deployed. This radar is more fully described in entry **2466.153**. The ST851 target tracking radar is a derivative of the ST850 which incorporates a Sperry general-purpose digital computer for the prediction of aim-off to give blind fire gun control. Without the television system, this unit will control small calibre rapid fire anti-aircraft guns and the complete equipment gives maximum flexibility to a combined missile/gun point defence system.

The S860 and S865 are mobile surveillance radars designed to support the ST850 and ST851 through the provision of target positional data. The S860 is a manned cabin with a dual operator position feeding target coordinate data to up to three fire control units. The S865 is housed in a smaller unmanned cabin from which radar data is transmitted, again, to up to three fire control units. In this case, however, the fire control units are provided with their own ppi displays so that target indication can be carried out by the fire control operator.

MANUFACTURER:
Marconi Radar Systems Ltd, Chelmsford, Essex, England.

2482.153
MARCONI/RRE SHRIMP BATTLEFIELD SURVEILLANCE RADAR

DESCRIPTION:
Jointly developed by Marconi-Elliott Avionic Systems and the Royal Radar Establishment, Shrimp is a very light J-band surveillance radar, which can detect moving vehicles and men at ranges up to 3 km and 1 km respectively. Total system weight including tripod mount and accessories is only 8.5 kg; but the radar can also be supported on a harness carried by one man in which case the weight is only 3.5 kg.

No other details of consequence had been received by press date.

STATUS:
Believed to be at an advanced development stage

MANUFACTURER:
Marconi-Elliott Avionic Systems Ltd, Elstree Way, Boreham Wood, Herts, England.

2415.153
PLESSEY ACR 430 AIRFIELD CONTROL RADAR

DESCRIPTION:
This X-band radar has been designed principally as a simple and inexpensive airfield aid for precision azimuth approach guidance and local area surveillance. Suitable for use with all types of aircraft, it may also be used for monitoring other landing aids, for marshalling traffic and for other surveillance duties.

Extensive use is made of fibreglass construction for strength and low weight, and solid state and integrated circuit design are used throughout. Installation is facilitated by the breakdown of the radar head equipment into readily handled sub-assemblies.

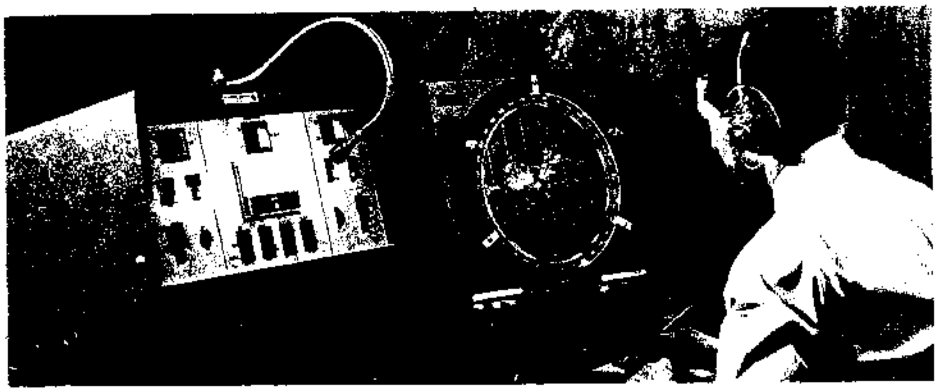
Two separate coverage beams are radiated and the associated equipment channels use identical parallel electronic units which may be rapidly interchanged. Reliability is thus further improved by parallel redundancy giving high operational availability.

A double curvature aerial is illuminated by two horns, each of which is coupled to a transmitter/receiver. One horn produces a cosecant pattern; the other produces a pencil beam which is geometrically centred to provide the high degree of accuracy necessary for approach guidance. Aerial rotation rates of either 20 or 40 rev/min can be selected from the remote control unit.

The two transmitter/receivers, together with their power units, are located in a housing at the back of the aerial. Each transmitter provides a peak power of 50 kW. The signal output at intermediate frequency is passed by cable to the remote radar control unit. The two IF receivers housed in this unit provide a wide range of receiver modes for interference and clutter rejection.

In a standard installation the remote control unit is associated with two 305 mm diameter autonomous rotating coil displays; and the three units may be remoted from the aerial site by up to 1,000 metres without the need of line amplification. Each display has a switchable electronic approach line and electronic bearing marker whilst a comprehensive switching arrangement enables alternative horn/transmitter/receiver/display combinations to be selected.

Considerable attention has been given to minimising installation and maintenance time. The complete equipment consists of the aerial assembly (with transmitter/receivers built in) and the two displays and control unit. With the exception of the input power cables, the only cable required to be installed on site is the cross-site cable connecting the aerial assembly to the remote control unit.

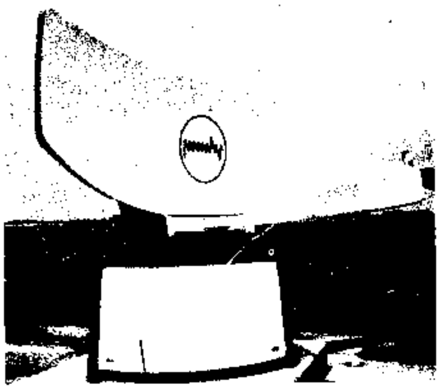


ACR 430 control unit and display

HISTORY:
Development of this radar was started in 1968 and the first prototype completed in 1969. The equipment is used by the British Government, local authorities and several overseas countries.

CHARACTERISTICS:

Radiation:
Frequencies: 9,320 ± 20 MHz and 9,460 ± 20 MHz
Polarisation: Circular (fixed)
Aerial:
Rotation rate: 2 speeds 20 ± 10% rev/min and 40 ± 10% rev/min in wind speeds of up to 55 knots with survival in wind speeds up to 120 knots
Tilt: 0 deg to + 18 deg adjustable from radar control panel (tilt is referred to nose of low beam)
High beam: Horizontal beamwidth 0.55 deg at — 3 dB points: Vertical beamwidth 2.5 deg cosecant squared to greater than 25 deg
Low beam: Horizontal beamwidth 0.55 deg at — 3 dB points: Vertical beamwidth 2.5 deg at — 3 dB points
Transmitters:
Magnetron peak power: 50 kW nominal
Pulse duration: (a) 0.1 microsec; (b) 0.5 microsec
Receivers:
Noise factor: Not worse than 10 dB
Frequency control: Automatic and manual
Characteristics: Linear: Linear differentiation; Logarithmic; Logarithmic differentiation; Wideband limiting; Pre-set sensitivity time control variable in range and level (all selected at radar control unit)
Displays:
Type: Autonomous rotating coil, desk-mounted plan position indicators
Quantity: Two displays are provided as standard equipment



Plessey 430 Airfield Control Radar Aerial assembly

Range scale: 4, 8, 16 or 32 nautical miles (7.4-29.3 km) per display radius
Range accuracy: Better than 10% of the range selected
Range ring accuracy: Better than 1% of the indicated range down to ½ nautical mile (0.93 km)
Azimuth accuracy: Better than ± 0.5 deg. The display system automatically aligns in azimuth
Environmental:
External temperature: —40 deg C to + 70 deg C
Internal equipment temperature: 0 deg C to + 40 deg C

MANUFACTURERS:
Plessey Radar, Addlestone, Weybridge, Surrey, England.

1140.153
PLESSEY AR-1 SURVEILLANCE RADAR

DESCRIPTION:
10 cm band, single-beam surveillance radar of modular design for fighter recovery, GCA surveillance, low-level surveillance, coastal surveillance and target acquisition.

Coverage on Canberra-type aircraft extends to 120 km (75 nm) and over 12,000 metres (40,000 ft) with a single transmitter. With the transmitters in frequency diversity the coverage is 157 km (85 nm) to over 15,250 metres (50,000 ft) at 80% detection probability. (see coverage diagram).

DEVELOPMENT:
The AR-1 was developed as a private venture in 1963 and entered service in 1964.

More than 100 AR-1 units were ordered by the British Government and other countries.

The AR-1 has now been superseded in production by the AR-15 (**2456.153**).

MANUFACTURER:
Plessey Radar, Addlestone, Weybridge, Surrey, England.

2484.153
PLESSEY AR-3D THREE-DIMENSIONAL AIR DEFENCE RADAR

DESCRIPTION:

The following brief notes relate to a new radar introduced by Plessey Radar Ltd shortly before our press date for this section.

AR-3D is an S-band air defence surveillance radar giving three dimensional information on targets by mechanically rotating the radar beam in azimuth and electronically scanning in elevation. The latter process is carried out by using the "squint" effect of frequency variation when using a linear array. The aerial feed is such a linear array comprising a vertical waveguide, whose internal stepped construction slows the velocity of propagation within the guide and an array of slot radiators from the guide. By slowing the internal wave a substantial beam deflection can be achieved by means of a modest frequency variation.

A long pulse is radiated and the transmitted frequency swept within the pulse – the sweep waveform being adjusted to vary the dwell time with change of sweep angle so as to obtain the appropriate effective coverage pattern. Target returns are thus centred on frequencies which indicate target elevation angle with each pulse. The returns are filtered at the receiver to give the required effective elevation "lobing" in coarse sectors of about 2° each. Returns from each "lobe" are then pulse compressed using a new design of acoustic surface wave equaliser to give an effective pulse length of 0.1 microsecond. Fine angle measurement is then made by frequency measurement on the compressed pulses.

CHARACTERISTICS:

Coverage: Adjustable. Typically 180 nm on 2 sq m target

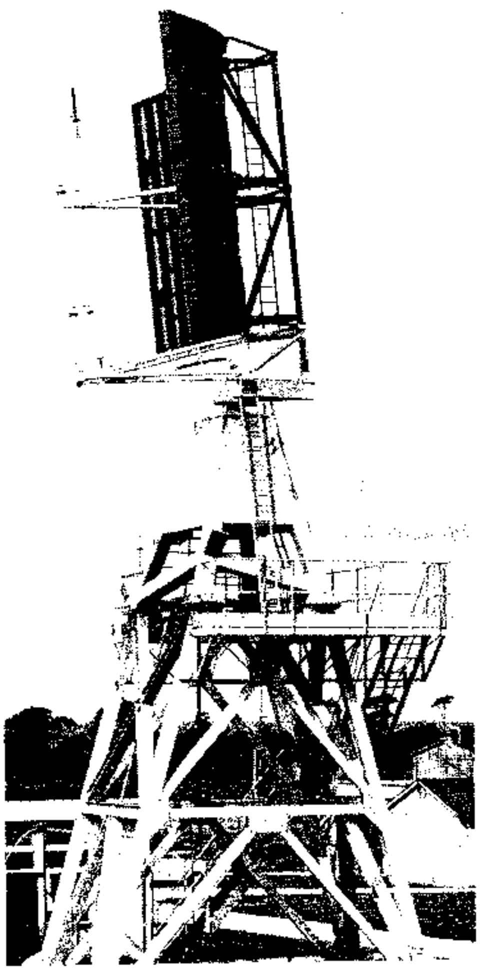
Radiation: Frequency selective within S band. The operating bandwidth is 200 MHz. Independent frequency selective filters for each of thirteen elevation channels, each having a band-width of approximately 20 MHz. The data below refers to linear polarisation.

Antenna:
Type: Linear array and parabolic cylinder
Polarisation: Horizontal
Beamwidth (azimuth): 1°
Beamwidth (elevation): 2°
Peak Sidelobe (azimuth): 25 dB
Peak Sidelobe (elevation): 23 dB
Scanning Angle: 30°
Adjustment: +4°–2°
Gain: 41.3 dB
Rotation Rate: 6 rev/min
Transmitter:
Peak Pulse Power: 1.11 MW
Mean Power: 10 kW
PRF: 250 pps
Frequency Band: S-band
Bandwidth (to 1.0 dB): 200 MHz
Pulse Length: 36 microsec
PA Tube: High power klystron grid modulated
Transmit Modes: Continuous or fast on/off
Receiver:
No. of Elevation Channels: 13
Bandwidth: 20 MHz/channel
Compression Ratio: 130:1 (lower channels)
Accuracy:
Elevation: 0.15°
Range: 15 m
Range Resolution: 40 m

STATUS:

An experimental model in an advanced development state was publicly demonstrated in June, 1974. Production models will use a new 1 MW klystron developed under UK government contract and the aerial will be somewhat larger than that illustrated here.

MANUFACTURER:
Plessey Radar, Addlestone, Weybridge, Surrey, England.



Experimental/demonstration model of Plessey AR-3D air defence radar aerial

2456.153
PLESSEY AR-15 SURVEILLANCE RADAR

DESCRIPTION:

Developed from the successful AR-1 series (**1140.153** above), the AR-15 is also an S band surveillance radar of modular design and suitable for operational uses similar to those for which the AR-1 was designed but including a so a mobile role (see **1141.153** below). The basic modules of the AR-15 can be used to provide a range of fixed installations with either single or dual transmitter/receivers.

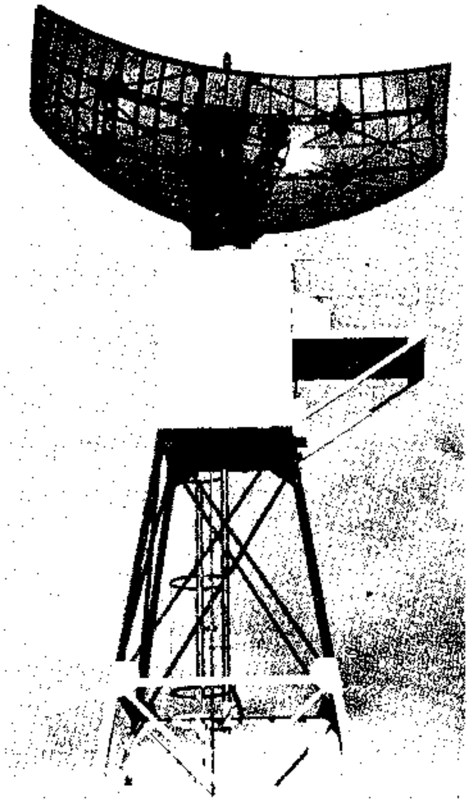
AR-15 coverage is similar to that of the AR-1 and the coverage diagram accompanying entry **1140.153** is representative also of the AR-15.

CHARACTERISTICS:

Frequency: Spot frequencies in the bands 2880 MHz to 3020 MHz (Alternative available)

Polarisation: Variable from linear through elliptical to circular. The performance figures quoted in this specification refer to linear polarisation.

Aerial:
Gain: 32 dB ± 1 dB relative to isotropic radiator
Horizontal aperture: 488 cm
Horizontal beamwidth: 1.5° to half power points
Vertical aperture: 198 cm
Horizontal sidelobes: –21 dB relative to maximum aerial gain within ±5°, –24 dB outside ±5°
Rotation rate: 15 rev/min clockwise. (At 50 Hz



Plessey AR-1 surveillance radar

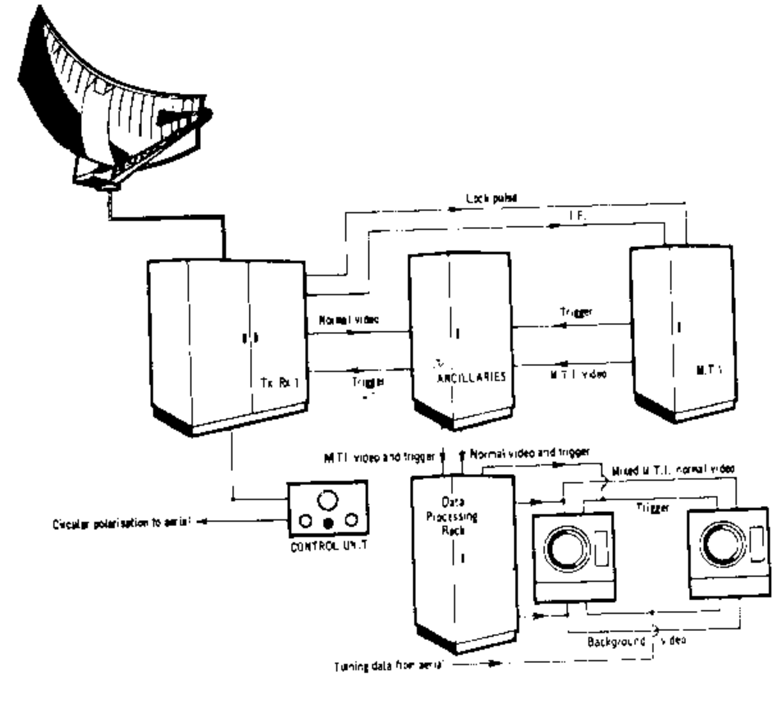


Diagram showing AR-1 radar system options

supply)
Windspeeds: Turning 70 knots. Survival 120 knot gusts
Transmitter:
Magnetron peak power: 625 kW nominal
Pulse length: 1 microsecond
Pulse recurrence frequency: 700 pps
Frequency range: (1) 2,700 to 2,900 MHz. (2) 2,900 to 3,100 MHz under local oscillator control
Receiver (Paramp):
Noise factor: Not worse than 4.5 dB
Intermediate frequency: 30 MHz
Overall bandwidth: 1.2 MHz
Automatic frequency control: AFC facility provided on magnetron
Receiver characteristics: Linear, Log, Linear plus differentiation, Log plus differentiation. (Selected at radar control unit)
Moving target indication: Digital MTI with cancellation ratio of 33 dB is fitted. This provides a typical SCV of 27 dB

DISPLAYS:
Transistorised fixed coil displays from the Plessey range.

STATUS
The AR-15 entered service in 1972 and is now in use overseas.

MANUFACTURER:
Plessey Radar, Addlestone, Weybridge, Surrey, England.

1141.153
PLESSEY AR-15 MOBILE SURVEILLANCE RADAR

DESCRIPTION
This is a mobile version of the AR-15 surveillance radar. Its performance is the same as for the static version (**2456.153**) but the equipment configuration is in some respects different.

The system is mobile with a cross-country capability which includes the possibility of deployment in desert conditions: the equipment is installed in containers which can be loaded into C-130 transport aircraft when detached from the trailers. The configuration of equipment is as follows:

Aerial Trailer:
A special purpose trailer which carries the aerial cabin, aerial and turning gear, with the IFF antenna mounted on the primary radar aerial reflector. Facilities for stowage of the off-mounted reflector and the other ancillary items are included.

Radar Container:
A container and trailer, which contains the radar transmitter-receiver equipment and the IFF transmitter-receiver, and has space for workshop facilities.

Radar Display and Radio Container:
A container and trailer which contains up to three radar displays, the IFF decoding equipment and up to three VHF/UHF transceivers with appropriate controls.

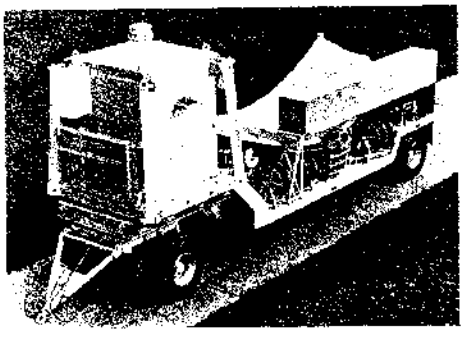
Diesel Generators:
Two mobile diesel generators are used for supplying power to the system. One of these is for stand-by purposes. In addition further cabins can be provided to house the crew and to provide mess facilities if required. The two diesel generators have adequate power to provide the local domestic supply for the crew.

AR-15 mobile system as deployed

DEVELOPMENT:
1970-1971.

STATUS.
In overseas service.

MANUFACTURER
Plessey Radar, Addlestone, Weybridge, Surrey, England.



Mobile radar aerial in road trim

2416.153
PLESSEY AR-5D AIR DEFENCE RADAR

DESCRIPTION.

This recently introduced radar is designed for the long range detection of small targets at both high and low levels. Operating in L band it has a maximum range coverage of 550 km, but its discrimination and short range performance are adequate to make it suitable for fighter recovery and marshalling as well as for long range detection.

The design concept provides for single and diversity transmitter-receiver configurations for maximum reliability and resistance to electronic countermeasures (ECM); and for use in conjunction with specialised ECCM receivers.

Particular attention has been paid to signal processing techniques which provide well defined aircraft responses in a form suitable for easy viewing by controllers using PPI displays and for compatibility with computer controlled data handling in air defence systems. IFF is available and can be fitted.

PERFORMANCE

Coverage is shown for typical military supersonic aircraft, using parameters selected to give maximum range.

The maximum display range of the AR-5 can be either 370 or 550 km depending upon the requirement. The high level coverage provided is sufficient to enable even the smallest aircraft to be tracked at maximum operational altitude. Low coverage at close range is also good and, subject to local siting limitations, it is possible to track aircraft to within 1.8 km of the aerial head. This performance is more than adequate for fighter recovery purposes whilst the ability to track fighters from take-off greatly simplifies operations by eliminating hand-overs from short-range to long-range radars.

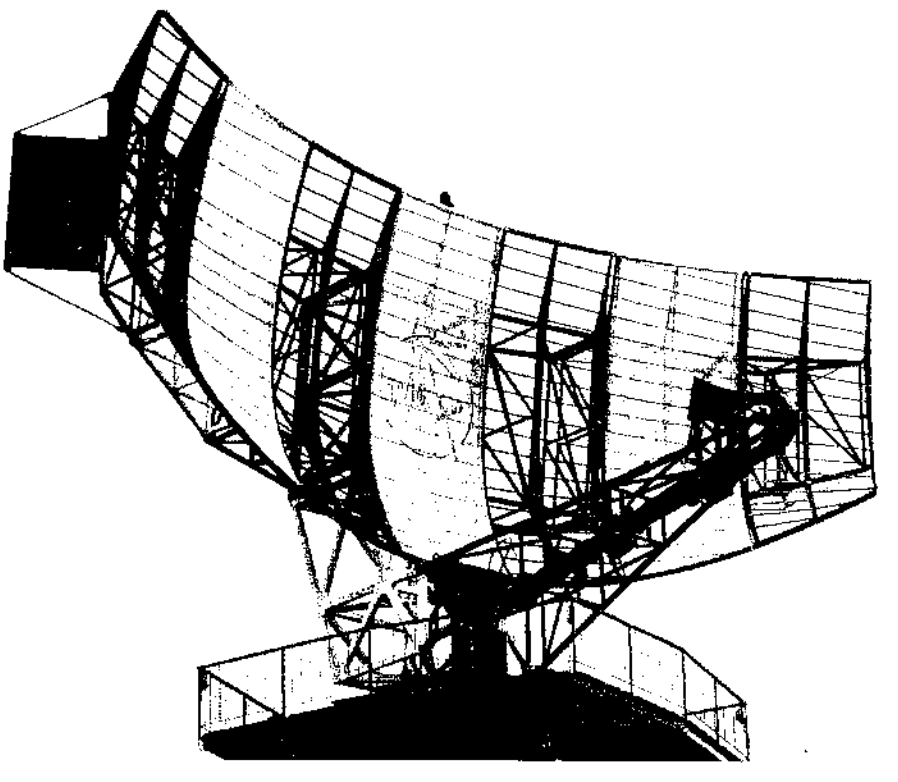
Two horns are used in the aerial feed system to derive the overall coverage pattern. The primary horn is used for both transmission and reception and provides the main pattern. The second horn, used for reception only, is fitted immediately below the primary horn and is adjusted to give a separation in elevation of approximately 5 deg between the axes of maximum gain of the two horns. The use of the second horn ensures adequate suppression of 'angels' whilst maintaining full coverage on wanted targets. Appropriate r.f. switching between the primary and secondary coverage patterns ensures that there is no loss of wanted targets.

Horizontal aerial beamwidth is 1.2 deg which provides an azimuth discrimination of 1 deg, thus ensuring that aircraft passing at a range of 370 km will be shown as separate echoes when separated by only 7.5 km. This, coupled with a range resolution of less than 290 m at maximum range, allows full control in the final stages of an interception.

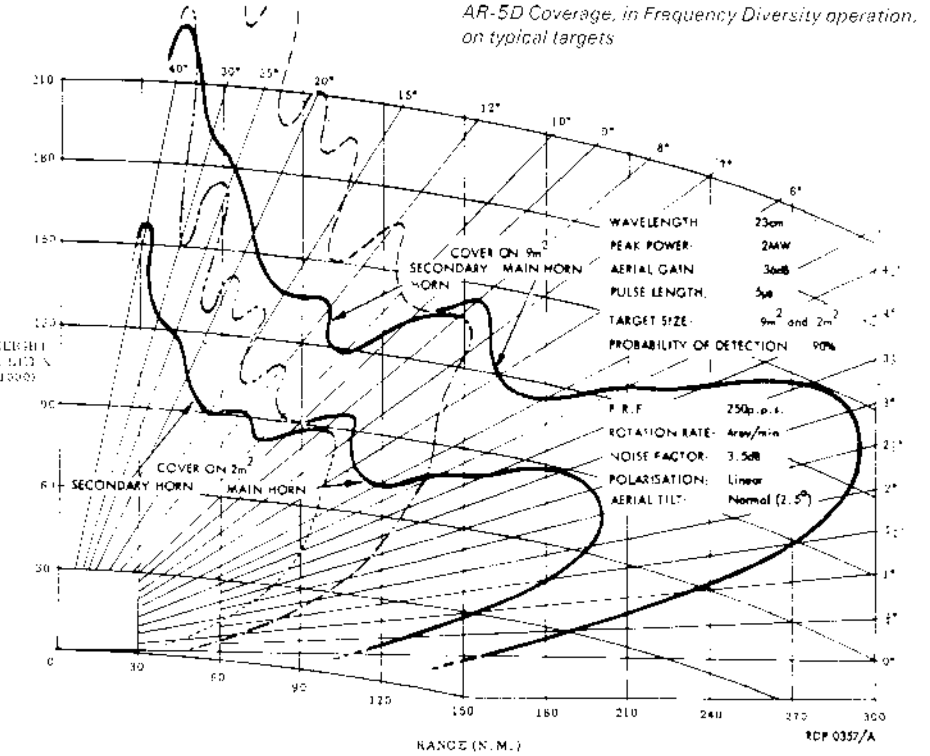
The standard aerial system has a rotation speed of 8 rev/min. This has been selected to meet the requirements of long-range detection, narrow aerial beamwidth and good MTI performance. The AR-5 employs a full transistorised digital MTI system which provides an overall sub-clutter visibility of 27 dB with the aerial rotating at 8 rev/min. PRF stagger is used to reduce the number of blind speeds. Using a single transmitter, the first blind speed is approximately 1,050 knots but with two transmitters operating in frequency diversity, there are no blind speeds within the performance capability of any envisaged aircraft.

Facilities are provided for superimposing raw radar video onto MTI video to enable the aircraft controller to select a background of permanent echoes which will not obscure aircraft returns. This facility enables the controller to provide a measure of terrain clearance to aircraft flying in the vicinity of high ground.

Weather returns are suppressed by use of variable linear to circular polarisation. Advantage is taken of the good target-to-clutter ratios at 23 cm operation to employ special receiver techniques for added improvement should any residual



AR-5D aerial



AR-5D Coverage, in Frequency Diversity operation, on typical targets

clutter remain after the introduction of circular polarisation.

CHARACTERISTICS.

Radiation:

Frequency: 1 or 2 frequencies in band 1,250 to 1,365 MHz. Each transmitter can be supplied optionally to operate on up to 4 selectable frequencies

Diversity guard band: 35 MHz nominal

Polarisation: Variable linear and variable from linear through elliptical to circular

Aerial:

Gain: 36 dB relative to isotropic radiator

Horizontal beamwidth: 1.2 deg at half-power points

Vertical beamwidth: 3.5 deg to half-power points with shaping to 40 deg

Aerial rotation rate: 6 to 15 rev/min single speed with option of half speed switching

'Angel' suppression: A second (receive) r.f. feed is provided

Transmitter:

Output valve: Tunable magnetron

Power output: 2.0 MW peak

Pulse length: In the range 2 to 5 microsec

Pulse recurrence frequency: in the range 250-750 pps with 7-period stagger

Receiver:

Type: Parametric amplifier

Over all noise factor: Not worse than 3.5 dB

Intermediate frequency: 30 MHz

Characteristics: Switchable to linear, logarithmic, Dicke f.x, ECCM logical (logarithmic with pulse length discrimination gated by Dicke-fix). Differentiation can be applied to any of these

Digital Moving Target Indicator:

Type: Double loop cancellation

Cancellation: Rack only 41.5 dB
Power Supplies:
Voltage: 380-440 V, 3-phase, +6%
Frequency: 50 Hz or 60 Hz
Power: 70 kVA total load at nominal 0.85 power factor and wind speed of 60 kt
Environment:
External equipment: Temperature, −40 deg to +70 deg C
Radar head equipment: Temperature, 0 deg to +55 deg C
Humidity: From 0 to 100%
Aerial: Rotation at 8 rev/min in wind speeds up to 80 kt (148 km/h) un-iced. Rotation at 8 rev/min in wind speeds up to 60 kt (111 km/h) iced up to 9.7 kg/sq metres. Survival in wind speeds up to 120 kt (222 km/h) un-iced

STATUS:

AR-5D has been selected by the British and other Governments and meets a wide range of operational requirements. Display systems are available to meet all applications from the simplest to the most complex computer-controlled Air Defence Control Centre.

The Plessey Type HF 200 Heightfinder Radar (**1142.153**) is of compatible performance and is normally supplied as the heightfinding element in ground controlled (GCI) systems.

MANUFACTURER:

Plessey Radar, Addlestone, Weybridge, Surrey, England.

1142.153
PLESSEY TYPE HF 200 HEIGHT-FINDING RADAR

DESCRIPTION:

This is a high power S-band nodding heightfinder which can be integrated with any plan radar. The nodding aerial has high gain (40 dB), a narrow vertical beamwidth (0.75 at 3 dB points) and fast slewing and nodding speeds can be imparted to the 35 ft (10.67 m) reflector by the action of two separate hydraulic systems. The maximum vertical sweep arc of the reflector is 36° but in the case of long range targets, where even at high altitudes the angle subtended is relatively small, the angle of sweep is automatically reduced as a function of range to avoid unnecessary waste of time and RF energy.

The hydraulic nodding system forms an integral part of the aerial structure and the hydraulic slewing system consists of a gearbox and motor on the aerial structure with an oil pump and control mechanism mounted in a box at the base of the aerial.

An S-band transmitter of 2½ MW peak power and an RF head which includes the receiver (which incorporates a selection of anti-jamming facilities) are contained in two adjacent cabinets.

Type HF 200 radar data is displayed upon a height range indicator (HRI). This may be associated with one or more azication PPI displays, height information being displayed upon a height scale at the HRI display and upon indicators at the PPI positions.

Relative heights between two aircraft may also be measured and the information indicated remotely.

Control of the aerial can be effected automatically from a suitable azication PPI whose operator adjusts a variable range and bearing marker line or symbol so that it coincides with the echo from the selected target. This action automatically applies position control signals to the hydraulic systems. The aerial slews on to the target bearing and the reflector nods over an angle sufficient to illuminate the target and the length of the height/range strobe on the HRI display alters to correspond to target range.

In computer-controlled data handling systems the aerial can be controlled automatically, the target height data being updated in a sequence determined by the computer programmes.

A basic control system based on verbal communication between PPI positions and the HRI operator is also available as a fundamental capability.

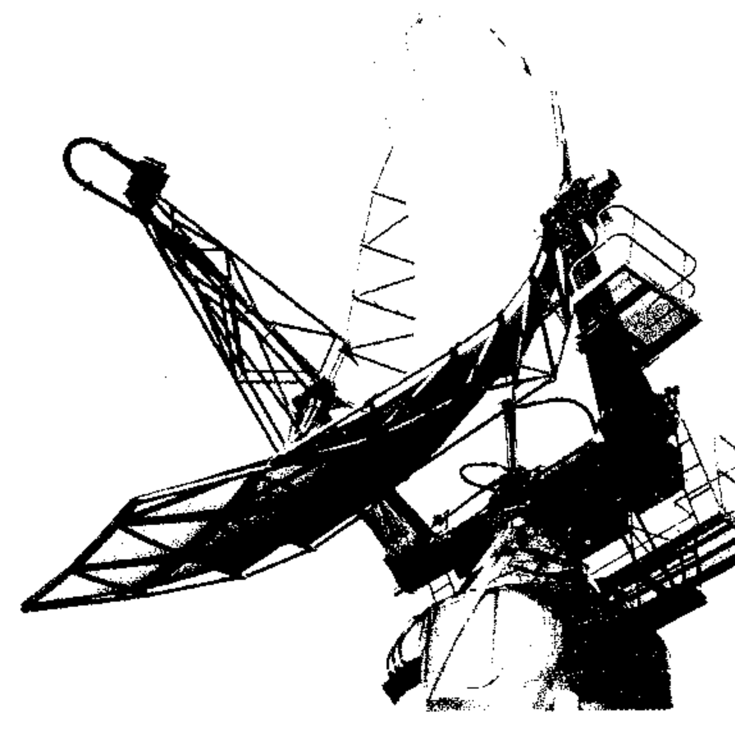
OPERATION:

The precise operational use for which the height data is intended determines the number of heightfinders and the nature and arrangement of the display equipment. For emergency early warning applications the heightfinder can be fitted for operating in a volumetric standby role over an adjustable azimuth sector which may be centred on any bearing.

Automatic Azication programming

This sub-system consists basically of a digital computer with a permanently wired-in programme. It is reliable, practically tolerance free and has operational flexibility.

A digital allocator uses a set of 14 bus highways in a ring-main configuration to couple all or any of the PPI to the allocator (up to 29 PPI may be used with one Type HF 200). Five of the highways specify a digital address which connects the designated PPI to the highway, five more specify the



Plessey HF 200 radar head

function of mode in that PPI and the remaining four carry a decimal number. A similar analogue system composed of some 8 bus highways is used to carry all the analogue information between the allocator and the PPI in use. Each PPI would have its own indicator unit for the height readout, complete with its own binary stores and decoders. It communicates exclusively with the digital allocator for all demands, height data and mode indication. Height requests are normally dealt with on a sequential basis, though selected PPI positions can request on a priority basis.

The allocator first scans the PPI positions sequentially for priority requests. If there are no priority requests and the aerial is free, the allocator will scan for non-priority requests and allocate control of the heightfinder accordingly. All PPIs have the facility for making absolute or relative height requests on a non-priority basis; priority facilities should be accorded only to certain selected PPI.

When a PPI position is granted control of the Type HF 200, the allocator conveys range and bearing information on the target in question to the HRI and aerial as required. After acting on this, the heightfinder system feeds target height information back to the allocator, where it is converted from analogue to digital form and routed via the digital highway to the height indicator of the requesting PPI. The height is indicated for a period of 30 seconds, or until the next request, and is represented by three figures and a decimal point, giving height in units of 100 ft.

Priority requests take precedence but any non-priority height processing already taking place in the system will be completed before attention is given to the priority request. A light indication appearing in place of the first figure on the digital height indicator (red for priority and green for non priority) informs the PPI operator that his request is next to be answered. A relative request will allow access to the height finder for two target height measurements, and the second readout will be the relative height between the two targets.

An extension of the allocator system permits the use of two Type HF 200 with up to 29 displays. In this case, two interface units optimise the use of the two heightfinders, while a control-allocator channels the PPI position requests and replies as already described.

DEVELOPMENT

Development was initiated in 1956 and the first prototype was completed in 1957. The first HF 200 entered operational service in 1958. Continuous development and improvement has been maintained since then.

CHARACTERISTICS:

Aerial System:
Reflector: Perforated aluminium alloy double curvature surface having a horizontal aperture of 2.44 m and a vertical aperture of 10.67 m
Polarisation: Variable, linear to circular (All figures given below are for linear polarisation)
Vertical beamwidth: Not greater than 50 minutes of arc at −3 dB points
Vertical sidelobes: (a) First or major side lobes better than −23 dB. (b) Minor sidelobes within ±8° of centre of main lobe better than −25 dB (c) Sidelobes from ±8° to ±13° better than −27 dB
Horizontal beamwidth: 2.5 ± 0.5° at −3 dB points
Gain: Better than 40 dB with respect to an isotropic radiator
Maximum nodding angle: −3° to +33° (with video blanking for 2° approximately at bottom end of nodding sweep)
Nodding rate: 20 sweeps per minute for the maximum nod angle (36°). 60 sweeps per minute for the minimum nod angle (8°)
Variation of nodding rate: Automatically as a function of range, giving an increased data rate

on long range targets

Nodding mechanism: Oil hydraulic system

Maximum slewing speed: 6 rev/min in either direction

Acceleration rate: 43 degrees/second^2

Slewing rate: Typical examples from state of rest to state of rest are: 30° in 2.1 seconds; 60° in 2.9 seconds; 120° in 4.4 seconds; 180° in 5.9 seconds

Slewing mechanism: A servo-controlled oil hydraulic system capable of providing the above rates with an adequate safety margin and operating with a maximum error of less than $\pm\frac{1}{2}°$. These speeds are obtainable in winds of 60 knots with an ice loading of 2 lb/ft^2. The aerial is capable of operating in an 80 knot wind without appreciable reduction of performance

Data transmission: A magslip resolver, coupled 1:1 with nod shaft, feeds nodding data to height/range display

Angle markers: Pulses of 5 volt amplitude with a separation of 2.5° are fed from an elevation angle marker generator

Volumetric scan: The sector sweep is variable from 3°-90° in steps of 3°. The start of the sector can be positioned at any azimuth angle throughout 360° (optional)

Circular polariser: Variable from linear through elliptical to circular. Ellipticity not greater than 1 dB in circular setting

RF bandwidth: 100 MHz within the frequency limits of 2,850-3,100 MHz

Slew video blanking: During slewing, microswitches give video blanking on the HRI display to within approximately 3° of the azication bearing

Transmitter/Receiver:

Frequency band: 2,850-3,100 MHz

Magnetron peak power: 2.5 MW nominal, subject to a duty cycle not exceeding 0.00142

RF pulse length: 5.5 microseconds nominal

Pulse repetition frequency: Preset in the range 220-230 pps

Receiver noise factor: 3.5 dB nominal at input to paramp

Receiver characteristic: Choice of linear, logarithmic, or ECCM processing

Differentiation: Can be applied to the selected video

Receiver bandwidth: 4.5 MHz logarithmic, 225 KHz linear

Receiver IF: 30 MHz (nominal)

Automatic frequency control: Maintains IF to within $\pm$50 KHz

Swept gain: Variable, pre-set at head amplifier

STATUS:

HF 200 radars are in world wide service. The latest solid-state version of the equipment is in production.

MANUFACTURER:

Plessey Radar, Addlestone, Weybridge, Surrey, England.

2424.153
RAPIER SEARCH & ACQUISITION RADAR

DESCRIPTION:

This system is an integral part of the Rapier anti-aircraft guided weapon system (**2424.131**). Little information has been officially released on this part of the system, and the following is an assessment based on available data.

This equipment comprises a primary surveillance radar working in conjunction with a computer and a secondary radar (IFF) interrogator-responsor to locate, identify and, where appropriate, initiate the tracking of enemy targets. The whole equipment is located in the Fire Unit of the Rapier system.

In the search mode the radar – a coherent pulsed Doppler equipment – scans continuously through 360° in azimuth. When a target is detected its azimuth range and velocity are measured, and on the same scan it is interrogated by the IFF whose dipole aerial is mounted on and rotates with that of the primary radar. If a "friendly" response is received the information on that target is cancelled from the system and the search continues without interruption.

If the target is adjudged hostile, an alarm signal is sent to the remainder of the equipment, the measured co-ordinates are used to direct the Tracker (see description of Rapier) towards the target and the operation of the radar is restricted to an arc containing the target.

It is, of course, possible that a friendly target might fail to respond to the IFF interrogation on a single pass of the surveillance system – e.g. because of an unfavourable aspect of the airborne aerial – but the above procedure provides time for a "friendly" response to be received before the engagement has gone too far.

STATUS:

Since the complete equipment forms an integral part of the Rapier system, deployment and similar details given in the description of the weapons system apply equally to the search and acquisition radars.

2428.153
SCORPION TARGET ILLUMINATING RADAR

DESCRIPTION:

Scorpion is a target illuminating radar (TIR) used with the Bloodhound surface-to-air guided missile system. Intended primarily for use with static installations of this system, the equipment can nevertheless be dismantled into transportable units.

Basically an X-band CW Doppler autofollow radar, the equipment also performs the functions of illuminating the target and thereby providing the reflected radiation to activate the semi-active homing system of the Bloodhound missile. In addition it has a limited target search facility and is equipped for target identification.

In its normal operational role the TIR is supplied with target and range bearing information from an associated surveillance radar. After appropriate co-ordinate transformation this data will define the target's position in a region bounded by bearing and elevation arcs which may be further restricted if information from a height-finding radar is also available. The TIR aerial system is so arranged that it can search the region thus defined and locate the target, whereafter it is locked on and follows the target automatically. Simultaneously, a positive identification process is initiated, resulting in a decision made by the Engagement Controller in the Launch Control Post (LCP) whether or not to engage the target.

When following a target the radar supplies angular position and velocity co-ordinates to the LCP. The missile launchers are servo-controlled using this positional information so that the missiles are always aligned and ready for firing. When a missile has been launched the TIR continues to track the target; and the reflected signal is used by the homing equipment in the nose of the missile to bring it close enough to the target for the proximity fuse to detonate the missile warhead.

A CW system was chosen for the Bloodhound TIR because of its good performance in the presence of natural or ECM interference. Scorpion is one of two TIRs available for use with Bloodhound, the other being FIRELIGHT which is a similar radar better suited to mobile roles. Scorpion is a larger radar than Firelight – the linear dimensions of the aerial system being twice as great – and has therefore a better long-range performance: furthermore, advantage has been taken of the added equipment space available to build in a considerable amount of circuit duplication with consequent increase in reliability.

CHARACTERISTICS:

Type: Static CW Doppler auto-follow radar

Frequency: X-band

Main Aerial: 4.2 m diameter

Facilities: Search and follow. Target identification

Associated system: Bloodhound SAGW System

MANUFACTURER:

Marconi Radar Systems Ltd, Leicester, England.

RAPIER TRACKING RADAR

DESCRIPTION:

Only limited information is available regarding this "blindfire" attachment for the Rapier surface-to-air guided missile system (**2424.131**), which was first shown in mock-up form at the 1970 Farnborough Air Show and in engineered form two years later.

The radar has been developed by the Radar Control Division of Marconi Space and Defence Systems, with Marconi-Elliott Avionic Systems as a major sub-contractor. This development was carried out on a UK Ministry of Defence funded programme with the British Aircraft Corporation as prime system contractor. The radar is designed to meet the threat posed by more advanced low-level strike aircraft which can operate at night and in low visibility. Until these aircraft became a real threat, low-level high-speed attacks were carried out in daylight and the original 'clear-weather' Rapier was devised by BAC with optical tracking to meet this threat. With the radar tracker in the system, the operator has a choice, up till the moment of launch, of which system will be the most efficient for the engagement.

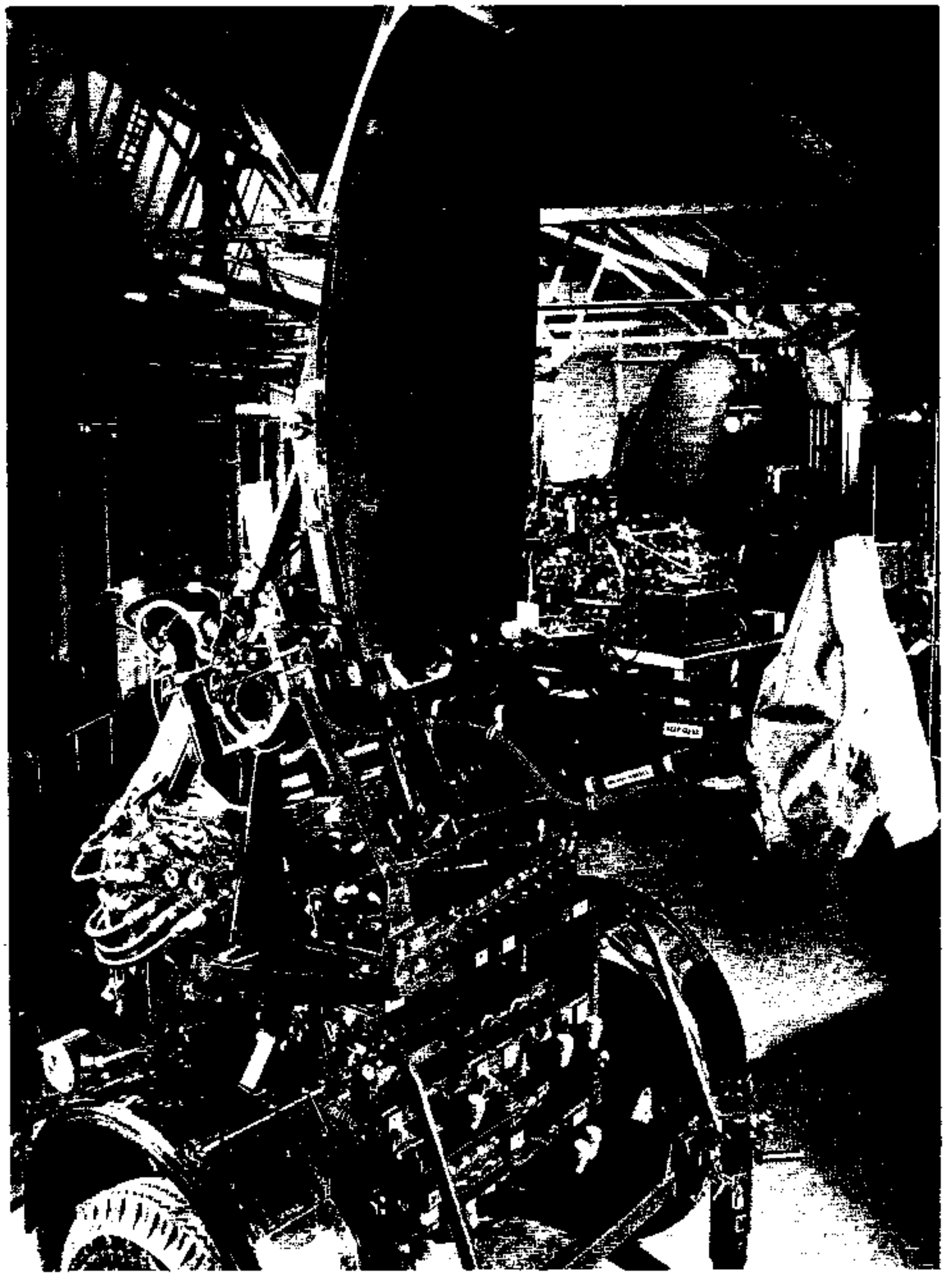
The radar incorporates advanced electronic techniques using boresight errors for accurate positioning of its own aerial and the angular difference between the missile and target sightlines for the generation of command guidance signals. The extremely narrow beam-width is the key to the accuracy and very low-level capability of the system, and also reduces the chances of background clutter, such as ground echoes or rainfall, obscuring the target echo. A number of other electronic measures are also designed into the system to minimise the effect of clutter and other unwanted signals.

The tracking radar is initially alerted to a hostile aircraft by the system surveillance radar, which indicates the approximate direction of the threat. The tracking radar will immediately swing onto this bearing, and rapidly establish the exact bearing, range and height of the target. When the radar is locked onto the target, the missile is launched and this, too, is tracked by the radar. The difference between the target and missile angles is instantly derived within the system and commands are automatically transmitted to the missile to guide it onto the target.

With a very fast-reacting, lightweight and mobile system such as Rapier, it is vital that the radar fits in with the operational concept with minimum change. The radar tracker is a self-contained, 'plug-in' unit, and requires no extra personnel to operate it.

STATUS:
An initial production contract was announced early in 1973 and the equipment is now in full production.

MANUFACTURER:
Marconi Space and Defence Systems Ltd, Warren Lane, Stanmore, HA7 4LY, England.



Rapier 'blindfire' radars in production

2466.153
ST850 TIGERCAT RADAR
DESCRIPTION:
Designed for use with the Tigercat surface-to-air missile system (**2465.131**) the ST850 radar with its associated television equipment gives the missile system an all weather capability as well as enhancing the clear weather performance through the provision of a television auto-gather facility. In conditions where the missile is visible, it is automatically gathered within a few seconds of launch after which the engagement is completed manually from the television monitor. In bad weather or at night, the missile is acquired by a second channel in the radar and indications of its deviation from the target line of sight are presented on the television monitor, enabling the operator to complete the engagement.

The radar is housed in a mobile cabin and can be integrated with the S860 and S865 mobile surveillance radars.

The cabin contains a two-bay equipment cabinet: one bay houses the tracker servo drive circuits and the X-band transmitter; the other houses the receiver and signal processing equipment and the master programming unit.

System controls and monitoring/indicating equipment are located in a separate control console sited at one end of the cabin. Two operator positions are provided at the console – one for radar/television operation and the other for missile control.

The cabin is fully air conditioned and its dimensions are approximately 3 metres long by 2 metres high by 2 metres wide. It is fitted with attachment points for mobilisors, screw jacks for levelling and lifting eyes for transportation.

The director is mounted on the roof of the cabin. It carries a 1 metre diameter aerial and the television camera. It is capable of continuous rotation in azimuth, being mounted clear of the cabin roof so that radar and television visibility extends from an elevation of 85° to a depression of 5°. When the equipment is sited higher than the surrounding terrain, targets flying below 0° elevation level can be tracked.

Facilities are incorporated in the director support framework on the cabin, so that the director can be lowered from its operational position into the cabin for stowage during transportation, when its overall height is 2.4 metres.

The aerial is of the twist-cassegrain type. A four-horn monopulse feed and comparator provide three separate r.f. outputs (viz. sum, elevation difference and azimuth difference signals) for processing in the i.f. receivers to produce acquisition and auto-follow data. High accuracy of angular data results from the combination of a narrow pencil beam and the monopulse signal processing.

The television camera is aligned to the radar boresight and provides optical information on the target being tracked by the radar. This system consists not only of a conventional camera and display, but also a data processing system which permits gathering of the Tigercat missile on to the television line of sight.

The pulse modulated transmitter employs an X-band magnetron to deliver a typical power of 160W mean and 180 kW peak. The magnetron is motor tunable over the frequency band 8.6 GHz to 9.5 GHz, being manually controlled from the radar console.

The local oscillator is a solid-state microwave source with voltage tuning to permit automatic frequency control, which controls the oscillator frequency to follow the tuning of the magnetron and maintains the correct intermediate frequency in the receiver.

The r.f. portion of the receiver system is housed on the elevation assembly behind the aerial. The i.f. outputs are connected via co-axial cables and the azimuth slipring unit to the i.f. portion of the receiver, which is housed in one of the equipment cabinets in the cabin.

The signal processing has two channels: the main one for acquisition and tracking of the wanted target; the subsidiary one for acquisition and tracking of the missile. All functions are carried out automatically using digital techniques under control of the master programming unit.

The master programming unit organizes the operational sequence of the radar in response to commands from the operator at the control console, and signals from the radar sub-system.

In defence situations where Tigercat missiles are supported by AA guns, the S1850 fire control unit can be extended, by the addition of a general purpose digital computer, to form the S1851. This latter unit can give prediction of aim off and automatic system control thus providing blind-fire gun control.

In support of the S1850 and S1851 tracking radars, the mobile surveillance radars type S860 and S865 are available. The S860 is fully autonomous with its own operators whilst the unmanned S865 feeds data to the tracker cabins but both can provide target indication facilities for multiple fire control units.

MANUFACTURER:
Marconi Radar Systems Ltd, Chelmsford, Essex, England.

2490.153
ZB 298 SHORT-RANGE GROUND SURVEILLANCE RADAR

DESCRIPTION:
ZB 298 (British Army nomenclature GS No 14 Mk 1) is a mobile radar for the detection, recognition and location of moving targets on the battlefield by day and by night in all weather conditions. In addition to these battlefield surveillance and target acquisition functions it can also be used for adjustment of artillery and mortar fire, for border protection, for sea and river surveillance and for protection of airfields and installations.

DESCRIPTION:
ZB 298 is a non-coherent pulsed doppler radar operating in X-band with a range out to 10 kilometres. Other than a long-life magnetron of proven high reliability, solid state techniques are employed throughout. The radar is inherently rugged in construction and requires no extra protection or special cases for transit. In its man-portable role it can be carried by two men.

The equipment can be brought into or out of action in 2-3 minutes, and is operated by one non-technical operator. Operator controls have been kept to a minimum and number five only.

The display unit, from which all operations of the radar can be controlled (including movement of radar head in azimuth and elevation), incorporates a unique solid-state visual display, which allows moving targets to be simply and rapidly acquired (and tracked), even in the presence of clutter and other interference. An audio display (headset) allows the operator to listen to the doppler signal of the selected target: these signals permit easy recognition of the type of movement.

The radar head is mounted on a tripod and the display unit – from which all radar functions can be controlled – can be located 20 or more metres away. The radar head can also be mounted on a wide range of military vehicles with the display unit inside. If required, the radar can be operated with the vehicle hatches closed.

OPERATION:
The radar head is controlled in azimuth and elevation by handwheels mounted on the display unit. The visual display is a gallium phosphide screen on which are displayed signals from any selected 1,000 metre range zone – adjustable in 500 metre steps and incorporating a 50 metre range marker bracket. Fine range control allows adjustment of range to 5 metres. An audio gate is ganged to the 50 metre bracket enabling audio signals appearing in that gate to be heard in the headphones. In addition, a 1,000 metre audio gate is available to give audio alarm over a selected 1,000 metre band.

Range presentation is by means of numerical indicator tubes giving direct range reading in 5 metre steps. Azimuth is shown on a direct-reading scale of mils with 2-mil graduations and elevation on a similar scale with 10-mil graduations.

DEVELOPMENT:
ZB 298 was developed on a British Government contract starting in 1964. The first prototype (B model) was completed in 1966 and the equipment is now in service. It is used by infantry battalions, armoured reconnaissance regiments and artillery observation posts.

TEST AND TRAINING EQUIPMENT:
Special check out and fault diagnosis equipment is supplied by the manufacturers enabling repairs to be effected by non specialist technicians.

A simulator, developed concurrently with the main equipment, makes use of audio signals previously recorded on tape from a ZB 298 radar. Up to four standard ZB 298 display units can be connected to the simulator. The simulator allows the instructor to control and graduate instruction, and the operator can be practised in all aspects of detecting, tracking (in range and azimuth) and recognising targets in a variety of different conditions including clutter and ECM effects, using all the controls on the display unit. With the aid of the simulator an operator can be trained to operate ZB 298 in a matter of days. The simulator also enables regular practice to be given in the recognition of different classes of targets.

COSSOR IFF GROUND EQUIPMENT

Since pioneering sidelobe suppression techniques in the early 1950s, Cossor Electronics have maintained an important role in the field of SSR/IFF. They have had wide experience in the planning and installation of civil SSR and military IFF systems and their current range of compatible surface equipments includes:

SSR.700 – Civil/military SSR/IFF ground systems.
SSR.750 – Military defence IFF system.
SSR.800 – Naval IFF systems.
CVP.100 Series – Video processing equipments.
CRS.320 – SSR/IFF aerials for on-mounting.
CRS.381 – Off-mounting or autonomous operation.

Miniaturised IFF Mk. 10 (SIF) Systems

A range of IFF systems of rugged construction is available:

IFF.825 – For mobile radar systems.
IFF.825M – Variant of IFF.825 for marine use (Fast Patrol boats).
CVP.114 Series – Defruiter/Decoder equipment.

IFF for Missile Systems:

Cossor have developed and manufactured the IFF elements for the following missile systems.

Blowpipe – (**2409.131**)
Rapier – (**2429.131**)
Thunderbird – (**2460.131**)

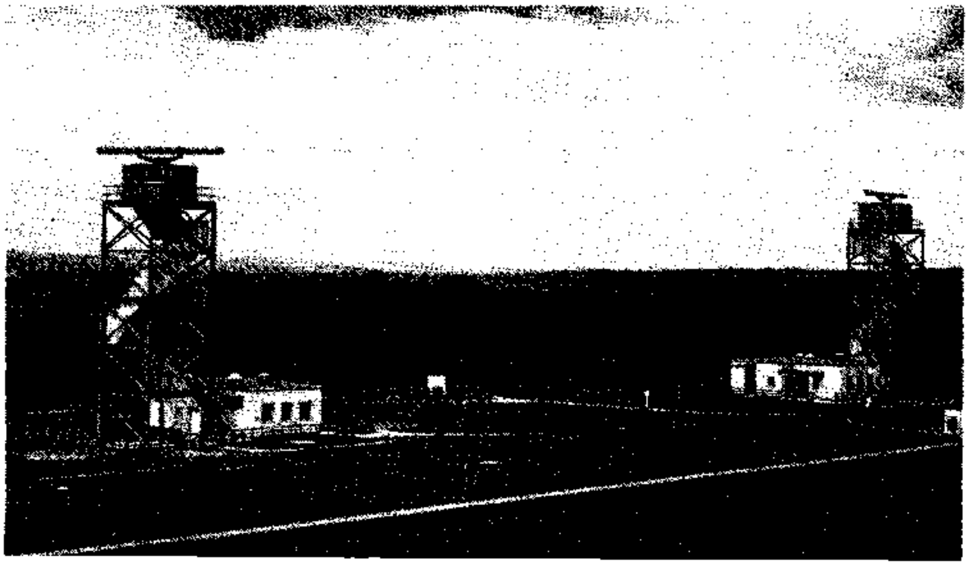
SSR.700

DESCRIPTION:

Designed for static installations, the SSR.700 system is compatible with many primary radars in an on-mounted configuration. The secondary radar aerial can be slaved to a primary for an off-mounted configuration, or the system can be used autonomously.

The SSR.700 interrogator-receiver uses solid-state techniques throughout, except for the final amplifier stages and the equipment parameters fully meet the requirements of STANAG 5017 and ICAO Annex 10.

When a primary radar has a spare channel in the rotating joint for IFF, the secondary aerial may be on-mounted. Aerials of different apertures are available to suit the IFF system requirements. Each aerial can provide three-pulse sidelobe suppression with pattern switching provided by a high speed r.f. switch above the rotating joint. The design of this switch obviates the need for an external drive pulse.



The Cossor SSR installation at Burrington, Devon

In the off-mounted configuration sidelobe suppression switching is performed in the interrogator.

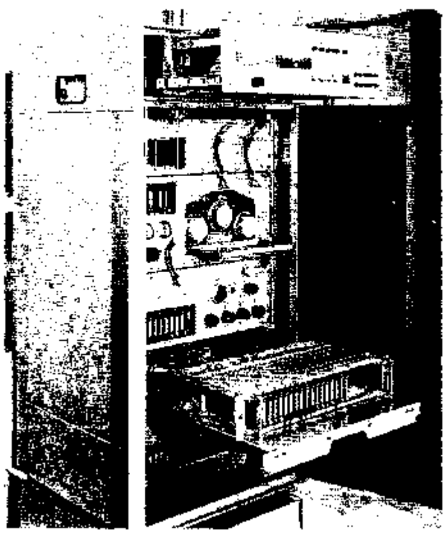
Automatic changeover between channels is included and extensive remote control facilities are provided.

The replies from transponders can be processed in a number of different ways and equipments are available to provide:

passive decoding
active/passive decoding
plot extracted data

The manner of presentation of processed data can be arranged to suit the desired arrangement.

CHARACTERISTICS:
Transmitter performance:
Frequency: 1,030 + 0.1 MHz
Power: 2 kW (peak)
Pulse Duration: 0.8 + 0.1 microsec
P.R.F.: 150 Hz to 450 Hz
Transmission modes: All civil/military modes. Pulse spacing tolerance +0.1 microsec
Mode Interlace: Single. Double. Triple. Triple with Aerial



SSR 700 equipment rack

Receiver performance:
Centre frequency: 1,090 + 0.1 MHz
Bandwidth: 10 MHz at −3 dB points
Defruiter: Cross mode correlation type with selection of 2/6, 2/7, 2/10 defruiting criteria. Store cycle time, 1.3 microsec. Range to suit requirements
Decoder: Facilities to suit requirements
Available controls: Raw – undecoded replies displayed. Bracket Decode – All transponders replying with bracket pulses are displayed. Mode/Code – all transponders replying with the mode/code as selected give an additional display indication. SPI – All transponders replying with the special identification pulse give a particular display indication
Emergency/communications failure: Transponders replying with code 7700 or code 7600 give a special display indication
Mode C decode: Height translation of Mode C replies by Flight Level or active display

STATUS:
The first system was delivered in May 1970. Equipments have been ordered by United Kingdom Board of Trade, Norway, Sweden, Denmark, Austria, Australia, Thailand, Israel and SHAPE Technical Centre.

A high power derivative, SSR.750 has been ordered by the United Kingdom Ministry of Defence (Air) for the Air Defence Radar Stations.

MANUFACTURER:
Cossor Electronics Limited, The Pinnacles, Harlow, Essex, England.

2418.153
PLESSEY IFF Mk 10 (SIF) INTERROGATION AND DECODING EQUIPMENT

DESCRIPTION:
Plessey's ground IFF Mk 10 equipment – which also provides all the basic facilities of the civil SSR system – is designed for use in conjunction with primary surveillance radars and uses an interrogator aerial that can be mounted on a suitably modified primary radar aerial.

IFF/SSR service is provided for transponder-equipped aircraft to a range in excess of 185 km and interrogation can be performed on two or three modes selected from the six IFF/SSR modes interlaced as desired.

Two sets of passive decoding controls, each having three separate code channels, are provided as standard but more can be added if required.

Solid state technology is used throughout, except in the transmitter r.f. stages, and most of the receiver and decoding circuits use integrated circuit components.

The system characteristics conform with STANAG 5017 and the equipment meets the environmental requirements of DEF 133 for partially protected ground equipment.

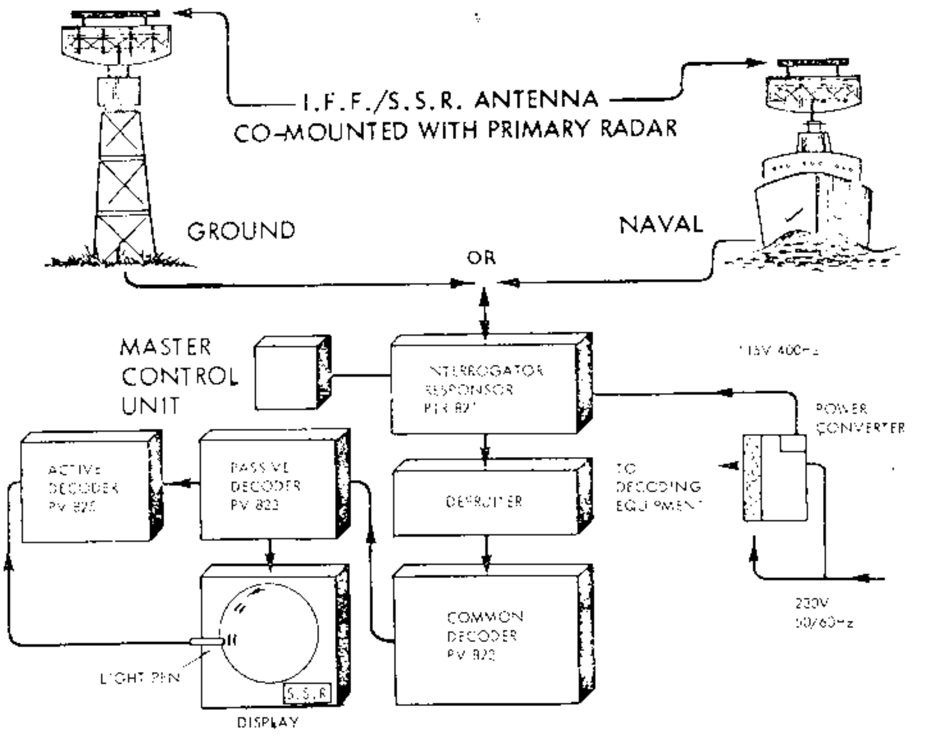
A block schematic diagram of the equipment shows the principal units. The interrogator aerial is the Litton/IFF 015B which has a 4.27 metre aperture with a beam-width of 4.25 deg. It can be mounted directly on any primary radar that can be provided with a double coaxial rotating joint to permit feed of secondary radar r.f. pulses to the IFF aerial and which can be mechanically modified to take the load. This aerial is capable of operation with a 3-pulse side lobe suppression system using sum and difference pattern switching with the switch in the aerial assembly.

A maximum peak power output of 5kW is supplied by the interrogator-responsor on all modes. This unit includes automatic test facilities that give an indication of transmitter output power and receiver sensitivity, and the circuits for performing the functions of mode encoding the transmitted interrogation pulses.

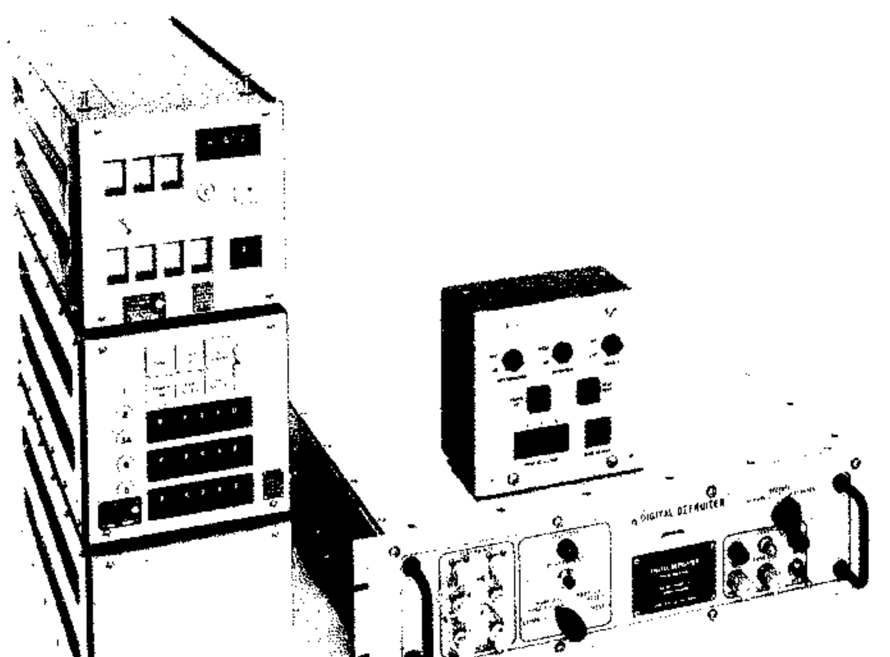
The common decoder logic unit contains the circuits for performing the functions of common decoding (serial-to-parallel code conversion and emergency recognition) of the received transponder replies.

Two passive decoders are provided, each giving three channels of decoding for a given mode, or decoding three separate identity codes each on a different mode. The passive decoder control unit provides thumbwheel selection of the three passive mode/code combinations, and video selection for the presentation of decoded replies on the primary radar display. The video selector switches provide the following functions:

Power On: Control of non-common decoder power supplies.
Raw: Undecoded IFF video.
Bracket Decode: All aircraft responding to the interrogator are indicated by a single slash overlaying the primary radar echo.
Code Decode: All aircraft responding on the modes and codes selected by the three channel thumbwheel switch groups are defined by a double slash, the first of which overlays the primary radar echo.
Lamps mounted on the front panel indicate:
T/R fault
Communications Failure' or A/C Emergency



Block diagram of Plessey IFF/SSR Interrogation and Decoding Equipment



Units of the Plessey IFF Mk 10 (SIF) system.
Left (top to bottom): Active Decoder, Passive Decoder, Common Decoder.
Right: Master Control Unit (top), Digital Defruiter (bottom)

Modes selected for interrogation

Additionally the following responses are displayed:

I/P or SPI. Aircraft replying with I/P on IFF Mk 10 (SIF) (2 train reply) or common system SSR (SPI) pulse, are defined by a wide single slash or 'bloomer'.

Emergency: Aircraft replying on:

Basic IFF Mk 10 (4 pulse reply) or IFF Mk 10 SIF (4 train reply) or Common systems SSR (codes 7600 and 7700), are defined by two wide slashes or 'double bloomer'.

When an emergency reply is detected, the response is immediately initiated on the display, however, the 'CMMS FAIL' and 'A/C EMERGENCY' lamps are activated only when the emergency reply is validated. This means the receipt of a preset number of emergency replies (preset from two to six) on adjacent p.r.i.s, before alarm initiation.

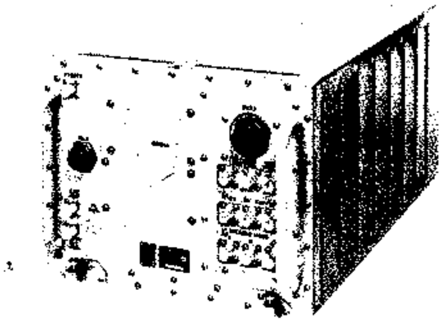
The range of IFF equipment is supplemented by an active decoder and a defruiter using digital techniques which can be provided as options.

HISTORY:

Plessey have been working on ground IFF/SSR systems for some years; and this particular development was begun in 1967 – a prototype equipment being completed in October 1968. Systems have been delivered to a number of overseas customers and the equipment is in quantity production.

MANUFACTURER:

Plessey Radar, Addlestone, Weybridge, Surrey, England.



Plessey IFF Interrogator

THE UNITED STATES OF AMERICA

ADAR – ADVANCED DESIGN ARRAY RADAR

DESCRIPTION:

This radar, so far an experimental system, has been designed to use electronically steered beams for the simultaneous tracking of close flying multiple targets – such as might be encountered when an incoming strategic missile separates out its warheads and decoys.

The transmitting and receiving arrays are separate, the former being a planar phased array that steers the transmitted beam by ferrite phase shifters. The radiated beam thus produced subtends angles of 3 degrees and 5 degrees. Wide-angle coverage is achieved by dividing the array into sub-arrays with time delays in the sub-array feeds.

The receiving array consists of a micro-wave optical system that takes its inputs from a multiplicity of horns, each of which produces a receive beam. A microwave switching matrix selects the desired beams and connects them to receivers. The receive beamwidth is 2 degrees. Microwave amplification is provided at each beam terminal output.

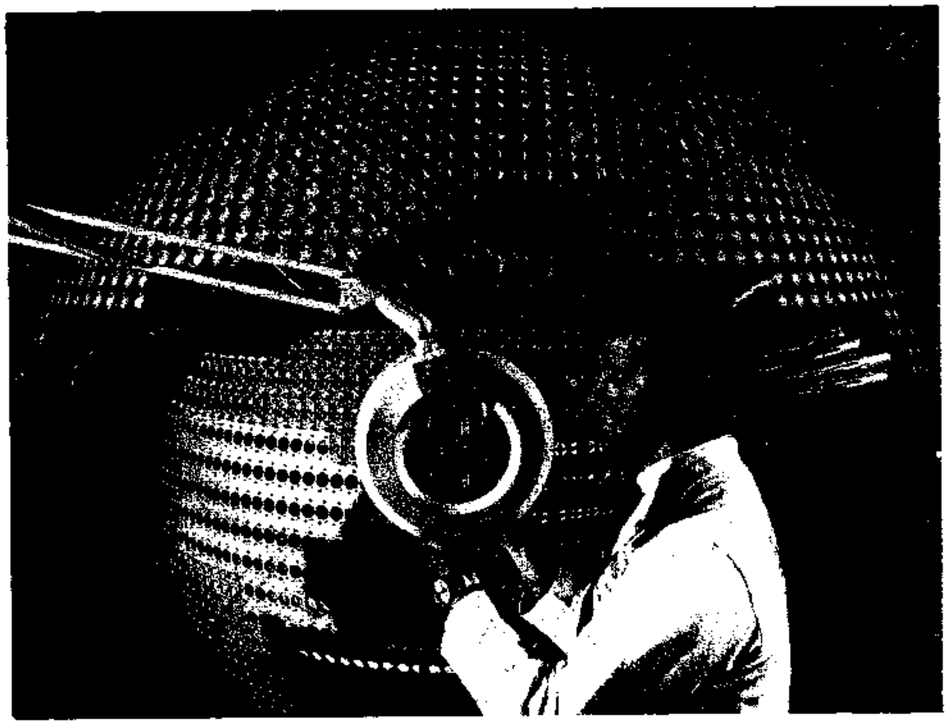
Scanning and tracking are completely automatic.

DEVELOPMENT:

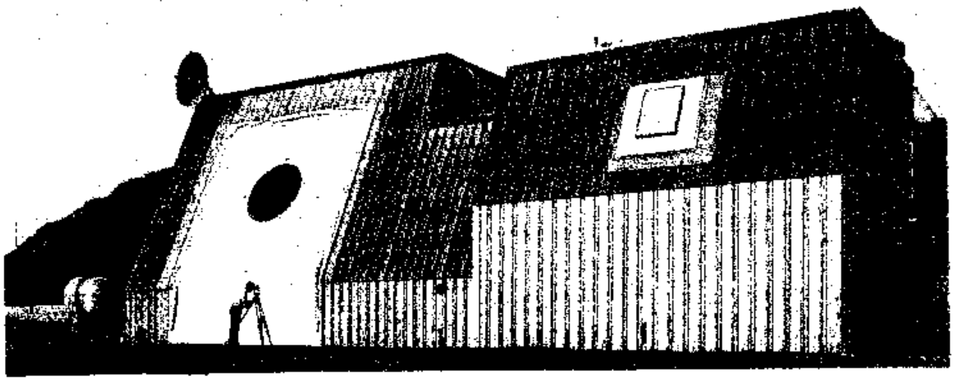
The equipment has been built and tested under a £20 million programme sponsored by the US Army's Advanced Ballistic Missile Defence Agency. Tests so far carried out have demonstrated the ability of the radar to resolve a number of close flying targets and track them simultaneously.

MANUFACTURER:

Hughes Aircraft Company, Fullerton, California, USA.



Part of one of the many antenna sub-systems in the ADAR receiving antenna



An engineering model – believed to be one-tenth scale – of the ADAR radar under test in California. The right-hand antenna is the transmitter, the receiving antenna on the left is hemispherical in shape. The small antenna in the top left-hand corner of the structure is part of a data link

AN/FPQ-6 AND AN/TPQ-18 PRECISION INSTRUMENTATION RADARS

DESCRIPTION:

AN/FPQ-6 and its transportable version AN/TPQ-18 are high-accuracy, amplitude comparison monopulse, C-band instrumentation radars designed primarily for tracking long-range high-velocity targets such as re-entry vehicles. They can function either in skin-tracking (single-pulse) or beacon tracking (pulse train) modes. The only differences between the two radars relate to the arrangement of their constituent units.

Physically the radars are large, 5 transmitter cabinets and 60 cabinet racks being required to house the basic electronics. The aerial is some 9 metres in diameter and uses a 5-horn Cassegrain feed. The transmitter has a peak power of 3 MW.

Targets can be tracked out to some 50,000 km and at target speeds up to 18 km/sec. Aerial tracking precision is 0.05 mil. In order to keep the data rate high when tracking such distant targets an "nth time round" unambiguous measuring technique is used – which makes possible prf's of 160 or 640. At the other extreme the aerial can be slewed at a rate of up to 28°/sec.

MANUFACTURER:

RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

2508.153
AN/FPQ-6 (MODIFIED) MONOPULSE TRACKING RADAR

DESCRIPTION:

AN/FPQ-6 is a C-band monopulse missile precision instrumentation radar used for tracking spacecraft or ballistic missiles.

Originally designed to give tracking ranges on spacecraft responder beacons up to 32,000 nautical miles, these radars have now been modified to give skin tracking ranges up to 800 nm and beacon tracking ranges to over 60,000 nm. The modification, by Radiation Inc, involved the installation of a sparless Dielguide feed and a cooled parametric amplifier.

STATUS:

Four of these radars are in service at the USAF Eastern Test Range (Patrick AFB), Grand Turk, Ascension and Antigua. All have been modified.

MANUFACTURER:

Original manufacturer, RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

Manufacturer of extended range modification equipment, Radiation Inc (subsidiary of Harris-Intertype Inc), Melbourne, Florida, USA.

Part of the antenna of the modified AN/FPQ-6 tracking radar at Patrick AFB

2857.153
AN/FPQ-13 TRACKING RADAR

DESCRIPTION:

AN/FPQ-13 is the designation of a modified version of the AN/FPS-16 C-band monopulse missile tracking (skin tracking and secondary radar) radar.

The modification consists of the addition of a Dielguide cassegrain feed which is designed to increase the aerial efficiency by 80% with consequent increase in range. The feed is a conical sparless structure which is designed to provide a more uniform illumination of the 6-metre reflector and reduce spillover. Radar transmitter power is 5 MW peak and 10 kW average.

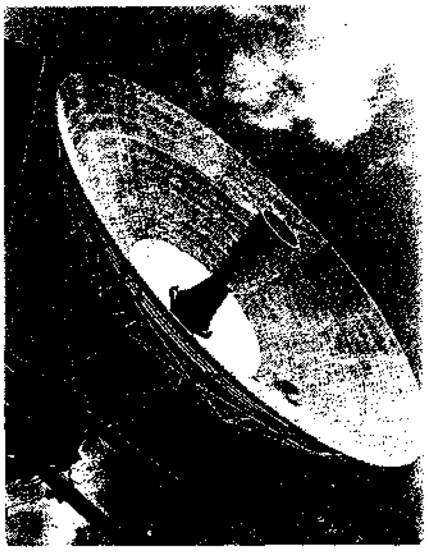
STATUS.

The radar is part of the USAF Eastern Test Range tracking network.

MANUFACTURERS:

Original FPS-16 radar: RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

Dielguide modification: Radiation Inc (subsidiary of Harris-Intertype Inc), Melbourne, Florida, USA.



Dielguide-equipped aerial of AN/FPQ-13

2492.153
AN/FPS-6 HEIGHT-FINDING RADAR

DESCRIPTION:

For many years the AN/FPS-6 Radar has been the principal height-finder used by US Armed Forces and many allied nations. Over 400 of these equipments have been delivered, including the mobile version, the AN/MPS-14 (**2496.153**).

A high-power S-band nodding-beam radar, the AN/FPS-6 is noted for extreme accuracy at long range, and three available versions give it wide versatility under a variety of environmental conditions.

The arctic tower installation consists of a 50-foot radome (either air-supported or rigid) mounted on a 25-foot, two-storey enclosed tower structure. De-icing is provided by a battery of infra-red lights inside the radome. Radome pressurising (when required), RF, and other electronic equipment is housed in the tower structure.

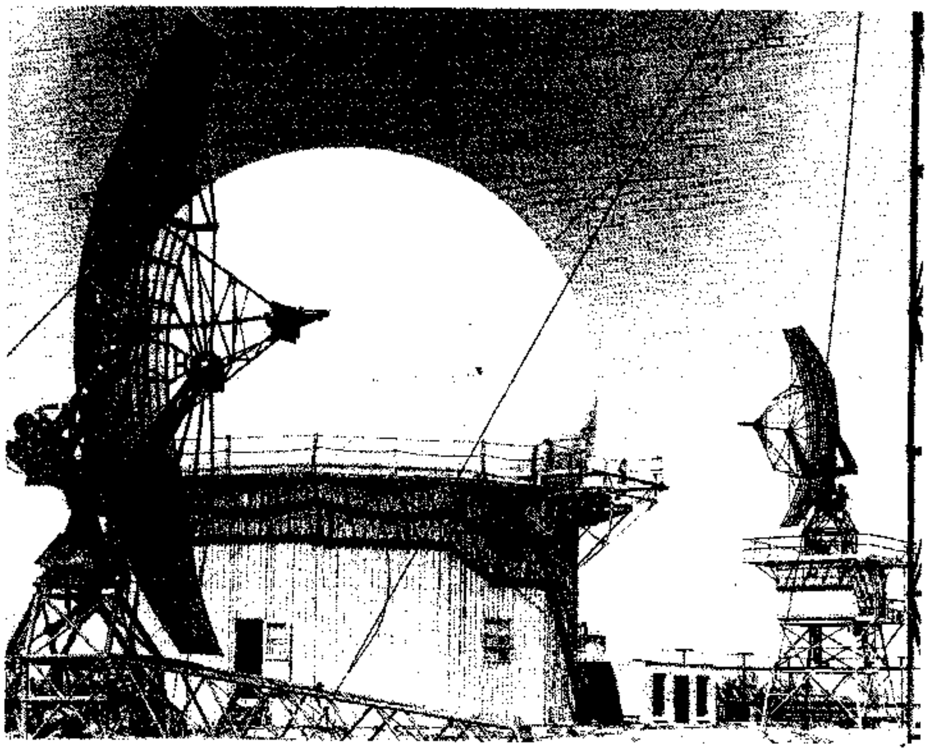
The temperate tower installation is designed for moderate or tropical climates. The 25-foot supporting structure for the antenna includes an enclosure for RF equipment.

The mobile version (AN/MPS-14) is a six-truck, three-trailer system designed for transport on short notice to new strategic or tactical sites.

The reliability and capability of the basic AN/FPS-6 system has benefited from a continuous improvement programme. Sets with various improvements have been designated as AN/FPS-6A, AN/FPS-6B, AN/FPS-6C, AN/FPS-6D, AN/FPS-89 (**2512.153**) and AN/FPS-90. All these improvements are available in field conversion kit form for the updating of radar sets from earlier production.

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.



Arctic Tower and Temperate Tower versions of the AN/FPS-6 height-finding Radar with the mobile version known as AN/MPS-14 in the foreground

2526.153
AN/FPS-7 3-D SEARCH & GCI RADAR

DESCRIPTION:

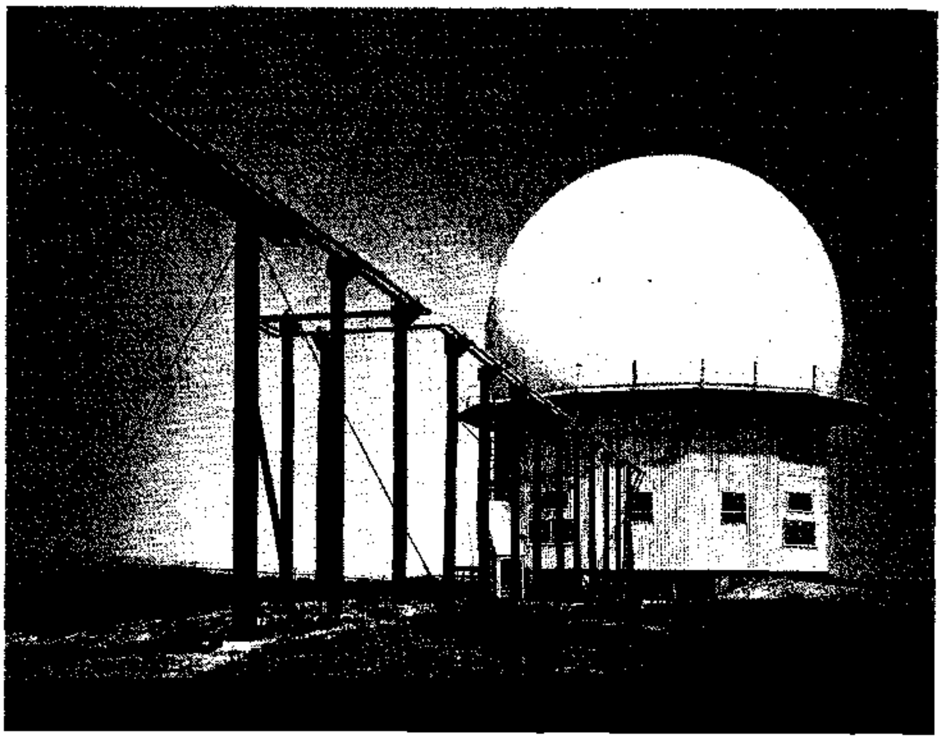
AN/FPS-7 is a very high power L-band (1,250-1,350 MHz) monopulse 3-D search radar. The equipment uses a stacked-beam heightfinding technique, the stack consisting of seven channels.

Search range is approximately 500 km and height coverage is up to 45,000 metres. The transmitter output stage is a high power klystron which delivers 10 MW at any of up to ten preset transmitter frequencies and with a pulse width of 6 microseconds. A dual-channel transmitting system is provided. When channel A is connected to the antenna through the waveguide switch, channel B is fed to a dummy load. This feature permits full preventive maintenance to be performed without having the equipment off the air.

The basic radar uses several separate but identical receiving systems. Spare receiving channels are available, and may be switched in place of some of the active receivers. The receiver incorporates MTI and anti-jamming circuits.

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.



AN/FPS-7 3-D Radar

2493.153
AN/FPS-8 SEARCH RADAR

DESCRIPTION:

The AN/FPS-8 is a medium-power L-band search radar designed for aircraft control and early warning and is installed at commercial airports and military bases both in the United States and overseas.

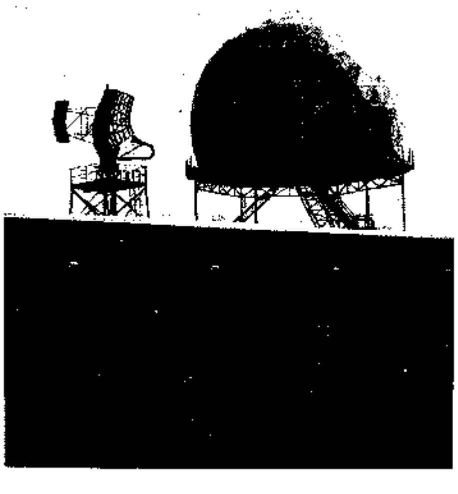
In most installations the antenna is exposed, being mounted on a temperate tower. For severe environmental conditions, the AN/FPS-8 is self-contained in an arctic tower with a protective radome

Over the years improvements have been made to the basic AN/FPS-8, culminating in the present version, whose nomenclature is AN/FPS-88 (V) (**2512.153**).

The AN/FPS-8 also has two mobile versions, the AN/MPS-11 and the AN/MPS11A (**2495.153**).

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.



AN/FPS-8 Search Radar

2527.153
AN/FPS-14 AND AN/FPS-18 MEDIUM-RANGE SEARCH RADARS

DESCRIPTION:

AN/FPS-14 is an S-band medium-range search radar. It has a power output of 400 kW and transmits 1 microsecond pulses at a PRF of 891-909 Hz. The antenna beamwidth is 1.4 degree between 3 dB points in the horizontal plane and 30 degrees in the vertical plane. Vertical or horizontal polarisation may be selected by the operator. Search range is about 110 km. AN/FPS-18 is similar to AN/FPS-14 but has a 1-2 MW transmitter.

STATUS:

Operational in the SAGE system and in Korea.

MANUFACTURER:

Bendix, Communications Division, Baltimore, Maryland, USA.

2528.153
AN/FPS-20 – AN/FPS-100 FAMILY OF LONG-RANGE SEARCH AND GCI RADARS

DESCRIPTION:

AN/FPS-20 is one of a family of very long-range dual-channel search and GCI radars. It is widely used partly because it was one of the equipments supplied under the MAP programme.

An L-band system, FPS-20 has a search range of some 350 km. The transmitter uses a power klystron with a 2 MW output. Pulse width is 6 microseconds and the PRF is 360 Hz. The antenna gain is 35 dB and the receiver noise figure 9 dB.

MTI is fitted and the radar has anti-jamming circuits. Data transmission facilities are included.

STATUS:

In service in many countries. AN/FPS-20 and subsequent members of the family are used in the SAGE (**2803.181**) and AWCS (**2533.181**) systems. Other static radars in the family are AN/FPS-20A, -20B, -64, -65, -66, -67 and -100. AN/GPS-4 and AN/MPS-7 are the mobile versions.

MANUFACTURER:

Bendix, Communications Division, Baltimore, Maryland, USA.

2494.153
AN/FPS-24 SEARCH RADAR

DESCRIPTION:

The AN/FPS-24 is a high-power low-frequency search radar. Each channel consists of 26 major cabinets, with an additional 11 cabinets that are common to both channels. It has very highly sophisticated anti-jamming features that make it extremely valuable in hostile environments.

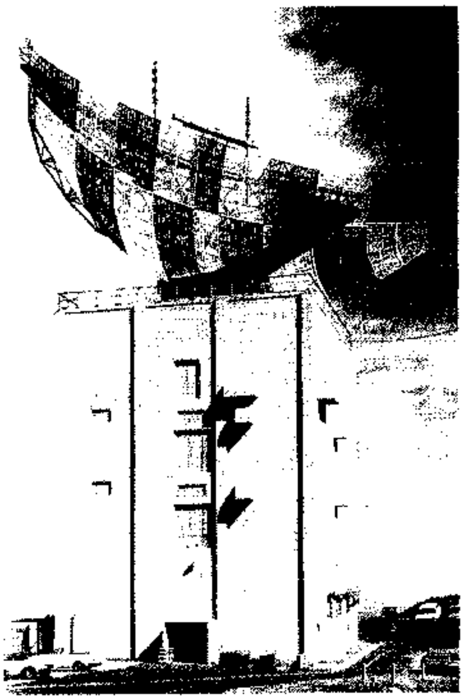
The radar is usually installed in a six-storey building with the antenna on top. In severe climatic conditions the antenna is enclosed in a radome, which is designed to withstand winds up to 150 knots. The overall antenna system weighs 92 5 tons.

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.



AN/FPS-24 Search Radar

2509.153
AN/FPS-49 EARLY WARNING AND TRACKING RADAR

DESCRIPTION:

One of the two basic types of radar used in the Ballistic Missile Early Warning System (BMEWS – **2525.181**), the AN/FPS-49 is a very large tracking radar that can also be used in a surveillance mode. It is installed at two of the three BMEWS sites, Thule (Greenland) and Fylingdales Moor (UK). At the third site, Clear (Alaska), a slightly different radar, the AN/FPS-92 – which is said to be an improved version of the AN/FPS-49 – is in use. To the extent that the three tracking radars at these three sites differ, one from another, it should be noted that the description that follows relates in the main to the AN/FPS-49 (A) radars at Fylingdales Moor.

The main reception and transmission element is a 25-metre diameter parabolic reflector mounted on a conical pedestal and capable of being rotated in azimuth and elevated and depressed so as either to track a detected target or to search for one continuously. A variety of possible scanning patterns provides for a number of search modes as well as for target acquisition and tracking. Scan rates of at least 10 degrees per second are attainable and the powerful hydraulic drive system employed is said to eliminate backlash.

Dish illumination is by four horns, to provide monopulse operation in both planes, with separate horns for reception. The system radio frequency is in the UHF band and the radar operates on several frequencies in that band. Having regard to this and the dish diameter it is probably reasonable to suppose that the beamwidth, between half-power points, is in the region of one to two degrees.

Output power is in the megawatt region, p.r.f. is 27 pulses/second (pulse duration unknown) and maximum range is about 5,000 km. Each radar has three power amplifiers; and in normal operation two of these are on-line at a time while the third is a "hot spare" feeding into a dummy load. The receivers incorporate low-noise parametric amplifiers.

The antenna structure is protected from the elements by a 43-metre diameter radome. This is of honeycomb-sandwich construction and consists of two high-density skins 1 mm thick with a Kraft-paper honeycomb core 15 cm thick. The honeycomb is made up in hexagonal and pentagonal blocks and 1,646 of these blocks make up the radome. The transmission efficiency of the radome is 98%; the average boresight error is 0.1 mil and the maximum error 0.3 mil; the boresight error rate is 0.005 mil/mil.

2511.153
AN/FPS-50 EARLY WARNING RADAR

DESCRIPTION:

AN/FPS-50 is the big static radar of the Ballistic Missile Early Warning System (BMEWS). It is installed at two of the three BMEWS sites at Thule (Greenland) and Clear (Alaska).

The radar uses a fixed antenna system comprising a 122-metre-wide and 50-metre-high parabolic-torus reflector which is fed by an organ-pipe scanner. Two narrow beams at two different angles of elevation are produced by this antenna and these two beams are caused to scan simultaneously over a sector in the near-horizontal plane so as to produce two horizontal direction fans, one above the other. As a missile passes through these beams its position and velocity co-ordinates are measured, from which can be calculated the trajectory, impact point, impact time and launch point.

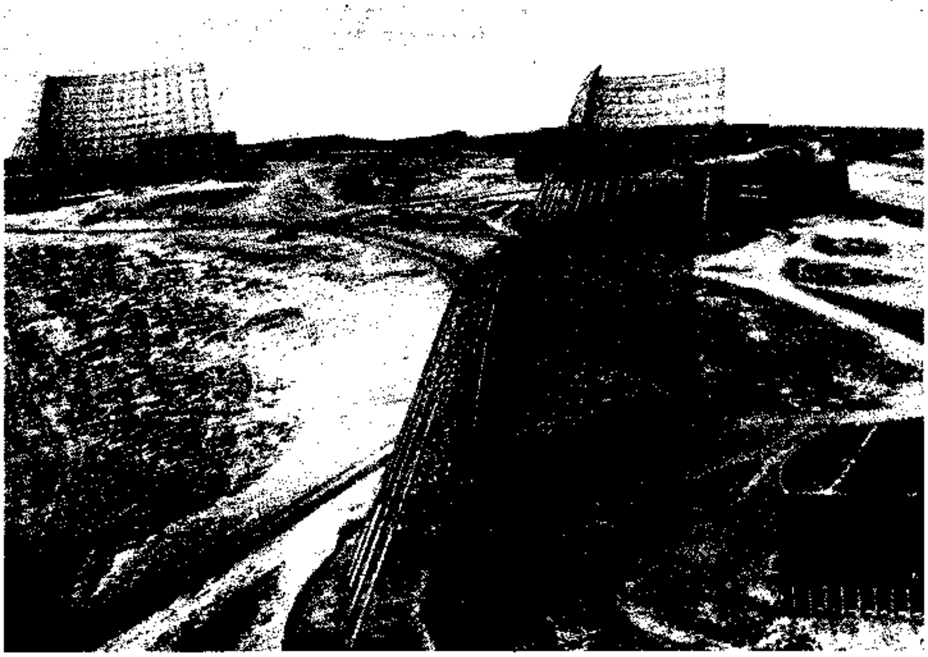
A parabolic-torus reflector was chosen for this radar because it provides an economical measure of scanning the beam from a physically large antenna over a wide scan angle without deterioration of pattern over this arc. The disadvantages of the arrangement are the large size of the total assembly and the large sidelobes that appear in intermediate planes.

Scanning such a reflector can be achieved in various ways; but in the AN/FPS-50 it is accomplished by arranging a series of feeds on the focal points of the torus and switching the transmitter power from one point to the next with an organ-pipe scanner.

At Clear and Thule the AN/FPS-50 radar are used in conjunction with the AN/FPS-49 or similar tracking radar. At the third station (Fylingdales Moor, England) only AN/FPS-49 or equivalent radars are used for early warning and tracking.

STATUS:
Operational.

MANUFACTURER:
General Electric Co, Heavy Military Electronic Systems, Syracuse, New York, USA.



AN/FPS-50 Early Warning Radar

2546.153
AN/FPS-85 LONG RANGE PHASED-ARRAY RADAR

DESCRIPTION:

This is a very large fixed-array radar located in Florida with its principal axis aligned due South across the Gulf of Mexico and capable of transmitting and receiving over an arc extending 60 degrees on either side of this axis.

A UHF system with a nominal frequency of 442 MHz, the radar uses separate transmit and receive arrays located side by side and both inclined at approximately 45 degrees to the horizontal. Exact dimensions of the arrays are not known, but the transmitter array is square, contains 5,184 transmitter modules and has a side of something over 30 metres. The receiver array is octagonal, contains some 39,000 antennas feeding 4,660 receivers and has a width of some 60 metres.

Peak radiated power has been reported as 32 MW with a nominal transmitter beamwidth of 1.4 degrees. Effective receiver beamwidth is said to be 0.8 degree. As already noted the radar beams are steerable over a 120 degree arc in azimuth: in elevation the coverage is about 105 degrees – from the radar horizon to 15 degrees beyond the zenith. The radar is thus able to track objects northwards at high elevation angles. In the normal tracking mode the receiver complex uses a 3 × 3 matrix of "beams" (i.e. receiving directions) in a monopulse mode for optimum resolution. Radiated energy can be varied, by using different modulations, to suit target requirements. In the original design only two energy levels could be selected but additional modulators are being provided to extend the range of choice and hence improve the efficiency of the radar.

This power level selection, together with all other control functions, is performed by IBM 360/65 computers, there being two of these in main and standby roles in the radar complex. These computers are programmed with both routine surveillance and routine and special tracking requirements: they carry in their memory orbital details of space objects for routine tracking so that the radar beam can, at an appropriate time dependent both on its position and the relative priority of the observation, be pointed in the direction in which the target would lie if its orbit had not been perturbed: since both intentional and accidental perturbation are common, the radar will normally have to execute a small search to locate and lock on the target.

Originally designed as the main US-based active sensor of the SPACETRACK system (**2825.181**) the FPS-85 is now to be used also to supplement the FSS-7 radars of the SLBM detection system (**2810.181**) and to operate as an Alternative Space Defence Centre (ASDC). The FPS-85 receives its SPACETRACK directions from NORAD Space Defence Centre (SDC) which also has as its SPADATS inputs the BMEWS (**2525.181**) and the US Navy SPASUR sensors. At this centre all known data on space objects near the Earth is filed in the computer memories; and incoming data on a space object can be checked against these memories to determine whether or not it is a known object in approximately two seconds. To guard against computer or other failure at the SDC the same data is to be held on file at the ASDC, which has an IBM 360/40 as well as its two IBM 360/65 computers, but in a form requiring more human intervention for a full search than is required at the SDC. It is said that a full search at the ASDC may take one minute.

Similarly the SDC processes data from all SPADATS sensors fast enough to issue new orbital data for all stations three times a day, whereas the ASDC will be able to do this only once a day.

DEVELOPMENT AND STATUS:

The FPS-85 was developed by Bendix, starting in 1962, and was the first large phased-array project in the USA. The first model was destroyed by fire in 1965 but was rebuilt and put into operation in 1969. It is currently operational in its SPACETRACK role, spending approximately one-third of its time to space surveillance and the remaining two-thirds to routine and special tracking assignments from NORAD. It is also now operational as an ASDC.

It is currently being modified, by the addition of the new modulators referred to above and of suitable software, to perform the SLBM detection function. It is expected to be operational in this role in mid-1974; and will then, in non-raid conditions spend about 30% of its time on space surveillance, 50% on space tracking for NORAD and 20% on SLBM early warning surveillance.

2512.153
AN/FPS-88 SURVEILLANCE RADAR

DESCRIPTION:

AN/FPS-88 is a medium-size L-band static surveillance radar. It is an improved version of the long-established AN/FPS-8 (**2493.153**), the improvements relating to range performance and to signal processing facilities.

The radar features a high-gain antenna, circular polarisation, dual-channel operation, a parametric amplifier receiver and a radar signal processor with some ECCM capability. There is also provision for using the main antenna as an IFF radiator.

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

2513.153
AN/FPS-89 HEIGHTFINDING RADAR

DESCRIPTION:

The AN/FPS-89 is a high-power S-band nodding-beam radar. It is an improved version of the AN/FPS-6 radar (**2492.153**), and like the AN/FPS-6 it is available in an arctic tower installation, a temperate tower installation, and a mobile version.

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

2847.153
AN/FPS-105(V) RANGE INSTRUMENTATION RADAR

DESCRIPTION:

AN/FPS 105(V) is designed for range use to make accurate measurements of target position and velocity for performance evaluation. It can be installed either in a permanent ground station or be packaged for shipborne use.

Its aerial is a 365 cm diameter solid-surface parabolic dish fed by a monopulse four-horn feed. Polarisation is vertical. The aerial can rotate continuously in azimuth and can be rotated through 200° (−10° to +190°) in elevation a cable being used to avoid the need for a rotating joint. Microwave circuits are mounted on the rotating section of the aerial mounting. The transmitter will radiate single pulses, pairs or triplets as required. Peak power is 1 MW and recurrence frequencies and pulse widths can be chosen for 160 and 640 pps and from 0.25, 0.5 and 1.0 microsecond respectively. Transmitter frequency is in C-band.

The digital range tracker contains a precise frequency standard and "ntn time round" circuits to enable a relatively high recurrence frequency to be used despite the long measuring ranges. Automatic search and lock-on are provided during target acquisition. 25 bits of range data are supplied by the system at data rates up to 40 times per second.

MANUFACTURER:

RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

2538.153
AN/FSS-7 SLBM DETECTION AND WARNING RADAR

DESCRIPTION:

This radar provides surveillance for the detection of sea-launched ballistic missiles and generation of warning for trajectories having impact points in the Continental United States. It is now deployed in several of the perimeter states of the USA.

A network of seven of these sensors with their associated data processing and remote display equipment has been developed and supplied by Cincinnati Electronics Corporation – successor by purchase of the Evendale operation of Avco Electronics Division. Prior to this an experimental programme was carried out, using the AN/FPS-26 heightfinder of the SAGE system (**2803.181**). in 1966: the FPS-26 was produced in quantity by Avco between 1958 and 1963.

The radar developed by Cincinnati Electronics has a parabolic antenna which performs both search and tracking functions and is capable of extremely high altitude missile detection.

The FSS-7 is automated by the computer control and programmed for sequential search, acquisition and tracking functions with attendant data processing for trajectory calculations and threat evaluation. Warning messages are generated for display at NORAD, SAC and the Pentagon.

STATUS:

Operational since 1971. Radars deployed in Maine, North Carolina, Florida, Texas, California (two radars) and Oregon. Responsible authority – USAF Aerospace Defence Command.

Numerous modifications to increase utilisation of the radar's performance capabilities have been incorporated since 1971 and work is continuing on others.

MANUFACTURER:

Cincinnati Electronics Corporation, 2630 Glendale, Milton Road, Cincinnati, Ohio 45241, USA.

2497.153
AN/MPQ-4 MORTAR LOCATING RADAR

DESCRIPTION:

The AN/MPQ-4 provides quick identification to pinpoint enemy mortar positions in map coordinates, enabling artillery units to launch counter-attacks. It uses a two beam intercept principle of location with positive first shell acquisition and has the capability for handling multiple targets.

All the equipment is mounted on two two-wheel trailers, each designed for its specific purpose. One trailer carries the primary radar equipment, while the other carries the primary power supply (a petrol engine generator set) and auxiliary equipment such as cable and spare parts.

The AN/MPQ-4 can be operated from virtually any site and can be set up in 15 minutes. Once set up it can be operated by one man. The operating and control console may be used on the equipment trailer or in a remote location.

CHARACTERISTICS:

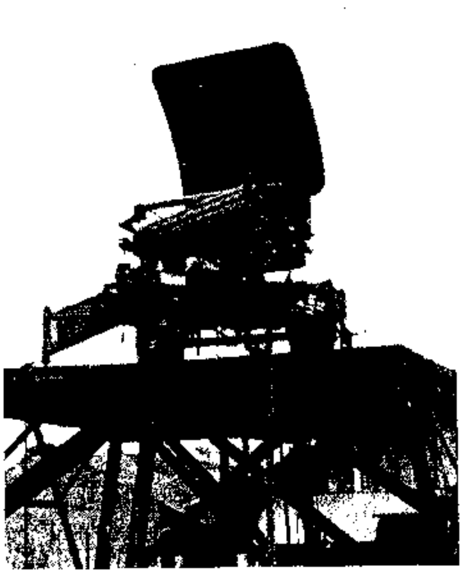
Frequency: 16 GHz
Detection range: 10,000 m (maximum)
170 m (minimum)
Sector scan: 25 degrees
Elevation coverage: −6° to +12°
Accuracy: within 50 m at 10,000 m
Presentation: B scope, 140 mm CRT
Weight: 2,268 kg
Mounting: two wheel trailer
Antenna: Reflector with Foster dual scanner feed

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.



AN/MPQ-4 Mortar Locator

2500.153
AN/MPQ-10A MORTAR LOCATING RADAR
DESCRIPTION:

The AN/MPQ-10A radar was initially developed in August, 1950 by the United States Army Electrics Command and was the first American mortar locating radar system. A total of 485 radar sets were delivered to the US Army between September 1951 and September, 1954. Radar AN/MPQ-10A is a mobile radar designed to locate and track mortar and artillery shells. It can be used with associated recording equipment to locate the point of origin and point of impact of the projectile. This radar set is designed primarily for use with Azimuth-Elevation Range Recorder RD-54/TP or Mortar Locator Computer CP-75/MPQ or other suitable automatic plotters or computers as a counter-mortar radar system. It is able to detect and accurately locate hostile artillery during and after firing. The system contains target display devices to assist in reducing the time between detection and the decision to fire, and operates on a continuous schedule under all conditions of weather, visibility and electronic environment. It is capable of being integrated into a field artillery unit which has the organic capability of delivering fire on the located target.

The radar consists of three major components: the tracker mount which contains radar set components; radar set control and the power unit.

CHARACTERISTICS:

Frequency range: 2,740 to 2,960 MHz
Pulse repetition frequency: 1,000 pulses/second
Pulse width: .8 microseconds
Polarisation: Vertical and horizontal
Peak power output: 200 kilowatts
Receiver sensitivity: −95 dbm
Signal-to-noise ration: 1.5 decibels
IF: 30 MHz
Tracking range: 460 m-18,300 m
Tracking height: 0 to 28,700 m
Tracking speed: 0 to 3,220 km/h
Azimuth tracking rate: 350 mils/second
Elevation tracking rate: 250 mils/second
Sector scan (azimuth): 200 - 800 mils
Transmitter: Magnetron
Presentation: B scope, 178 mm cathode ray tube, J-scope 76 mm cathode ray tube
Antenna: Off-centre dipole (conical scan) parabolic reflector
Weight: 2,722 kg

STATUS:

Believed obsolescent.

2495.153
AN/MPS-11 AND AN/MPS-11A SEARCH RADARS
DESCRIPTION:

The AN/MPS-11 and AN/MPS-11A are mobile versions of the AN/FPS-8 medium-power L-band search radar (**2493.153**). The difference between the two mobile versions is that the AN/MPS-11 antenna is mounted after arrival at site on a manually erected tower, while the AN/MPS-11A antenna is permanently installed for transport and operation on a 40 mm gun carriage, permitting more rapid initial operating capability.

The AN/MPS-11 may be transported by aircraft or by two trailers and nine M-35 trucks. Set-up time, with 15 men, is two hours.

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

2496.153
AN/MPS-14 HEIGHT-FINDING RADAR
DESCRIPTION:

The AN/MPS-14 radar is the mobile version of the AN/FPS-6 high-power S-band nodding-beam radar (**2492.153**). It is designed for transport by six trucks and three trailers to temporary strategic or tactical sites. Trailers are functionally designed for quick loading and unloading, and assembly and disassembly may be accomplished in rapid and efficient fashion.

The trailers serve the dual purpose of transporting the equipment and supporting certain electronic components during operation. For example, the RF equipment need not be removed from the trailer for operation, and the entire unit is protected by a prefabricated shelter assembled at the site. The shelter is equipped with space heaters and lighting fixtures.

The AN/MPS-14 system's electronic components are identical to and interchangeable with those of the AN/FPS-6.

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

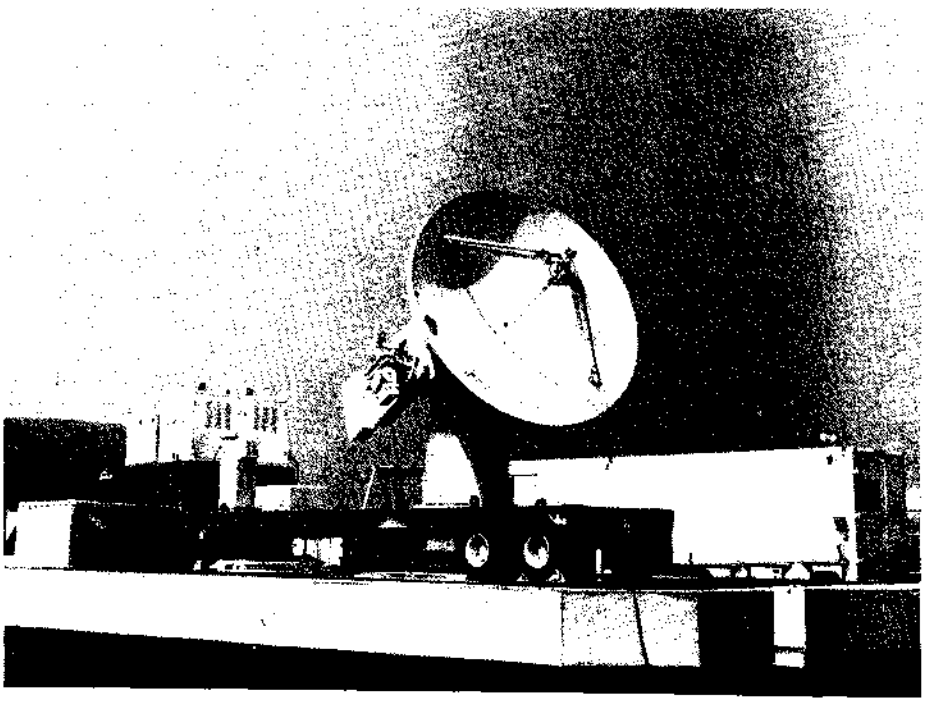
2514.153
AN/MPS-36 MISSILE TRACKING RADAR
DESCRIPTION:

AN/MPS-36 is a new type of mobile instrumentation radar built originally in 1970 for the US Army testing grounds at White Sands Missile Range.

The radar can accurately track targets travelling up to 36,000 knots at ranges up to 60,000 km. Data accuracy has been measured at one metre in range and target velocities within 5 cm/sec on trajectories of missiles and missile re-entry vehicles.

Advanced integration circuits are extensively designed into the equipment. A general-purpose computer has been integrated into the radar to provide real-time mission support and pre- and post-system checkout and calibration.

The radar is housed in a 12.4 metre electronics trailer and a 366 cm diameter antenna is mounted on an 11 metre pedestal trailer. With this arrangement, the radar can be moved from site to site on roads, air, or sea and be operational within eight hours after arrival.



AN/MPS-36 Missile Tracking Radar

CHARACTERISTICS:

Transmitter Power: 1 MW min
Antenna Gain: 43 dB min
Antenna Beamwidth: 1.2° max
Antenna Sidelobes: 20 dB min
Pedestal Coverage, Elevation: −5° to +185°
Pedestal Coverage, Azimuth: Continuous
Azimuth Tracking Rate: 890 mils/sec
Elevation Tracking Rate: 500 mils/sec
Azimuth Acceleration Rate: 400 mils/sec^2
Elevation Acceleration Rate: 400 mils/sec^2
Azimuth Tracking Precision at 20 dB S/N: 0.2 mils, RMS
Elevation Tracking Precision at 20 dB S/N: 0.2 mils, RMS
Range Tracking Precision at 20 dB S/N: 2.7 m, RMS
Range Tracking Precision at 10 dB S/N: 6.4 m, RMS
Range Tracking Precision at 6 dB S/N: 9.1 m, RMS
Range Rate Tracking Precision at 20 dB S/N: 90 cm/sec RMS
Range Tracking: 2,000 nm min
Installation Time to Power On: 8 hours, max
Receiver Noise Figure: 4 dB max
Maximum Range, 6-inch Sphere: 90 km
Reliability (Design Goal) – MTBF: 100 hours

STATUS:

The first equipment was delivered in 1970 and met or exceeded all design specifications. Eleven radars are now operational at US test ranges and three have been provided to Germany. The radars are used for studies of weapons systems and space programmes.

MANUFACTURER:

RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

2540.153
AN/PPS-5 COMBAT SURVEILLANCE RADAR

DESCRIPTION:

AN/PPS-5 is a portable battlefield radar designed to detect and locate individual men up to 5,000 metres and groups of men or small vehicles up to 10,000 metres.

Particular features of the equipment are automatic or manual sector scanning and full-range surveillance. The significance of the latter is that in the automatic scanning mode the operator is presented with a picture that shows all detectable targets in the azimuth sector scanned. This display as such does not identify the targets, but once he has detected them visually on his display the operator can search the particular area where a target has been detected and identify it aurally in the manner common to most battlefield surveillance radars.

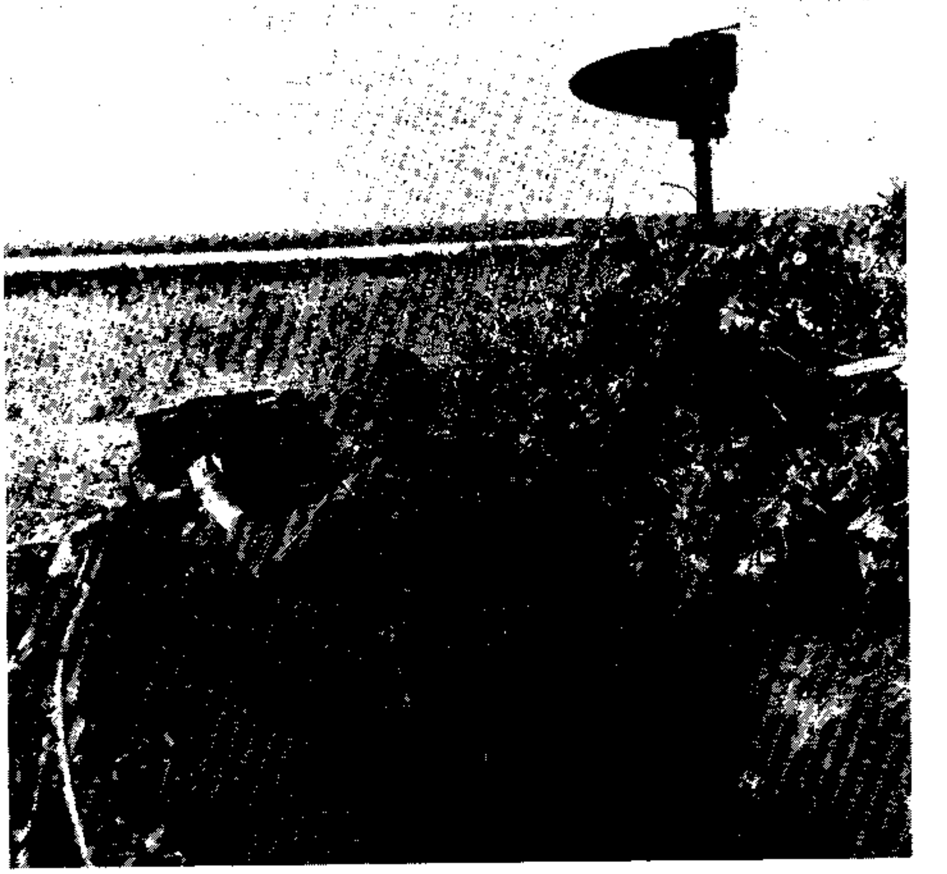
Furthermore, this search is carried out by winding out a range gate until it covers the target; and then stopping the automatic sector scan and adjusting the antenna for maximum signal. In addition to identifying it, therefore, the operator can measure its range and azimuth co-ordinates directly.

The equipment works in the 16-16.5 GHz band (tunable) and has a peak power of 1 kW and a p.r.f. of 4,000 p.p.s. An accuracy of ± 20 metres in range and ± 10 mils in azimuth can be achieved.

Physically the equipment consists of three rugged packages weighing about 40 kg. Power consumption is about 57 W.

MANUFACTURER:

AIL Division of Cutler-Hammer Inc, Deer Park, Long Island, New York 11729, USA.



AN/PPS-5 Radar

2537.153
AN/TPN-19 LANDING CONTROL CENTRAL

DESCRIPTION:

AN/TPN-19 is a terminal ATC system comprising an Airport Surveillance Radar, a Precision Approach Radar and an Operations Centre. The radar systems are linked to the Operations Centre by microwave links (10 nm). The system is designed for rapid world-wide deployment as well as fixed base installations. Packaging techniques make the system completely transportable by aircraft, helicopter or road vehicle.

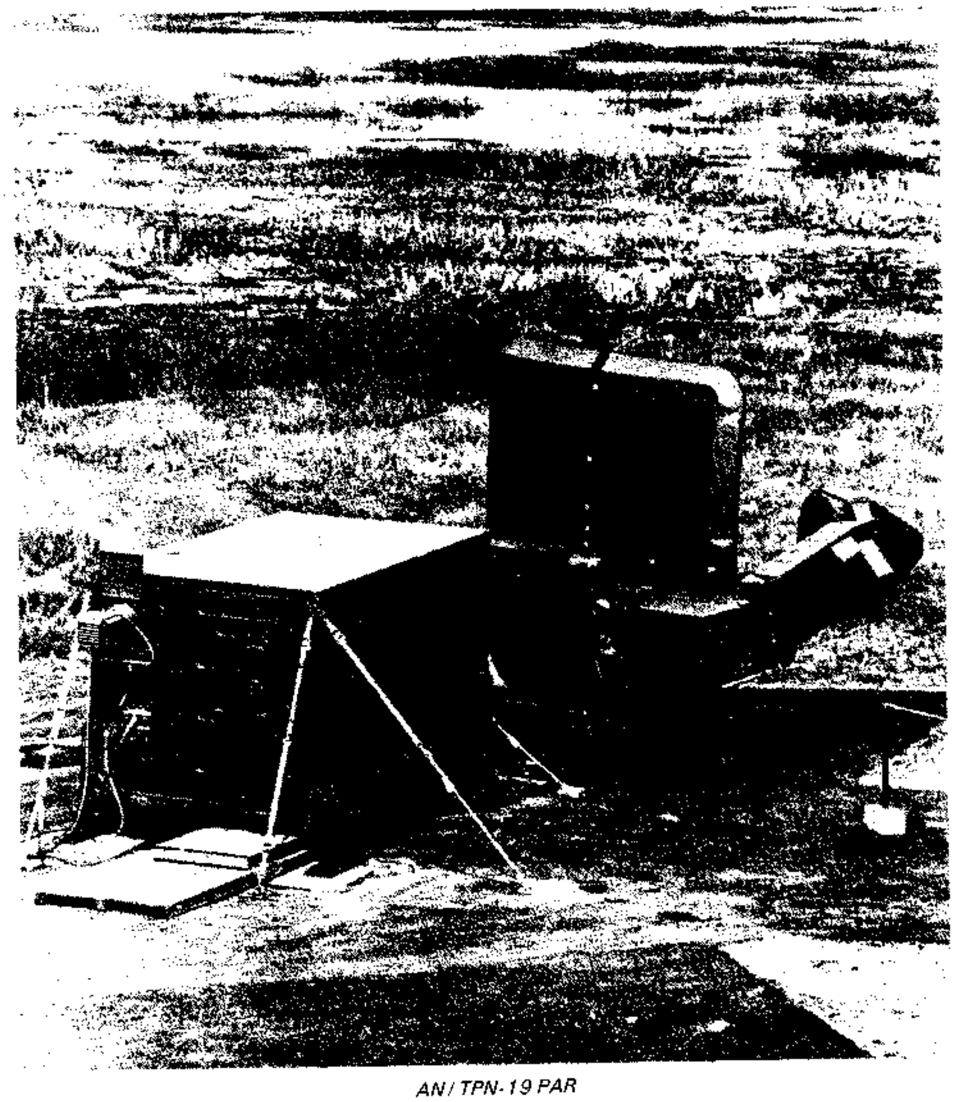
The Airport Surveillance Radar is a dual-channel, 2 × 450 kW S-band, MTI radar. Its most noteworthy features are a multiple (12) horn antenna feed which produces lobe-free coverage up to 12,000 metres and 60 nm on a one-square-metre target; a low-angle pattern which is electrically variable and programmable in range and azimuth to reduce clutter returns; a digital coherent and non-coherent MTI system to eliminate weather returns and a staggered p.r.f. to eliminate blind speeds below 1,100 knots.

The Precision Approach Radar is said to represent a significant advance in the state-of-the-art. Operating in X-band, it has a range of 20 nm even with precipitation at 5 cm/hour. This results from the use of the narrow pencil beam (0.75° × 1.4°) produced by the 824-element phased array antenna of 320 kW. A monopulse system, it can track up to 6 targets simultaneously. For multiple runway coverage the antenna assembly can be slewed through 270°.

In the GCA configuration there are three displays but through simple modular extension the system provides seven displays for a full RAPCON configuration. All displays are dual mode and can be changed to display either an ASR or PAR presentation instantaneously.

STATUS:

AN/TPN-19 has been developed for the USAF Systems Command as part of the Tactical Airbase requirement and is currently in production. The system has successfully undergone rigorous rain tests in which an F4 aircraft was tracked in up to seven inches of rain per hour. The system was also



AN/TPN-19 PAR

the first landing system to meet formal USAF commissioning criteria at Nellis AFB which is located in one of the world's worst ''clutter'' areas.

MANUFACTURER:
Raytheon Company, Equipment Division, Wayland, Massachusetts 01778, USA.

AN/TPN-19 Landing Control Central

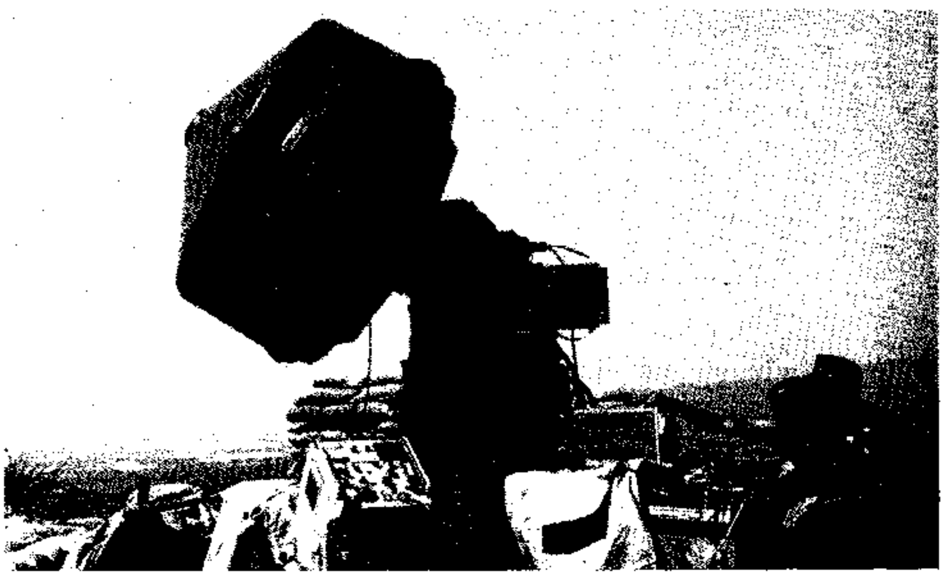
2498.153
AN/TPQ-10 RADAR COURSE DIRECTING CENTRAL

DESCRIPTION:
The AN/TPQ-10 Radar Course Directing Central is designed to provide accurate all-weather guidance to aircraft for performance of close air support missions.

The equipment consists of a tracking radar and an operational shelter containing the radar controls, a computer, displays, and communication equipment. Designed specifically for tactical air operations, it is easily transported by helicopter, cargo aircraft, or truck.

The AN/TPQ-10 is normally manned by a strike controller and a radar operator. The strike controller is responsible for maintaining voice contact with the aircraft and other ground units, inserting required data into the computer, and monitoring the progress of the mission on his display. The radar operator is responsible for identifying and acquiring the aircraft initially and monitoring the automatic tracking.

During a mission the radar tracks the aircraft and provides continuous position data to the computer and to the strike controller's display. Data on target location, wind conditions, and weapon characteristics are inserted into the computer, which combines this information with the continuous aircraft position data from the radar. Commands generated by the computer from this information are transmitted by data link to the aircraft, where they are fed into the autopilot to guide the aircraft to the target. If the aircraft does not have data link equipment, the strike controller can transmit the necessary commands by voice communication.



AN/TPQ 10 Radar Course Directing Central

In addition to close support operation guidance, the AN/TPQ-10 can be used to guide flare missions and all-weather troop and cargo drops, to provide assistance for automatic return to base and ground-controlled runway approaches during conditions of low visibility, and to control drone aircraft.

STATUS:
Operational.

MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

1526.153
FORWARD AREA ALERTING RADAR TPQ-32/MPQ-49

DESCRIPTION:
The Forward Area Alerting Radar (FAAR) has been designed to meet a US Army requirement for a lightweight early warning air surveillance radar to increase the effectiveness of air defence weapons, such as Chaparral and Redeye missiles and the Vulcan 20 mm gun system, against low-level aircraft attacks. It has been developed in both transportable and mobile versions, these being designated TPQ-32 and MPQ-49, respectively. The principal system elements and operation are identical or similar in both.

The complete system comprises a 25 cm primary radar with an on-mounted secondary (IFF) horn antenna, shelter- or truck-mounted radar data extraction and processing units, operator's console, VHF data link, and a number of remote target indicators for use at individual missile or gun sites.

The primary radar operates at a frequency in the 25 cm band and is a pulse-doppler equipment using a low-noise stable master oscillator, a grid-modulated travelling-wave-tube transmitter, and an all solid-state homodyne (zero IF) receiver. The receiver translates target information to video frequencies which are range gated, doppler filtered and compared with an alarm threshold. Target data is then transmitted via the VHF data link to remote sites, and presented on the operator's console CRT. The antenna measures 183 cm by 107 cm and is carried on a telescopic mast. The latter is of four sections, pneumatically operated, and capable of extension to a height of about 11 metres. 360 degree coverage is provided. A horn antenna for the IFF is mounted on the upper edge of the main reflector. The IFF system used is the TPX-50, and this provides for either automatic or manual target interrogation.

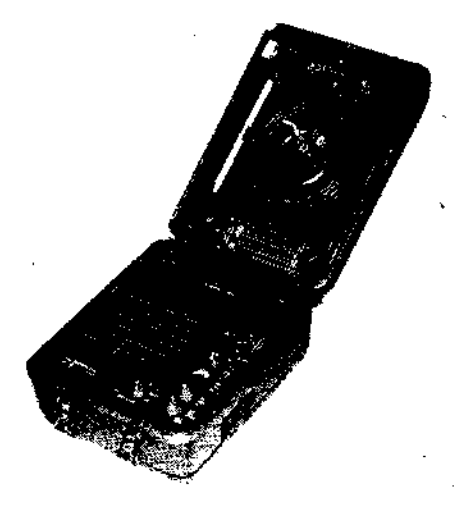
The operator's console has a 25 cm diameter PPI display which normally presents only processed video which is time-shared with the PPI generator and the symbol generator to show targets, a 7 × 7 rectangular grid matrix, and target designation symbols for transmission to remote indicators via the data link. Controls are provided for selection of 'black-scope' or processed video display, sector blanking, threshold adjustment, automatic or manual IFF interrogation, IFF mode selection, radar transmitter/receiver control and self-test functions, and data link operation. The console can be removed from the truck or shelter to enable the complete system to be operated from a position up to 50 metres from the radar site.

The VHF data link VRC-46 has three operating modes: data, voice, and RAID – Rapid Alerting and Identification Display. This link carries target information from the central operator's console to up to 12 remote Target Alert Data Display Sets (TADDS) at weapon sites.

Each TADDS (GSQ-137) consists of a single 6 kg unit comprising a display, audio warning, and VHF receiver. The display consists of a replica of the 7 × 7 matrix appearing on the operator's PPI display with each square representing a specific area of the total radar coverage. The presence of a target in any one square, as determined by the central operator, is denoted by the appearance of a coloured disc in the appropriate square of the TADDS. Green discs denote friendly aircraft and red hostile. Plotting of target tracks is by means of a wax pencil. Controls on the TADDS unit provide for test functions, data link address code selection, and data link receiver frequency selection between 30 and 76 MHz. The lid of the unit carries a magnetic compass for orientation purposes.

The mobile version of FAAR, MPQ-49, is housed in a transportable S-250 shelter, utilising the six-wheel-drive M-561 vehicle as prime mover. The system can also be carried by C-130 transport aircraft, or air positioned in a battlefield environment by a CH-47 helicopter. The TPQ-34 is a modified version of FAAR, in non-mobile form, which provides all-weather target detection and location against personnel and vehicles in densely foliated environments. This version is also known as GSR, Ground Surveillance Radar, TPQ-34.

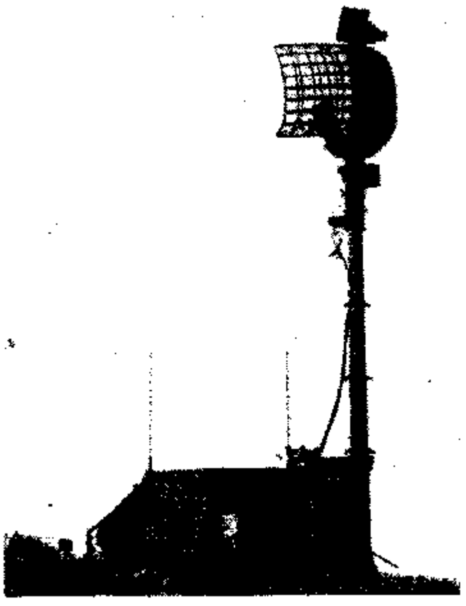
Other applications ascribed to the system include 360 degrees detection of first round mortar and rocket fire, and use as a tactical air traffic control centre. Although designed for essentially manual operation, FAAR is capable of integration with automatic air defence systems.



GSQ-137 Target Alert Data Display Set for FAAR system. Unit contains VHF data link relay and matrix display for presentation of target data from central radar site. A number of these units can be located at anti-aircraft sites

DEVELOPMENT:

Development was undertaken by Sanders Associates, Inc for the US Army Missile Command under a series of contracts. Prototypes were delivered to the US Army in late 1968 and early 1969, and initial production was ordered under a $7.1 million contract in March 1969. In addition to tests at US home bases and engineering establishments, FAAR has been deployed in South-east Asia in the TPQ-34 Ground Surveillance Radar configuration. In this role, the IFF antenna is apparently deleted.



Antenna of MPQ-49 Forward Area Alerting Radar on pneumatically operated telescopic mast. Horn for IFF is carried on reflector upper edge

STATUS:

The first production model MPQ-49 was delivered to the US Army in January 1972, when it was stated that contracts amounting to $30 million had been awarded.

MANUFACTURER:

Sanders Associates, Inc, Radar/Ordnance Division, Crosby Road, Bedford, Massachusetts 01730, USA.

2848.153
AN/TPQ-36 MORTAR LOCATING RADAR

DESCRIPTION:

Limited information only is available on this radar which is currently under development. What is known is that it is an automatic device including electronic scanning, sophisticated computer data processing and a rotating cylindrical map board.

Of light construction and suitable for rapid deployment, the system will comprise an equipment shelter on a Gamma Goat articulated vehicle and an aerial assembly pallet carried on an M-116 trailer.

The system's electronics scanning capability will enable targets to be located over a 90° arc. The signal processing system will be programmed to reject returns from birds, rain or ground clutter.

STATUS:

Development. Hughes announced receipt of a contract from US Army Electronics Command late in 1973. The project is directed by the MALOR (Mortar and Artillery Locating Radar) Project Office of the US Army.

MANUFACTURER:

Hughes Aircraft Company, Fullerton, California, USA.

2849.153
AN/TPQ-39 DIGITAL INSTRUMENTATION RADAR

DESCRIPTION:

AN/TPQ-39 is a one-man instrumentation radar of modular design which can readily be transported by air or over land and can be installed and set up in one hour. It is intended for use in range safety applications or for any target tracking process for target or system evaluation.

A 250 kW C-band transmitter is used with a 1.5 microsecond pulse and a recurrence frequency of 640 pulses per second. The aerial is a 183 cm paraboloid with a point source sequential monopulse feed which can track continuously in azimuth and has an elevation arc of 190° (−5° to +185°).

As the equipment's name suggests, digital techniques are extensively used in the system; and the use of solid-state devices wherever possible has resulted in a radar having a total system weight of less than 2,000 kg and a power consumption of only 15 kW.

STATUS:

A contract for the supply of these radars to all three US armed services was placed in mid-1973 with delivery of three radars due in 1974.

MANUFACTURER:

RCA Government and Commercial Systems, Moorestown, New Jersey, USA.

Units of the AN/TPQ-39 Digital Instrumentation Radar

2529.153
AN/TPS-21 AND AN/TPS-33 PULSE-DOPPLER BATTLEFIELD RADARS

DESCRIPTION:

These two radars are X-band portable manpack equipments used to detect persons or vehicles in motion on the ground. Targets are detected at ranges lying between approximate limits of 100 metres and 18,000 metres with a range measurement accuracy of +23 metres or +1% of range whichever is the greater. Angular accuracy is +25 mils.

Scanning is either manual or automatic in range with sector scan. For the TPS-21 radar detection is solely by audible tone in the operator's headphones; in the TPS-33 equipment there is also an A-scope display.

STATUS:

Operational in US armed forces.

MANUFACTURER:

Admiral Corporation, USA

2516.153
AN/TPS-32 AUTOMATIC 3-D TACTICAL SURVEILLANCE RADAR

DESCRIPTION:

AN/TPS-32 is an automatic digital 3-D tactical radar designed for use by the US Marine Corps for amphibious operation. It is the land or land-sea forces' equivalent of the AN/SPS-48 radar (**1252.253**) used by the US Navy.

Coverage is provided up to 480 km in range and up to 30,000 metres in altitude. The antenna used with the system is a rectangular array some 10 metres in height and inclined at an angle of about 30 degrees to the vertical. The array consists of 18 sub-arrays that are used to produce 9 pencil beams transmitted on 9 different frequencies: these beams are electronically swept in the vertical plane as the antenna rotates. The outputs from the nine receivers associated with these sub-arrays are computer processed to provide data for display on a variety of PPI tubes. An IFF antenna is mounted on top of the main array and IFF signals are combined with the primary radar data to make identification information readily available to the operator.

DEVELOPMENT:

AN/TPS-32 is derived from earlier experimental work carried out on a radar designated XN-2 that was developed by ITT Gilfillan for the US Bureau of Ships. Ten of the new equipments are on order for the USMC and other NATO countries are understood to be interested.

MANUFACTURER:

ITT Gilfillan Inc, 7821 Orion Avenue, Van Nuys, California 91409, USA.

2530.153
AN/TPS-34 TRANSPORTABLE AIR DEFENCE RADAR

DESCRIPTION:

TPS-34 is a tactical early-warning radar for use in forward air defence systems. Said to be the first tactical radar to utilise the V-beam 3-D technique.

The radar provides long-range three-dimensional data on high-speed aircraft and missiles from battlefield sites. It can be transported by helicopter in units averaging less than 200 kg in weight and can be assembled and operating in less than eight hours from touchdown.

STATUS:

In service in the US and British armed forces.

MANUFACTURER:

Sperry Gyroscope Division, Great Neck, NY, USA

2517.153
AN/TPS-43 TACTICAL 3-D RADAR

DESCRIPTION:

AN/TPS-43 is a lightweight air transportable S-band radar designed for use with manned aircraft or SAM batteries in a wide variety of tactical environments. It provides solid 3-D cover to 170 nm on a fighter aircraft such as the F.102 and measures heights to within ±305 metres of true target height at 100 nm by signal amplitude comparisons in six channels. Extensive clutter rejection and ECCM features are incorporated in the design, including a digital coherent MTI system, pulse-to-pulse frequency agility, jamming analysis and transmission selection (JATS), coded pulse anti-clutter system (CPACS) and sidelobe suppression. Later models, up to AN/TPS-43D, include equipment refinements and increased operational capability.

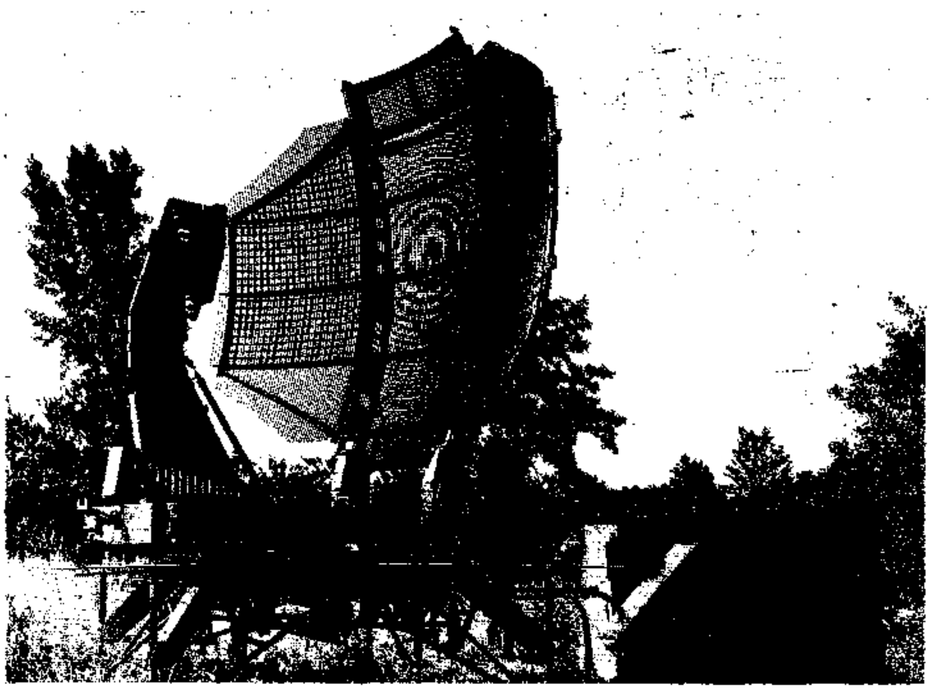
For ease of air shipment the equipment divides simply into two pallet loads each of less than 1,600 kg. One load comprises the shelter unit, transmitter receiver and displays, the other consists of the antenna assembly, the feed and ancillary equipment. The entire equipment can be packed into two 2½-ton trucks for road transport.

To minimise weight light alloys are used wherever possible in the main mechanical structures and microminiaturisation techniques are used where possible in the electronic circuits. A linear beam twystron tube is used for the transmitter: this incorporates the advantages of both the klystron and the TWT and results in reduced complexity in the transmitter circuits.

The feed array design is based on those of earlier Westinghouse-built radars. Among its features are the use of a stripline matrix to form the height-finding beams: IFF feed integral with radar feed and consisting of dipoles on each side of the radar feed plus a printed circuit radiator mounted on the back of the feed to act as the sidelobe reference antenna; use of this latter antenna during the dead time between transmitter pulses is available for the JATS function.

CHARACTERISTICS:

Range: Solid 3D coverage on fighter aircraft to 170 nm or more
Data rate: 10 seconds (6 rev/min antenna)
Elevation coverage: 0° to 20°
Electrical characteristics:
Power output: 4 MW peak, 6.7 kW average



AN/TPS-43 Radar

Frequency: 2,900-3,100 MHz in 16 discrete steps (with pulse-to-pulse agility)
Pulse duration: 6.7 microseconds
Antenna gain: Transmit, 36 dB; Receive, 40 dB
Azimuth beamwidth: 1.1°
IFF Azimuth beamwidth: 4.0° (or sum/difference ISLS antenna)
Noise figure: 5 dB
Prime power: 40 kW, 400 Hz 120/208V
Mechanical Characteristics:
Weight: 3,200 kg (two 1,600 kg units) to 4,200 kg
Transport: C-130 aircraft (0.23 by volume), two M-35 trucks, two sets of transporters, or two helicopter loads
Road speeds: Up to 96 kmh
Air lift altitudes: Up to 15,000 metres
Siting requirements: 6 × 10.5 m clear area on slope of 10% or less
Reaction time: 50 minutes with a 6-man team
Wind resistance: Operate to 52 knots, survive 92 knots (tied down)
Operating altitude: Up to 3,000 metres above sea level
Operating temperature: −40°F to 125°F (−40°C to +52°C)
Other:
MTBF: 235 hours
MTTR: 0.75 hour
Outputs to: Three 120 metre cables with storage reels
Operations centres PPI: AN/UPA-62 40 cm CRT for air control and monitoring
IFF/SIF equipment: AN/UPX-23 Interrogator Set and AN/UPA-59A Active/Passive Decoder
Transmitter tube: Linear beam Twystron
Air Conditioner/heater: A/E32-18

MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

2518.153
AN/TPS-44 TACTICAL SURVEILLANCE RADAR (ALERT)

DESCRIPTION:

AN/TPS-44 is a lightweight, solid-state, transportable L-band air surveillance radar. It was designed for use anywhere in the world as the sensor for the Forward Air Control Post of the US 407L System (TACS).

The equipment comprises a transportable equipment shelter (containing the electronic equipment including IFF) and a palletised antenna. It can be transported by helicopter, aircraft and all forms of surface transport and it is said that it can be put into operation after transport in less than one hour.

Main features of the equipment are set out in the accompanying table.

DEVELOPMENT:

Prototypes of the equipment were submitted to the USAF and successfully passed all tests. Following this the equipment was put into production, and by October 1968 25 systems had been delivered to the USAF.

CHARACTERISTICS:

Antenna:
Type:
Search: Modified parabolic
IFF: Integral with search radar feed system and reflector
Aperture: Search:
Horizontal: Greater than 45 metres
Vertical: Greater than 2.7 metres
Beam width (one-way): Search and IFF:
Horizontal: 3.8°
Vertical: 8° with cosecant squaring from 7° to 27°
Polarisation:
Search: Horizontal
IFF: Vertical
Type of feed: Search and IFF: Horn
Beam pattern Search and IFF:
Horizontal: Conventional fan beam (cosine between 3-dB (points), side lobes 25-dB down back lobes 30-dB down
Vertical: Conventional fan beam with cosecant squaring
Scan:
Azimuth: 0 to 15 rev/min, clockwise in automatic, or manually searchlighting, clockwise or counter clockwise
Elevation: Manually adjustable, −3° to +6°
Transmitter:
Power:
Peak: 1 MW, or greater
Average: 1.12 kW at 800 0.745 kW at 533,

1.12 kW at 26 /
Pulse Repetition Frequency:
Manually selectable: 800, 533, 267
Momentary selectable: ± 10 microsec stagger on 800 PRF
Frequency: 1.25 to 1.35 GHz, continuously tunable over full range by local or remote tuning control
Tuning rate: 1 MHz per second
Pulse: Width automatically selected when PRF is selected.
1.4 microsec for 800 PRF
1.4 microsec for 533 PRF
4.2 microsec for 267 PRF
Rise time: 100 nanosec. max
Receiver:
Noise figure: Typically 3 dB, overall
Dynamic range: 65 dB
Choice of IF: logarithmic, linear, or wideband limiting
Signal Processing:
MTI:
(a) Analogue type
(b) Signal delay line canceller
(c) Cancellation ratio – typical 40 dB
(d) Subclutter visibility –30 dB searchlighting, 20 dB scanning (6 rpm)
(e) FM IF delay line processor with phase locked tracking loop detector, video cancellation
VSI: Uses same processor as MTI
Feedback factor typical 0.97
Accuracy:
Range: 0.33 nautical mile on 267 PRF; 0.1 nautical mile on 800 and 533 PRF
Azimuth: + 1°
Type of information displays:
(a) PPI
(b) A-scope
(c) Output jacks and cabling provided for remote displays

MANUFACTURER:
Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

2519.153
AN/TPS-48 3-D TACTICAL RADAR

DESCRIPTION:

AN/TPS-48 is an updated version of the AN/TPS-27 (**2515.153**) and, so far as is known, has been created only by modifying models of the earlier radar.

Principal differences are:
(1) Weight and size reduction. Whereas AN/TPS-27 requires nine M-35 trucks to put it on the road AN/TPS-48 requires only two.
(2) Field assembly time reduced from 150 man-hours to about six.

The compact modified radar is housed in two compact modular shelters.

DEVELOPMENT:
Westinghouse received a contract from the USAF to modify eight of their AN/TPS-27 radars to the new standard.

MANUFACTURER:
Westinghouse Aerospace and Electronic Systems, Baltimore, Maryland, USA.

2520.153
AN/TPS-61 TACTICAL SURVEILLANCE RADAR

DESCRIPTION:
AN/TPS-61 is an air-transportable L-band tactical radar for airfield surveillance, gap-filling and similar functions for which a transportable radar may be required.

Important features of the equipment are high-quality MTI circuits, built-in IFF/ATCRBS capability and a high-performance lightweight PPI display. MTI circuits include a digital MTI system and CPACS circuits. The display is the AN/UPA-62 Indicator Group which Westinghouse have developed for the USAF and which is an exceptionally compact 16-inch (406 mm) display with a very wide range of facilities.

DEVELOPMENT:
Produced in the summer of 1969 for test by USAF and USMC

CHARACTERISTICS:
Performance:
Range: Solid 2D coverage up to 87 nm on fighter-sized aircraft
Data rate: 6-12-15 rpm (10 second, 5 second, 4 second)
Elevation coverage: 24,000 metres, cosecanted to 45°
Electrical Characteristics:
Power output: 100 kW, Peak, Average 2.2 kW
Frequency: 1,250-1,350 MHz 0.24-0.222 metres
Pulse duration: 26 microsec/compressed to 2 microsec
Antenna gain: 28.5 dB
Azimuth beamwidth: 2.7°
Receiver noise figure: 3.5 dB
Prime power: 15 KVA, 400 Hz, 3-phase
Mechanical Characteristics:
Weight: 1,700 kg
Transport: C-130 Aircraft, M-35 truck, 1 UH-1 Helicopter
Road speeds: Up to 95 kmh
Reaction time: 30 minutes with 4-man team
Wind resistance:
Non-operating: 90 knots and ice up to 2 radial inches
Operating: 52 knots and ice to 0.5 radial inch
Operating altitude: Up to 10,000 ft above sea level
Non-operating: Up to 50,000 ft above sea level
Temperature:
Non-operating: –62°C to +71°C (–80°F to +160°F) for periods of storage and exposure up to 180 days
Operating: –40°C to +52°C (–40°F to +125°F)
Antenna dimensions: Vertical 2.14 metres
Horizontal: 5.49 metres
Shelter construction: Standard military S280 shelter. Dimensions, 373 cm long, 203 cm wide, 211 cm high
Other:
MTBF: 450 hours
MTTR: 0.28 hour
PPI: 406 mm AN/UPA-62
Air conditioner/heater included

AN/TPS-61 Radar. Cutaway drawing showing display arrangement

MANUFACTURER:
Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

2535.153
AN/TPX-42 IFF/ATCRBS GROUND EQUIPMENT

DESCRIPTION:
AN/TPX-42 is an advanced secondary radar system comprising interrogator/responsor, data-processing and display equipment. It is being supplied to US military and civilian authorities for civil/military air traffic control and military defence purposes. There are several different possible configurations of the equipment depending on specific application, fixed and mobile RAPCONs, fixed and mobile GCAs, RATCCs, and civil air terminals.

Main units of the system are the Antennas, the SSR Interrogator/Receiver, the Synchronizer/Coder, the Interference Blanker (Defruiter), the Video Signal Processor, the Indicator Data Processor, and the Display Consoles.

Coded pulse trains appropriate either to the Mark X IFF/SIF or to the ATCRBS system are transmitted by the interrogator which is triggered by the Synchronizer/Coder; the latter providing either internally generated pulses or pulses connected down from associated primary radar.

The Defruiter accepts the incoming signals from the Receiver and applies automatic three-mode interlace defruiting. It can operate over a wide PRF range of from 25 to 1,000 Hz. The Defruiter output is applied to the Video Signal Processor which standardises and decodes all replies in the interrogator coverage area (active decoding). The VSP also identifies potential garble situations, detects true target position for range and azimuth, correlates and validates identity and altitude codes, and combines all this information into a single message for each aircraft once per antenna revolution.

These messages are received by the display processor which converts and corrects the altitude code according to the prevailing conditions, converts the polar radar coordinates into Cartesian coordinates and provides the converted data to the displays together with memory data for display of aircraft tracks. The displays present synthetic position symbols in accordance with the processed radar video together with numeric codes for identity and altitude plus aircraft tracks and other data as required.

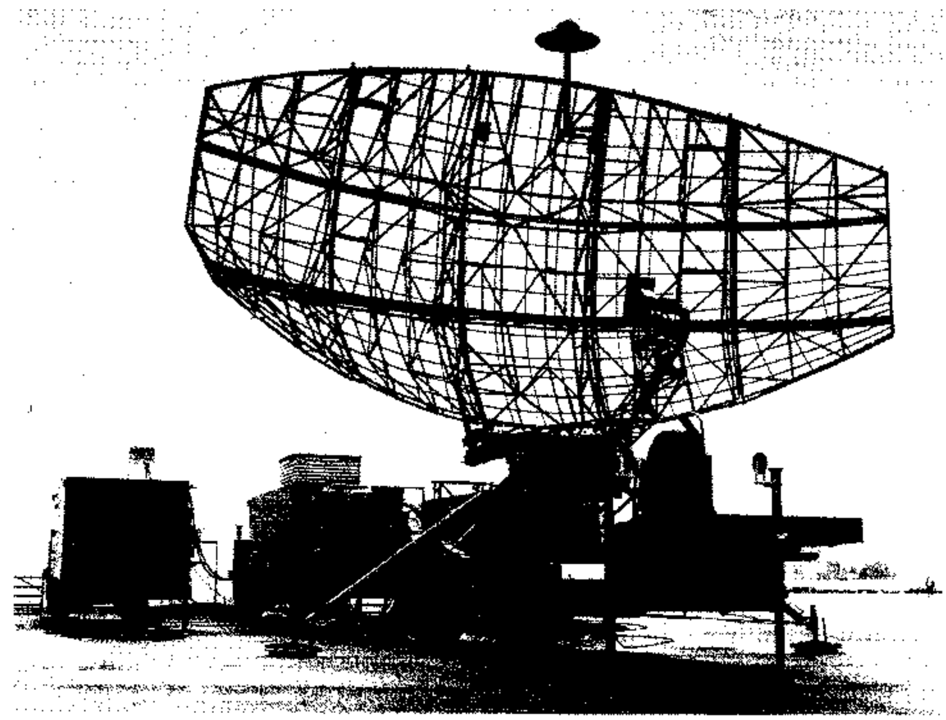
STATUS:
In production. A contract for 304 military systems was placed with AIL in October 1969. Civil systems are also on order for the FAA.

MANUFACTURER:
AIL Division of Cutler-Hammer Inc., Deer Park, Long Island N.Y. USA.

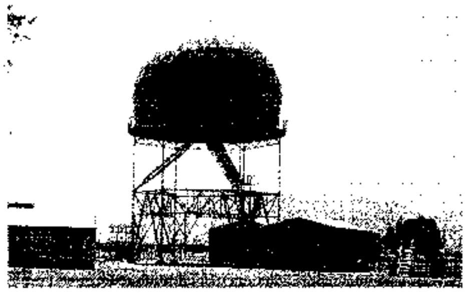
2547.153
AN/VPS-2 RANGING RADAR
DESCRIPTION:
This coherent doppler MTI radar is the range sensor of the Vulcan forward area air defence system (**2850.131**). Targets are acquired and tracked optically in this system but high-speed range and range rate data are required as inputs to the lead computing sub-system.
The axis of the radar antenna is servoed to the optical line of sight. The sight case and gun bore are physically fixed in alignment; but the sight reticle, which defines the optical line of sight, can move relative to the sight cage and is controlled by a gyro. As the gunner tracks the target, the angular tracking rate and the radar-measured range and range rate are computed to predict future target position and then to control the sight reticule, introducing between the optical and firing axes the lead angle and super elevation required for successful target engagement.
Although primarily directed by optical means, the AN/VPS-2 radar has an automatic search and lock-on characteristic so that it tracks the target accurately.
CHARACTERISTICS:
Search range: 5,000 m
Tracking capability: 15 m/sec to 310 m/sec
Subclutter visibility: 40 db or better
STATUS:
Operational. The radar was developed under a US Government contract placed in March 1966. The first prototype was completed in the same year and the equipment entered US Army service in 1969.
MANUFACTURER:
Lockheed Electronics Company, Route 22, Plainfields, N.J. 07060, USA.

2844.153
AVADS FIRE CONTROL RADAR
DESCRIPTION:
This radar is used with the Automatic Vulcan Air Defence System (AVADS – **2843.131**) and is a modification of the AN/VPS-2 range-only radar (**2547.153**), used with the earlier Vulcan system (VADS – **2850.131**).
The purpose of the modification is to enable the radar to track in angle as well as in range. As modified, it consists of a rear-feeding, low side-lobe, polarised twist, cassegrain reflector protected by a fibreglass front plate; a gearless, gyro-stabilised electrical drive mechanism; and signal processing and interface electronics, most of which are the same as have long been successfully used in the VPS-2.
Like the VPS-2 the AVADS radar is a pulse doppler system working in X-band and has an operational range span of 200-5,000 metres.
STATUS:
Evaluated by US Army. Decision on procurement awaited
MANUFACTURER:
AVADS prime contractor: General Electric Company, Lakeside Avenue, Burlington, Vermont 05421, USA.

2499.153
HIPAR (HIGH POWER ACQUISITION RADAR)
DESCRIPTION:
HIPAR (High Power Acquisition Radar) is designed specifically for use with the United States Army's improved Nike Hercules surface-to-air missile system. The improved Nike Hercules system is deployed in key areas in the United States and overseas as a defence against high-performance aircraft, air-to-ground missiles, and tactical ballistic missiles. HIPAR was developed as an integral part of the system to provide significantly increased detection capabilities. It supplies long-range coverage and extremely precise azimuth data on small supersonic targets.
In addition to long range, the high-gain narrow-beam antenna used by HIPAR provides high-angle coverage. Its high-altitude coverage is said to be appreciably better than that of most present-day acquisition or surveillance radars.
To permit the full detection capabilities of the high-gain antenna to be realised despite the presence of enemy jamming, what are said to be unique moving target indicator (MTI) and receiver circuits have been developed for use with HIPAR. These circuits employ anti-jamming techniques that are said to provide capabilities not previously possible with conventional MTI techniques.



HIPER (High Power Acquisition Radar)



HIPER (High Power Acquisition Radar)

Both static and mobile HIPAR systems have been produced for the Army's use in both United States and Europe. The mobile version, which uses the same electronics and components as the static version, is said to be the highest-powered mobile radar of its kind in the free world. An important feature of the antenna for the mobile version is its ability to be changed quickly from cosecant-squared coverage to fan-beam coverage.
Mobile HIPAR is transported on five flatbed trailers and can be emplaced by Field Army personnel after minimum training.
STATUS:
Operational
MANUFACTURER:
General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

2783.153
RCA PORTABLE BATTLEFIELD RADARS
DESCRIPTION:
Two miniaturised battlefield radars have been developed by RCA for the detection of moving people or vehicles in poor visibility conditions.
Both radars operate in X-band. The smaller, 2019M2, has a transmitter-receiver unit weighing only 1 kg and the complete radar weighs only 4 kg with batteries capable of 12 hours uninterrupted operation. The larger radar, 4019M2, has three times the range capability of the smaller equipment and has a transmitter receiver weighing only 3.6 kg; and the complete radar with accessories weighs only 6.35 kg.
The 2019M2 radar can detect a man at a distance of 500 metres – with a range accuracy of 6 metres – and features single 3-control operation. Of modular construction it has an indicated MTBF of 5,000 hours. It is well suited to small unit deployment; the lightweight transmitter-receiver can conveniently be mounted directly on such weapons as the M16 rifle, the M60 machine gun, the M79 grenade launcher and the M67 recoilless rifle. Thus mounted the radar will give fire control data direct to the weapon user.
The 4019M2 is a more sophisticated equipment. In particular it features a look/listen acquisition mode in which it is possible for the operator to range on one target while continuing to look for others. This radar is also suitable for unmanned operation and can be used in quantity to set up a perimeter warning system. For this purpose the radar can be tripod-mounted, but for other operations the transmitter-receiver is quite light enough to be held in the hands if required.
CHARACTERISTICS:

	2019M2	**4019M2**
Frequency:	8,750 MHz	8,750 MHz
Detection range: (on 0.5 sq m target)	500 m	1,500 m
Location range:	500 m	2,500 m
Range resolution:	25 m	25 m
Target speeds detected:	1.74 km/h	1.74 km/h
Signal output display:	Doppler aural only	Doppler aural and visual alarm
Power consumption: (at 24 V DC)	3 W	5 W

Height (approx):	23 cm	20 cm
Width (approx):	33 cm	33 cm
Depth (approx):	10 cm	13 cm

Weight (approx):		
Transmitter-receiver:	1 kg	3.6 kg
System:	4 kg	6.4 kg

MANUFACTURER:
RCA, Government and Commercial Systems, Moorestown, New Jersey, USA.

2791.153
SAFEGUARD MISSILE SITE RADAR
DESCRIPTION:
The Missile Site Radar (MSR) of the Safeguard ABM system (**2798.131**) is a large multiple phased-array S-band equipment. In the original Safeguard proposals there was provision for up to twelve of these radars strategically located across the contiguous United States: it now seems fairly certain, however, that there will be only one such radar deployed operationally in the area and that any subsequent requirement for operational facilities similar to those provided by the MSR will be met by the deployment of a different radar (see **2806.131** and **2792.153**).

A prototype installation of the MSR has been operating at Meck Island in the Kwajalein Atoll since September 1968 and has been used in conjunction with the Spartan and Sprint (**2811.131** and **2812.131**) missile trials. The operational installation is nearing completion near Nekoma, North Dakota, close to the Spartan launch site, within 25 km of the four Sprint launch sites and some 40 km south-west of the Perimeter Acquisition Radar (PAR – **2790.153**). The radar is housed in a truncated reinforced concrete pyramid some 23 metres high and mounted on a square reinforced concrete underground building about 70 metres square and 16 metres high. A circular phased array about 10 m in diameter is mounted on each of the four faces of the pyramid which are directed towards the four points of the compass: each array contains 5,002 phase shifters and the radar has a detection range of more than 300 nm (550 km).

Targets will normally be detected at long range by the PAR which will then programme the MSR accordingly. For an exo-atmospheric interception a Spartan missile may be launched on command from either PAR or MSR as circumstances dictate, but in either case the MSR tracks both target and missile and commands the missile on to the required interception course. For an endo-atmospheric interception the MSR system commands the launch of a Sprint missile from one of the four launch sites and controls the interception.

STATUS:
At the time of writing the MSR is at its installation test stage. Components and subsystems are being evaluated and the integrated system is being tested by satellite tracking. Handover to the US Army is scheduled for October 1974 and initial operational capability for June 1975.

MANUFACTURER:
Raytheon Company, Equipment Division, Wayland, Massachusetts 01778, USA.

2790.153
SAFEGUARD PERIMETER ACQUISITION RADAR
DESCRIPTION:
The Perimeter Acquisition Radar (PAR) of the Safeguard ABM system (**2798.131**) is a very large phased-array equipment of which it was originally intended to build a chain to provide ABM data for all the contiguous United States. It was intended that most of these radars would consist of a single radiating array and associated equipment, but a few would have had more than one array. The original intention has been progressively whittled down, however, and the radar now constructed near Cavalier, North Dakota, seems likely to be the only one to be deployed operationally.

This radar has a single radiating face pointing northwards with an azimuth coverage of about 120° and a missile detection range believed to be about 1,800 nm (3,300 km). The face is mounted on the sloping side of a reinforced concrete structure some 30 metres high and having a square base with a side of about 61 metres. The array consists of some 6,600 dipole elements which have been reported as radiating at 442 MHz with a power of 1.1 kW each. The array is roughly octagonal and about 30 m wide.

Associated with the radar is an elaborate computer system which calculates the trajectory and impact point of any hostile target detected by the radar and generates information either to programme the Missile Site Radar (**2791.153**) some 40 km to the south-west or to launch a Spartan interceptor missile (**2811.131**) from the 30-missile launch field co-located with a 16-missile Sprint (**2812.131**) launch field near the MSR. Time for the PAR to determine the trajectory of a detected re-entry vehicle is believed to be about three seconds.

STATUS:
Hardware installation and test virtually complete. Software should be complete and handed over to give an initial operational capability by June 1975.

MANUFACTURER:
Prime contactor for the PAR – General Electric Company, Syracuse, New York, USA.

2792.153
SITE DEFENCE RADAR
DESCRIPTION:
An important item in the US Site Defence ABM system (**2806.131**) is a new phased-array radar which will be supplied by the General Electric Company. This radar will perform functions generally similar to those required of the Safeguard MSR (**2791.153**) but limited to endo-atmospheric interception with the Sprint II missile (**2807.131**).

The Site Defence radar will be substantially smaller than the MSR: the area of each of its four phased arrays is said to be only one-fifth of that of each of the MSR arrays; and from sketches that have been published it appears that the complete radar and computer installation will be in the region of one-tenth of the size of the MSR. The radar uses ferrite phase shifters, dipole radiating elements and shadow grid travelling-wave tubes. The associated data processing hardware and software is also much less elaborate, and therefore cheaper, than that which was specified for the MSR.

STATUS:
Development. System integration testing for the whole Site Defence system is scheduled to begin at Kwajalein in 1977

MANUFACTURER:
General Electric Company, Syracuse, New York, USA

THE UNION OF SOVIET SOCIALIST REPUBLICS

2860.153
BACK NET GCI RADAR
DESCRIPTION:

An early Russian GCI and a predecessor of Barlock (**2861.153**) the radar known to NATO as Back Net has a six-feed antenna system similar to that of Barlock.

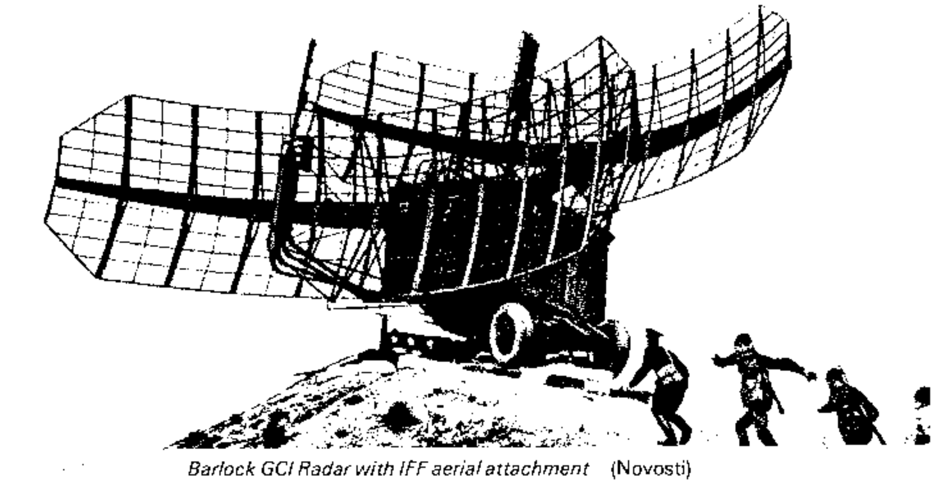
Multiple feeds are widely used in Russian surveillance and GCI radars. Part of the reason for this is the possibility of increasing the total radiated power within the confines of component limitations; but another reason is the possibility of using such antenna systems to provide some form of height information.

Other predecessors of Barlock include Big Bar A (**2862.153**) and Big Mesh (**2863.153**) both of which also have six-feed antenna systems.

2861.153
BARLOCK GCI RADAR
DESCRIPTION:
This large ground control interception (GCI) and search radar is a trailer-mounted equipment that has two large truncated paraboloid reflectors with clipped corners

Operating frequencies of the radar are in the S-band. Each of the reflectors is fed by three feeds so that a total of six stacked beams results, each beam having a power output in the region of IMW. These beams enable the radar to be used as a height indicator. Individual frequency bands for the stacked beams are:

2695 – 2715 MHz
2715 – 2750 MHz
2815 – 2835 MHz
2900 – 2990 MHz
2990 – 3025 MHz
3080 – 3125 MHz



Barlock GCI Radar with IFF aerial attachment (Novosti)

Known to the Russian forces as P-50 this radar has a p.r.f. of 375 pulses/second and pulse widths of 1.8-3.1 microseconds for the S-band transmission and 2,4 microseconds for an L-band identification (IFF-type) secondary radar transmitter that is often found in association with Barlock.

Range capability of Barlock is about 300 km, range accuracy is about 90 metres and angular accuracy about 0.5 degree. The entire trailer body rotates for azimuth scanning at rates up to about 12 rev/min.

STATUS:

Known to have been in operational use for at least 12 years.

2862.153
BIG BAR A GCI RADAR
DESCRIPTION:

A GCI radar with a six-feed antenna system similar to that of Barlock (**2861.153**). See also entry for Back Net (**2860.153**) above.

2863.153
BIG MESH GCI RADAR
DESCRIPTION:

A GCI radar with a six-feed antenna system similar to that of Barlock (**2861.153**). See also entry for Back Net (**2860.153**) above.

2864.153
DOGHOUSE ABM RADAR
DESCRIPTION:

One of several large fixed phased-array radars deployed by the Russian authorities for missile detection. Doghouse is the NATO name given to a radar with a very large array antenna.

Complicated signal processing is used in the installations to which these large antenna arrays belong. It is believed that this is an area where Russian technology is somewhat weaker than, say, that of the USA; and in support of this view it has been pointed out that such signal processing techniques are not much used in smaller Russian radar installations and that this may be because they have decided to apply limited resources first and foremost to the solution of such critical problems as strategic missile defence.

Principal known use of the Doghouse radar is as the intermediate range radar of the Moscow ABM complex. It accepts targets from the long-range Hen House radar (**2879.153**) and hands them on to the Try Adds (**2948.181**) radars. Doghouse operates in the VHF band at around 100 MHz – hence the need for the very large phased array to achieve a sensible beamwidth. It is said to be capable of radiating a peak power upwards of 20MW and to have a p.r.f. of 50 pulses/sec – which is broadly consistent with its reported range of some 1500 nm (about 2,800 km).

STATUS:

Operational in the Moscow ABM network.

2866.153
FAN SONG MISSILE CONTROL RADARS
DESCRIPTION:

Fan Song is the NATO code-name given to a family of compound radar installations that have been developed for use with the Guideline (US code SA-2) surface-to-air missile (**2942.131**).

Five of these radars have so far been identified (by suffix letters A to E) and common to all of them are the detection and tracking of the target, the command guidance of the missile and the tracking of the missile. It is said that these radars can handle up to six targets at once and guide three missiles at a time. It appears, however, that the missile must pass through the guidance beam within a few seconds (reportedly 6) of launch if it is to be acquired and steered towards the selected target. A further problem appears to be a limitation in the amount of steering information that the missile is capable of receiving from the ground station. Nevertheless, the Russian forces have kept Guideline (in various versions) in service for many years and it has been used in action successfully by the North Vietnamese, although possibly expensive in operation, therefore, the system as a whole would appear to be effective.

Details of some of the Fan Song series are given below. All members of the series contain as a major element a track-while-scan radar which scans a designated sector with two flapping fan beams radiated from two orthogonal antenna systems. The flapping motion has a sawtooth profile and uses the electromechanical system known as the Lewis scanner. The "fan" in the code-name refers to these fan beams and the "song" to the bird-like sound of the demodulated radiation from these radars.

STATUS:

Fan Songs of various kinds are in service with Guideline missiles in the U.S.S.R. and satellite and client countries.

2867.153
FAN SONG B MISSILE CONTROL RADAR
DESCRIPTION:

Fan Song B is an S-band member of the Fan Song series (see **2866.153** above). Radiation from its two Lewis scanners is at 2,965-2,990 MHz for one and 3,025-3,050 MHz for the other: peak power output is in the region of 600 kW and the equipment has a first-time-round range capability of between 60 and 120 km.

The equipment is trailer-mounted and the scanned sector can be changed by rotating the trailer and tilting the whole superstructure. The sector scanned is about 10 degrees high and 10 degrees wide, these dimensions being the approximate fan beam width, the beam width in the scanning direction being only about 2 degrees for each beam.

A small parabolic antenna, mounted at one end of the horizontal Lewis scanner is used to transmit UHF command guidance signals to the missile.

2868.153
FAN SONG E MISSILE CONTROL RADAR
DESCRIPTION:

Fan Song E is a C-band member of the Fan Song radar series (see **2866.153** above). Similar in many respects to Fan Song B (**2867.153**) its main differences are the frequency of the radiation from the Lewis scanners and the fan beam (and hence the sector) dimensions. The beams in Fan Song E are about 7.5 degrees wide in the fan and about 1.5 degrees wide in the scanning direction, carrier frequencies are 4,910-4,990 MHz and 5,010-5,090 MHz and peak power is about 1.5 MW. Unambiguous range is 70-145 km.

In addition to the antenna for the command guidance signals, which is similar to that of Fan Song B, Fan Song E has two further parabolic dishes mounted on top of the horizontal Lewis scanner. One of these is horizontally and the other vertically polarised and their purpose is to provide a LORO (Lobe On Receive Only) feature. This is an ECCM technique in which the scanning action of the Lewis scanner is restricted to the receive channel by diverting the transmitted signal, which otherwise would be radiated from the scanner, into a dummy load. This signal is then replaced by a signal from one of the parabolic dishes (the other being for use with the other Lewis scanner) of sufficient power to operate the whole system.

The reason for adding the LORO facility is that by monitoring the Lewis scanner radiation an enemy pilot can tell roughly whether or not he is the prime focus of the attention of the ground forces. If he is, he can employ deceptive electronic counter-measures (DECM) to confuse the radar – such countermeasures typically involving an apparent shift of target angle.

STATUS:

C-band Fan Song radars are in widespread use with Guideline missiles. A particular installation of Fan Song E is that with the Guideline missile on the cruiser *Dzerzhinski* – currently the only known shipborne installation of the missile.

2871.153
FIRE CAN FIRE CONTROL RADAR
DESCRIPTION:

This S-band trailer-mounted radar appears to have been derived from the American SCR-584 radar that was extensively used during the latter years of the Second World War and which was supplied to the Russian forces by the USA. A typical wartime application of the SCR-584 radar was its use on the "Diver" gunsites that were set up on the East coast of Britain to combat the V.1 attack. The radars then were used with 3.7 inch (94 mm) AA guns and the electronic predictor. The Russian radar appears to be used with smaller 57 mm and 85 mm guns.

Fire Can operates at a frequency of 2,700 to 2,900 MHz, has a pulse width of 0.3 to 0.8 microsecond and a p.r.f. of 1,840-1,900 pulses/sec. Peak operating power is believed to be about 300 kW.

Like the SCR-584, the Fire Can antenna is a parabolic dish, perforated to reduce weight and windage, that is mounted on a pedestal on top of the flat roof of the radar trailer. Power is radiated from a rotating dipole feed driven from the rear of the dish and signals from the common T/R system are used, in the tracking mode, to operate a lock-follow system that produces tracking accuracies of about 1.6 minutes of arc in azimuth and 2 minutes in elevation.

The radar can also be operated in a search mode with the antenna rotating continuously in azimuth and nodding in elevation. In this mode the antenna, which has a diameter of about 150 cm, produces a pencil beam with an effective beam width of about 5 degrees. In this mode all received signals are displayed on a PPI but the dipole feed is driven all the time so that the operator can switch rapidly from search to track.

It is believed that Fire Can can acquire targets (search mode) at a maximum range of about 80 km and track them from about 35 km. Tracking accuracy in range is said to be about 13-15 metres.

STATUS:

In service. It is reported that some 75 of these radars were at one time deployed for use in North Vietnam.

2872.153

FIRE WHEEL FIRE CONTROL RADAR

DESCRIPTION:

Fire Wheel is the NATO code-name for another SCR-584-derived fire control radar similar to Fire Can and Whiff (**2871.153** and **2893.153**).

2873.153

FLAP WHEEL FIRE CONTROL RADAR

DESCRIPTION:

Flap Wheel is the NATO code-name for a conical scan radar that is believed to have much the same range of operating frequencies as Gun Dish (**2876.153**). It is used to provide fire control data for 130 mm AA guns.

2874.153

FLAT FACE TARGET ACQUISITION RADAR

DESCRIPTION:

Flat Face is the NATO code-name of a radar known in Russia as the P-15. It is a vehicle mounted acquisition radar that is used in conjunction with the Low Blow missile control radar (**2884.153**) and the Goa surface-to-air missile (**2938.131**).

This radar operates in the UHF band and radiates its signals from two elliptical paraboloid reflectors each measuring about 11 × 5.5 metres. The radar has a range capability of about 250 km with a range accuracy of about 90 metres and an angular accuracy of about 0.5 degrees. Frequency bands are about 810-850 MHz and 880-950 MHz, p.r.f.'s are 200-800 pulses/sec and 600-680 pulses/sec. Vertical beamwidth is about 5 degrees and horizontal about 2 degrees. Peak power is about 400 kW.

STATUS:

Operational in Egypt and Vietnam – where 40 Flat Face radars have been reported. Deployed generally with Goa missile.

2875.153

GAGE ACQUISITION RADAR

DESCRIPTION:

Gage is the NATO code-name for an acquisition radar that is used in conjunction with the Yo-yo missile control radar (**2895.153**) which in turn is used with the early Russian surface-to-air missile Guild (**2944.131**). Operating frequency is believed to be about 3GHz and peak power about 2MW.

2876.153

GUN DISH FIRE CONTROL RADAR

This broad-band fire control radar is used in conjunction with the quadruple 23 mm AA gun mounting on the ZSU-23-4 SP AA vehicle (**5548.103**). This vehicle is used by the AA battalions of the armoured and mechanised divisions of the Red Army and of other Warsaw Pact armies. The NATO code-name "Gun Dish" is obviously prompted by the appearance of the ZSU-23-4 vehicle.

Designed as it is to oppose low-level aircraft attacks the system of which Gun Dish is a part has to have a short reaction time. The guns can be slaved to the radar in elevation and are mounted, in the ZSU-23-4, in a rotatable turret on which the radar is mounted also and which contains a fire-control computer.

It is believed that Gun Dish operates over a wide band of frequencies – from X-band to the lower K-band frequencies.

Gun Dish Fire Control Radars with 23 mm AA guns on ZSU-23-4 SP AA vehicles (Novosti)

2877.153

HEN SERIES EARLY WARNING RADARS

DESCRIPTION:

Several exceptionally large early warning radars observed by American reconnaissance have been given a series of names containing the word "Hen". First to be so named was Hen House (**2879.153**); others whose names have been reported are Hen Egg, Hen Nest and Hen Roost. Few details have been received concerning these radars: the notes below summarise the available information.

Hen Egg

Operating frequency around 2GHz. Peak power around 3 MW. Pulse width 5-15 microseconds: p.r.f. up to 300 pulses/sec. These figures suggest the high mean power of about 5 kW per beam.

Hen Nest

Operating frequency about 800 MHz. Peak power about 3.5 MW.

Hen Roost

Operating frequency not definitely known but thought not to be less than 500 MHz. Peak power similarly believed to be about 5 MW. 2 × 2 degree beam.

STATUS:

All these Hen radars – and probably several others – are believed to be operational; although it is quite possible that some of them are only experimental designs (albeit used operationally) that may well not be repeated.

2878.153

HEIGHTFINDING RADARS

DESCRIPTION:

Several basically similar nodding height-finder radars have been identified and named by NATO. The generic code-name is Cake, and variants on this basic concept are known by such names as Patty Cake, Rock Cake and Sponge Cake.

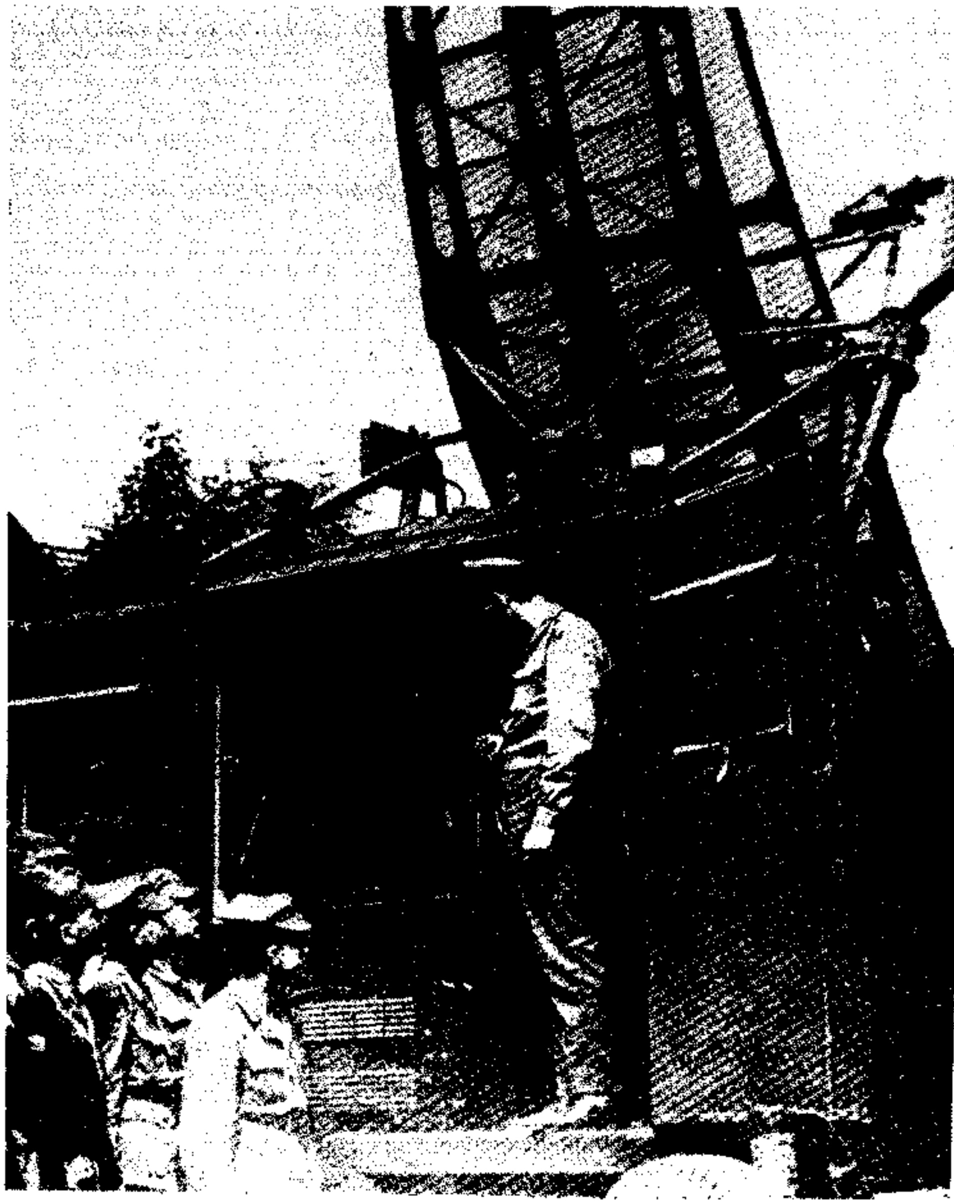
These radars, with their large, peel-shaped nodding antennas typically radiate beams with a width of some 3.5 degrees in the vertical plane. Nodding frequency is typically about 30-40 cycles/min and range is upwards of 200 km. One such radar, Sponge Cake, has a range in the region of 300 km, a range accuracy of about 2 km

500 metres, both at a range of 200 km.

All appear to operate frequencies somewhat above 2 GHz and to have peak powers around 3 MW.

STATUS:

Operational.



Cake series heightfinding radar

2879.153

HEN HOUSE ABM RADAR

DESCRIPTION:

This is the name given by the US authorities to a very large Russian array that was first detected in the late 1950's and was at that time thought – if indeed it was a radar – to be part of a detection tracking and control network for satellites.

Subsequently, however, it was discovered that these enormous radars perform an important early warning and tracking function in the Russian ABM weapons system, providing radar coverage comparable with that planned for the US Safeguard (**2798.131**) system. No details of the radar are known other than that the antenna array is exceptionally large – perhaps as much as 300 metres long and 20 metres high. This billboard array is said to be inclined at about 45° from the vertical.

It is reported, however, that the performance of Hen House is comparable with that of the FPS-50 detection radars (**2511.153**) of the American BMEWS system (**2525.181**) – i.e. a detection range in the region of 3,200 nm (about 6,000 km) and a track-while-scan capability. It is believed to operate on about 150 MHz and has been reported as having a variety of p.r.f.'s from 25 to 100 pulses/sec, variable pulse widths, a complicated beam scan pattern with two beams scanning in azimuth, two scanning in elevations and one scanning in a circular pattern. Peak power is believed to exceed 10 MW.

STATUS:

Hen House radars have been reported as being operationally deployed near Irkutsk, near the Barents sea and in Latvia not far from the Baltic. See also general notes on the "Hen" series (**2877.153**).

2880.153

KNIFE REST A EARLY WARNING RADAR

DESCRIPTION:

Knife Rest radars, as they are known to NATO, have the Russian designation P-10. They were the forerunners of the Spoon Rest radars (**2889.153**).

Knife Rest A has an operating frequency band of 70-73 MHz, radiates about 100 kW peak power, has a pulse width somewhere between 4 and 12 microseconds and horizontal and vertical beam widths in the region of 20-25 degrees. Range capability is somewhere around 350 km.

STATUS:

Operational – certainly in Vietnam – although the more modern Spoon Rest is deployed in the same theatres.

2881.153

KNIFE REST B & C EARLY WARNING RADARS

DESCRIPTION:

General characteristics of these early warning radars are similar to those of Knife Rest A (**2880.153**) except that the range capability is lower at only about 90 km. Knife Rest B is shown to operate in the frequency band 83-93 MHz.

STATUS:

Knife Rest B is certainly operational in Vietnam.

2937.153

LONG TRACK SURVEILLANCE RADAR

DESCRIPTION:

Long Track is the NATO code-name for a tactical surveillance radar used with surface-to-air weapon systems as an early warning/putter-on.

Long Track is commonly associated with the Ganef missile system (SA4 – **2934.131**); and since this missile is one of the longer-range AA weapons is the Russian inventory it may be assumed that Long Track has a substantial range, despite the fact that it operates in the X-band (American I-band).

STATUS:

Operational, certainly with SA-4 missile and possibly elsewhere. Used for SA-4, in conjunction with the Pat Hand fire control radar (**2936.153**).

2884.153
LOW BLOW TRACKING AND MISSILE CONTROL RADAR

DESCRIPTION:

Low Blow is the NATO code-name given to a family of X-band radars used with land-based Goa (US code AS-3) missiles (**2938.131**). These radars are not the same as those used with ship-borne Goa missiles which are known as Peel Group radars (**1323.253**). The name Low Blow reflects the ability of the radar to guide the missile towards low flying targets through heavy clutter.

Like the Fan Song series (**2866.153**) the Low Blow radars use pairs of electromechanically scanning trough antennae mounted orthogonally, but to improve low-angle performance the troughs are mounted at 45 degrees from the horizontal. It appears, too, that the troughs are not Lewis scanners but a form of organ-pipe scanner.

Carrier frequencies of the Low Blow family lie in the 9,000-9,400 MHz band, p.r.f. between 1,750 and 3,500 pulses/sec with unambiguous range correspondingly lying between 40 and 85 km. Radiated beamwidth is in the region of 12 degrees in the fan and 1.5 degrees in the direction of scan. Pulses are between 0.25 and 0.5 microseconds in duration and peak power output is around 250 kW.

STATUS:

Operational with Goa missiles. Commonly associated with Flat Face (**2874.153**) or Squint Eye (**2891.153**) acquisition radars.

2936.153
PAT HAND FIRE CONTROL RADAR

DESCRIPTION:

Little information is available on this radar which is used in conjunction with the SA-4 (Ganef – **2934.131**) surface-to-air missile system. Pat Hand is, of course, a NATO code-name.

In normal operation the Pat Hand radar is put on by the Long Track surveillance radar (**2937.153**). It acquires and tracks the target, provides command signals to guide the missile and tracks the missile by a secondary radar process using a missile-borne beacon transponder. Pat Hand works in the upper C-band (American H-band).

STATUS:

Operational with SA-4 missiles.

2964.153
SCORE BOARD IFF RADAR

DESCRIPTION:

Score Board is the NATO code name for an IFF-type ground interrogator used by the Russian forces. Presumably a very early equipment it has an aerial array consisting of two horizontal rows of two radiators per element, the two double rows being mounted one above the other to give a 4-row array of what appears (in some poorly reproduced pictures) to be a total of 32 dipole radiators. The whole is mounted on a rectangular rotatable framework.

STATUS:

Apparently operational.

2889.153
SPOON REST A EARLY WARNING RADAR

DESCRIPTION:

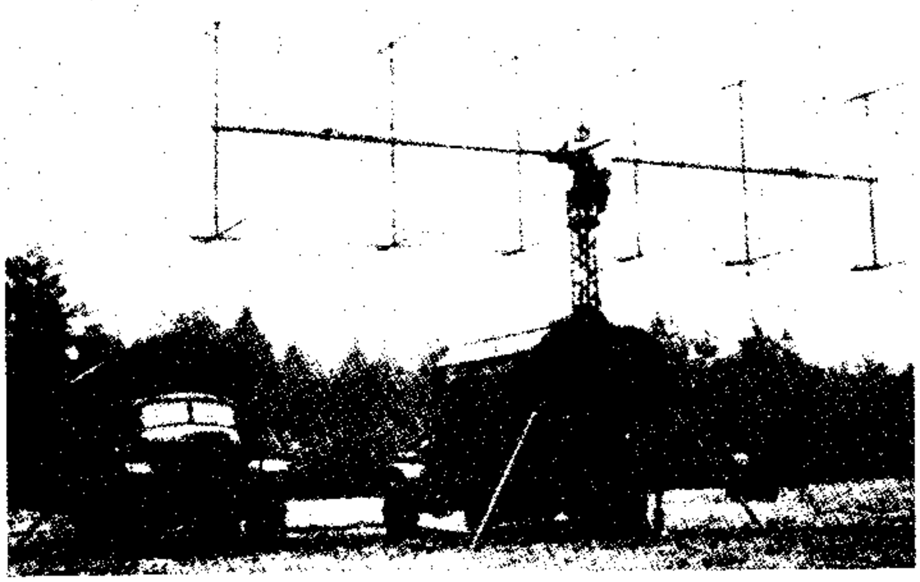
Known in Russia as the P-12, the radar known to NATO as Spoon Rest A is an early warning radar that is used sometimes in conjunction with the Fan Song radars (**2866.153**) and the Guideline surface-to-air missile (**2942.131**).

This is a VHF radar working in the 147.161 MHz band and radiating at about 350 kW peak from a Yagi array. Range capability is up to about 275 km and antenna beamwidths are around 2.5 degrees in the vertical and something over 1 degree in the horizontal plane.

The radar is a heavy one and is mobile in two vehicles – one carrying the generator and the other the antenna array and the radar cabinets.

STATUS:

Operational – certainly in Vietnam, where 34 sets are believed to have been used operationally, and in Egypt where one was captured by the Israeli forces.



P-12 Spoon Rest radar

2891.153
SQUINT EYE ACQUISITION RADAR

DESCRIPTION:

This air target acquisition radar is used in place of Flat Face (**2874.153**) and in conjunction with the Low Blow missile control radar (**2884.153**) and the Goa surface-to-air missile (**2938.131**) in circumstances in which good low altitude cover is required.

STATUS:

Operational.

2885.153
STRAIGHT FLUSH FIRE CONTROL RADAR

DESCRIPTION:

Straight Flush is the NATO name given to the radar and command guidance system used with the SA-6 Gainful – (**2930.131**)surface-to-air missile system. It is believed that the system performs the following functions –

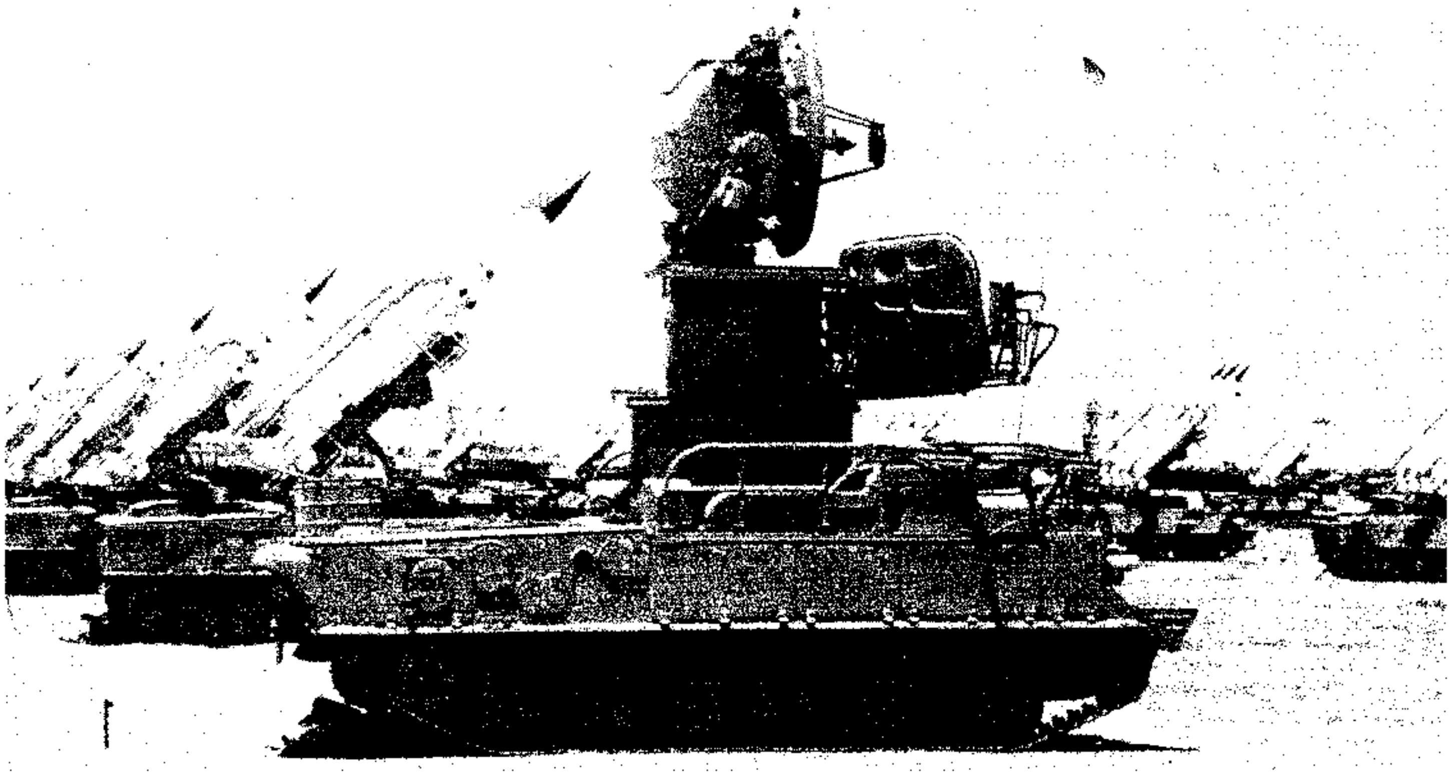
Limited search
Low-altitude detection/acquisition
Target tracking and illumination
Missile radar command guidance
Secondary radar missile tracking.

Reports of the frequencies used for these functions have not been entirely consistent. It seems, however, that the first three functions are performed in C-band (American G and H bands) the low altitude function being performed at about 5GHz and the high-altitude functions at about 6GHz. Target tracking (and probably illumination) is an X-band (American I-band) function at around 8GHz and so probably is the command link, while the secondary radar response for missile tracking is probably at a rather lower frequency.

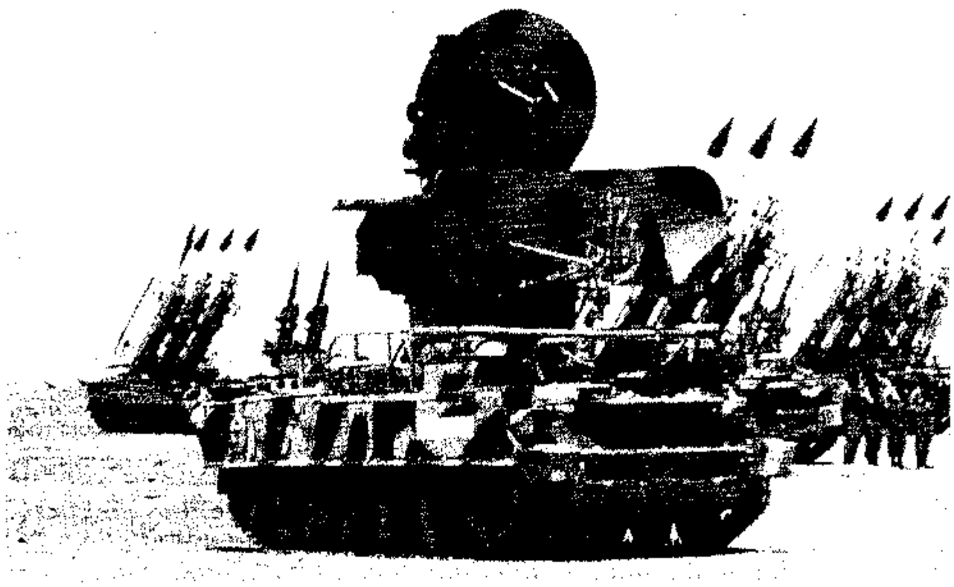
The arrangement of the system can be seen in the accompanying pictures. The upper, tracking, radar aerial assembly is assumed to be able to rotate independently of the lower aerial and it is further assumed that the two aerials and associated apparatus can be rotated relative to the carrying vehicle on a turntable which is presumably located at the top of the circular turret on which the whole assembly is mounted. Examination of the original photographs suggests that the lower aerial may be pivoted so as to execute a sector scan of some kind and there is some indication that it can be tilted up or down – presumably to compensate for vehicle attitude. These observations are consistent with the assumed functions listed above: the combined radar superstructure is probably too massive for any kind of continuous circular search process; and the arrangement probably provides for a slow circular search into an associated sector scan, the circular motion being halted when a target is located and resumed only if the target starts to move out of the sector.

The feed arrangements of both aerials are interesting. The lower aerial appears to have two feeds (which can be seen more clearly in the original pictures than in the accompanying reproductions) the upper one consisting of a single horn – which presumably produces a low angle pencil beam – and the lower feed comprising two or possibly three horns which may well produce a slightly shaped high-cover beam. There could be more sophistication to it than this but if so it is not obvious or obviously likely. The use of two separate feeds, however, is consistent with the suggestion that the low and high-altitude patterns are radiated at different frequencies.

There is, however, some additional waveguide in this feed which is not explained by what has been said above. It appears to be for a higher radiation frequency (than C-band) and could be for one of the other functions (command link or secondary radar – more probably the former). Finally it looks as though both parts of the main feed have a quarter-wave-plate circulariser in front of them. If this is a correct reading of the photographs it tends to date the technology of the equipment: a radar of this sort built in the West ten or more years ago would have used waveguide



Straight Flush fire control radar and SA-6 Gainful missiles. In the background can just be seen a van-mounted radar with two aerials mounted one above the other. This is presumably the early-warning radar of the complete SA-6 system (Photo: Sava Haery / SIPA Press)



Straight Flush fire control radar. Note the pairs of AFV-mounted SA-3 (Goa) missiles in the background (Photo: Sava Haery / SIPA Press)

circularisers. It also looks as though the third (higher-frequency) feed bypasses the plate – which makes sense.

Turning now to the upper aerial, the function of the tripod-mounted device projecting in front of the dish is not clear. The remainder of the assembly is fairly evidently a conical scanning system using a rotating feed driven by a motor in the housing at the rear of the dish. This housing also almost certainly contains the microwave transmitter-receiver stages to avoid the need for multiple rotating waveguide joints.

Two of the struts supporting the projecting 'device' appear to be simple metal rods or tubes secured to the face of the dish: the third (bottom) strut, however, is different, fairly certainly passes through a hole in the dish and could be a waveguide. The way in which the upper struts meet the 'device' seems a little clumsy if they are no more than supports however, and while it may be that the 'device' is yet another aerial of some sort, we incline to the view that it is either another quarter-wave plate or a beam-spoiler for some operational purpose and that the bottom strut is merely a kind of push rod (hence the need to go through a hole – a waveguide would not) for moving the 'device' into and out of the way.

Apart from the microwave stages of the tracking radar it seems probable that the bulk of the radar electronics is housed in the bin-shaped structure beneath the tracking radar pedestal. The turret may be assumed to house the displays and control gear.

STATUS:

Operational. The accompanying pictures were taken in Egypt in June 1974 at a parade celebrating the 7th anniversary of the Six-Day War. Radars of this type were used with Gainful missiles in the 1973 Arab-Israeli War.

2892.153
TOKEN EARLY WARNING AND GCI RADAR

DESCRIPTION:

This S band early warning and GCI radar is similar to the US CPS-6B radar (the first V-beam radar). Like Barlock (**2861.153**) it has twin truncated parabolic mesh reflectors. Five beams are produced; and in the GCI role it has a range of about 150 km and can measure to within 0.5 degree in azimuth and 300-1,500 metres in elevation. In the early warning role it has a range of 250-300 km and a range accuracy of about 1 km.

2893.153
WHIFF FIRE CONTROL RADAR

DESCRIPTION:

This is a van-mounted S-band gunfire control radar. Like Fire Can (**2871.153**) it is derived from the American SCR-584 equipment that was supplied to Russia during the Second World War.

Construction and performance are generally similar to those of Fire Can. The antenna gain of Whiff, however, is somewhat greater.

2895.153
YO-YO MISSILE CONTROL RADAR

DESCRIPTION:

An early missile control radar, Yo-Yo is used to control the Guild (**2944.131**) surface-to-air missile (US designation SA 1).

It is reported that this radar can track more than 30 targets at a time. Flapping beam techniques are used for target tracking and the radar uses six rotating antennas to cover a scanning area of some 70 degrees both in azimuth and in elevation. Operating frequency is around 3GHz and peak power around 2MW.

NAVAL RADAR

DENMARK

1575.253
TERMA NAVIGATION RADAR

DESCRIPTION:

The Terma navigational radar system is designed to form an integral part of the total radar system on board naval vessels. A multi-display system capable of operating in various master/slave combinations is available. The operational mode is selected on either display by illuminated push-buttons indicating all possible operational modes as well as the actual operating mode for each display. The system includes features such as true motion, moving target indication, logarithmic IF-amplifier, and electronic-counter countermeasure (ECCM) equipment. All units are built up as a modular system using accessible plug-in modules making the radar equipment easily serviceable.

SCANNER UNIT:

The antenna is a horizontally-polarised X-band slotted wave-guide antenna with narrow beam and low side-lobe level. The antenna feed system (including a waveguide rotary joint) offers a low standing wave ratio at the input flange. Two scan rates may be selected by electronic switching of the drive system. The scanner position information is given through synchro transmitters and heading marker signal. The unit is driving rain proof and a de-icing system is included.

RECEIVER-TRANSMITTER UNIT:

The transmitter tube is a pulsed magnetron which is controlled from a solid-state magnetic modulator. Two pulse repetition rates and two pulsewidths may be selected individually. The modulator is divided into two separate assemblies with common input and output circuits, one for long and one for short pulse. The trigger assembly synchronises the total system and selects automatically internal or external synchronising mode. A trigger-pulse shaper and delay assembly perform compensation for transit times in the wave-guide and receiver system. The RF system is integrated in one assembly and includes the wave-guide duplexer, the T-R switch, the IF mixer, the AFC mixer, and the solid-state local oscillator.

DISPLAY UNIT:

In this unit, a plan position indicator with a circular 30 cm cathode ray tube is used. The flat-faced front of the unit includes all operation controls, and a light filter in front of the CRT permits daylight operation without a viewing hood.

General performance characteristics:
Scanner Unit:
Antenna: 2.1 m slotted waveguide
Scanner rotation: Switchable between 24 and 48 r.p.m. ± 10 per cent at 60 Hz, or 20 and 40 rpm. ± 10 per cent at 50 Hz input frequency
Horizontal beamwidth: Less than 1 degree within 3 dB points
Vertical beamwidth: 20 degrees within 3 dB points
Polarisation: Horizontal
Gain Better than 32 dB with respect to isotropic radiator

Receiver/Transmitter Unit:
Transmitter:
Frequency: Fixed within 9,375 ± 30 MHz
PRF:
Short pulse: Nom. 4,000 Hz ± 200 Hz
Long pulse: Nom. 2,000 Hz ± 200 Hz
Pulse length: 0.06 ± 0.01 / microsec, or 0.6 ± 0.1 / microsec
Peak power: 20 kW ± 1 dB measured at the output flange

STATUS:

Development was carried out in co-operation with the Swedish Navy, and was completed in 1972.

MANUFACTURERS:

DRBC 32 NAVAL RADAR

DESCRIPTION:

The DRBC 32 designation embraces a family of X-band fire control radars, of which there are at least five variants (denoted by suffix letters running from A to E) in use in French Navy ships, and which are associated with a variety of director units. The latter may or may not include optical direction facilities. Weapons associated with these directors normally are either 100 mm or 57 mm guns.

A stabilised mount is usual for DRBC 32 installations and, in all but the DRBC 32 A, the radar dish is protected by a radome attached to the antenna assembly itself. The 'A' model, as seen on the helicopter-cruiser, *Jeanne d'Arc*, has exposed circular reflector and feed assemblies. However, the DRBC 32 A as seen on anti-submarine T47 class escorts do have a protective radome for the antenna. The *Aconit* anti-submarine corvette is fitted with the DRBC 32 B. The C70 class corvettes, the *Colbert* and the *Duperré* have the DRBC 32 C, and the only known DRBC 32 D installation is aboard the *Tourville*. The A69 class of Avisos now in construction are to be fitted with the DRBC 32 E.

1593.253
DRBI 10 3D NAVAL RADAR

DESCRIPTION:

The DRBI 10 is a three-dimension, S-band naval air surveillance radar for search and interceptor control functions. It is believed to be a naval version of the land-mobile radar Picador (TH.D 2200), Entry No. **2119.153**, which in turn evolved from the TH.D 1940. Performance data quoted in the following paragraphs refer to those obtained for the Picador.

All three of these radars employ a 3.4 × 3.4 m scanner with Robinson-type feed arrangements by means of which the pencil beam is moved in the vertical plane as the antenna rotates in azimuth. The combination of the two motions produces a displacement of the beam in space which corresponds to a saw-tooth motion, enabling height information on detected targets to be obtained. Range is quoted by the manufacturers as between 100 and 140 nautical miles against a fighter aircraft size target.

The transmitter/receiver is of solid-state design, except for RF tubes, and the transmitter uses a continuously tunable magnetron to give a nominal output between 1 and 2 MW. The receiver has a low-noise parametric amplifier and two receiver chains for ECCM. These are a Lin/IAGC chain and a constant-false-alarm rate chain, automatically switchable according to the environmental situation. A single transmitter, or two in frequency diversity can be employed and there are provisions for IFF.

Operator facilities include: azimuth selection (azication), low altitude blanking, antenna rotation control (continuous, sector scanning, manual pointing, etc).

DEVELOPMENT:

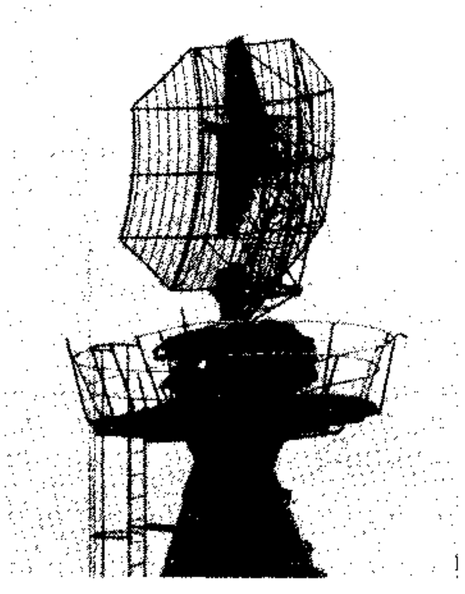
Development was carried out in the 1960s, and the prototype TRS 2200 Picador was completed in 1968.

STATUS:

The only known fittings are aboard French vessels. These include the carriers *Clémenceau* and *Foch*, which each have two; the helicopter carrier *Jeanne d'Arc*; the guided missile cruiser *Colbert*; experimental ship *Ile d'Oléron*; and four T53 Class aircraft direction destroyers.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92, Bagneux, France.



DRBI 10 three-dimensional radar

1889.253
DRBI 23 NAVAL RADAR

DESCRIPTION:

The DRBI 23 naval radar is an L-band (23 cm) three-dimensional air search and target designation radar forming the main detection element of the French Navy Masurca surface-to-air missile system (Entry No. **1177.231**). Transmitter peak power is quoted as several MW, and it incorporates a carcinotron oscillator. Six amplification stages are provided, these being capable of virtually identical gain at any frequency within the range of the carcinotron oscillator.

The aerial, which is protected by a large radome, is of the inverse Cassegrain type. An array of feed horns directs radiation to a semi-reflective parabolic mirror which in turn returns the energy to a flat plate reflector. This imparts a 45-degree polarisation change which permits the formed beams to pass through the semi-reflector. Vertical angular information is obtained by the use of monopulse techniques, this data being processed to provide corrected height information on aircraft targets. This information, together with plan position data, is available for use in the ship's action data system and weapons systems. Stabilisation against ship's motion is incorporated, and the antenna assembly includes an IFF antenna unit. The system provides for auto plot extraction and the DRBI 23 is interfaced with a digital computer. Associated with it are the Masurca missile tracking and guidance radar groups DRBR 51.

STATUS:

In service in the French Navy missile frigates *Suffren* and *Duquesne*.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.

1890.253

DRBR 51 NAVAL RADAR

DESCRIPTION:

The DRBR 51 radar group provides for the tracking and missile guidance functions of the French Navy's Masurca surface-to-air missile system (Entry No. **1177.253**). Search and target designation facilities are provided by the DRBI 23 three-dimensional air search radar (Entry No. **1889.253**). The DRBR 51 is a multi-mode equipment and associated with the antenna assembly is a television camera for optical tracking of low-flying targets. The complete system provides for the control of both versions of Masurca missile, the Mk 2 Mod 2 command to line-of-sight model and the Mk 2 Mod 3 semi-active radar homing model. The modes of operation of the two types are summarised below.

When firing the Mk 2 Mod 2 radio command Masurca, the main antenna of the DRBR 51 group is used to track the target and also measure the angular displacement of the missile relative to the line-of-sight to the target. Another dish antenna transmits the necessary command signals to the missile to keep it on the line-of-sight. A third antenna having broad beam characteristics is used for the initial missile gathering phase. Command signals are transmitted at frequencies in the 7 cm band, and two missiles may be simultaneously controlled. There are two 5 cm radar tracking channels, "Blue" and "Yellow", one for each missile and each radio command Masurca round is equipped with a 5 cm transponder to facilitate missile tracking.

When firing the Mk 2 Mod 3 radar homing version of Masurca, the main dish of the DRBR 51 operates as target tracker and X-band illuminator.

STATUS:

The missile cruiser, *Colbert*, and the two missile frigates, *Suffren* and *Duquesne*, each have two DRBR 51 systems.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.

1893.253

DRBV 13 NAVAL RADAR

DESCRIPTION:

The DRBV 13 naval radar is a pulse-doppler equipment, believed to operate in the S-band. It is stated to be a multi-mode radar providing both search and tracking facilities for the SENIT action data automation system installed in the Aconit corvette, which is the only vessel known to be fitted with the DRBV 13. The antenna array and turning gear are completely enclosed by a large plastic radome, itself mounted atop a prominent structure which is presumed to house the associated electronics, in an almost amidships location. No technical or performance data have been obtained.

1892.253

DRBV 20 NAVAL RADAR

DESCRIPTION:

The DRBV 20 is a long-range search radar operating in the metric wave-band. Two aerial outfits are employed. The smaller, DRBV 20 A, version is installed in a variety of French Navy vessels and can be identified by its large open lattice antenna, of rectangular outline, slightly curved and with a horizontal array of dipole feed elements. The larger, DRBV 20 C, is fitted on French aircraft carriers and has a flat, rectangular antenna array comprising three horizontal rows of dipole feed elements. No performance or other details of technical characteristics have been obtained.

STATUS:

The DRBV 20 A is installed in the Tartar – armed T47 escorts (four in class); the two escort leaders, *Cassard* and *Chevalier Paul*, and the E50 fast escort *Corse*. The DRBV 20 C is fitted in the aircraft carriers *Clemenceau* and *Foch* and on the missile cruiser *Colbert*.

1891.253

DRBV 22 NAVAL RADAR

DESCRIPTION:

The DRBV 22 is a conventional naval search radar, probably having an L-band operating frequency and possibly incorporating dual-beam (high- and low-cover) facilities in some cases. It is widely fitted, both in French Navy vessels and in the ships of other countries. Different versions that have been identified are the DRBV 22 'A', 'C' and 'D' models.

The antenna assembly is very similar in appearance to the American SPS-6 and SPS-12 radars (Entries Nos. **1744.253** and **1566.253**, respectively) but the French equipment can be readily distinguished from both US radars by the two supporting stays for the feed horn that are attached to the upper edge of the reflector of the DRBV 22 radar.

STATUS:

Known fittings in French Navy vessels include:

DRBV 22 A: five T47 anti-submarine escorts; four T53 escorts; four E50 fast escorts; 14 E52 fast escorts; nine 'Aviso' escorts; the helicopter-carrier *Arromanches;* and the corvette *Aconit*.

DRBV 22C: the experimental ship *Ile d'Oléron*

DRBV 22 D: the helicopter-cruiser *Jeanne d'Arc;* the missile tracker ship *Henri Poincaré*.

Ships of several other nations have been fitted with the DRBV 22, in most, if not all, cases the 'A' version.

1594.253

DRBV 23 NAVAL SURVEILLANCE RADAR

DESCRIPTION:

The DRBV 23 is an L-band (23 cm) long-range naval air search and surveillance radar, similar in appearance to the Jupiter naval radar (Entry No. **1236.253**). The most readily discerned external difference is the prominent tubular horizontal supports for the DRBV 23 scanner, compared with the lighter structure of the Jupiter.

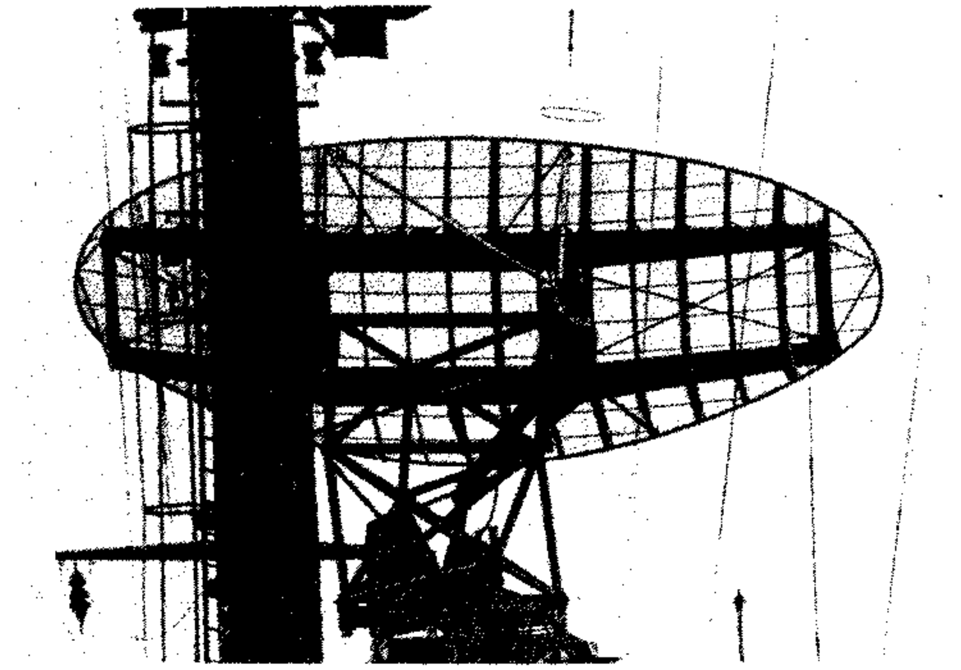
Two versions have been identified, the DRBV 23 B and DRBV 23 C, the former being that fitted in aircraft carriers of the French Navy, and the latter being a solid-state version fitted in the *Colbert*.

STATUS:

The only known fittings are on the following French Navy ships: the aircraft carriers *Clémenceau* and *Foch*, helicopter carrier *Jeanne d'Arc*, and the *Colbert*.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.



DRBV 23 L-band air surveillance radar on the French command cruiser De Grasse

1062.253

TRITON SURVEILLANCE RADAR

DESCRIPTION:

C-band, 5 cm, air and surface surveillance radar for shipboard mounting. Used for surveillance and target designation functions in the Thomson-CSF Vega Series of ships' fire control systems (which see). In these systems, Triton is used either on its own or in conjunction with either the Castor or Pollux tracking radars. It may also be used alone as a navigational radar. The various fire control systems in this series provide for the operation of guns, guided torpedoes, and surface-to-surface missiles, and combinations of these weapons.

The antenna is of the non-stabilised type, with a broad radiation lobe in elevation to counteract the effects of ship's motion.

Solid-state circuitry, based on printed circuit boards and silicon semi-conductor devices, is used in construction, the only vacuum devices being the magnetron, klystron and CRT. The last of these is normally a 35 cm diameter unit.

Operating frequency is in the C-band and transmitter peak power is quoted as 200 kW. A low-noise microwave amplifier and three reception channels are provided in the receiver section of the T/R unit. Transmitter features include variable transmission frequency, variable PRF and two pulse-lengths. It can also be supplied with a linear digital MTI facility.

DEVELOPMENT:

Private venture, started in 1967. First prototype was completed in 1968.

Triton Characteristics:

Frequency: C band

Peak power: 250 kW

Stabilised or non-stabilised antenna:

Three receivers: linear, anti-jamming, anti-clutter.

Dimensions and Weight:

Antenna weight: 170 kg

Transmitter receiver: 1,507 mm × 1,000 mm × 700 mm

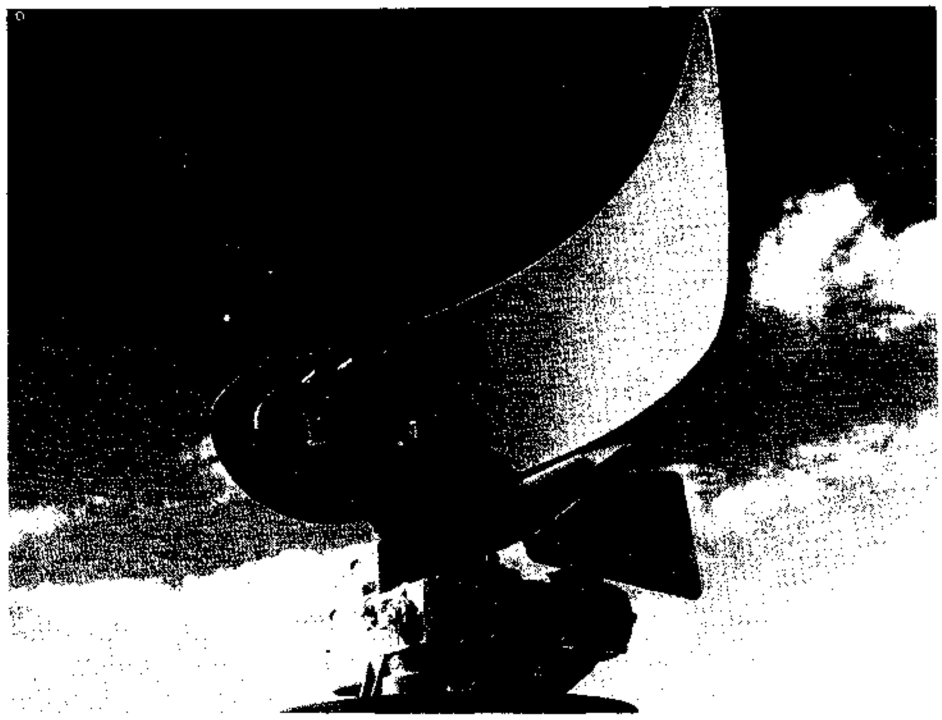
Range: Air target (fighter): 30 NM Surface target: horizon

STATUS:

The Triton radar is in production for use in Vega fire control systems being supplied to French and foreign services.

MANUFACTURERS:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.



Triton naval surveillance radar

1063.253
CASTOR TRACKER RADAR

DESCRIPTION:

Shipborne doppler filter tracker radar used in the Thomson-CSF Vega series of naval fire control systems operates in X band and allows two types of operation:

(a) full doppler operation for both acquisition and range

(b) classic operation, non-doppler

Doppler filtering operation gives the radar special capabilities for acquisition and tracking of small, low flying air targets, in the presence of clutter echoes of diverse kinds. Non-doppler operation assures the presentation of accurate splash plotting data, enabling knowledge of fire errors on sea targets through observation of the splashes

Solid state circuitry and digital techniques are employed.

This lightweight tracking radar usually operates in conjunction with a Triton 5 cm surveillance and target designation radar equipped with MTI receiver.

Castor II Characteristics:

Monopulse radar:

Frequency: X band (tunable)

Peak power: 36 kW

Range finder: 0 to 15 and 0 to 30 km

Display: A, R, E or B

Doppler f...ering: 2 modes (anti-clutter, anti-rain)

Acquisition modes: fully automatic and semi-automatic

Dimensions and weight

Antenna weight: 450 kg

Transmitter: 1,915 × 600 × 750

Receiver: 1,080 × 600 × 390

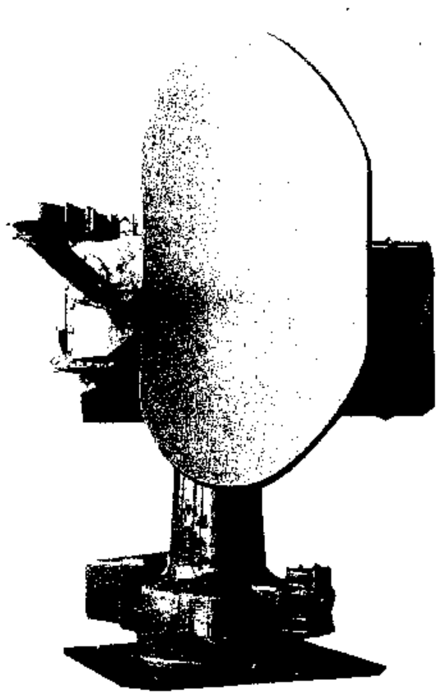
Fire control console: 1,915 × 600 × 600 mm (with F.C computer)

STATUS:

The non-doppler version has been in production since 1972, and the doppler Castor prototype was completed in 1974.

MANUFACTURERS:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins 92222-Bagneux, France.



Castor tracker radar head

1064.253
POLLUX TRACKER RADAR

DESCRIPTION:

Shipborne tracker radar used in the Thomson-CSF Vega Series of naval fire control systems. It exists in both conventional and pulse-doppler forms. Usually operates in conjunction with a Triton 5 cm surveillance and target designation radar. Mainly for gun control operations.

The Pollux radar operates on a frequency in the X-band, 3 cm region, and is a fast conical scan tracker radar. Circular polarisation is employed. Solid-state circuitry, using silicon semiconductors, is employed, and peak transmitter power is quoted as 200 kW. Range finding capability extends to 30 km, and target acquisition is stated to remain reliable to 20 km under the most adverse weather conditions.

The doppler version is equipped with digital doppler filter for acquisition and tracking. Two doppler filtering modes and a non-doppler operating mode are provided.

DEVELOPMENT:

Started in 1968 as a private venture. First prototype completed in 1969.

Pollux Characteristics:

Conical scanning radar:

Frequency: X band

Circular polarisation:

Peak power: 200 kW

Range finder: 0 to 30 km

Precision:

Range: 20 m

Azimuth: 1 mrd

Display: type A/R, A/B or A/E

Doppler version:

Peak power: 30 kW

Range finder: 0 to 15 and 0 to 30 km

Fixed-echo rejection ratio: 30 dB

Minimum target speed: 20 m/s

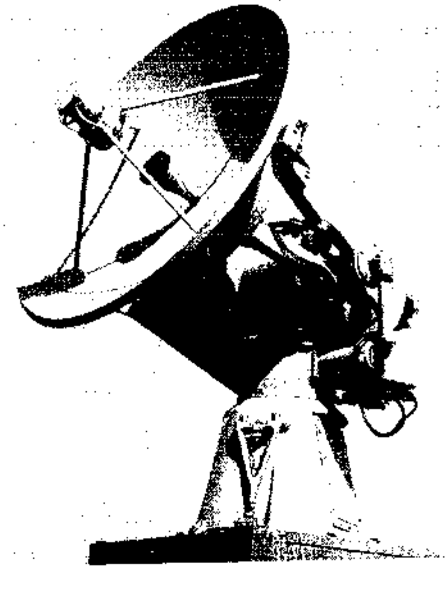
Dimension and weight:

Antenna weight: 450 kg

Transmitter and Servo Cabinet: 1,850 mm × 600 mm × 600 mm

Receiver Cabinet: 1,850 mm × 600 mm × 600 mm

Fire Control Console: 1,850 mm × 600 mm × 600 mm (computer included)



Pollux tracking radar

STATUS:

Production commenced in 1969 with entry to operational service planned for 1970. Details of users have not been revealed but contracts for Vega fire control systems have been placed by both French and foreign navies. The doppler version prototype was completed in 1973.

MANUFACTURERS:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

1687.253

SEA TIGER II 45 SURVEILLANCE RADAR

DESCRIPTION:

Sea Tiger is a shipborne S-band combined surveillance radar, which can be used in the Thomson-CSF Vega Series of ship's fire control systems. Intended to equip medium-tonnage ships, it is designed to perform the following functions in a very severe clutter and jamming environment:

(a) air surveillance
(b) surface surveillance
(c) target designation for weapon systems (guns; missiles)

Visibility in clutter is achieved through the use of complementary techniques such as circular polarisation, pulse compression, doppler filtering, and an anti-clutter reception chain.

The Sea Tiger radar comprises the following elements:

(1) A double-curvature aerial with switchable circular/linear polarisation and integrated IFF aerial.
(2) A roll-stabilised turntable.
(3) A transmitter with coherent amplifier chain emitting frequency-modulated pulses (pulse compression) over a wide frequency range.
(4) A receiver with multiple reception chains: MTI, lin, log, CFAR. The MTI is a digital linear device whose characteristics, associated with the stability of the amplifier chain, make it possible to detect a missile in the most severe clutter environment.

CHARACTERISTICS:

Operational performance:

Detection range: 60 nm on a 2-m^2 (fluctuating) target with Pd = 50%

Altitude detection: 50,000 ft (15,240 m)

Elevation pattern: cosecant up to 50°

Sub-clutter visibility: greater than 42 dB

First blind speed: Mach 2

Antenna:

Gain: 29 dB

Polarisation: circular/linear, switchable

Rotation speed: 12 and 24 rpm

Stabilisation: roll stabilisation better than ±0.5°

Transmitter: frequency agility, pulse compression average power 1 kW

Receiver: noise figure better than 3.5 dB, 4 different reception chains – MTI, LIN, LOG, CFAR anti-clutter

STATUS:

Derived from the Tiger radar (Entry No. **2156.153**). Prototype under development.

MANUFACTURERS:

Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.

1236.253

JUPITER NAVAL AIR SURVEILLANCE RADAR

DESCRIPTION:

The Jupiter is an L-band (23 cm), long-range air surveillance radar with a peak transmitter output power of 2 MW with a 2.5 microsecond pulse and a PRF of 450 pulse/second. The aerial measures 7.5 × 3 metres and has two rotation speeds 7.5 and 15 RPM. Weight is approximately 1,000 kg. Both primary and secondary (IFF) radar channels are provided by the one aerial system. Beam width at half power points of the primary radar pattern is 2.5 degrees or less. The primary radiation pattern gives a cosecant-squared diagram up to 50 degrees elevation.

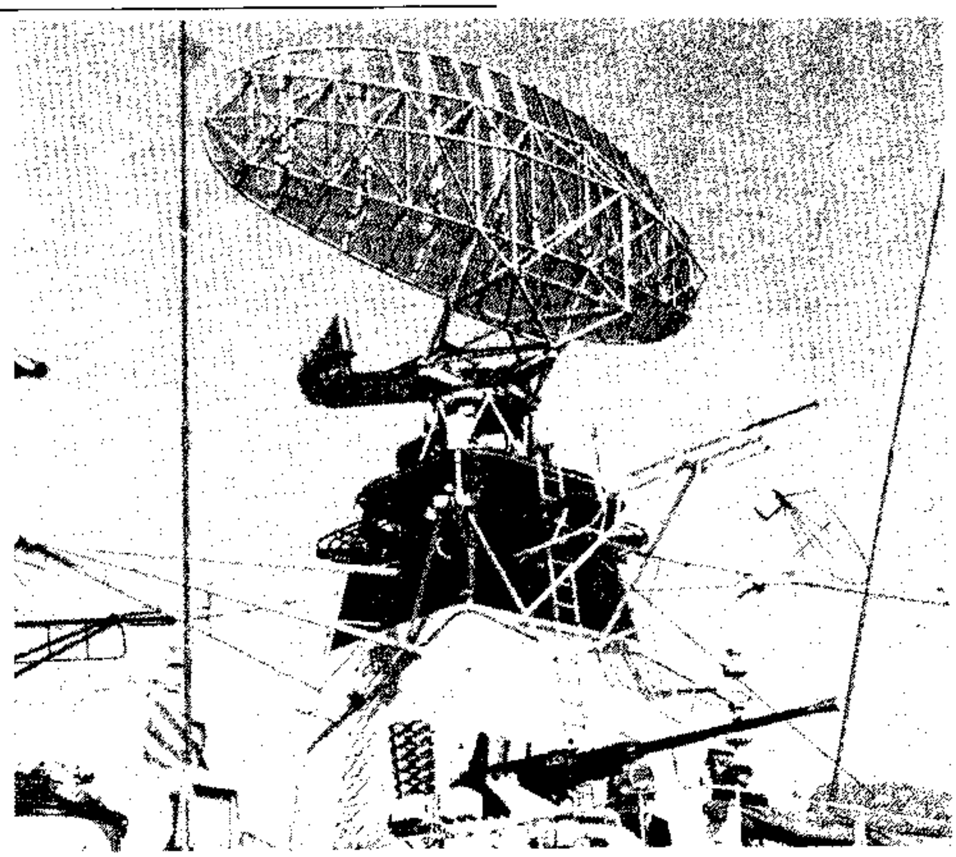
Range performance figures quoted give detection out to at least 200 km on a fluctuating target of 2 m^2 cross-section with a detection probability of 50 per cent, and under the same conditions a target with 10 m cross-section can be observed out to 275 km.

Solid-state circuitry is used throughout, with the exception of the microwave stages, and a fixed-frequency, water-cooled magnetron is used in the transmitter. Comprehensive signal processing facilities are incorporated to provide maximum protection from natural interference (such as sea clutter) and ECM.

The receiver section provides multiple reception chains: wide dynamic range receiver and anti-clutter circuits for surface surveillance and detection of low-speed targets. Jupiter is produced in both non-MTI and MTI versions. The latter is equipped with a linear digital MTI receiver for operation in clutter environment.

STATUS:

The Jupiter is in use with medium and large vessels of the French Navy, as the DBRV 23 (Entry No. **1594.253**) with different antenna, and on the South African frigates.



Jupiter long-range air surveillance radar on South African Navy frigate President Kruger

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

1237.253

SATURNE II-30 (TRS 3043) NAVAL SURVEILLANCE RADAR

DESCRIPTION:

The Saturne II-30 is a medium-range air and surface surveillance and target designation radar designed for use on medium-size naval vessels. It is an S-band equipment, and uses a 1 MW (peak) transmitter to provide cover out to 115 km. Aerial dimensions are 3 × 1.15 m, and the scanner rotation rate is either 10 or 20 RPM. Beam-width in azimuth at the 3dB points is 2 degrees. Linear or circular polarisation can be selected. IFF facilities can be added. The scanner is mounted on a stabilised turning-gear platform.

The transmitter/receiver is a solid-state equipment, and the transmitter offers variable frequency operation and two different pulse lengths.

The reception chain offers: a logarithmic with anti-sea clutter channel, and a CFAR channel. Provision is made for the addition of a digital linear MTI. A microwave amplifier is included in the receiver section, which has a noise figure of better than 4dB.

MANUFACTURER:

Thomson-CSF, Division Radars de Surface, 1 rue des Mathurins, 92222-Bagneux, France.

1688.253

ELI 4 IFF INTERROGATOR

DESCRIPTION:

The LMT ELI 4 is a shipboard secondary surveillance radar interrogator for IFF functions in association with transponders carried by friendly aircraft and ships. The equipment is designed for either rack mounting or independent installation. Apart from one tube, the ELI 4 is of solid-state design and extensive use of digital ICs is made. A number of the sub-assemblies are pluggable and are common to other interrogator versions such as the ground-based ER-116-A, and the airborne ER-115-A and NR-AI-5-A.

CHARACTERISTICS:

The ELI-4 incorporates a coder, a transmitter and a receiver.

Peak radiated power: Selectable: 0.5, or 2 kW

Transmission Frequency: 1,030 ± 0.5 Mc/s (±0.2 optional)

Receiver Sensitivity: –83 dBM

Receiver Frequency: 1,090 Mc/s
Possible modes: 1, 2, 3/A and C. Mode 4 with suitable coder and decoder
Interlacing facilities: Up to 4 SIF modes. Permanent self-monitoring of all operational characteristics
Size: 200 × 510 × 600 mm
Weight: 25 kg
Power supply: 115 V 400 Hz 3 phase 120 W
MANUFACTURER:
Le Matériel Téléphonique, 46-47, Quai Alphonse Le Gallo, 92103 Boulogne Billancourt, France.

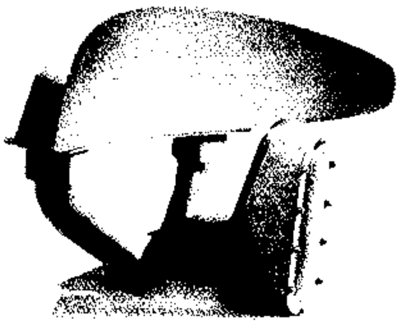
1240.453
CALYPSO II (TH.D 1031) SUBMARINE RADAR
DESCRIPTION:
The TH.D 1030 Calypso II is an X band radar specially designed to provide surface surveillance and navigation facilities for submarines. The installation comprises two units, aerial head and transmitter/receiver and display cabinet, having a combined weight of 350 kg. The aerial is mounted on a periscope mast, and its dimensions are 1 m in span and 48 cm in height.

The transmitter/receiver and display unit is transistorised and peak power is 70 kW, the mean power being 12 to 30 watts, depending upon the duty cycle. Pulse widths are 0.15 and 0.5 microseconds, and the PRF is variable. This feature, plus provision for manual or automatic variation of the radar operating frequency, provide a valuable ECCM capability. Other ECCM features are incorporated in the receiver section, which provides a variety of signal processing options.

The transmitter provides four transmission modes, at either normal or reduced power, thus offering facilities for maximum security and operational flexibility. The four modes are: continuous transmission, short burst transmission (1.0 and 0.1 second), sector scan transmission, and transmission into a dummy load. The last of these enables the radar to come into operation immediately the aerial is above the sea surface, or following a period of radar silence.

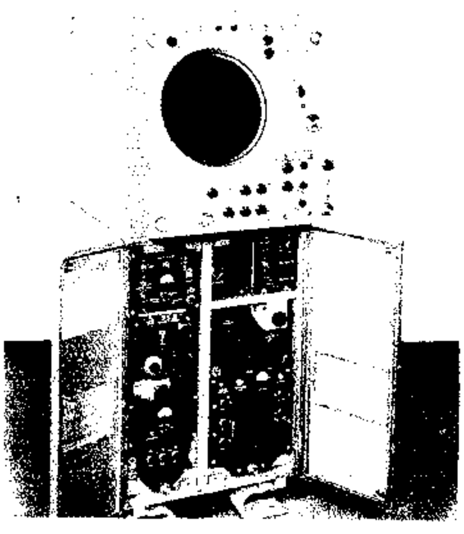
The detection range of the radar is principally limited by the radar horizon and typically is 10 nautical miles against a surface target of escort vessel size or above. The Calypso II also has an air surveillance capability and can provide detection of an ASW aircraft at ranges out to 15 nautical miles at heights up to 2,000 metres.

A 25 cm diameter PPI display and an A-scope presentation are provided at the operating console, the former having three range-scale settings, off-set, and marker facilities. The operating control for transmission mode, manual frequency variation etc are on this unit.

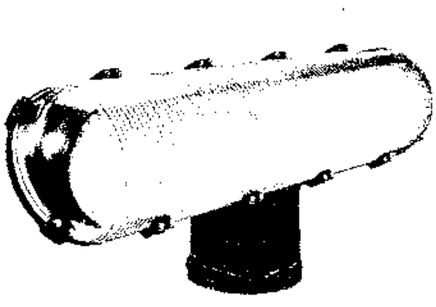


Scanner of the TH.D 1030 Calypso II submarine radar. Span is 1 metre

The TH.D 1031 is derived from the TH.D 1030, and is intended for larger submarines. The principal differences are the use of a display remote from the transmitter/receiver unit, and the provision of an antenna on the optical attack periscope to provide target range data for weapon systems. The latter facility is intended for use when the approach to the target has been made by means of sonar.
DEVELOPMENT:
The TH.D 1030 was developed by Thomson CSF in the mid 1960s and the first prototype was completed in 1968.
STATUS:
At May 1970, over 20 sets had been produced for the French and German Navies.
MANUFACTURER:
Thomson-CSF, Division Radars de Surface, 1, rue des Mathurins, 92222-Bagneux, France.



Calypso II transmitter/receiver and display unit



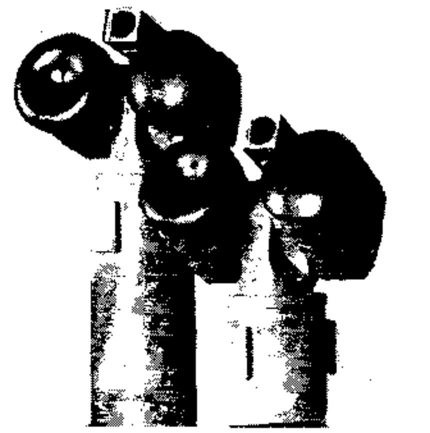
Alternative antenna for Calypso II submarine radar

INTERNATIONAL

1578.253
EX 77 MOD 0 DIRECTOR GROUP
DESCRIPTION:
This radar group provides search, target designation, tracking, and illumination for the NATO Sea Sparrow point defence missile system, which is under development by Belgium, Denmark, Italy, the Netherlands, Norway, and the USA (Entry No. **2770.231**). As such, the EX 77 Mod 0 director group forms part of the EX 91 Guided Missile Fire Control System; EX 91 Mod 0 has a single director group, and the EX 91 Mod 1 has dual directors. Each group has separate antennas for transmission and reception, the dishes of which are protected by radome covers. The radar receiver is carried on the receive antenna unit. The antennas share a common mounting on the EX78 Mod 0 Missile Director Pedestal. An on-mounted television camera is also provided.

Operation is probably in the X-band, and in general, the EX 77 Mod 0 resembles the RTN-10 radar proposed for Sea Sparrow by Raytheon. A somewhat similar mode of operation to that described in Entry No. **1245.253** might therefore be expected.

The receiver is the responsibility of the Danish Terma Company, and this unit's functions include clutter filtering, ECM channel, signal conversion and amplification. The EX 83 Mod 0 Radar Set Console has search and tracking displays, status and fault indicators, radar operating controls, and built-in test equipment. Operating controls provide for such functions as scan pattern selection, ECM facility selection, check-out etc. The transmitter Group EX73 Mod 0 provides RF power for search, acquisition and tracking in air and surface models target illumination and modulation for the Seasparrow missile; rear reference signal for missile tuning; local oscillator for the receiver; and range reference for radar target data processor provides target detection, doppler tracking, range tracking, and angle track signals; visual and aural indications to the radar set console; ECCM; and test functions.
DEVELOPMENT:
Development was initially undertaken in the late 1960s by Raytheon, and subsequently on a joint basis by companies in four of the six nations which now form the NATO Seasparrow group. The four were Denmark, Italy, Norway and the USA.
STATUS:
In early 1972 the radar had reached an advanced stage of engineering development.



Dual EX Mod 0 Director Group radars for NATO Seasparrow missile fire control system

MANUFACTURERS:
Raytheon, USA – Main contractor
Terma, Denmark – Radar receiver
Selenia, Italy – Consoles

1700.253
RAN-2C NAVAL RADAR
DESCRIPTION:
The RAN-2C is a dual-purpose surveillance radar, operating in the C-band, and intended for use as the main radar on small vessels such as corvettes or as the secondary equipment on larger ships. The two main functions are to provide data for surface plots and simultaneously to provide air warning facilities. The radar uses a single coherent transmitter and a single antenna unit (G2), which is roll and pitch stabilised, but two receiver systems. One receiver is employed for surface operation and the other for air operation. The transmitter transmits in two RF bands, with different PRF and pulse-length, to provide for complete dual operation. In addition, frequency agility during the time on target is performed to take

advantage of the diversity effect and for ECCM purposes. The air warning channel has a very effective MTI and a CFAR receiver. The surface surveillance channel is provided with a logarithmic receiver with FTC. The design ensures good CFAR performance under varying conditions and the characteristics of C-band operation at low evaluation angles and a high clutter cancellation ratio, provide high performance against low-level targets such as aircraft or missiles

STATUS:
The RAN-2C is in current production.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate, SpA, Via Tiburtina, Km 12,400, 00'3 Roma, Italy.

1364.253
RAN-3L NAVAL RADAR

DESCRIPTION:
The Selenia RAN-3L is a long range, early warning radar, specifically designed for service in naval vessels in the frigate/destroyer/cruiser class.
The radar is of advanced design and provides air/surface warning and target identification for a modern shipborne defence system. A double curvature reflector with double channel IFF/radar feed is used (G 11) and scanner stabilisation can be provided (G12). A high-power coherent transmitter is employed, and the receiver features include a frequency programmer, Stalo, and quadrature IF channels. The main feature of this radar is the capability to operate in the presence of active or passive interference with minimal degradation of performance. Digital techniques are extensively used through the processing circuitry to provide stable and reliable operation.
The maximum detection range is about 200 nautical miles and the vertical coverage extends to more than 30,000 metres. Operations in the L-band.
DEVELOPMENT:
Development was started in 1968 under Italian Navy contract.
STATUS:
Development is in progress and entry into service is planned in 1974. A number of these equipments will be supplied to the Italian Navy and to foreign navies.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina, Km 12,400, 00131 Roma, Italy.

1527.253
RAN-7S NAVAL RADAR

DESCRIPTION:
The Selenia RAN-7S is a medium-power naval radar operating in the 10cm band and specifically designed for installation in corvettes, frigates and destroyers. The equipment is suitable for dual function application to both air and surface target warning operations, and solid-state construction (with the exception of a few high-power circuit elements), ensures high reliability. The basic design allows for a number of optional facilities, thus providing for a range of operational capabilities and phased expansion of overall performance. By the adoption of optional items the RAN-7S is available in four configurations.

(1) Basic
(2) With ECCM
(3) With Digital MTI
(4) With integrated ECCM/DMTI and signal processing

An additional facility which can be incorporated with any of the above configurations is automatic variation of the operating frequency. Operational capabilities of the Basic RAN-7S are air warning, aircraft direction, surface surveillance, and navigation.
To meet varying operational and installation requirements, three antenna arrangements are available:

(1) The G6 antenna, comprising a double curvature reflector with added high angle coverage.
(2) The G8 antenna with modified cosecant-squared pattern and remotely controlled elevation adjustment.
(3) The G8 antenna with stabilised mounting platform.

IFF can be integrated with all three.
A modified cosecant-squared beam pattern is used to provide good cover to high altitudes. Pulse-width can be either 1 microsecond for air detection, or 0.5 microsecond for surface surveillance. Horizontal beamwidth is 1.4 deg, these values have been chosen to provide good resolution of surface targets and very good air search performance. In the latter role, range is in excess of 100 km, with cover extending up to 12,000 metres. The high discrimination needed for surface search is ensured by the use of the shorter pulse duration. In the interests of high performance in the air detection role, in the presence of a high clutter environment (land returns, chaff, rain, etc) Selenia has evolved a completely new and effective digital MTI system. This has been termed by the developers as a "pseudo-non-coherent" MTI, and is available as an optional sub-system which can be either original fit or added later. A special ECCM kit is a further option, and this provides the radar with a Constant False Alarm Rate (CFAR) characteristic under a number of jamming conditions.
DEVELOPMENT:
The RAN-7S was developed in 1970 from the Selenia ATCR-3T series of land-based air defence radars.
STATUS:
In current production. The antenna system has been supplied to the Danish Navy.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Radar Division, Via Tiburtina Km 12, 400 Roma, Italy.

1699.253
RAN-10S NAVAL RADAR

DESCRIPTION:
The RAN-10S is an advanced S-band coded radar for combined air and surface surveillance. The radar design philosophy is the same as that of the RAN-3L early warning radar (Entry No. **1364.253**), and a number of items are common to both systems. Basic characteristics that the two radars share include:
Improved accuracy and resolution due to time compression of the radiated waveform.
Good sub-clutter visibility in natural or hostile interference.
Clutter cancellation simultaneous with RF agility.
CFAR.
The G10 antenna assembly provides for simultaneous air and surface search and is a roll-stabilised parabolic cylinder reflector with double channel radar/IFF feed. The transmitter is a medium power coherent equipment, and the receiver incorporates a parametric amplifier, frequency programmer, quadrature IF channels, and digital processing.
The RAN-10S is intended for fitting in vessels of medium tonnage such as corvettes, frigates, or fast destroyers. Typical operational roles include air warning, tactical air control, helicopter direction, surface surveillance, navigation, and anti-ship missile direction.
STATUS:
In development.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina Km 12,400, Roma, Italy.

1365.253
RAN-11 L/X NAVAL RADAR SYSTEM

DESCRIPTION:
The RAN-11 L/X is a shipborne integrated radar system specifically designed for installation in small ships such as corvettes, patrol and coastal gunboats, torpedo boats or missile boats.
The system is composed of an L-band transceiver for air warning and an X-band transceiver for low altitude cover and surface surveillance.
Doppler filtering and pulse compression are used in the L-band receiver channels to provide an extremely high sub-clutter visibility and CFAR characteristic. Digital processing is used and solid-state techniques are employed. The L-band processed video is suitable for mixing with another video signal without degradation, and the two radars may therefore simultaneously feed the same display. The X-band portion of the equipment is the RTM-13X transmitter/receiver.
The aerial system, which is roll and pitch stabilised, operates in both X- and L-bands and includes an IFF antenna
The system is extremely compact, light in weight and designed to stand up to the environmental conditions experienced in small naval vessels. The detection range is about 100 km for the L-band radar, and the range coverage of the X-band radar extends up to 35 km, according to manufacturer's figures.
DEVELOPMENT:
Development was started in 1969.
STATUS:
The equipment is currently being manufactured on behalf of certain European navies. Production of a substantial number of equipments is planned.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA Via Tiburtina Km 12, 400, Roma, Italy.

1701.253
RAN-13X NAVAL RADAR

DESCRIPTION:
The RAN-13X Mod 2 is an X-band radar, basically for surface search, and additionally for low-flying target acquisition. The equipment uses the same RTM-13X transmitter receiver of the RAN-11L/X (Entry No. **1365.253**), and thus has common logistic requirements with the Orion fire control radar (entry No. **1368.253**). The combination of X-band operation, narrow beamwidth and relatively high power, yields greatly improved detection capability at low elevation angles. A high scanning rate reduces reaction time. The RAN-13X is intended for use as the main radar aboard fast patrol boats, missile boats, and vessels up to corvette size, or as a complementary equipment to larger ships' principal radars.
The G15 antenna assembly comprises a double curvature reflector with dual IFF/radar feeds, and a stabilised mounting. Other features include: single knob RF tuning, multiple reception channels and remote control of scanner elevation coverage angle.
STATUS:
The RAN-13X is in current production.
MANUFACTURER:
Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina Km 12,400, Roma, Italy.

1367.253
ORION RTN-16X NAVAL RADAR

DESCRIPTION:

The ORION RTN-16X is an X band monopulse radar for integration with gun or missile fire control systems. Operational functions of the equipment include: autonomous search, automatic acquisition, air target tracking, surface target tracking, optional missile guidance and splash spotting. Displays appropriate to these functions are provided.

The equipment has been designed with the purpose of maintaining the same operational characteristics and procedures of the ORION RTN-10X. The well proven units of the RTN-10X are used extensively throughout the design in order to standardise the equipments and to ensure the same order of reliability.

STATUS:

The prototype has been successfully tested, and the equipment has reached the production and delivery stages.

DEVELOPMENT:

Started in 1969 as a private venture.

MANUFACTURER:

Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina Km 12,400, Roma, Italy.

1368.253
ORION RTN-10X NAVAL RADAR

DESCRIPTION:

The ORION RTN-10X is a conical-scan pulse radar operating in the X-band. It has been especially developed for one man operation, and installation with gun or missile fire control systems in naval vessels. Specifically, the Orion is used in conjunction with Selenia equipment (see Albatros system) or with other equipment (El San Giorgio, Ferranti, Galileo etc.). Operational range is about 40 km.

The antenna system consists of a slatted parabolic reflector and feed, with integral trunnion box, mounted on an elevation over train director. Elevation coverage is plus 90 to minus 30 degrees. The trunnion box contains the feed drive motor for high-speed conical scanning, and the assembly which performs the target acquisition scanning mode. The unit is fitted to accept a CCTV camera and camera control unit.

The equipment is, with the exception of CRTs and a few special tubes, of solid state design. The range tracking and timing system employs digital techniques, resulting in a greatly improved dynamic response, together with high accuracy and stability. Controls and monitoring instruments for the complete system are located in the operating console. This arrangement allows the operator to monitor the functioning of the apparatus and simultaneously observe the signals displayed on the CRTs.

Acquisition of a target is initiated by external designating input sources. The radar then switches to the acquisition phase and upon detection of the target, automatic tracking is started. As an alternative, the radar can perform an autonomous search programme, in this way further complementing the surveillance system with the low altitude detection capability inherent to the Orion equipment.

Much consideration has been given in design to the reliability of the radar and to the rapid location of faults, and the equipment is provided with built-in monitoring instruments and quick connection plugs and sockets. An optional performance monitor unit is also available which further extends quick checking capabilities.

The equipment is supplied either in its basic configuration or in an improved version, in order to provide a scaled performance to meet specific operational, environmental and installation requirements.

The basic version, as well as the radars already in service, can be given, when deemed necessary, the more advanced capabilities of the improved version by the adoption of modification kits. The additional facilities can be selected from among the following:

(1) Frequency Agility.
(2) Pulse Doppler processing
(3) Special ECCM processing

DEVELOPMENT:

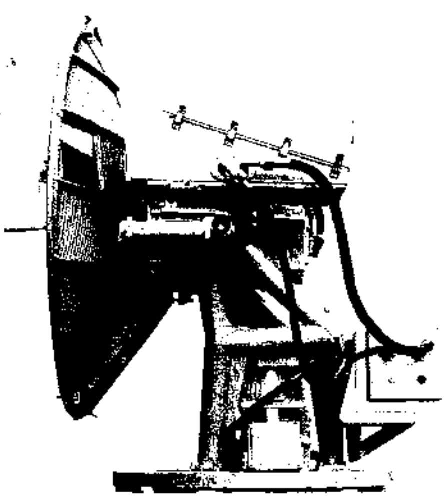
The development of the Orion series started in the early 1960s on behalf of the Italian Navy. Significant improvement in technology and design has been successfully introduced into the original project. The last series, which is named Orion-10X, was developed in 1970 and series production began in 1972.

STATUS:

This radar has been extensively supplied to the Italian Navy and to many foreign navies. In series production.

MANUFACTURER:

Selenia-Industrie Elettroniche Associate SpA, Via Tiburtina Km 12,400, Roma, Italy.



Orion RTN-10X radar antenna director

1704.253
SEA HUNTER SEARCH RADAR

DESCRIPTION:

The Sea Hunter fire control system (Entry No. **1552.281**) is notable for the ingenious co-mounted, but independent search and tracking radars, both of which are carried on the four-axis stabilisation system (pitch, roll, azimuth, and elevation) from which the system designation 'Sea Hunter-4' is derived. This entry is concerned with the search radar, which is the lower of the two carried on the combined mount. The tracker radar is described in Entry No. **1705.253**, which radar is also used on separate mountings, either for use with a Sea Hunter-4 system or in conjunction with other search/target designation radars. The Sea Hunter search radar is not normally fitted separately.

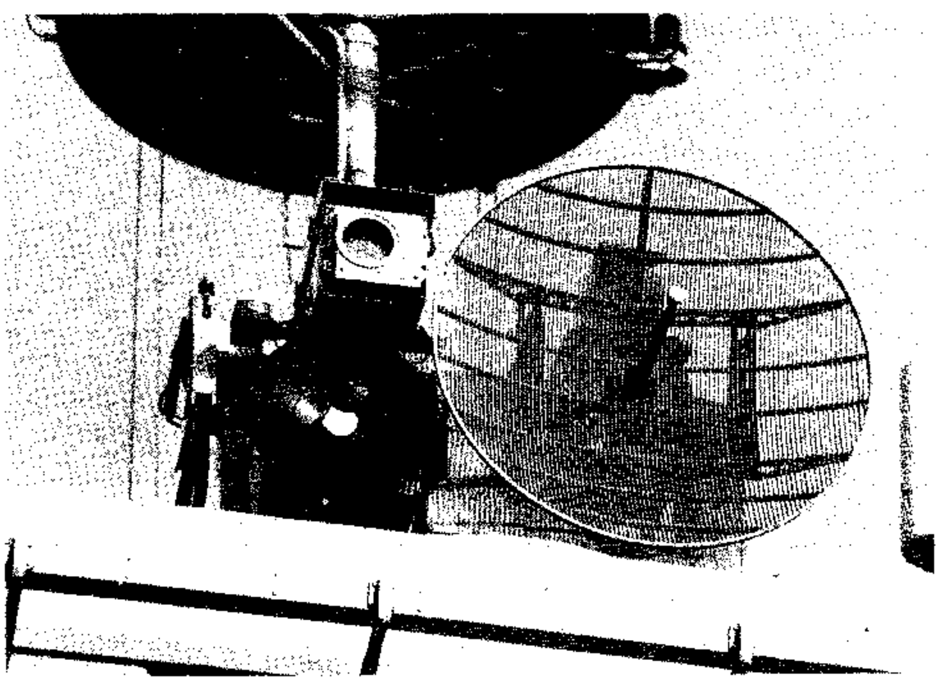
The operating frequency is in the X-band and transmitter power is 180 kW. Pulse length and PRF are adjustable. The receiver incorporates all the normal measures against natural and man-made interference. The antenna has a shaped cylindrical reflector illuminated by an end fed slotted waveguide feed to produce a cosecant-squared radiation pattern for air and surface search and splash spotting. Antenna span is about 2 metres, and high rotation rates are employed.

STATUS:

In production and fitted in vessels of several navies.

MANUFACTURER:

Contraves Italiana SpA, 995 Via Tiburtina, 00156 Roma, Italy.



Sea Hunter 4 track and search radar antenna mounting with TV camera and command transmitter antenna dish

1705.253
SEA HUNTER TRACKING RADAR
DESCRIPTION:

The Sea Hunter tracking radar is an X-band equipment forming part of the Sea Hunter 2 and Sea Hunter 4 fire control systems (Entries Nos. **2371.281** and **1552.281**). In the former system it is not associated mechanically with a search radar, but in the latter case it is carried on a combined stabilised mounting with the Sea Hunter search radar (Entry No. **1704.253**).

The Sea Hunter tracking radar has a 100 cm diameter circular parabolic dish antenna, and helical and horizontal scan patterns are provided for air target search. After target acquisition, tracking is automatic. The receiver incorporates full measures against natural clutter and ECM, and 'track-while-scan' facilities are an optional addition to the system.

STATUS:

In production and fitted on vessels of several navies.

MANUFACTURER:

Contraves Italiana SpA, 995 Via Tiburtina, 00156 Roma, Italy.

1702.253
3 RM SERIES NAVAL RADARS
DESCRIPTION:

The 3RM Series are X-band navigation and surface warning radars, with some air target capability. The antennae used are of the slotted waveguide type and provide horizontal beamwidths from 0.8 to 2.0 degrees, depending upon the antenna length, and a vertical beam pattern of 26 degrees, shaped to 40 degrees. Scanner rotation rate is 25 RPM. Two transmitters are available, with outputs of 7kW or 20kW. The display unit has a 9-in (23 cm) diameter PPI.

3RM Characteristics:
Frequency: 9,375 MHz
Peak Power: 7kW or 20 kW
Antenna: Slotted waveguide
Rotation rate: 25 RPM
Pulse length/PRF: 0.05 microsec/6,000 Hz
0.15 microsec/3,000 Hz
0.5 microsec/1,500 Hz
1.5 microsec/750 Hz
Receiver: linear, lin-log
Display: 23 cm PPI; eight ranges 0.25 to 40 nm

STATUS:

In production and fitted to ships of a number of navies, and notably on the West German fast patrol boats of the 143 and 148 classes. The Italian Navy missile hydrofoil, P420-Swordfish, is fitted with the 3RM 7-250 version, which has a different antenna and a second 250 kW transmitter.

MANUFACTURER:

SMA-Segnalamento Marittimo ed Aereo, Via del Ferrone-Soffiano, PO Box 200-50100 Florence, Italy.

1703.253
SPQ-2D NAVAL RADAR
DESCRIPTION:

The SPQ-2D is a medium power X-band radar whose principle of operation is based on time shared transmission of long and short pulses to achieve simultaneous video signals with high sensitivity for surface search and short-range air search, or with high resolution for navigation and close-in control. The last feature is particularly appropriate for rescue operations and the direction of ASW helicopters.

The SPQ-2D equipment is currently integrated as the target designation radar in various electronic combat systems.

Two control units which include all the operational controls of the radar permit use of remote or local controlling facilities by either CIC or EW operators. The SPQ-2D is designed for IFF compatibility and there is provision for 'Beacon' operation in conjunction with an X-band transponder. Among the optional addition facilities which are available are: track-while-scan operation at an antenna rotation rate of 40 rpm; frequency agility; pulse doppler MTI at S-band integrated with the X-band for sea-skimmer detection; and varying modes of operation.

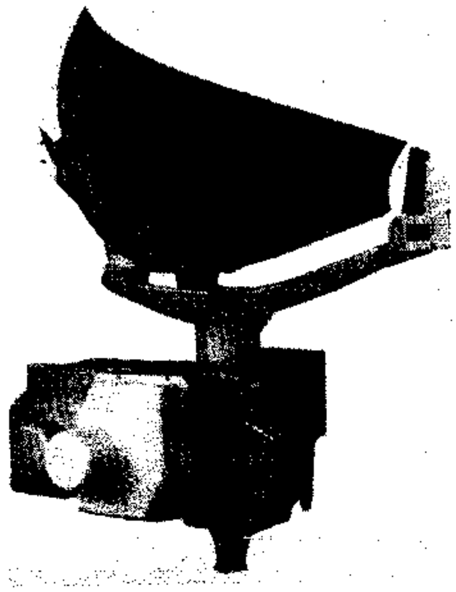
The antenna assembly is produced in both stabilised and non-stabilised forms. The reflector is a double-curvature lattice and mesh structure of about 3 metres span, and is illuminated by a feed horn carried by an underslung support boom.

STATUS:

The SPQ-2D has been in production for several years and is fitted on ships of several navies including the Italian Navy, Canadian Navy (DDH 280 frigates), and the Venezuelan Navy.

MANUFACTURER:

SMA-Segnalamento Marittimo ed Aereo, Via del Ferrone-Soffiano, PO Box 200-50100 Florence, Italy.



SPQ-2D antenna group with stabilised mount

THE NETHERLANDS

1554.253
DA.05 NAVAL SURVEILLANCE RADAR
DESCRIPTION:

The DA.05 is an S-band surveillance radar for shipboard applications, and provides for air surveillance, surface warning, target designation for fire control radars and weapon director systems. A solid-state transmitter/receiver is used, a tunable magnetron providing for operation on any one of six pre-set frequencies. Facilities are provided for an on-mounted secondary radar (IFF) antenna on the main radar scanner. The latter is constructed of stainless steel to permit operation in adverse salt and exhaust environments.

Performance characteristics have not been revealed. Operational features include high discrimination; medium-range air cover and good surface detection; two rates of antenna rotation; optional circular polarisation; low-noise receiver; MTI with digital cancellation and optional digital video correlator; digital video processor; automatic test facilities.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Netherlands.

1257.253
SIGNAAL NAVAL HEIGHT-FINDER RADAR
DESCRIPTION:

This is a nodding type height-finder radar for use in conjunction with a naval air surveillance radar. No technical details have been released, but this equipment is similar to the land-based Type SGR 109 radar and is probably a naval version of it. The following details apply to the Type SGR 109.

Operating frequency is in the S-band, and transmitter peak power is 400 kW. Two pulse lengths, 0.5 or 1.5 microseconds are employed, with a PRF of 1,000 pulse/sec for the former and 500 pulse/sec for the latter. Rotational speed for the scanner is 60 deg/sec, and two rates of vertical scanning are provided: 50 scans per minute over a sector of −2 to + 8 degrees, and 20 scans per minute over a sector of—2 to +50 degrees. The elevation sector scan is varied automatically with range.

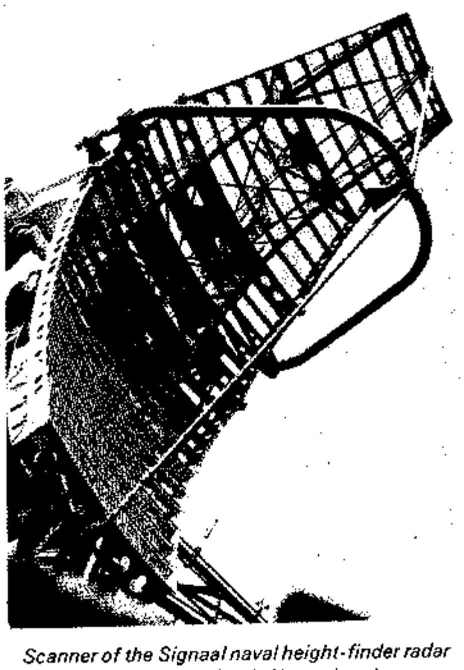
Range performance is up to 150 nautical miles (280 km), and coverage in height extends to about 36,000 metres. Up to six targets per minute at random within 360 degrees azimuth can be handled.

Anti-jamming measures include STC (Sensitivity Time Control), FTC (Fast Time Constant), adjustable PRF, video filter and anti-paralysis techniques.

The SGR 109 has a wider scanner than that of the naval height-finder shown in the accompanying illustration, so that the horizontal beam width is likely to be rather greater than the two degrees of the SGR 109.

STATUS:

The only known installation of this radar is on board the Argentinian aircraft carrier *25 de Mayo*.



Scanner of the Signaal naval height-finder radar

MANUFACTURER:

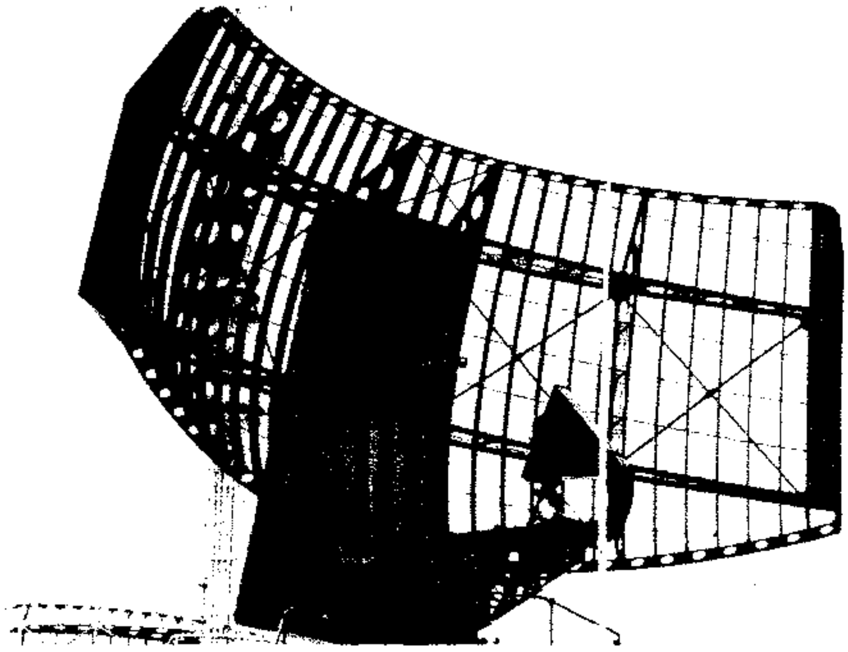
Hollandse Signaalapparaten, Hengelo, Netherlands.

1256.253
LW.02 NAVAL AIR SURVEILLANCE RADAR
The LW.02 is an L-band (23 cm), high-power long-range air surveillance radar for use on vessels of frigate size or above. Peak transmitter power is 500 kW and maximum detection range about 100 nautical miles. Vertical cover extends to 18,000 metres.

A double curvature reflector measuring 7 metres by 2.9 metres is used and a distinguishing feature of this radar is the large 'trunk' at the rear of the centre section of the scanner. There is also an LW.03 version of this radar, the only known difference between the two models being in the scanner rotation rates. The LW.02 rate is between one and ten RPM, and the LW.03 5 or 10 RPM.

STATUS:
Royal Netherlands Navy vessels fitted include the cruisers *De Ruyter* and *De Zeven Provincien*, frigates of the "Van Speijk" class and the "Holland" and "Friesland" classes of anti-submarine destroyers. Foreign vessels fitted include W. German, "Hamburg" class destroyers and the training ship *Deutschland*. "Swedish Holland" class destroyers and the cruiser *Gota Lejon*, the Canadian support ship *Protecteur*, the Argentinian aircraft carrier *25 de Mayo*, two Colombian, ex-"Holland" class destroyers, the Malaysian frigate *Hang Jebat*, and Australian "River" class escorts. A number of new-buildings are to be fitted.

MANUFACTURER:
Hollandse Signaalapparaten, Hengelo, Netherlands.



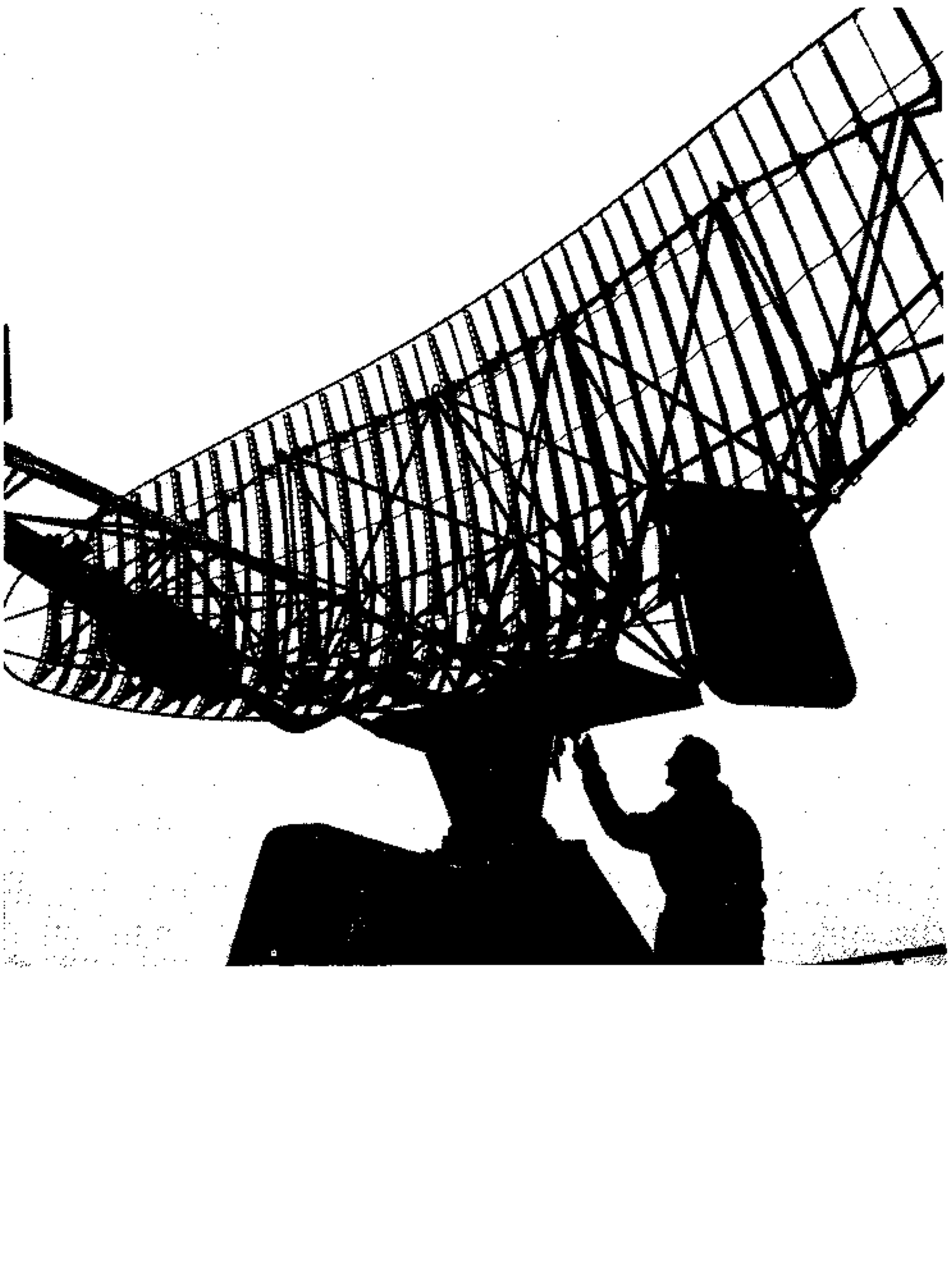
Signaal LW.02 long-range air surveillance radar aerial. Scanner in background is for Signaal target designator radar (Royal Netherlands Navy Photo)

1553.253
LW.04 NAVAL AIR SURVEILLANCE RADAR

DESCRIPTION:
The LW-04 is a long-range air surveillance radar operating in the L-band. Although designed for shipboard installation, this radar is equally suited for shore-base operation. To permit siting in adverse naval environments, the scanner reflector is constructed of stainless steel to enable operation in salt and exhaust gas environments. The transmitter/receiver is of solid-state design and uses a ceramic thyratron and a tunable magnetron. Facilities for the integration of secondary surveillance radar (IFF) are provided.

Performance characteristics have not been released. Operational features include high discrimination; two scanner rotation rates; optional circular polarisation; operation of any of six pre-set frequencies; low-noise receiver; MTI with digital cancellation, pulse interference suppression; built-in automatic test facilities.

MANUFACTURER:
Hollandse Signaalapparaten, Hengelo, Netherlands.



Signaal LW.04 naval surveillance radar antenna.

1258.253
SIGNAAL SURFACE WARNING AND NAVIGATION RADAR

DESCRIPTION:

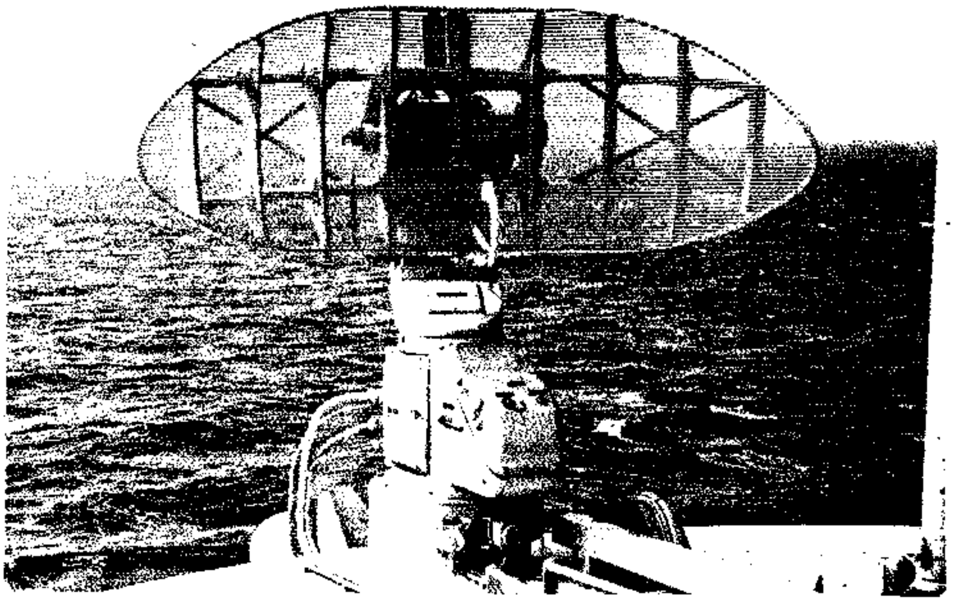
This is a conventional ship's surface warning and navigation radar operating in the X or C-band. The aerial system consists of a normal horn radiator and paraboloid section reflector. The waveguide arrangements behind the reflector suggest that there is some provision for adjusting the elevation angle of the aerial to a limited extent. No details have been made available.

STATUS:

Radars of this type have been extensively supplied to the Royal Netherlands Navy and foreign navies.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Netherlands.



Signaal surface warning and navigation radar (Royal Netherlands Navy photo)

1555.253
ZW.06 SURFACE SEARCH AND NAVIGATION RADAR

DESCRIPTION:

The ZW.06 is an X-band naval surface search and navigation radar providing surveillance, navigation, helicopter control, and limited air surveillance facilities. Of compact and lightweight construction, it is suitable for installation on very small vessels. The transmitter/receiver is of solid-state design, and the scanner is of stainless steel construction to permit siting in adverse environments.

Operational features include: surface cover to radar horizon; air coverage sufficient for helicopter guidance; high resolution for navigation; provision for integration of helicopter transponder systems; sector scan facility; digital video processor. Anti-clutter measures and ECCM provisions include: circular polarisation; logarithmic receiver with pulse length discrimination; sensitivity time control; suppression of non-correlated pulses; tunable transmitter; sector scan transmission (sector can be varied between 10 and 160 degrees).

Signaal ZW.06 surface search and navigation radar antenna

ZW.06 Specification:

Antenna: Parabolic reflector 2.9 m wide, 1.2 m high, with off-set feed horn
Polarisation: Horizontal or circular, selectable
Vertical beamwidth: 19 degrees at —3dB
Horizontal beamwidth: 0.9 degrees at —3dB
Side-lobe level: —23dB
Gain: 31 dB
Rotation speed: 24 rpm
Maximum windspeed: 170 km/h
Transmitter:
Type: Tunable magnetron
Frequency band: 8,600-9,500 MHz
Reciever:
Overall noise: 12dB
Intermediate frequency: 60 MHz
Receiver channels: Linear, or logarithmic with PLD. Pulse interference suppression on both channels.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Netherlands.

1590.253
SIGNAAL M20 SERIES FIRE CONTROL RADAR

DESCRIPTION:

This radar is the principal sub-system of the Signaal M20 Series of naval fire control systems, and in its full form consists of two radars sharing a common stabilised mount and housed in a near-spherical radome. In certain installations, the upper, target tracking and illumination radar only is used, in which case a hemispherical radome is employed. In the double installation, the tracker/illuminator is carried above the search radar, with the gimbal and stabilising assembly in between. The general arrangement can be seen from the accompanying illustration.

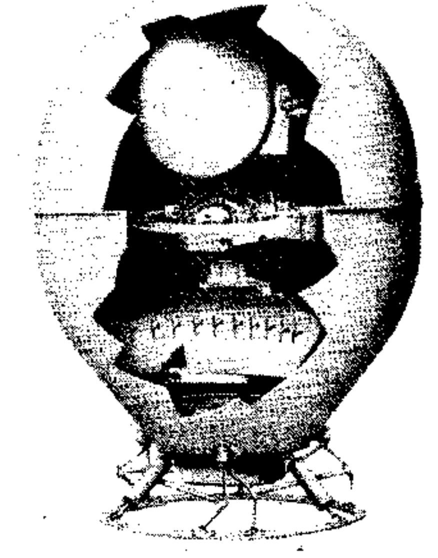
No performance details have been obtained, but the search radar apparently operates in the X-band, and the target tracker/illuminator may be either X-band also, or possibly dual frequency such as K-band with X-band for illumination. The version illustrated is as used in the WM27 fire control system which is capable of directing gun fire against air or surface targets and control of one surface-to-surface missile. Two targets can be tracked automatically and simultaneously.

STATUS:

The M20 series of fire control radars is widely fitted and details of known installations are given in the M20 Series Fire Control Systems entry (No. **1259.281**) in Section One of this edition of Jane's Weapon Systems.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Zuidelijke Havenweg 40, PO Box 42, The Netherlands.



Signaal M20 Series fire control radar

1589.253
SIGNAAL 3D MULTI-TARGET TRACKING RADAR

DESCRIPTION:

The Signaal 3D Multi-Target Tracking Radar (MTTR) is an advanced air search and target tracking radar capable of handling upward of 100 aircraft tracks. A very high data rate is assisted by the use of an antenna array consisting of back-to-back pairs of parabolic reflectors and planar electronically scanned antennas, all four of which have common turning gear. IFF/SIF secondary radar can be integrated with the MTTR. The parabolic dishes are used for search and the electronic-scan antennas for target tracking. High and low cover is provided. Beam steering and data extraction are performed by an SMR Series digital computer.

Operational functions include: long range search; search information with high data rate for low-flying aircraft; search information with high resolution of close in air targets; automatic position and height information; simultaneous tracking of over 100 aircraft targets; target designation facilities for other systems. No performance or other technical details have been obtained. Estimated diameter of the parabolic dishes is in the region of 6.0 metres. Both land and naval uses are likely, and the latter is understood to incorporate full stabilisation.

DEVELOPMENT:

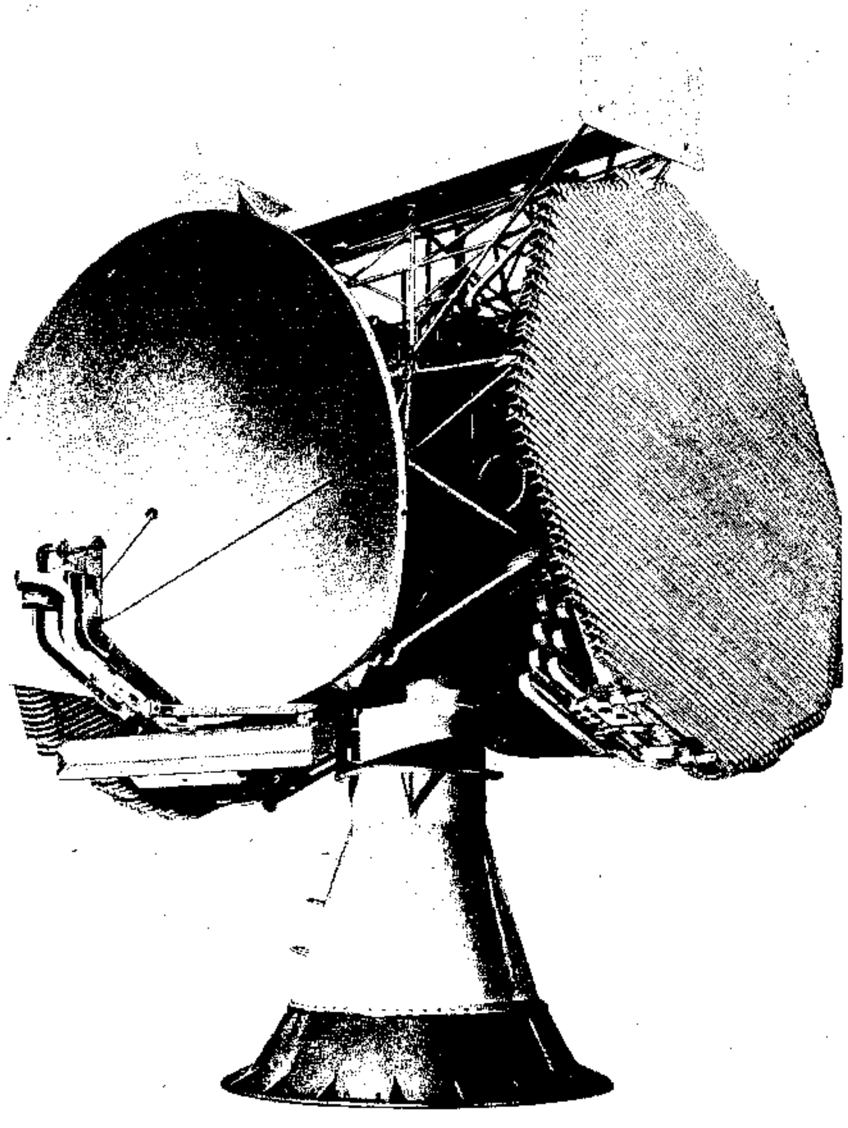
Development has been in progress since the late 1960s under sponsorship of the Netherlands Ministry of Defence. At one stage a radar of this description was the subject of a joint UK/Netherlands project, and the radar was to have been fitted to RN Type 82 Class vessels, but the UK subsequently withdrew from the programme.

STATUS:

The 3D MTTR forms one of the major sensors of the SEWACO action information and fire control system for a new class of Royal Netherlands Navy guided weapon frigates. There are no other known fittings at this stage.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Zuidelijke Havenweg 40, PO Box 42, The Netherlands.



Antenna array of Signaal 3D MTTR

1591.253
SIGNAAL M40 SERIES FIRE CONTROL RADAR

DESCRIPTION:

The M40 Series fire control radar is a conventional X-band tracking radar which is widely used for gun fire control and direction of the Seacat missile. The scanner is mounted above the operator's cab and rotates with it to provide azimuth motion. Separate elevation motion is provided. This radar is used in two M40 Series Fire Control systems mostly, the M44 for Seacat operation, and the M45 for guns. The transmitter/receiver is housed below decks, and there is a separate waveguide pressure-drier. No other details have been obtained.

STATUS:

M40 Series radars are extensively fitted to vessels of several navies. Details of known fittings appear in the M40 Series FCS entry (No. **1261.281**) in Section One of this edition of Jane's Weapon Systems.

MANUFACTURER:

Hollandse Signaalapparaten, Hengelo, Zuidelijke Havenweg 40, PO Box 42, The Netherlands.

9 GR 600 RADAR TRANSMITTER/RECEIVER

DESCRIPTION:

This X-band, 200 kW broad-band, frequency-agile transmitter/receiver equipment is the basis of a number of Swedish Philips radar systems. Used with the 9 GA 300 antenna it forms the Subfar radar (Entry No. **1545.453**); with the 9 GA 205 it is employed in the Mareld coastal radar; with the stabilised 9 GA 202 antenna it forms the search radar element of the TORCI (Entry No. **1541.281**), 9 LV 200 (Entry No. **1542.281**), and Seafire (Entry No. **1543.281**) naval fire control systems; and it can also be used with the 9 GA 203 antenna for general shipboard applications.

9 GR 600 SPECIFICATION:

1008Transmitter:

Frequency range: Random pulse-to-pulse frequency shift up to 450 MHz in the band 8,700-9,500 MHz

Pulse peak power: 200 kW

PRF: 2,000-3,000 Hz

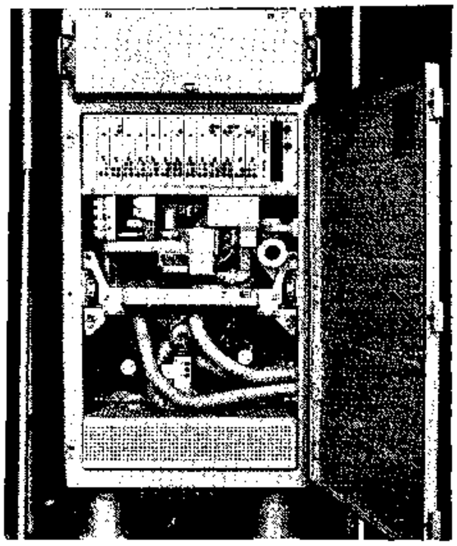
Pulse width: 0.2 to 1.5 microseconds

Output valve(s): One or two spin-tuned magnetrons

Receiver:

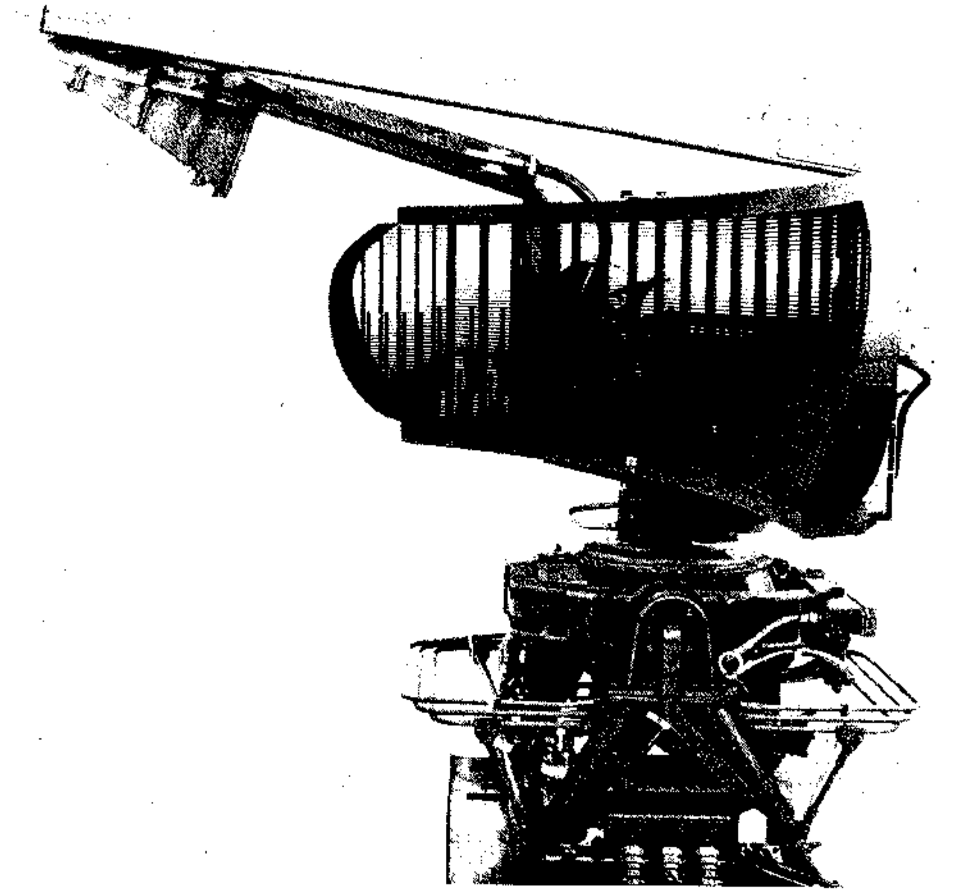
Frequency range: 8,500-9,600 MHz

Bandwidth: 3 and 8 MHz, matched to pulse length



9 GR 600 frequency X-band transmitter / receiver

Noise: 10 dB, average. 8 dB with low-noise preamp
Receiver characteristics: lin and log, log/lin, STC
Optional features: Image rejection mixer-preamplifier; Dicke-fix receiver; pulse length discriminator; IAGC; narrow-band jamming suppression; spectrum analyser; passive ECM mode; frequency programming circuits
Antenna 9 GA 202:
Type: Parabolic, horn-fed, stabilised
Frequency band: 8.5-9.5 GHz
Rotation: Up to 60 RPM
Beamwidth: Horizontal – 1.1 deg, vertical – 4 deg.
Gain: 37 dB
Sidelobes: 28 dB
Stabilisation limits: Roll –50 deg, pitch –30 deg.
Spiral scan: Up to +20 deg. (Optional)
Aperture: 2,100 × 560 mm
Weight: 135 kg, plus 25 kg with spiral scan unit
Antenna 9 GA 203:
Type: Quarter cheese, unstabilised
Frequency band: 8.5-9.6 GHz



9 GA 202 stabilised X-band antenna for search and fire control

Rotation: Up to 60 RPM
Beamwidth: Horizontal 1.4 deg, vertical 30 deg.
Gain: 28 dB
Sidelobes: 25 dB
Aperture: 1,600 × 75 mm
Weight: 90 kg
Antenna 9 GA 300:
Type: Parabolic, unstabilised, submarine
Frequency band: 8.5-9.6 GHz
Rotation: Up to 24 RPM
Beamwidth: Horizontal 2.4 deg, vertical 20 deg.
Gain: 29 dB
Sidelobes: 20 dB
Aperture: 1,000 × 140 mm
Weight: 85 kg
MANUFACTURER:
Philips Teleindustri AB, Fack, 175-20, Järfälla-1, Sweden.

1547.253
9 LV 200 TRACKING RADAR

DESCRIPTION:

This is a Ku-band frequency-agility naval fire control radar forming part of the 9 LV 200 fire control system (Entry No. **1542.281**) in which it is used with an X-band search radar. The main role is that of target tracking for gun fire control, and the radar is a monopulse equipment with stabilised antenna and a Cassegrain scanner system. The radar mounting also carries a TV camera for additional tracking facilities. A feature of the mounting is a new type of direct drive hydraulic motor capable of a slewing speed of 85 deg/sec, and an initial acceleration of 500 deg/sec^2.

Specification:
Type: Ku-band frequency-agile monopulse
Frequency range: Random pulse-to-pulse in Ku-band
Magnetron type: Philips YJ 1320
Pulse peak power: 65 kW
PRF: About 2,000 Hz
Pulsewidth: About 0.2 microseconds
Receiver noise: 11 dB
Antenna:
Beamwidth: 1.3 deg (at 3 dB points)
Gain: 40 dB
Sidelobes: 22 dB
MANUFACTURER:
Philips Teleindustri AB, Fack, S-175 20, Järfälla-1, Sweden.

Director radar antenna assembly of a 9 LV 200 fire control system with TV camera equipment

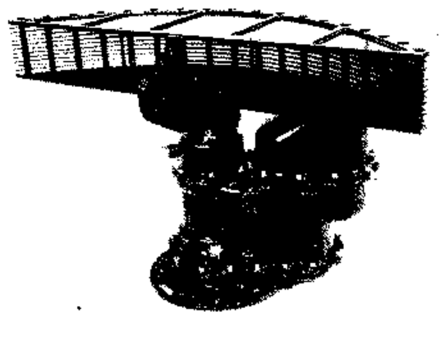
1545.453
SUBFAR SUBMARINE RADAR

DESCRIPTION:

The Subfar equipment is an air and surface search radar for submarines and comprises the Philips 9 GA300 antenna with a 9 GR600 transmitter/receiver. Subfar is the principal sensor in the 9 TCI 210 submarine torpedo fire control system (Entry No. **1544.481**).

The GA 9 300 antenna is designed for mounting on a submarine's radar mast and is unstabilised. It is of parabolic (half cheese) configuration with aperture dimensions of 1,000 × 140 mm. The horizontal beamwidth is 2.4 degrees, and 18-20 degrees vertically, at the 3dB points in both cases. Weight, with turning gear, is about 85 kg, and the rotation speed is 24 rpm. The combined reflector and turning gear unit enhances bearing accuracy by eliminating error sources such as torsional effects in the radar mast.

The 9 GR 600 transmitter is an X-band, frequency-agile system having a pulse peak power of 200 kW. Weight of the equipment is 200 kg. The transmitter frequency range provides for random pulse-to-pulse frequency shift up to 450 MHz in the band 8,700 to 9,500 MHz, and the



9 GA 300 antenna of subfar submarine radar corresponding range for the receiver is 8,500 to 9,600 MHz. PRF is variable between 250 and 3,000 pulses/second, and pulse widths of 0.15 to 1.5 microseconds can be accommodated, extendable to 2.5 microseconds to special order.

Linear/logarithmic, variable STC and differentiation circuitry is standard, and there is a comprehensive list of optional features, which includes:

Tunnel diode low-noise preamplifier
CFAR circuitry
Instantaneous AGC
Pulse length discriminator
Narrow-band jamming suppressor
Image rejection mixer-preamplifier
Additional magnetron as 'hot spare'
Passive ECM mode

Operational facilities provided are, surface target detection and tracking (continuous or programmed); limited air search; radar navigation; and passive ECM mode. The system can also be used for short duration transmission in sectors of between 10 and 180 degrees.

MANUFACTURER:
Philips Teleindustri AB, Fack, 175 20, Järfälla-1, Sweden.

COSSOR NAVAL IFF

DESCRIPTION:

The current range of Cossor naval IFF systems is the 800 Series, comprising three versions, IFF.800, IFF.825 and IFF.825M. The first of these is the standard equipment for general applications and the other two are miniaturised versions for special applications.

IFF.800:

Basic units of this system are the CRS.329 transmitter/receiver (interrogator); antenna assembly CRS.320, CRS.380, or CRS.381; and CRS.383 high-speed antenna switch. Optional items are: remote control unit, relay unit, and auxiliary transmitter/receiver. The CRS.329 is of modern, solid-state design throughout apart from the final transmitter amplifier. Integrated circuits are extensively used, and all pulse timing employs digital techniques. This unit is available as either a single cabinet assembly or as separate sub-units for assembly into standard racks. The CRS.381 antenna is a lightweight unit of 335 cm span, and suitable for direct mounting onto a primary radar scanner, or separately, with its own turning gear.

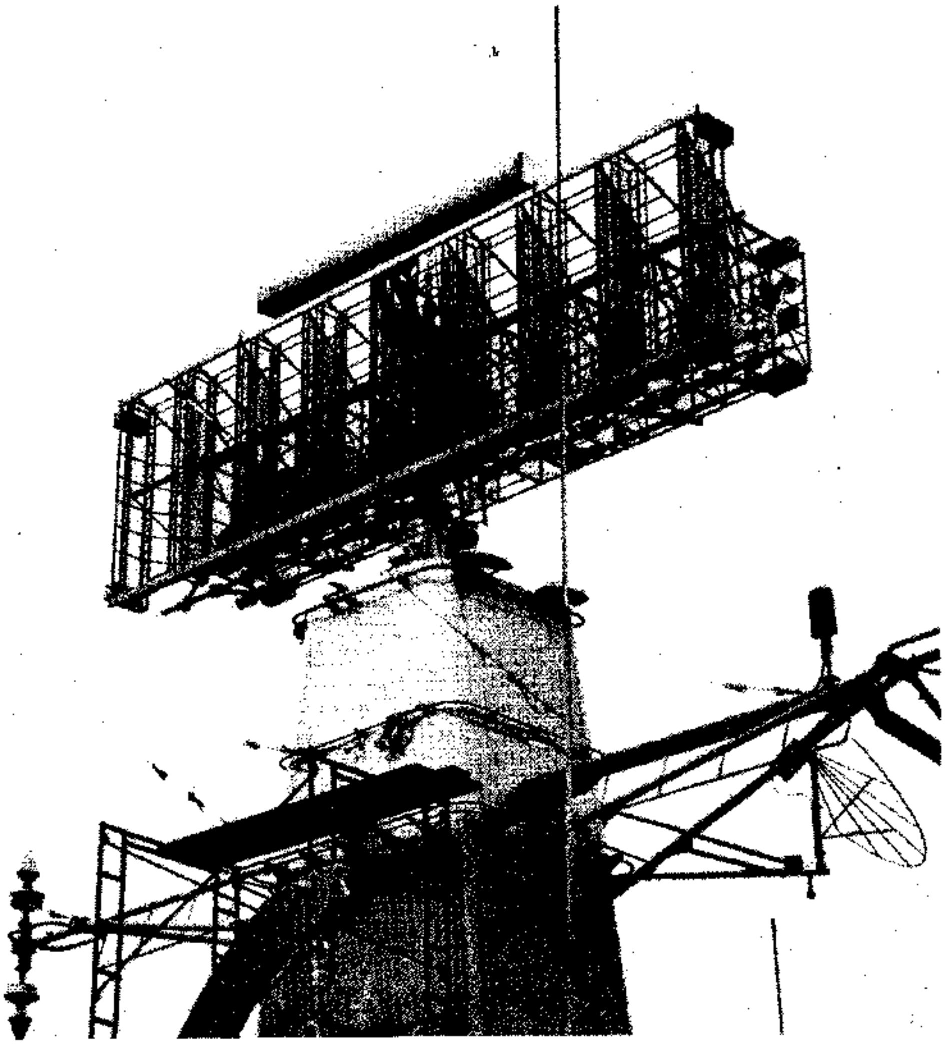
Facilities provided include IFF Mk.10 (SIF) operation with 4096 Codes, where appropriate, on Modes 1, 2, 3/A, and C; 3-pulse side-lobe suppression; video processing includes Active/Passive decoding, de-fruiting, de-garbling, emergency code facilities. Manual and automatic self-test facilities are incorporated.

IFF.825:

The Cossor IFF.825 has been designed for applications in surface-to-air missile systems which incorporate displays. The decoder is suitable for computer driven operation.

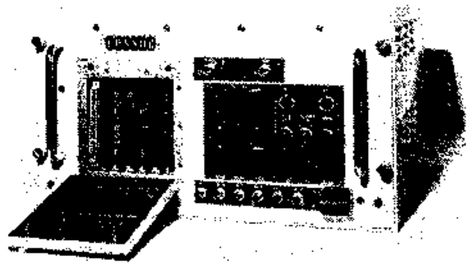
IFF.825M:

The Cossor IFF.825M is a rugged, miniaturised IFF.Mk10(SIF) equipment, designed to meet the operational requirements of Fast Patrol Craft. It conforms to the NATO document STANAG 5017 and DEF specification 133 (Table N1). I.S.L.S. is provided for modes 2 and 3/A.



Cossor CRS-381 IFF antenna mounted on Type 965 long-range radar antenna aboard the RNZN ship Canterbury

Specification:
Interrogator:
Transmitter:
Frequency: 1030 MHz (nominal)
Power: Minimum 250 watts
Pulse spacing:
Mode 1 P1 – P3 $\pm$ 0.1 microsec
Mode 2 P1 – P3 5 s $\pm$ 0.1 microsec
Mode 3/A P1 – P3 8 s $\pm$ 0.1 microsec
ISLA P1 – P2 2 s $\pm$ 0.1 – 0.15 microsec
Rise Time: × 0.1 microsec
Duration: 0.8 $\pm$ 0.1 microsec
PRF: 300 Hz (nominal)
Receiver:
Frequency: 1090 MHz $\pm$1.5 MHz
Bandwidth: 8.5 MHz $\pm$1.5 MHz (at 3dB points)
Sensitivity: –101 dBW (for 10 dB sig/noise ratio)
Swept gain: Provided as standard
Self Test: Manual and Automatic
Remote Control: Facilities provided
Power Requirements:
IFF 825
240V $\pm$6%: 48-50 Hz: 50 VA
IFF 825M
115V$\pm$ 6%: 400 Hz:50VA
Mechanical Dimensions:
Height: 27.0 cm
Width: 53.3 cm
Depth: 38.1 cm
Weight: 40.8 kg

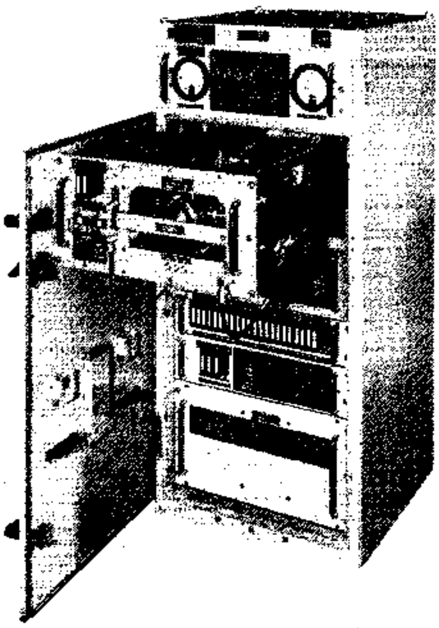


Cossor IFF.825 miniaturised transmitter/receiver

STATUS:

Since its introduction in 1969, the Cossor IFF.800 has been sold to the Royal Navy, Commonwealth and other navies, and at least 55 systems have been supplied.

MANUFACTURER:
Cossor Electronics Ltd, The Pinnacles, Harlow, Essex, England.



Cossor IFF.800 transmitter/receiver

1563.253
MRS3/GWS22 FIRE CONTROL RADAR

DESCRIPTION:

The MRS3/GWS22 is standard Royal Navy equipment for the direction of guns (MRS3) and Seacat missiles (GWS22). The initial application was to gunfire control for quick-firing medium guns of 3-, 4.5-, and 6-inch calibres. Following application of the system to the Seacat system, the MRS3/GWS22 has been the subject of steady modification and can be seen in several forms.

Each MRS3 comprises the director, and below deck, a control console and predictor. The director platform is unstabilised but compensations for ship's motion are derived from a Sperry gyro unit containing two gyros. One of these initiates aim-off and the other provides stabilisation data. The arrangement of equipment on the platforms differs between the several versions of the system; the target tracking radar is mounted to one side of the centre line, and is generally of standard configuration. Beside this are positions for operators (one or two) and with or without protective cabins, while other installations are designed for remote operation. The latest version is equipped with a Marconi television system aligned with the radar bore sight for missile guidance.

Target designation can be provided by a number of methods, including radar, optical, or from a ship's action information system. Air or surface targets can be engaged, and the director radar may be operated in a target acquisition mode.

DEVELOPMENT:

Development was carried out in the 1950s by Sperry in collaboration with the Admiralty and a number of other contractors. As stated, the equipment has undergone considerable further development since entry into service.

STATUS:

The MRS3/GWS22 has been extensively fitted in the Royal Navy on ships of the "County", "Leander", "Daring" and "Tiger" Classes, and on aircraft carriers. A number of Commonwealth and other navies are equipped with the system, including ships of the Australian, Indian, New Zealand, and Chilean navies. Production is continuing. A large contract for the modernisation of RN MRS3 systems was awarded to Sperry in late 1973.

MANUFACTURER:

Sperry Gyroscope Division, Sperry Rand Ltd, Bracknell, Berks, England.

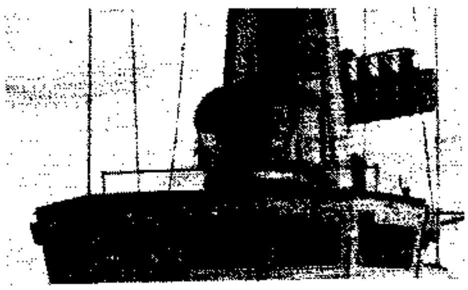
MRS3 director radar unit with protective cab



Early type MRS3 gun fire control radar with canvas hood. Antenna of Type 965 air surveillance radar can be seen also

1751.253
AWS-2 NAVAL RADAR

DESCRIPTION:

The Plessey AWS-2 Naval Surveillance Radar is a high performance and extremely versatile S-band surveillance radar designed for installation on vessels of the destroyer, frigate and corvette classes. The AWS-2 will detect small aircraft at a range of the order of 60 nautical miles at a height of 25,000 feet. The equipment can be readily integrated into a ship's gun or missile fire control systems. Features of the equipment include:

(1) A diversity transmitter/receiver configuration which provides instantaneous standby operation, and under normal conditions improves the probability of detection of a given target compared to a single transmitter system. Diversity operation, by virtue of the frequency separation of the two transmitters, provides additional protection in an ECM environment.
(2) A dual PRF/pulse width facility, which, in conjunction with a dual aerial rotation rate, provides flexibility in choice of operating roles.
(3) Multi-characteristic ECCM receiver to optimise operation in the prevailing radar conditions.
(4) A variable polarisation facility which enables the radar performance to be optimised under precipitation conditions
(5) Tunable magnetrons which enable the RF frequency to be altered to eliminate mutual interference with associated vessels.
(6) Ability to be either the master or slave timing source.
(7) Capable of being integrated with an on-mounted IFF system.

The equipment fills the following operational roles:—

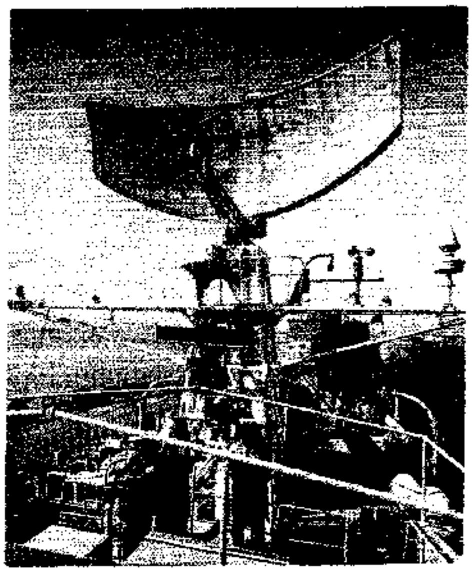
(1) Air warning with high altitude cover
(2) Aircraft control
(3) Surface warning
(4) Air and surface target indication.

The aerial system consists of a horn-fed, double curvature reflector mounted on turning gear which provides an aerial rotation rate of 10 or 20 revolutions per minute. The horn and the variable polariser form an integral part of the RF feed and are supported by a boom arm. An IFF aerial and an SLS switch may be fitted on the reflector. The all up weight of the aerial system excluding the IFF equipment is 742 kg. The metal reflector has a horizontal aperture of 5,055 mm and an accurately contoured surface of 9,300 mm^2. The feed horn is fin-loaded to give it particular characteristics which are important for variable polarisation. The design enables an ellipticity ratio of better than 1dB to be achieved. The calculated integrated cancellation ratio obtained when operating in the circular polarisation condition is approximately 20 dB.

The transmitter/receiver provides S-band RF pulses of 1.5 microsecs or 0.35 microsecs duration at repetition frequencies of 300 pps and 1,000 pps respectively. The receiver system incorporates a parametric RF amplifier for low overall system noise factor and reliability. A solid-state S-band local oscillator is fitted. With the exception of the magnetron, thyraton and parametric amplifier pump klystron, the whole of the transmitter/receiver uses solid-state devices.

The receiver fitted to the AWS-2 is designed to minimise the effect of interfering signals by rejecting all those whose characteristics differ from the transmitter pulse, and at the same time to provide all the essentials of a modern receiver.

In the receiver the functional circuits can be selected individually to provide the following modes with the transmitter operating on long pulse:—



Plessey AWS-1 naval radar head

(1) A linear receiver.
(2) A linear receiver with video differentiation (FTC)
(3) A logarithmic receiver
(4) A logarithmic receiver with video differentiation (FTC).
(5) A logarithmic receiver with pulse length discrimination (PLD).
(6) A Dicke-Fix receiver.
(7) An ECCM receiver (logarithmic with PLD, gated by quantised Dicke-Fix).

The receiver is optimised for use in the long pulse (1.5 microsec) transmitter condition, on short pulse (0.35 microsec) the receiver characteristics available are those at (1) to (4) inclusive above. Choice of receiver characteristics is made at the radar control unit, sited in the operations room.

Plessey AWS-2 Characteristics:
Aerial:
Horizontal aperture: 505 cm
Vertical aperture: 198 cm
Polarisation: Variable 45 deg linear to circular
Speed: 10/20 rev/min (switchable)
Gain: 32 dB
Horizontal beam width: Not more than 1.5
Vertical beam width: Cosec° to 40 deg
Weights and Dimensions:
Aerial reflector:
Height: 198 cm
Width: 505 cm
Turning radius: 274 cm
Weight: 262 kg
Transmitter/receiver:
Transmitter:
Frequency: For two transmitters in the bands 2,700-2,900 MHz and 3,000-3,100 MHz respectively
Magnetron peak power: 750 kW nominal (measured at a duty cycle of 0.0006)
Pulse duration and PRF: 1.5 microsecs ±10% at 400 pps or 0.35 microsecs ± 10% at 1,000 pps
Receiver: Parametric RF amplifier, balanced crystal mixer, pre-amplifier and main receiver
Overall noise factor: Better than 4.5 dB
Intermediate frequency: Centred on 30 MHz

DEVELOPMENT:
Started as a private venture in 1956, the AWS series are essentially naval versions of the AR-1 and AR-15 land-based air surveillance radars. The first prototype was completed in 1960, and entry into service followed soon afterwards.

STATUS:
Radars from the AWS series are in operational use by an undisclosed number of navies.

MANUFACTURERS:
Plessey Radar, Station Road, Addlestone, Weybridge, Surrey, England.

2419.253
PLESSEY NAVAL IFF Mk 10 (SIF)

DESCRIPTION:
This equipment is designed to provide a range of integrated systems with comprehensive facilities for IFF Mk 10 with SIF. Being modular in design, the particular requirements of widely varying types of surface warship can be met. Ships which are fitted with IFF interrogation facilities are able to distinguish between friendly and hostile ships and aircraft, and by the incorporation of suitable decoding (SIF) equipment, positive identification can be made of specific categories of friendly forces, or of individual units, according to the manner of use.

Similar in general principle to the IFF/SSR interrogation and decoding equipment described in Entry No. **2418.153**, it is packaged specifically to suit naval applications and meets the requirements of DEF 133 for protected shipborne equipment. It differs significantly from the equipment mentioned in Entry No. **2418.153** in as much as a smaller antenna for the interrogator is fitted. Because a naval IFF system must function from ship-to-ship as well as from ship-to-air, a transponder is also included in the equipment. The transponder is non-operative when the interrogator of the same equipment is transmitting. The basic naval IFF system incorporates, in a single equipment cabinet, the interrogator and transponder with all the associated power supplies, local control facilities and common decoding equipment. External to the cabinet, but included in the package are an omni-directional antenna for the transponder, and a directional antenna for the interrogator, which is normally mounted on the surveillance radar aerial. Also external to the equipment cabinet are the individual manually controlled passive decoding units, which are fitted in the operations room adjacent to those displays whose operators require selective decoding facilities.

By operation of press-button controls, the following data can be displayed:

(a) Raw video: unprocessed IFF replies from all targets, appearing as multiple 'slashes' at random range intervals determined by the reply code.
(b) Bracket decode: processed IFF replies from all responding targets, appearing as a single 'slash' coincident with the primary target echo.
(c) Selective decode: processed IFF replies from selected codes (up to three per decoder), appearing as a double 'slash' super-imposed on the primary target.
(d) Emergency: receipt of a reply bearing the emergency Mk 10 (SIF) codes will cause a distinctive multiple broad 'slash' to appear on the display on the appropriate bearing, and the emergency indicator lamp on the control panel will operate. The decoder will also respond to emergency transmissions, from basic Mk 10 IFF and civil SSR equipments.

Active decoding facilities which complement those provided by the passive decoding can also be accommodated.

An omni-directional Aerial Type AS177 of RN approved design, manufactured by CEG/AEI is supplied for operation with the transponder. It is a compact unit weighing 3.5 kg and is fitted on the ship's yard.

Directional aerials of various sizes and characteristics, according to the application, are supplied for use with the main surveillance radar antenna. The choice depends on the physical characteristics of the primary radar with which the IFF system is associated, and on the range of the primary radar.

A typical aerial is type AS2189/U of Litton manufacture. This is a 1.9 m unit weighing 25.5 kg and is suitable for mounting on the Plessey AWSI surveillance radar antenna. A side-lobe suppression switch is incorporated in the assembly to ensure effective operation with freedom from spurious returns. Alternative facilities suitable for other types of primary sensor (e.g. Royal Navy Type 965) are also available.

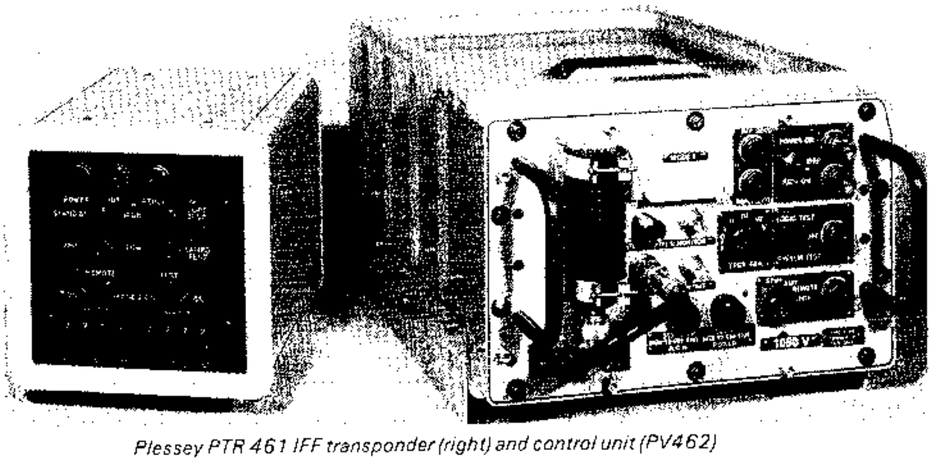
DEVELOPMENT:
Development of the equipment began in 1966 and a steady production programme is now established.

STATUS:
Export orders totalling over £250,000 have been recorded and include fittings in NATO vessels.

MANUFACTURER:
Plessey Radar Ltd, Addlestone, Weybridge, Surrey, England.

1896.253
PTR 461 SHIPBORNE IFF TRANSPONDER

DESCRIPTION:
The PTR461 transponder operates on Modes 1, 2 & 3/A and provides a means of ship identification in response to interrogation by ground, shipborne or airborne secondary radars. It is in general accordance with the Military Mark 10 (SIF) requirements defined in NATO Stanag 5017. The design techniques employed put great emphasis on ease of maintenance but retain, wherever possible, the highly reliable modules of the Plessey PTR446 airborne transponder. The PTR461 transponder includes its own monitoring facilities to allow fault-finding down to module level, which is accomplished using only an oscilloscope and multi-meter.



Plessey PTR 461 IFF transponder (right) and control unit (PV462)

A digital shift register replaces the conventional delay lines in the encode and decode circuits, thus providing time delays independent of temperature variations. Integrated circuits are used for the logic circuit, logarithmic response, i.f. amplifier and video processing circuits.

The transponder operates in conjunction with the control unit PV462 which may be installed remotely from the transponder. The code controls for Modes 1 and 3/A are housed on the control unit and the code control for Mode 2 is situated on the transponder. The self-test facility can be controlled from either unit, and both units contain lamps which allow the transponder performance to be monitored.

The transponder PTR461 is derived from the lightweight transponder PTR446 and uses common modules which give a logistic compatibility. The control unit is designed to fit into the Versatile Console System (VCS).

PTR461 Characteristics:
Power output:
Nominal power output: 24dBW
Minimum power output: 23dBW
Maximum power drop during first 1000hr 1.5dBW
Typical output power after 2000hr 21dBW
Pulse rate: 1200 replies/sec each containing up to 14 reply pulses (Note: The 'x' pulse is not normally used).
Triggering sensitivity (Min): −72 to 80dBm
Dimensions:
Transponder:
Width: 308.6 mm
Height: 220.8 mm
Depth: 392.4 mm
Weight approx: 12.25 kg
Control Unit:
Width: 152.4 mm
Height: 152.4 mm
Depth: 161.9 mm
Weight approx: 1.35 kg

MANUFACTURER:
Plessey Avionics & Communications, Ilford, Essex, England, IG1 4AQ.

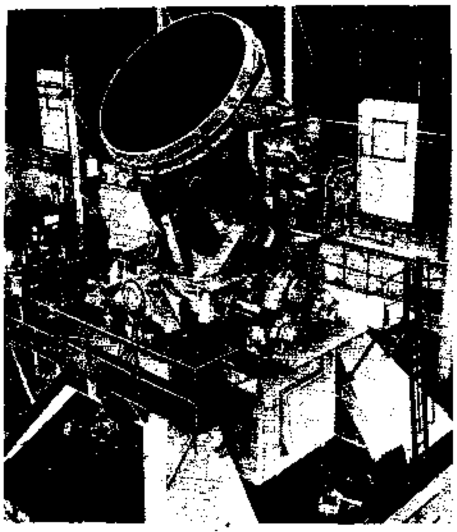
RN TYPE 901 RADAR
DESCRIPTION:

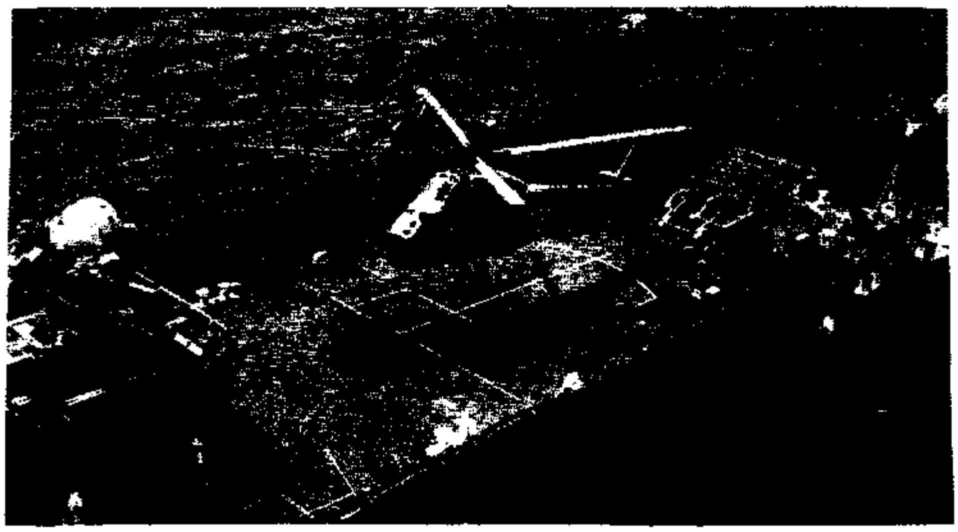
The Royal Navy Type 901 radar equipment provides target tracking and missile guidance for the Seaslug shipborne surface-to-air missile system (Entry No. **6003.231**). Each of the eight RN "County" Class guided missile destroyers is fitted with a single Type 901 radar, forward of the helicopter deck, for use with the twin Seaslug launcher aft. A stabilised mount is provided and the right-hand side of the director head carries equipment for initial 'gathering' of the beam-riding Seaslug missile. No performance details of the Type 901 have been released. Operation at C-band frequencies is probable.

MANUFACTURER:

Marconi Radar Systems Ltd, New Parks, Leicester, England, LE3 1UF.



Type 901 radar during manufacturer's tests



Aft end of "County" Class destroyer showing Seaslug launcher, and Type 901 missile guidance radar forward of helicopter deck

1559.253
RN TYPE 909 RADAR
DESCRIPTION:

The Royal Navy Type 909 radar provides target tracking and illuminating facilities for the Sea Dart, GWS-30 air defence missile (Entry No. **6004.231**). This weapon has an anti-ship capability, and the radar is stated to be suitable for gun laying also, so that a surface target capability must be assumed. The antenna is of the Cassegrain type and has a diameter of 2.44 metres. A small dome mounted near the upper edge probably houses an associated IFF antenna. On board ship, the complete antenna assembly will be protected by a cupola radome. The radar head and the office cabin, containing transmitter/receiver unit and associated electronics, are constructed as a single pre-fabricated assembly to reduce installation and replacement time and to enable functional testing before fitting.

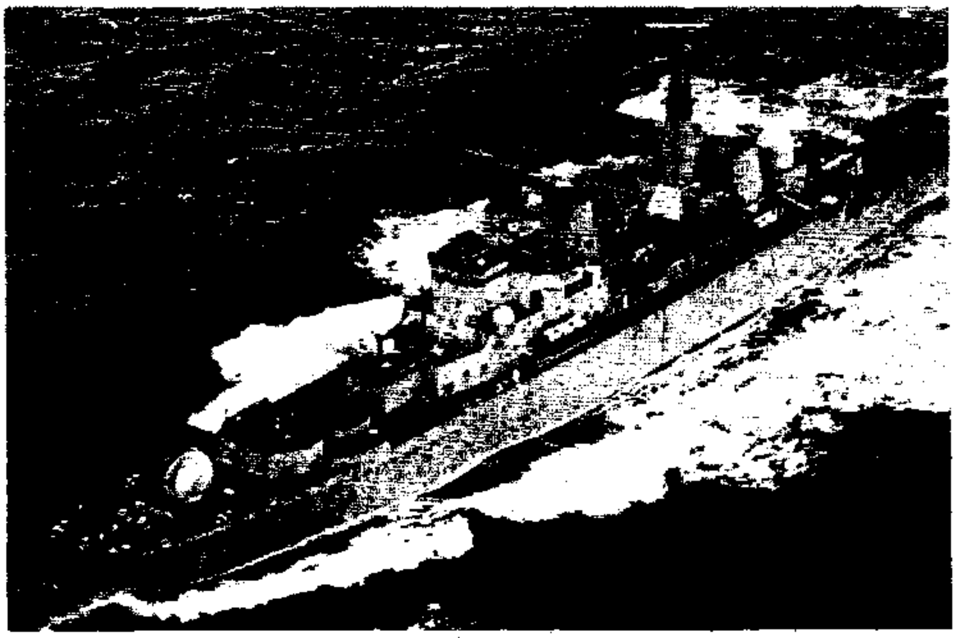
Few technical particulars have been revealed. A C-band operating frequency range is likely and a high transmitter power can be expected. It has been stated that elaborate ECCM are incorporated to counter both active and passive ECM. A photograph appears with the Sea Dart missile entry.

STATUS:

The Type 909 has been specified for Type 42 destroyers for the Argentinian and British Navies, and for the RN Type 82 destroyer. Each ship will have two radars of this type, mounted in fore and aft radomes. Full production had started in 1971.

MANUFACTURER:

Marconi Radar Systems Ltd, New Parks, Leicester, England LE3 1UF



The Type 82 destroyer HMS Bristol. *Forward Type 909 Sea Dart missile guidance radar is not yet fitted with protective radome as is the aft Type 909. Dual array AKE(2) Type 965 search radar can be seen, with Type 992Q atop mast. Radomes beside bridge contain communication satellite aerial dishes* (Royal Navy)

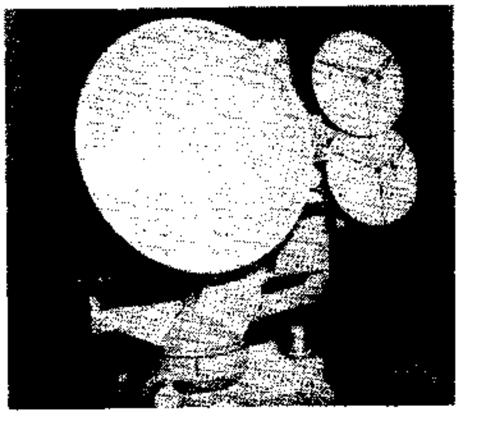
1562.253
RN TYPE 910 RADAR
DESCRIPTION:

The Type 910 is the radar tracking element of the GWS 25 Seawolf point defence missile system. It is used with, and receives target designation data from, the Types 967 and 968 air and surface surveillance radars (Entry No. **1561.253**). Few technical details have been released, but X-band operation and a Cassegrain antenna are likely. The Seawolf uses command to line of sight guidance, and the arrangement of antennas suggests that the main tracking radar is flanked by horns and dishes for guidance and telemetry functions and IFF. A closed circuit TV camera system is associated with the radar.

Information from this tracker could be used for gun control also, and the TV tracker on the same pedestal could also be employed for gunnery purposes.

MANUFACTURER:

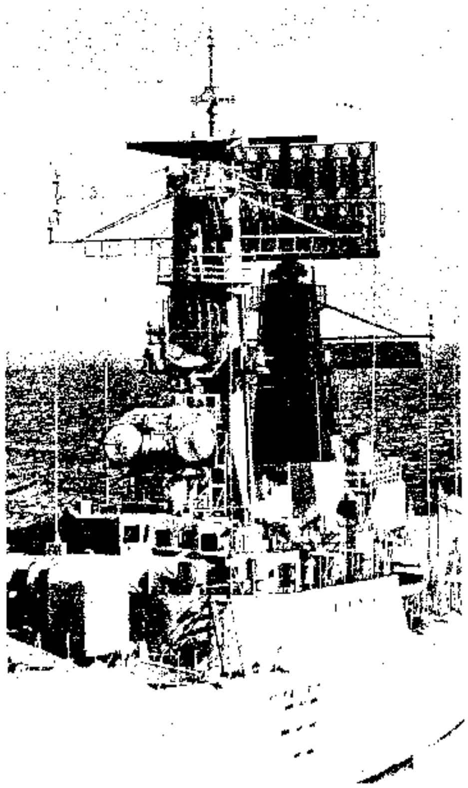
Marconi Radar Systems Ltd, New Parks, Leicester, England LE3 1UF.



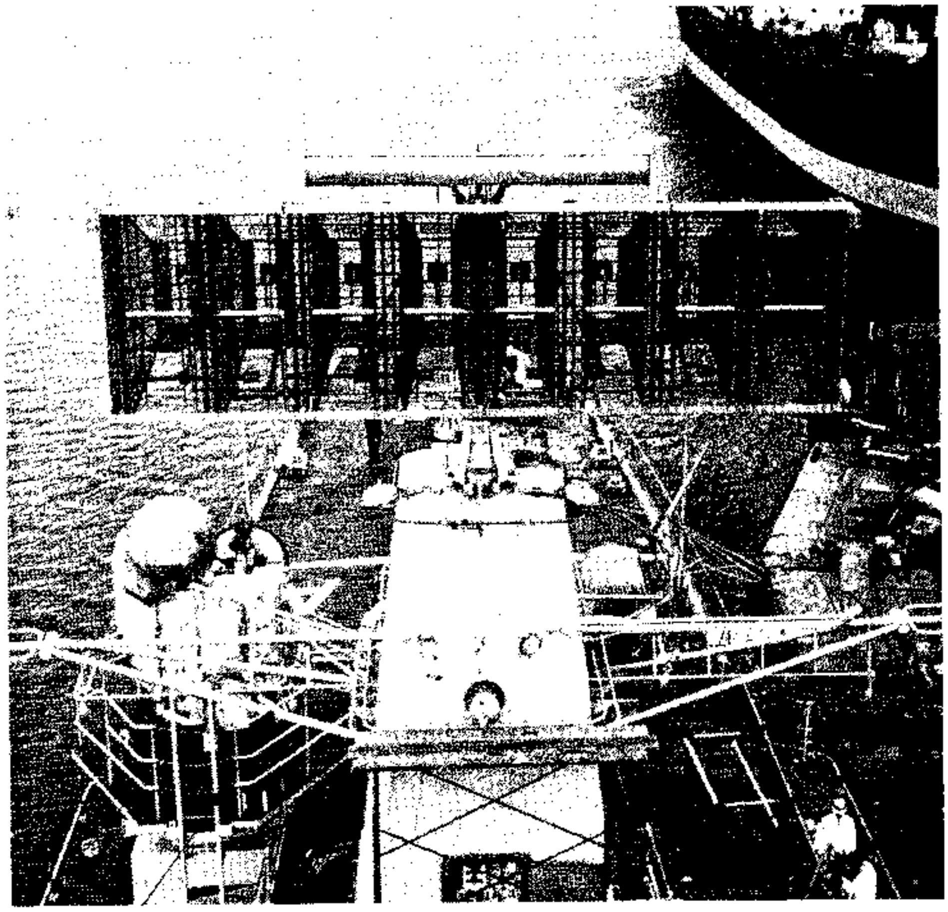
RN Type 910 Seawolf target tracker and missile guidance radar

1558.253
RN TYPE 912 RADAR
DESCRIPTION:
Type 912 is the Royal Navy designation for the Selenia Orion RTN-10X fire control radar fitted to RN ships. It is an X-band equipment, conical-scan pulse radar, and the mounting arrangements include facilities for a closed-circuit television system for acquisition and missile gathering functions. More details will be found in Entry No. **1368.253** among the Italian entries of this section.

1560.253
RN TYPE 965 RADAR
DESCRIPTION:
The Type 965 is the standard long-range air search radar of the Royal Navy and is widely used on ships of sizes ranging upward from frigates. The operating frequency range lies in the metric wavelength band and output powers in the megawatt range are assumed. In addition to air surveillance, the Type 965 fulfils target designation functions for guided weapons systems, and integrated IFF Mk 10 facilities are provided.



HMS Salisbury, *showing Type 965 search radar with double aerial outfit AKE (2). Other radars shown are the Type 277 nodding height finder above the 'Plane-5' radar gun fire director. Type 993 S-band search radar, and what is possibly a Type 992 mounted aft* (Royal Navy)



Close-up view of Type 965 AKE-1 antenna array, with Cossor IFF antenna on upper edge

The Type 965 employs a lecher-line oscillator as the RF power source, modulated by the output of a resonantly charged discharge line. The modulator is a hydrogen thyratron of the self replenishing type. To avoid interference with communications, extensive filtering is applied before the RF is fed to the air dielectric feeder and antenna. The receiver is basically a conventional superhet, with AFC and a specially designed low-noise cascode RF amplifier stage. Both linear and logarithmic IF amplifiers can be selected. Duplexing is by means of a hybrid ring arrangement of lengths of tuned co-axial cable.

The antenna array consists of a row of eight dipoles, each at the rear of a 'horn' formed of metal mesh, the whole having a characteristic 'bedstead' appearance. The complete antenna scanner assembly may consist of either one or two such groups, and both versions are extensively employed. An IFF antenna is usually mounted on the upper edge of the primary array.

STATUS:
The Type 965 has been in production for several years and is widely deployed in both single and double array forms by the Royal Navy, and is fitted in single array configuration of RNZN Type 12 Leander class frigates.

MANUFACTURER:
Marconi Radar Systems, Ltd, New Parks, Leicester, England LE3 1UF.

1561.253
RN TYPES 967 AND 968 RADARS
DESCRIPTION:
The Royal Navy Type 967 is an air surveillance radar which can be integrated with the Type 968 surface surveillance radar to form a very compact medium-to-short range defence radar. They will provide high performance facilities to fulfil the requirements of air and surface warning, search and target designation, from sea level to high elevation angles. These radars with the Type 910 Target tracker and missile guidance radar form the radar group for the Seawolf anti-aircraft and anti-ship-missile weapon, GWS 25 (Entry No. **2442.231**).

The waveguide antennas for both radars are mounted back-to-back in a common housing carried by a single fully-stabilised mount. The whole will be protected by a radome. No technical details have been revealed but operating frequencies are probably in the X- or C-bands. Extensive precautions have been taken to limit the effects of sea clutter and ECM. The system has its own digital processor, a Ferranti FM 1600 series computer. A high rotation rate for the scanner is probable.

Scanner and stabilisation arrangements of RN Type 967/968 for Seawolf point defence system. Separate antennas for surface and air search contained in a common housing

MANUFACTURER:
Marconi Radar Systems Ltd, New Parks, Leicester, England LE3 1UF.

1253.253
RN TYPE 975 RADAR

DESCRIPTION:

The Type 975 is a lightweight, X-band, high definition surface warning radar designed for fitting on frigates, coastal and inshore minesweepers, and other naval craft of similar size. Its primary function is navigation, but in some installations it is specially adapted for mine hunting in conjunction with a suitable plot and underwater detection equipment. This version is designated Type 975ZW, and incorporates true motion displays and provision for marking sonar targets on the display.

Transmitter power is 50 kW (nominal), and either a 182 cm or 304 cm slotted waveguide scanner is used. Two models of display unit are available, JUC/1 and JUC/2. The former is a water-tight unit with magslip range and bearing, and the latter has synchro range and bearing transmission. Seven range scales provide displays of 0.75 to 48 nautical miles. Minimum detection of the radar is less than 32 metres, and bearing accuracy is within one degree.

STATUS:

This radar has been extensively fitted to ships of the RN and other navies, and although now superseded by the Type 1006 (Entry No. **1394.253**), many Type 975 units are still in use.

MANUFACTURER:

Kelvin Hughes Division of Smiths Industries Ltd, New North Road, Hainault, Ilford, Essex, England.

1254.253
RN TYPE 978 RADAR

DESCRIPTION:

The Type 978 is a 3-cm navigation radar designed for fitting on frigates and larger ships. The scanner used is a 'double-cheese' type unit with the upper section used for transmission, and the lower for reception. Transmitter design is conventional, employing a blocking oscillator trigger circuit, hard valve modulator and a magnetron. The receiver incorporates automatic frequency control to compensate for magnetron frequency drift. Logarithmic amplification and differentiating circuits are incorporated to improve performance in adverse conditions such as rain or sea clutter.

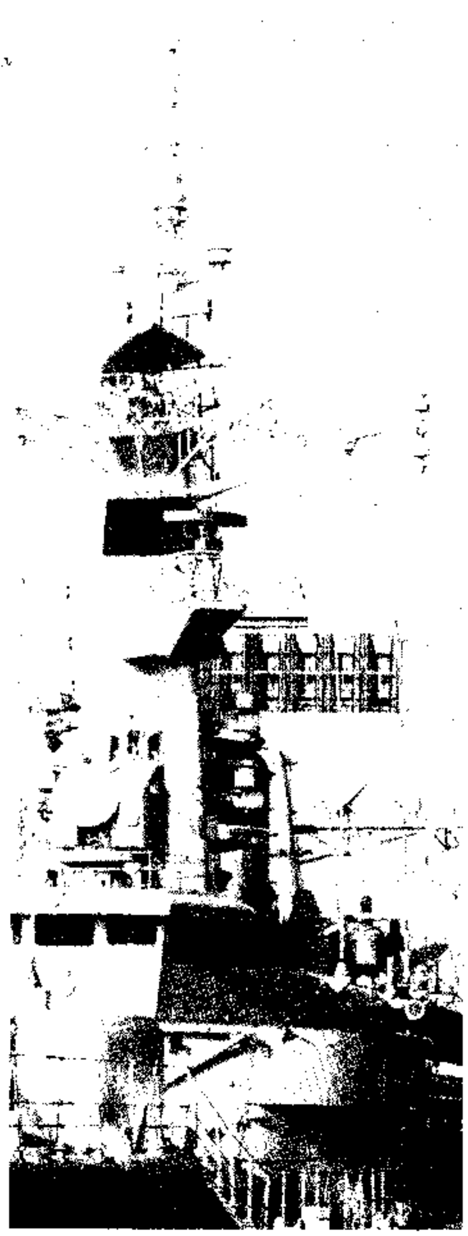
The main display is a PPI presentation with true motion facilities, and to this can be added Optical Plotting Attachment (OPA), an optical mixing device to permit the addition of tactical information to the display. A further display can also be used with the Type 978 where more accurate range and bearing data is required. This is a B-scope display, allowing any part of the PPI picture to be expanded for closer examination.

DEVELOPMENT:

Development took place in the 1950s, as a successor to the Type 974. Over 1,000 of the latter radar have been supplied to more than 50 navies.

MANUFACTURER:

Decca Radar Ltd, Decca House, Albert Embankment, London SW1, England.



This picture of aerials on HMS Andromeda *shows (top-to-bottom): various DF and EW units on mast, Type 993 'quarter-cheese' scanner, Type 978 navigation radar, Type 965 long-range search radar with IFF (aft of mast), and MRS3 fire control radar director* (Royal Navy)

1041.253
TYPE 984 NAVAL AIR SURVEILLANCE RADAR

DESCRIPTION:

Few details of the Type 984 have been released, but its general configuration and those statements which have been made enable some conclusions to be drawn concerning its operation.

The antenna system consists of a number of primary energy sources stacked in the vertical focal plane of a 4.267 metre diameter microwave lens. The energy from each scanner (source) is collimated by the lens and forms a narrow pencil beam in space. As with an optical lens system, the angle at which the beam emerges from the lens depends on the angular off-set of the source from the optical axis. The scanners are disposed, vertically, about the optical axis and hence produce a number of beams at different angles of elevation. The action of the scanners is to move each energy source, at high speed, through a small angle thereby swinging the beams through the same angle. The scanners are synchronised so that all the beams'scan upward at the same time, the time between the beginning and end of the scan cycle being correlated with elevation.

In this way a series of separate scans are swept in elevation, at plan data rate, thus making it possible to extract height and PPI data.

A further, fixed, beam at low elevation provides long range early warning of approaching targets.

The transmitters and receivers are mounted on a framework supported on trunnions at the rear of the antenna assembly, or nacelle, which is itself stabilised on a second pair of trunnions, thus providing stabilisation of the optical axis against ship's motion.

Special display arrangements were evolved for the Type 984 and there was provision for the presentation of either 'raw' data or processed information in the form of a 'tactical' display. The latter consists of eight-figure groups encircling each target position. The figures give information as to size, category, height, etc. Switches enable the number of targets displayed to be selected according to any of their parameters.

Subsequent Type 984 installations have been made on vessels equipped with computer based action data automation systems, providing an opportunity for further sophistication of radar data handling.

STATUS:

The only known operational installations of the Type 984 are on board British aircraft carriers. First to be fitted was HMS *Victorious*, prior to recommissioning in 1958. Other vessels since equipped are HMS *Eagle* and *Hermes*.

DEVELOPMENT:
The Type 984 radar is the result of a collaborative programme between The Marconi Co and the Admiralty Surface Weapons Establishment. Work on the project is believed to have started about 1950.

MANUFACTURERS:
Marconi Radar Systems Ltd, New Parks, Leicester, England LE3 1UF.

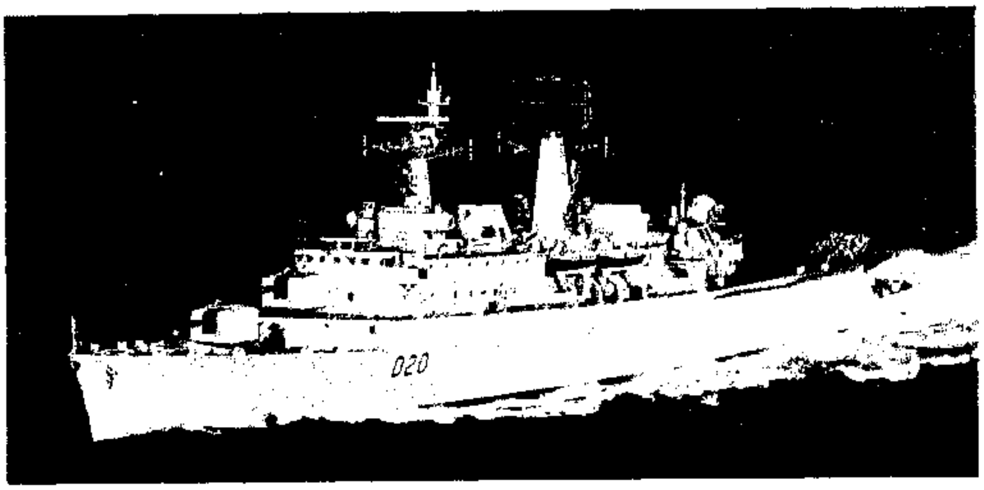
Type 984 air defence radar on board HMS Hermes

1753.253
RN TYPE 922 Q RADAR

DESCRIPTION:
The Royal Navy Type 992 Q radar is a fully stabilised 10 cm (S-band), high-power pulse radar equipment, fitted in destroyers and frigates. It is a prime source of surface/air target information for the Action Information Organisation system, and provides space-stabilised output data which can be synchronised in pulse and rotation with that of other radars fitted in the ship. It is of solid-state electronic construction apart from certain circuit elements which retain vacuum tube devices.

STATUS:
Fitted in RN "County Class" guided missile destroyers.

MANUFACTURER:
Marconi Radar Systems Ltd, New Parks, Leicester, England LE3 1UF.



HMS Fife. *Radar fit is the same as for HMS* Glamorgan, *shown nearby. Also visible in this picture are Type 277 height-finder aft of mainmast and Type 901 Seaslug guidance radar by helicopter deck* (Royal Navy)

"County" Class destroyer, HMS Glamorgan, with Type 992Q Scanner on foremast. Below is Type 978 navigation radar, and MRS-3 radar director over bridge. Mainmast has Type 965 search radar with AKE (2) aerial outfit. Note ECM arrays

1394.253
RN TYPE 1006 RADAR

DESCRIPTION:
The Type 1006 Radar and the associated displays and aerial outfits form a high definition navigation radar system which meets the operational and reliability requirements of the Royal Navy. Interface standards with certain existing naval equipments have been maintained. Throughout the design and development of the equipment emphasis has been placed on the reliability, accessibility and ease of maintenance of the equipment. The equipment will be fitted in both submarine and naval surface vessels and in ships of the Royal Fleet Auxiliary. The Type 1006 will be the standard X-band navigational radar of the Royal Navy and is replacing three obsolescent radar systems now in service. The Type 1006 is designed to metric standards. It is in full production.

Aerial Outfit AZJ:
The surface role aerial outfit consists of a 2.4 metre slotted waveguide linear array rotated at 24 rpm by a turning mechanism. The array has a horizontal beamwidth of 1° and low side lobe levels to give good bearing discrimination. The vertical beamwidth of 18° gives good performance in conditions of roll and pitch. The rotational speed is maintained in wind speeds up to 100 knots by an AC driving motor which also ensures a low magnetic signature. Aerial bearing data is provided by a coarse/fine 400 Hertz synchro system which also includes bearing rate information from a 400 Hertz tachogenerator. To ensure operation in severe weather conditions a pneumatic aerial de-icing system is available. This is effective down to −30° centigrade. To meet special ship fitting requirements the aerial outfit may be inverted and mounted on the underside of a mast spur.

Aerial Outfit AZK:
This aerial outfit consists of a 3.1 metre slotted waveguide linear array rotated by the same type of turning mechanism as outfit AZJ. It is used when the improved bearing discrimination given by the 0.75° beamwidth is required. The increased aerial gain also improves the range performance of the radar system. The remaining details of outfit AZK are similar to those for AZJ.

Transmitter-Receiver (Surface):
The equipment is non-thermonic with the exception of the magnetron, and operates at a frequency of approximately 9,445 MHz. The solid state modulator, which may be externally

synchronised, provides three pulse lengths at two repetition frequencies to drive the magnetron which is coupled directly to the RF head. The advanced broadband design of the RF head ensures the best obtainable minimum range under adverse waveguide conditions. The three pulse lengths of 80, 250 and 750 nanoseconds ensure good short range discrimination and long range performance. A Gunn diode local oscillator is controlled by an AFC with tuning indication, the IF generated is fed to a combined linear/logarithmic receiving system. The linear video is used for navigational radar displays and the logarithmic video is used for weapon system data extraction. The receiver bandwidth is automatically optimisted for the transmitter pulse length in use.

A high-isolation waveguide switch and dummy load is provided to allow the transmitter-receiver to be run under radar silence conditions. The mechanical coupling of the on/off switch to the waveguide switch ensures the protection of the mixer crystals when the system is not powered. Multiple outputs of sync and video enable up to four displays to be operated directly without the need for signal retransmission units.

Transmitter-Receiver (Submarine):
In order to be compatible with the existing submarine aerial system a variant of the transmitter-receiver operating at 9,650 MHz is available. It is otherwise identical to the surface role equipment. The design of the RF head prevents damage to the equipment from massive waveguide reflections which occur if the aerial is submerged whilst transmitting.

Display Unit JUD:
This unit is non-thermionic with the exception of the cathode ray tube. The display unit uses a rotating scanning coil system to provide range scales from ½ to 64 data miles. The unit uses a 31 cm (12 inch) cathode ray tube. Fixed coils provide off-centring facilities up to 75 per cent of a radius from either an external true motion unit or from internal sources. Display presentation is normally North-stabilised. An adjustable electronic range marker is provided whose range is displayed on neon numeric indicators. The crystal controlled range marker system has two range scales FINE and COARSE; either may be set to YARDS or DATA MILES. The range strobe is continuously variable; it is independent of the display range scale. It shows:

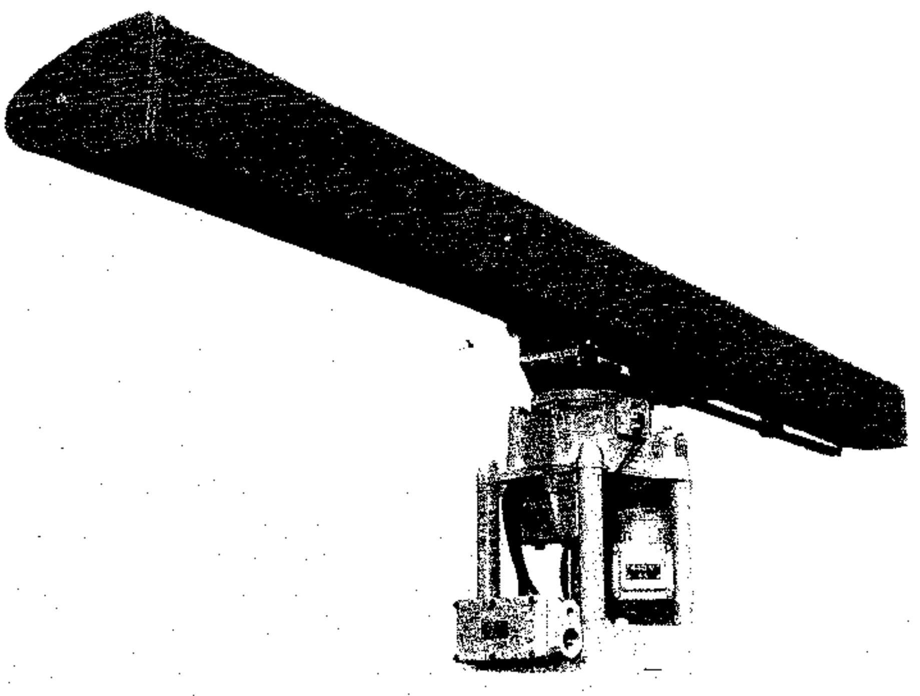
Fine/coarse	Yards/Miles
fine	yards
fine	miles
coarse	yards
coarse	miles

Range increments	Maximum marker range
5 yards	10,000 yards
0.005 data miles	10 data miles
50 yards	100,000 yards
0.05 data miles	64 data miles

A mechanical parallel line cursor and an electronic bearing marker are provided. The position of the bearing marker is displayed on neon numeric indicators with an accuracy of +½°. Readings may be taken of both true and relative bearing. The information from the range and bearing markers is available in Binary Coded Decimal form for remote display or feeding to ancillary equipment. The display will accept heading line, radar video and three channels of auxiliary video information. Front panel switches allow the selection of the auxiliary video channel to be displayed. The range switch will normally control the transmitter pulse length. An overriding Pulse Length Selection control may be used to override the range switch pulse length selection to give medium or long transmitter pulse lengths.

A flat face anti-parallax reflection plotter is available. Nine range scales are provided, covering ½ to 64 Data Miles.

Display Unit JUD(2):
The facilities of the display have been extended for surface role applications to operate in conjunction with computer systems such as CAAIS (Computer Assisted Action Information System). Additional symbol writing coils and amplifiers are provided together with pulsed off-centring amplifiers to enable the display of interscan symbolic data on appropriate range scales from analogue information inputs. Outputs of the range scale setting are provided for the alignment of ancillary equipment.



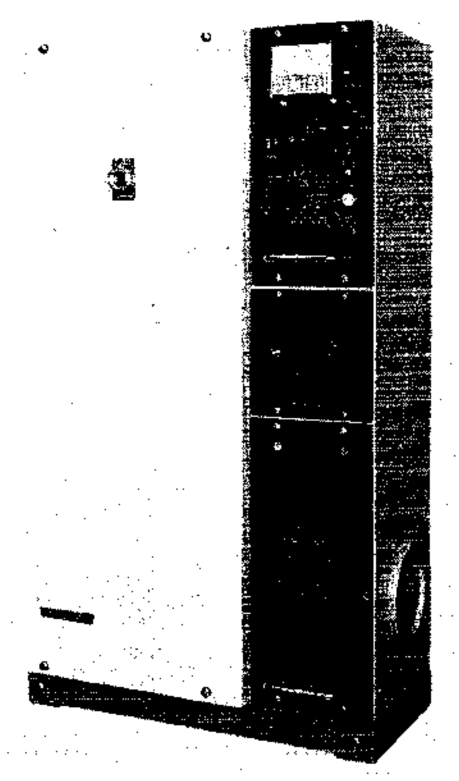
Type 1006 radar antenna head

True Motion Outfit QAB:
The Outfit QAB is a solid state electro mechanical computer for the provision of true motion presentation on the Radar 1006 JUD Display.

Submarine Use:
The Type 1006 is compatible with the Submarine Bridge Display which is primarily used to assist conning when submarines enter or leave harbour.

No details of the submarine antenna system have been obtained.

DEVELOPMENT:
Development began in 1969, and the Type 1006 radar and the associated displays and aerial outfits have been developed by Kelvin Hughes in collaboration with ASWE.



Type 1006 transmitter/receiver

STATUS:
Sea trials were conducted during 1970 aboard HMS *Grenville* and HM Submarine *Otus*. The Type 1006 radar has been in series production for the Royal Navy and other navies since 1971.

MANUFACTURER:
Kelvin Hughes, New North Road, Hainault, Ilford, Essex IG6 2UR, England.

1895.253
S604 HN NAVAL RADAR

DESCRIPTION:
The S604 HN is a long range surveillance radar operating in L-band and designed to give optimum performance in a jamming environment. The aerial comprises a single curvature cosecant squared reflector with linear squintless feed to give low side lobes. The 2.3 MW peak power oscillator is a variable frequency magnetron, vapour cooled to ensure constant temperature. Magnetron frequency is governed by a crystal controlled STALO – frequency pulling is eliminated by the incorporation of a ferrite isolator between magnetron and duplexer; and frequency pushing by a modulator pulse stabilising circuit. The receiver chain includes a parametric amplifier with a noise figure of 2.8 dB.

The equipment incorporates a digital signal processor giving moving target indication (MTI), clutter constant false alarm rate (CFAR) control and pulse repetition frequency discrimination. Pulse repetition frequency stagger is provided on the trigger system which can supply outputs for a complete ship's radar system.

S604 Characteristics:
Aerial Assembly:
Aperture: 5.5 m × 1.83 m
Frequency: 1,250 to 1,365 MHz
Azimuth Beamwidth: 3.2° (at 1,330 MHz)
Elevation Beamwidth: Cosec² to 45°
Sidelobes: —30 dB in horizontal plane
Gain: 28 dB (at 1,330 MHz)
Weight (Aerial & Pedestal): 1,350 kg
Transmitter/Receiver:
Output Power: 2.3 MW peak

Frequency: 1,250 to 1,310 MHz (tunable) or 1,305 to 1,365 MHz (tunable)
Parametric Amplifier:
Noise Figure: 2.8 dB
Weight: 1,250 kg
Single Processor:
MTI: double cancellation digital
PRF Stagger: 6-period
PRF Discrimination:
Video Outputs: Analogue and digital suitable for driving Plot Extractors

STATUS:
The land version of this radar is in series production, but no details of shipboard installations have been obtained.
MANUFACTURER:
Marconi Radar Systems Ltd, New Parks, Leicester, England.

1508.253
ST 801/2 NAVAL TRACKING RADAR

DESCRIPTION:
The ST 801 is a lightweight X-band monopulse search and tracking radar for the direction of small and medium calibre guns, and for target tracking in guided missile systems. It is intended for use against air or surface targets, and the weight and dimensions of the system are appropriate to installation on *all* classes of vessel from patrol boats upwards. The ST 801 is designed to interface with, and be controlled by, a weapons system computer. The type ST 802 is the autonomous version of ST 801 and includes facilities and additional equipment for independent operation and control in systems not equipped with a central computer complex.

The radar director head is a 2-axis mount carrying a 1 m diameter antenna, and optionally, a TV camera. The mount is controlled by electric servos in azimuth and elevation, with stabilisation of the sight line during tracking by means of rate gyros. The aerial is of the twist Cassegrain type and is one metre in diameter. A four-horn monopulse feed and comparator provide three separate RF outputs (sum, elevation difference and training difference signals) for processing in the IF receivers to produce acquisition and auto-follow data. Accurate angular data results from the combination of a 2.4 deg pencil beam and monopulse signal processing. With TV camera, the director head weighs 532 kg.

The X-band transmitter incorporates a tuneable magnetron, and a short pulse length is used in the interests of range resolution and tracking accuracy. The receiver employs monopulse tracking and embodies features such as the tuneable magnetron, monopulse signal processing, MTI, passive tracking of targets using ECM, and CFAR, to reduce the effects of counter measures. MTI (coherent on receive) is available as an option, this providing discrimination against sea clutter when tracking small, low-flying targets.

OPERATION:
Weapons which can be associated with the ST 801 include Seacat, Exocet, The Mk VIII 4.5 in gun, and the 40 mm automatic gun. Acquisition of air or surface target is automatic, following target designation by search radar or other means. After acquisition, the target is automatically tracked and appropriate data supplied to weapon systems. The ST 801 antenna head is able to rotate continuously in azimuth at 20 rpm, and this feature in conjunction with the optional MTI is of value in providing additional surveillance cover at low elevation.

If the TV sub-system is fitted, it may fulfil either of two distinct roles, depending upon the weapon system employed. With command line-of-sight missiles, the TV system will permit automatic missile gathering after launch, from a below-decks position. Alternatively it may be used as a back-up to radar tracking in either daylight or low light-level mode.

STATUS:
The ST 801 is a private venture development in collaboration with L. M. Ericsson, and has been proposed to a number of navies with the lightweight Seacat missile system.

S810 SERIES NAVAL SURVEILLANCE RADARS

DESCRIPTION:
Four models of the series, S810, S811, S815 and S816, are comprised of various combinations of two sizes of scanner, and two transmitter/receiver equipments. These are summarised in the table of characteristics.

Marconi Naval Radar Type S810 is a lightweight stabilised X-band surveillance radar, suitable for fitting in small warships down to the size of fast patrol boats where there are limitations of space and weight. X-band gives good performance against surface targets, a major requirement for fast patrol craft, whilst satisfactory coverage is maintained against air targets by the use of a stabilised aerial in a radome, with vertical cosec^2 beamshape. A narrow horizontal beam width ensures accurate target indication data for pointing weapons and for putting-on a tracking radar.

Detection of surface targets such as fast patrol boats is horizon limited and strike aircraft of 4m^2 can be detected at ranges in excess of 20 km with the S810 and S811 models, and up to 30 km with the S815 and S816 radars. A digital MTI system is available (S810 and S815) to enhance the system performance against small high-speed targets in clutter and the magnetron transmitter is tunable to counter ECM.

S810 Series radars use a pulse transmitter with a typical peak power output of 200 kW, of the same design as in the lightweight search/tracker Radar Type ST 801 (Entry No. **1508.253**), resulting in a reduction in the on-board spares if both radars are fitted in a ship. In all versions, the receiver provides either logarithmic or linear video for the operational displays.

Radars of this range can also operate as the ship's navigation radar, where space and weight restrictions on the masthead limit the number of aerials. An optional additional short pulse/low power transceiver can be fitted to give the resolution necessary for inshore navigation.

The aerial head, stabilised in roll and pitch, rotates at 20 rev/min and is enclosed in a radome for protection and minimum weight. The elliptical reflector used in the S810 and S811 measures 1.2 m wide by 0.45 m high and that of the S815 and S816 2.5 m by 0.9 m. Both types are constructed of glass-reinforced plastic. A single horn feed is located at the focus of the reflector which is contoured to provide a narrow horizontal beam and a cosec^2 vertical beam. The turntable consists of an aluminium alloy centre tube and outer casing, azimuth bearing and azimuth drive and data units. The complete aerial/turntable assembly is supported on a stable platform controlled to within ½° of the vertical reference for roll angles up to 25° and pitch angles up to 10°, with acceleration up to 30° per second per second. The 1.8 m or 3.5 m diameter radome which encloses the whole aerial assembly is constructed of a 12 mm thick sandwich of glass reinforced plastic and

foam.

The transmitter employs a tunable magnetron operating within the frequency band 8.6 to 9.5 GHz and delivers a typical peak power of 180 kW. All components are solid state except the magnetron and the hydrogen thyratron in the pulse modulator.

Two receiver channels, one logarithmic, the other linear, are provided. The required channel is selected by a switch located near the PPI display. MTI processing is available in S810 and S815 models, the digital MTI filter being a double canceller employing shift-register storage and feedback. The radar operates with a staggered PRF in the MTI mode in order to overcome the disadvantages of 'blind speeds'. Compensation is provided for ship and wind velocity. When clutter cancellation is not required, the MTI can be switched out and the radar then operates with an unstaggered pulse-repetition frequency.

The Type 812 is another model of this series, and is a naval surveillance radar with MTI specially designed for the detection of low-flying missiles and aircraft, in that it incorporates doppler processing to reduce sea clutter, and has a pencil beam aerial on a stabilised two-axis mount.

RAYTHEON RTN-10 FIRE CONTROL RADAR

DESCRIPTION:

The RTN-10 is a combined search and tracking radar, designed principally for use in conjunction with Sea Sparrow III missiles for defence of ships from low-level aircraft attack. Operating frequency is assumed to be in the X-band for compatability with the Sea Sparrow III passive radar homing guidance system. The RTN-10 can be used with either the R-308 or R-204 ship-board Sea Sparrow launcher systems.

The configuration of the RTN-10 radar is somewhat unusual. Two rectangular scanner housings are carried on either side of a central trunnion supported by a short cylindrical mount. The scanners can be rotated about the horizontal axis (as a pair), and the whole assembly can be rotated in azimuth. The manufacturers state that the weight is low enough (approx 300 kg) to permit mast mounting to increase the effective radar horizon. Overall dimensions are 165 cm span and 122 cm height. Scanner motion limits in elevation are minus 30 degrees, and plus 90 degrees.

The complete system consists of the radar and an operator's console. The former unit contains the transmitter/receiver. The operator's console has a CRT display for the display of signals during search or tracking, with azimuth information presented horizontally and speed vertically. Target radial velocity and range data are displayed by counter-type indicators. Controls are provided for radar operation and weapon control. Details of the operation of the RTN-10 appeared in the 1973-74 Jane's Weapon Systems.

STATUS:

Little definite information has been released concerning applications of this system, but it is believed that development was largely influenced by a Canadian requirement. The RTN-10 radar is also embodied in the land-based Sparrow III/M-113 weapon system.

MANUFACTURER:
Raytheon Company, Ship Missile Systems, Bedford, Mass. 01730, USA.

1749.253
SPG-49 RADAR

DESCRIPTION:

The AN/SPG-49 radar is the guidance radar for the naval surface-to-air missile systems Terrier and Talos. With the former system it is associated with the SPG-55 fire control radar, and in the Talos system it is used in conjunction with the SPG-56. No performance characteristics have been released but range is estimated to be at least 100 km.

The two SPG-49/SPG-56 radar fire control groups for the Talos missiles on the USS Long Beach (US Navy)

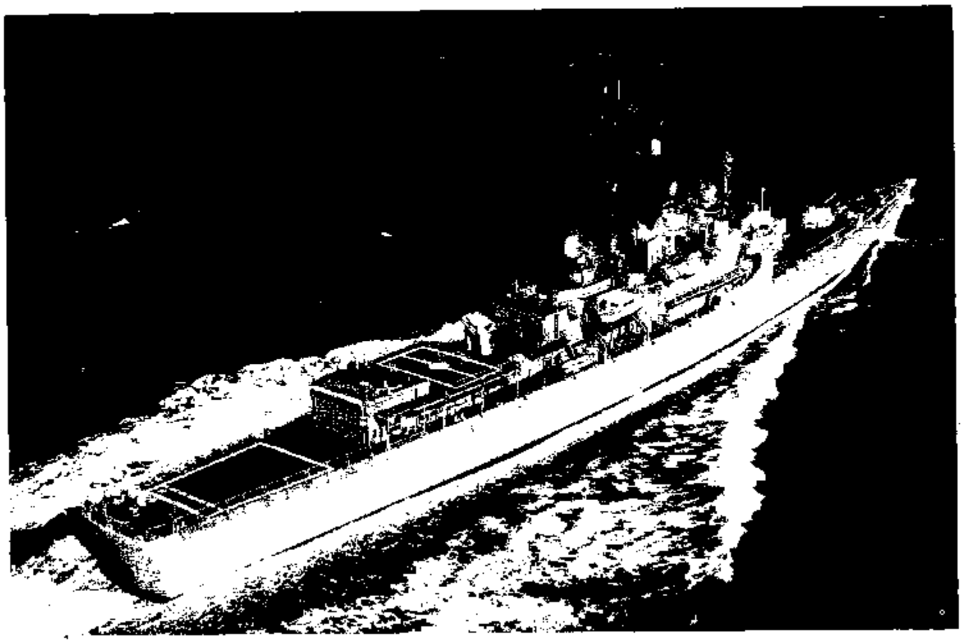
STATUS:
In service with the US Navy since the early 1960s.
MANUFACTURER:
Sperry, USA.

SPG-49 / SPG-56 radar groups (US Navy)

1247.253
SPG-51 RADAR
DESCRIPTION:
The AN/SPG-51 radar forms a major element of the American Mk 73 gun and missile director system (which see), being intended mainly for use with the Tartar surface-to-air missile (which see), for which it fulfils target tracking and missile guidance functions. Operating frequency is probably in the X-band. A circular parabolic dish reflector with off-set horn feed is used, and this, together with the transmitter/receiver, is mounted on a gearless power drive turning gear produced by General Electric.

The radar line of sight can be rotated continuously in train, and can be elevated from minus 30 degrees to plus 83 degrees relative to the deck plane. Initial pointing information is supplied to the SPG-51 by a search and target designator radar. This information is received via the Mk 73 director's Mk 118 computer which generates a search pattern for the SPG-51 until target acquisition is accomplished. Automatic tracking is then initiated and the SPG-51 feeds angle error and range information to the Mk 118. The computer generates fire control data for transmission to gun mounts and missile launchers. It also provides missile seeker angle data.

STATUS:
The SPG-51 is widely used on USN vessels, and development proceeded through A, B and C versions. The last of these had reached prototype stage by July 1969, and the others were then operational.



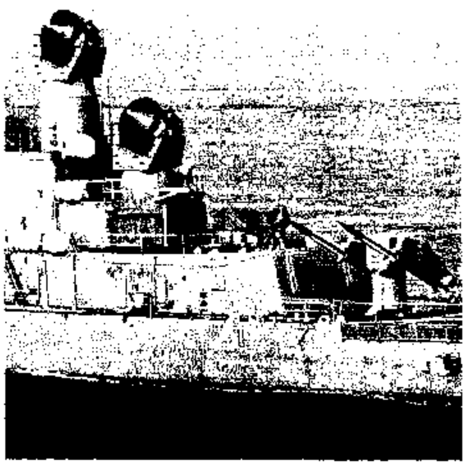
The guided missile escort, USS Julius A. Furer. *SPG-51 missile guidance radar is aft of funnel* (US Navy)

MANUFACTURER:
Raytheon Company, Bedford, Mass, 01730, USA.

1748.253
SPG-55 RADAR
DESCRIPTION:
The AN/SPG-55 radar is the C-band fire control radar for the shipborne Terrier surface-to-air missile system, and associated equipments are the SPA-44 CW target illuminator, SPG-49 guidance radar, and the SPQ-5 long-range tracking radar. Range of the SPG-55 is believed to be of the order of 50 km and the transmitter power about 50 kW.

Two SPG-55 Terrier fire control radars are mounted atop bridge house of USS Sterett. *Other radars are SPS-48 3-D search radar aft of SPG-55s, SPS-40 on aft 'mack', and X-band fire control director* (US Navy)

STATUS:
The SPG-55 equipment entered production in 1960 and has since been fitted to Terrier-fitted ships of the US Navy and foreign navies.
MANUFACTURER:
Sperry, USA.

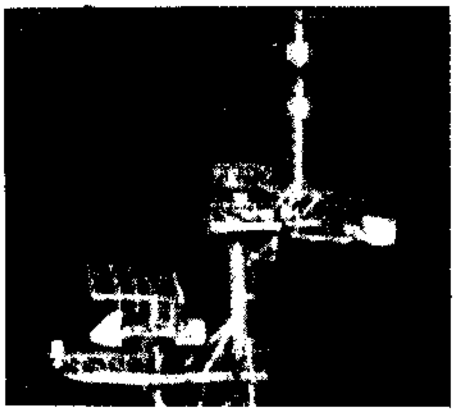


Terrier missile installation on board guided missile frigate USS Dahlgren. *SPG-55 missile guidance radars can be seen forward of the missile installation.* (US Navy)

1750.253
SPG-56 RADAR
DESCRIPTION:
The AN/SPG-56 is a C-band missile guidance radar used in conjunction with the SPG-49 (Entry No. **1749.253**) for control of the Talos naval surface-to-air missile system. No performance details have been released but range is estimated to be at least 100 km. Target illumination is carried out by the SPG-49 while tracking and missile guidance is the function of the SPG-56.
STATUS:
In US Navy service since the early 1960s.
MANUFACTURER:
Sperry, USA.

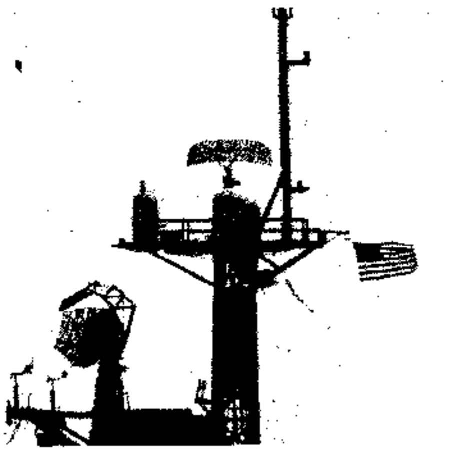
1744.253
SPS-6 RADAR
DESCRIPTION:
The AN/SPS-6 is a naval air surveillance radar, operating in the L-band of the radar spectrum and having an output of the order of 500 kW. Approximate range of the equipment is 100-200 km. The SPS-6 is widely used on ships of the US Navy and numerous other nations and has been in service for about 20 years. During this period various versions, denoted by suffix letters to the designation, have been evolved. These differ in transmitter/receiver and antenna details.
A successor is the SPS-12 (Entry No. **1566.253**) which can be very similar, but which is distinguished from the SPS-6 by the absence of balancing vanes to the rear of the scanner reflector.
STATUS:
In addition to the various classes of USN vessels fitted with the SPS-6 it is used by the navies of Italy, Japan, Spain, Taiwan, Turkey and Venezuela.
MANUFACTURERS:
Westinghouse, Bendix.

SPS-6 radar is on tripod platform of escort USS McMorris (US Navy)



SPS-6 surveillance radar on the American escort USS Lester. *Upper scanner is for SPS-10 radar* (US Navy)

1564.253
SPS-10 RADAR
DESCRIPTION:
The AN/SPS-10 is a surface search radar operating at C-band frequencies. The scanner is of open lattice construction and is illuminated by a horn feed supported by a boom projecting from beneath the lower edge of the scanner. The transmitter/receiver is mounted below decks, so that radar head weight is minimised, thus permitting mounting as high as possible on the ship's upperworks. Approximate dimensions are span 5 metres and depth 1.8 metres. No performance specifications have been disclosed.
STATUS:
The SPS-10 has been in service for about 10 years and is extensively fitted on US Navy ships, and vessels which have been passed on to friendly navies by the USN.
MANUFACTURER:
Sylvania Electronic Systems, Needham, Massachusetts 02194, USA.



The American escort, USS Bagley, *is seen here with SPS-10 search radar (top) and SPS-40* (US Navy)

SPS-10 surface search radar antenna

1536.253
SPS-12 RADAR

DESCRIPTION:

The AN/SPS-12 is a powerful (between 0.1 and 1.0 MW) long-range air search radar operating in the L-band. A parabolic open lattice scanner is illuminated by a large horn feed supported by a boom projecting from the lower edge of the reflector.

In general appearance it is very similar to the SPS-6 (Entry No. **1744.253**), from which it probably evolved, but the SPS-12 does not have the balancing vanes behind the reflector which are a feature of the SPS-6.

No performance details have been published.

STATUS:

The SPS-12 is extensively fitted on US Navy ships, and those of other navies, including Brazil, Canada, Japan, Greece, Italy and Venezuela.

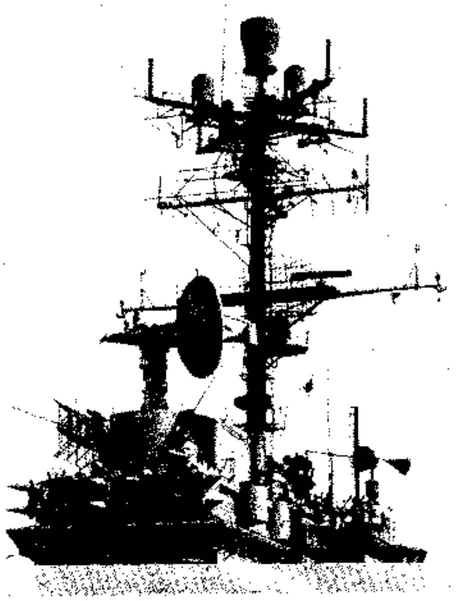
MANUFACTURER:

RCA, Moorestown, New Jersey, USA.

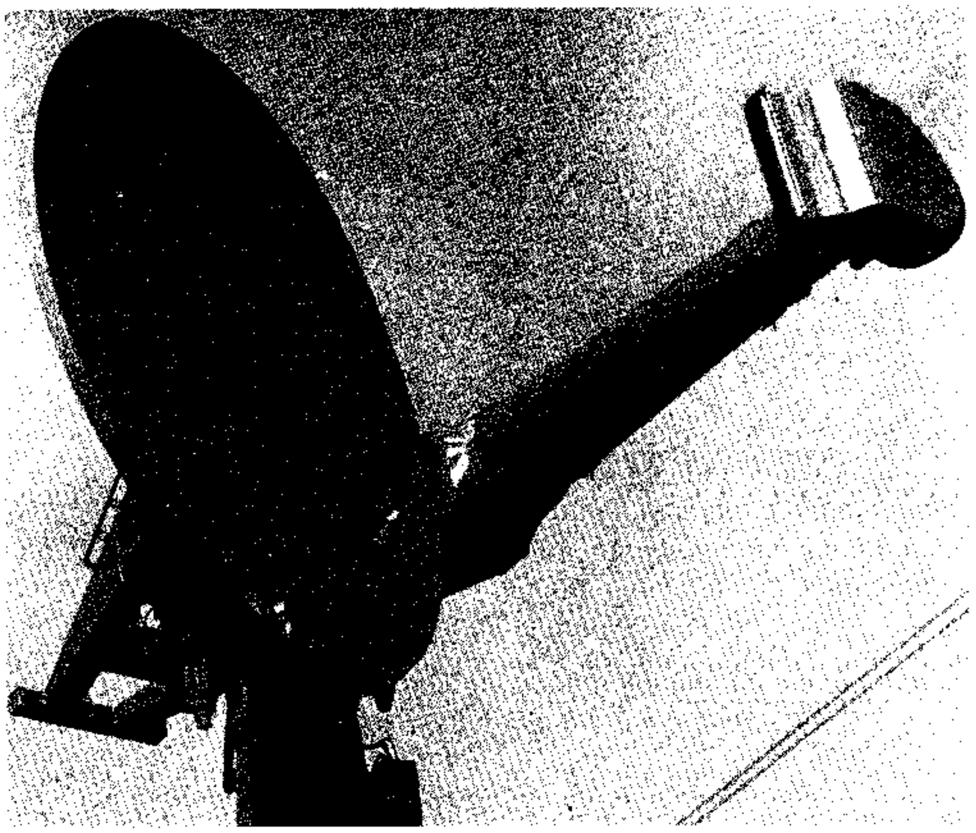
1745.253
SPS-30 RADAR

DESCRIPTION:

The AN/SPS-30 is a long-range three-dimensional radar fitted in certain aircraft carriers and some guided missile ships of the US Navy. Among its features are a high-gain antenna of characteristic configuration (see illustration), broad-band frequency operation, and high power output. The antenna is mechanically stabilised against ship's motion, with compensation for roll and pitch. It is stated to provide range, bearing and height information on multiple airborne targets with 'extreme' accuracy. Although primarily a high-grade height-finding radar, the SPS-30 is capable of being used for additional tasks such as long-range air search and target designation.



Another view of the SPS-30 height-finding radar on a USN aircraft carrier



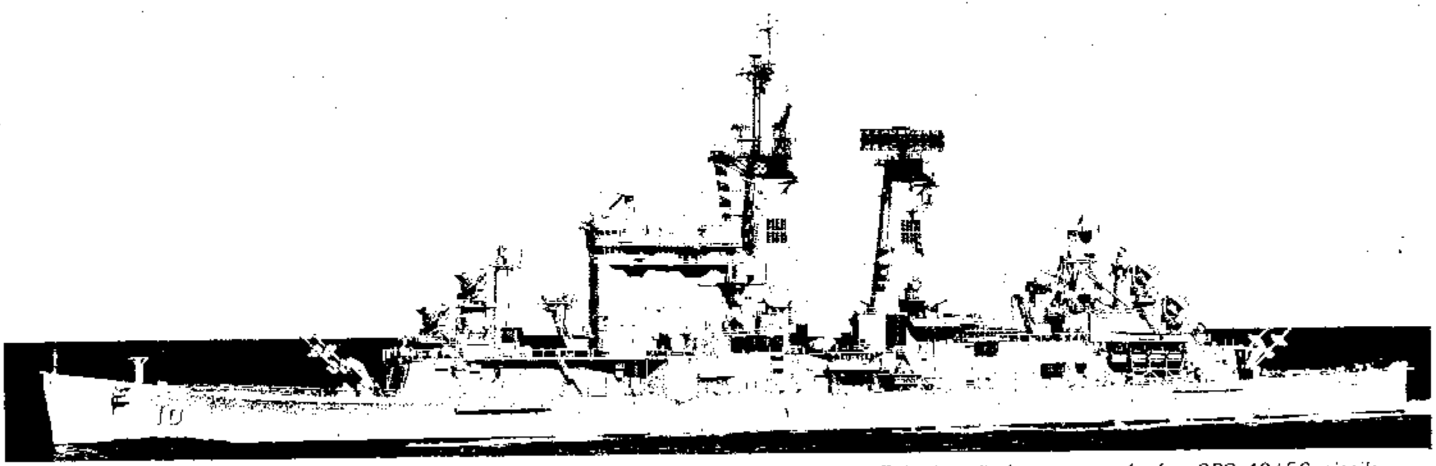
SPS-30 3-D radar head

STATUS:

The SPS-30 was introduced into US Navy service in the early 1960s and is carried on many aircraft carriers and some guided missile ships.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York.



The original print of this illustration reveals at least 20 radars on the USS Albany. *Fore and aft Talos installations account for four SPG-49/56 missile guidance groups, with which are associated two SPS-30 height-finders, and four X-band trackers; port and starboard missile launchers have two SPG-51 guidance radars; at the base of the after funnel, on each side is an X-band director radar for gunfire control; search radars include SPS-43, SPS-39 and SPS-10; several navigation and pilotage radars are fitted* (US Navy)

1250.253
SPS-32 (SCANFAR) RADAR

DESCRIPTION:

The AN/SPS-32 is a completely fixed array ship's air and surface surveillance radar, using four large flat arrays mounted on the vessel's superstructure and electronic scanning to provide 360 degree three-dimensional coverage. Dimensions of each panel are 6 metres high × 12.2 metres wide, and the weight 47,700 kg. It is used as a long-range detector and target designator radar in conjunction with the AN/SPS-33 tracking radar (which see), also an electronically scanned equipment. Both are used with the NTDS, Naval Tactical Data System. Beam steering is controlled by a digital computer which also provides for electronic compensation for ship's pitch and roll. A fan-shaped beam is employed.

DEVELOPMENT:

No constructional details have been released, but the period during which this equipment was developed suggests that beam steering is accomplished by a delay switching technique rather than the programmed switching of a massed array of individual radiating elements which is a feature of later electronic scanning radars.

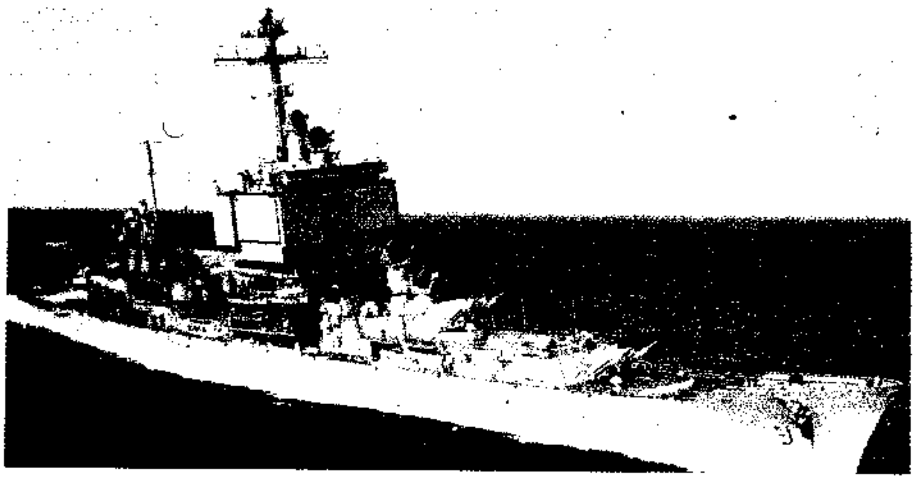
The first Hughes development programmes in this area were initiated in 1954, with the MPS-23 transportable ground-based radar, and in 1955 with the SPS-42 shipboard radar. Both these used mechanical rotation for azimuth cover. Development of the SPS-32 began in 1956.

STATUS:

SPS-32/SPS-33 installations have been made on the nuclear-powered missile cruiser USS *Long Beach*, the carrier USS *Enterprise*, and the nuclear-powered frigate USS *Bainbridge*. Recent photographs of the last of these vessels show no evidence of the characteristic 'bill-board' arrays, however, and possibly these have been removed to permit the test installation of a later electronic scanned radar, the AN/SPS-72. In August 1969, it was announced that Hughes had received a $2.6 million contract to start work in 1970 on the up-grading of the radar installation in the USS *Long Beach*.

MANUFACTURER:

Hughes Aircraft Company, Culver City, California, USA.



"Bill-board" aerial arrays of the SPS-32 and SPS-33 surveillance and tracking radars on the USS Long Beach. *Horizontal arrays are the SPS-32 and the vertical arrays are for the SPS-33*

1251.253

SPS-33 (SCANFAR) TRACKING RADAR

DESCRIPTION:

The AN/SPS-33 is a companion radar to the air and surface detection radar, SPS-32 (which see). It uses similar technology, the main difference being that the beam form used is of the 'pencil' type for the tracking of targets designated by the SPS-32. Dimensions of each panel are 7.62 metres high × 6 metres wide, and the weight about 122,600 kg. Control of beam steering and tracking is controlled by a digital computer, and target tracking information obtained by the SPS-33 is available for input to the NTDS Naval Tactical Data System for the direction of missiles.

DEVELOPMENT:

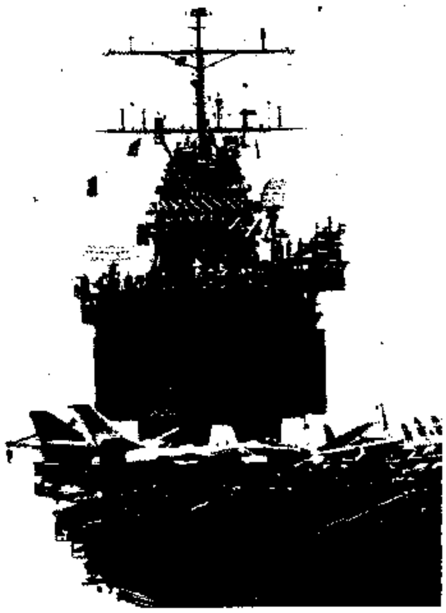
Development was started shortly after that of the SPS-32 and the two programmes subsequently progressed in parallel.

STATUS:

This is essentially the same as that of the SPS-32 and is described in the entry for that equipment.

MANUFACTURER:

Hughes Aircraft Company, Culver City, California, USA.



The nuclear-powered aircraft carrier USS Enterprise. *Planar arrays for SPS-32 and SPS-33 electronically scanned radars are prominent. Note also the elaborate ECM arrays above, and the SPS-6 to the left.* (US Navy)

1565.253

SPS-37 RADAR

DESCRIPTION:

The AN/SPS-37 is a metric wavelength, long-range air surveillance ship's radar of conventional design. The antenna consists of lattice structure with an open mesh reflector, and supporting an array of 28 dipoles arranged in four horizontal rows of seven. The upper edge of the scanner usually carries an associated IFF antenna. Approximate dimensions of the SPS-37 array are: span 6.0 metres, and height 3.3 metres. No performance details have been disclosed.

DEVELOPMENT:

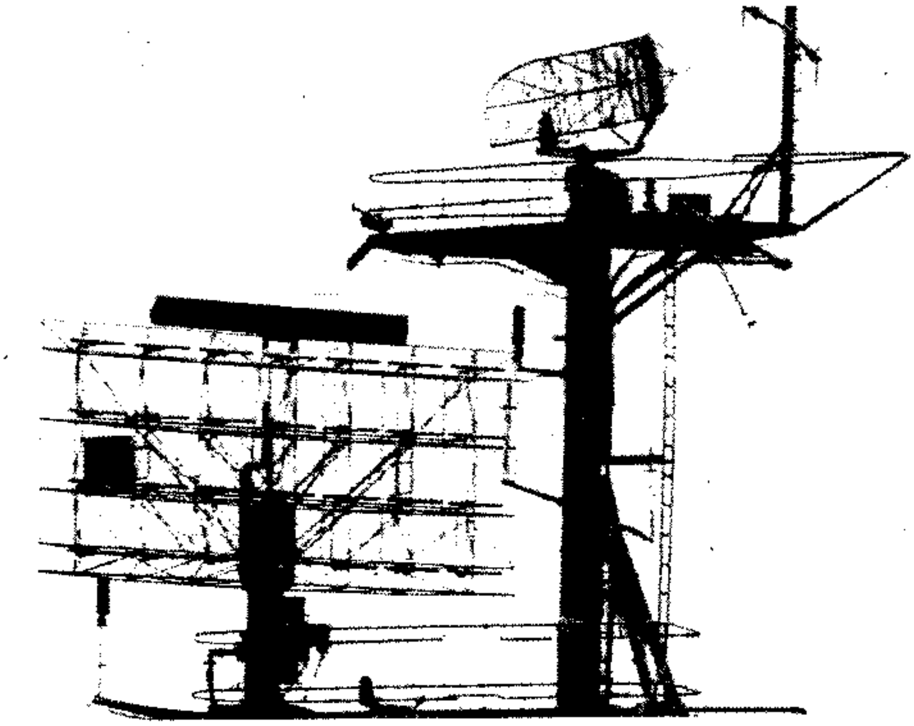
Development took place in the early 1950s.

STATUS:

The SPS-37 entered service in 1958 and production ceased in 1962. It is widely fitted on ships of the US Navy and of some friendly navies.

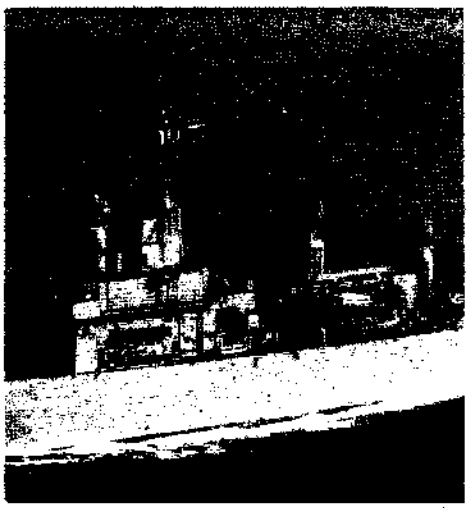
MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.



SPS-37 naval air surveillance radar antenna (left), *with on-mounted IFF. The upper radar is an SPS-10 surface search unit*

1249.253
SPS-39 (FRESCAN) RADAR
DESCRIPTION:
The AN/SPS-39 is a ship-borne three-dimension radar for air surveillance, using mechanical rotation for azimuth coverage and electronic scanning for beam steering in the vertical plane. The aerial reflector is a partial cylinder formation with its axis tilted at about 15 degrees from the vertical. Vertical scanning is achieved by automatic switching of stacked radiators carried in a faired structure in the centre of the reflector. Plan position, and target height information is provided by the SPS-39. Compensation for ship's pitch and roll is applied by electronic processing of the radar beam switching and signals received. Range is between 200 and 300 km, and the antenna weight is about 1,270 kg.
DEVELOPMENT:
Development was carried out in the early and mid-1950s with entry into service about 1959-60.
STATUS:
The SPS-39 has been extensively fitted in various classes of guided missile ships of the US Navy, and is also in use by the Italian Navy. Some American vessels originally fitted with SPS-39 have since been equipped with the later SPS-52 (which see Entry No. **1248.253**).
MANUFACTURER:
Hughes Aircraft Company, Culver City, California, USA.



Radars fitted in DLG 18, USS Worden, *include three SPG-55 missile guidance radars, SPS-39 three-dimensional search radar, SPS-37 and SPS-10 search radars* (US Navy)

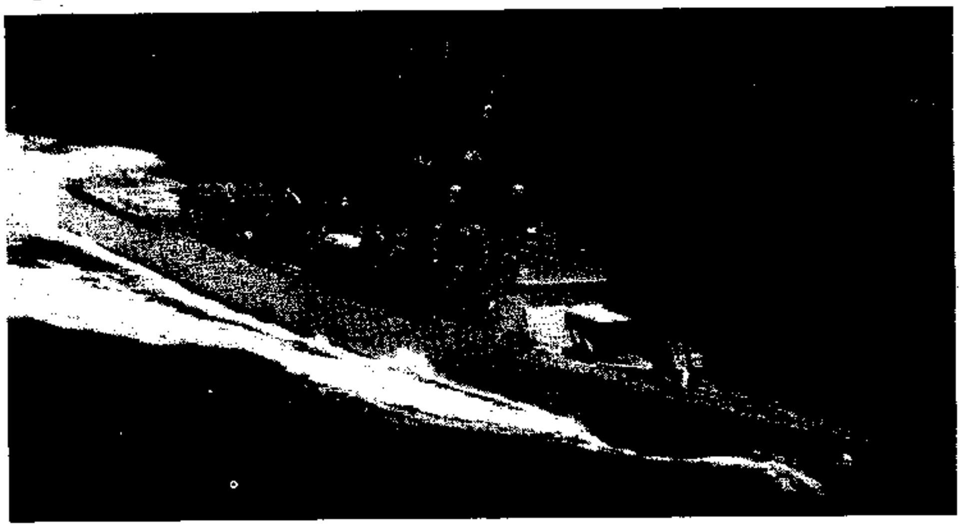
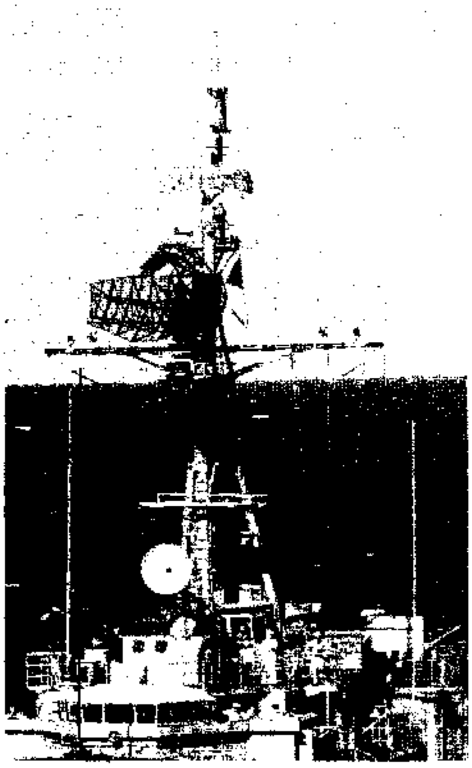
Scanner of the three-dimensional AN/SPS-39 naval air surveillance radar

1746.253
SPS-40 RADAR
DESCRIPTION:
The AN/SPS-40 is a naval search and surveillance radar for the detection of air targets at long and medium ranges. Official performance data have not been released but operation in the S-band is probable and a transmitter power of about 1 MW may be expected. The reflector is of open lattice construction and has somewhat irregular, angular outlines. A prominent characteristic is the use of an over slung, lattice construction boom to support the feed assembly.
STATUS:
The SPS-40 was first introduced into US Navy service in the early 1960s and is now seen on numerous classes of ship of all sizes from escorts upward. It has subsequently been fitted in ships of other navies, among them those of West Germany, Australia and Spain.
MANUFACTURER:
Lockheed Electronics, USA.



The USN escort USS O'Callahan *with its SPS-40 search radar facing the camera* (US Navy)



SPS-40 search radar, with smaller SPS-10 scanner above

1747.253
SPS-43 RADAR
DESCRIPTION:
The AN/SPS-43 is a high-power, very long-range search radar, probably operating at metric wavelength frequencies and using a transmitter output of 1 to 2 MW. The large (about 10 metres span) antenna assembly is of open lattice construction of rectangular aspect, but with a characteristic 'side-ways-W' profile in side elevation. The upper edge of the array generally carries an on-mounted IFF antenna.

This collection of US naval radars includes the SPS-43 (upper right), with on-mounted IFF; X-band fire control radar (lower right); SPS-10 search radar, above SPS-43; SPS-30 height-finder (centre); SPS-52 three-dimensional radar (left)

STATUS:
The SPS-43 has been in operational service with the US Navy since the early 1960s and is fitted to many of the larger ships of the US Navy.
MANUFACTURER:
Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

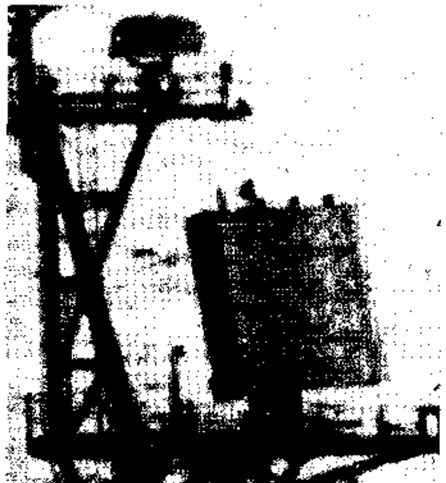
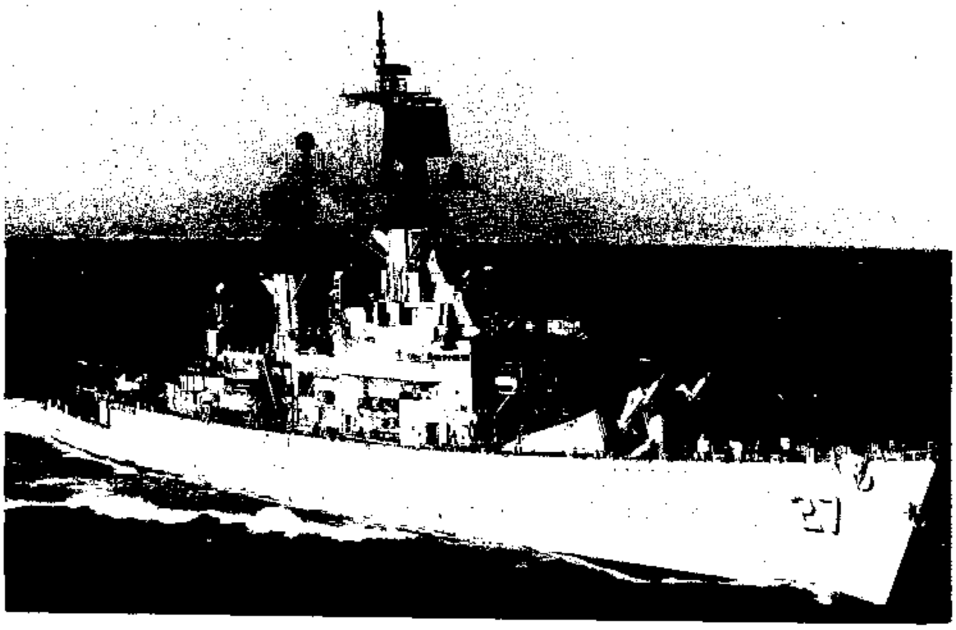
1252.253
SPS-48 AIR SURVEILLANCE RADAR
DESCRIPTION:
The AN/SPS-48 is a three-dimensional, long-range air surveillance radar for ship-board applications. It uses a combination of mechanical scanning in azimuth and electronic beam steering in elevation to provide plan position and height information on aircraft targets. Operating frequency is believed to lie within the S-band.
In general appearance and in operating principles the SPS-48 is similar to the SPS-52 (which see). Several features enable the two types to be distinguished, however. The SPS-48 is somewhat larger, and there is only one 'end-plate' to the flat aerial array, on the left side when facing the aerial. The scanner is of square proportion, compared with the oblong configuration of the SPS-52. In most installations, the SPS-48 has an on-mounted IFF aerial at its upper edge, whereas with the SPS-52 the IFF is normally mounted at the lower edge.
STATUS:
The SPS-48 is fitted to surface-to-air missile carrying vessels of several classes of the US Fleet.
MANUFACTURER:
ITT-Gilfillan, Inc, 7821 Orion Avenue, Van Nuys, California 91409, USA.



SPS-48 planar array three-dimensional radar with on-mounted IFF, and SPS-10 scanner above



Flat antenna of SPS-48 three-dimensional air search radar is prominent in this picture of USS guided missile frigate, DLG-27. Also visible are SPS-37 and SPS-10 surveillance radars, and SPG-55 missile guidance radars (US Navy)

1248.253
SPS-52 RADAR
DESCRIPTION:
The AN/SPS-52 is a ship's air surveillance, three-dimensional radar, providing both target position and height information. Three-dimension coverage from a single scanner is achieved by a

US guided missile destroyer, USS Goldsborough, *showing SPS-52 antenna mounted on after stack, SPS-40 and SPS-10 on foremast, two SPG-51 missile fire control radars aft, and X-band director above bridgehouse* (US Navy) combination of electronic and mechanical scanning. The beam is scanned electronically in elevation, while azimuth cover is achieved by conventional mechanical rotation of the aerial head.

The scanner assembly consists of a flat planar array, flanked by two flat end-plates, the whole being tilted at an angle of about 18 degrees from the vertical. This is probably necessary to provide the required high cover from the electronically scanned elevation beam.

The array is thought to be composed of rows of slotted waveguide radiators, end fed from a 'concertina' waveguide system running the length of one side of the array. Beam forming and steering in the vertical plane is probably accomplished by selective switching of the feed to each row of slots, under control of the digital computer which forms part of this radar. The SPS-52 is assumed to be an S-band equipment, and on this basis there are probably about 60 horizontal rows of radiating slots.

STATUS:

The SPS-52 replaces the SPS-39 on certain vessels of the USN "Charles F. Adams" class of guided missile destroyers (DDG); and the three ships of this class in the Royal Australian Navy, *Brisbane, Hobart*, and *Perth*, all carry the SPS-52. Other USN ships fitted include some of the "Coontz" class of guided missile frigates (DLG). The Italian guided missile carrier, *Vittorio Veneto*, has been fitted with the SPS-52, and this radar has also been ordered for Spanish guided missile destroyers.

MANUFACTURER:

Hughes Aircraft Company, Fullerton, California, USA.

1697.253
SPS-55 NAVAL RADAR

DESCRIPTION:

The SPS-55 is modern solid-state surface search and navigation radar developed as a replacement for the SPS-10. It is designed for service on ships of destroyer size or above. Operational uses are: the detection of small surface targets from ranges of less than 50 metres to the radar horizon; navigation and pilotage; tracking of low-flying aircraft and helicopters, detection of submarines at snorkel and periscope depth.

A lightweight aerial (less than 90 kg) has a low profile configuration to minimise installation space requirements, and consists of a back-to-back, end-fed, slotted array with both linear and circular polarisation. The horizontal beamwidth is 1.5 degrees, and beam squint compensation is used to optimise bearing accuracy over the operating frequency range. Vertical beamwidth is 20 degrees.

The transmitter/receiver subsystem is housed below decks in a single cabinet, and is capable of operating at any selected frequency in the band from 9.05 GHz to 10 GHz. Two pulse widths (1.0 and 0.12 microsecs) are available and can be selected from the front panel. The minimum peak transmitter output is 130 kW.

The SPS-55 set does not normally include its own display, and a separate control unit is provided to permit remote operation of the transmitter/receiver and scanner subsystems.

SPS-55 Characteristics

Aerial:

Rotation rate: 16 rpm

Polarisation: Circular or linear

Horizontal beamwidth (3 dB): 1.5 degree

Gain: 31 dB

Transmitter:

Frequency band: 9.05 GHz to 10 GHz

Peak power: 130 kW

PRF/pulse width: 750 PPS/1.0 microsec; 2,250 PPS/0.12 microsec

Receiver:

Type: Low-noise RF amplifier, image-suppression filter mixer

IF: 90 MHz

Bandwidth: 1.2 MHz (long pulse), 10 MHz (short pulse)

Receiver processors: Linear logarithmic, FTC, variable sensitivity time control

DEVELOPMENT:

Development as replacement for SPS-10.

STATUS:

In production and installed in some USN ships.

MANUFACTURER:

Cardion Electronics, Woodbury, New York, 11797, USA.

1359.253
SPS-58 NAVAL RADAR

DESCRIPTION:

The AN/SPS-58 is an L-band, pulse-doppler air search and target acquisition radar, designed to operate with the USN Point Defence Surface Missile System, but capable of use with a variety of other weapons. A major design consideration has been the achievement of good low elevation angle performance, high data rate and clutter rejection characteristics to meet the threat of low flying aircraft attacks. An integral IFF system is included in the SPS-58 system.

The transmitter is mostly of solid-state design, but with klystron power amplifier stages. Modular construction is employed and built-in test facilities are provided. By using a digital doppler filter for signal processing, it is claimed that high sub-clutter visibility is achieved, and level and channel adjustments are eliminated.

Provision has been made in the design for the addition of further facilities such as automatic target designation to weapons systems, or the application of adaptive radar techniques.

STATUS:

The SPS-58 is the latest naval radar of those developed by Westinghouse, and is in current production. The SPS-58 has completed operational evaluation and is service approved by the US Navy.

MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, USA.

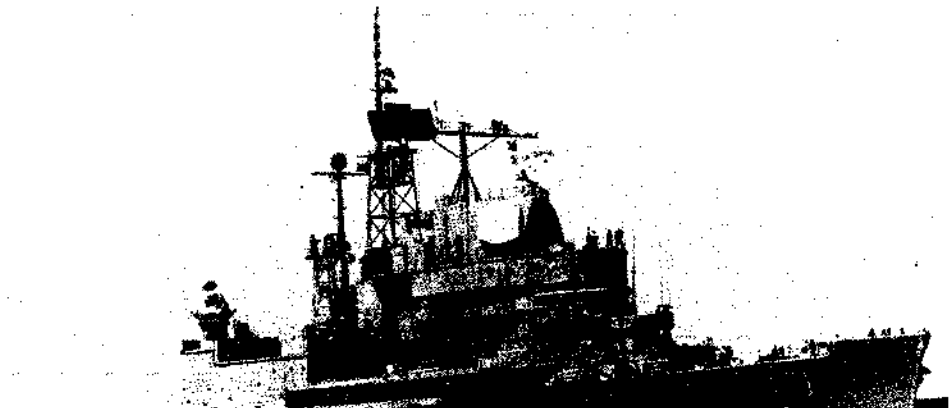
1570.253
SPY-1 MULTI-FUNCTION ARRAY RADAR

DESCRIPTION:

The AN/SPY-1 is an electronically-scanned fixed array radar under development for the US Navy Aegis fleet air defence missile system, and generally known by the acronym MFAR (Multi-Function Array Radar). It will operate in the S-band, and the output is several megawatts. The Raytheon transmitter will serve several parallel channels simultaneously. The phase scanned arrays will be mounted in pairs on each ship, two on the forward deckhouse and two on the after deck-house, to provide all-round radar cover. Each array has 4,100 discrete elements, and measures 3.65 × 3.65 metres. These elements are controlled by AN/UYK-7 digital computers to produce and steer multiple radar beams for target search, detection and tracking. The MFAR also tracks ship's own missiles fired against hostile targets. It also has the function of providing target designation data for the Raytheon target illuminating radars which direct the semi-active homing missiles employed in the Aegis system.

DEVELOPMENT:

The SPY-1 radar is under development by RCA, the Prime contractor for the overall Aegis system,



USN test ship USS Norton Sound *with SPY-1 phased array radar mounted on deckhouse above bridge. The small antenna just above and to right of the array face is slaved to the SPY-1 and illuminates the target during the interceptor missile's terminal homing phase* under a contract awarded in 1969. The antenna array began tests in August 1972, and by April 1973 the transmitter and array were integrated for further tests before embarking on full scale testing with other elements of the Aegis system.

By early 1974 land-based tests of the radar had been completed and the array was moved from RCA's Moorestown, New Jersey, test site to Long Beach Naval Shipyard, California for installation in the USS *Norton Sound* in preparation for sea trials. On May 1, 1974 it was announced that while operating in the USS *Norton Sound*, the SPY 1 had detected and automatically gone into the tracking mode to track more than 20 aircraft flying over the Pacific.

THE UNION OF SOVIET SOCIALIST REPUBLICS

Note on Soviet Radar Designations

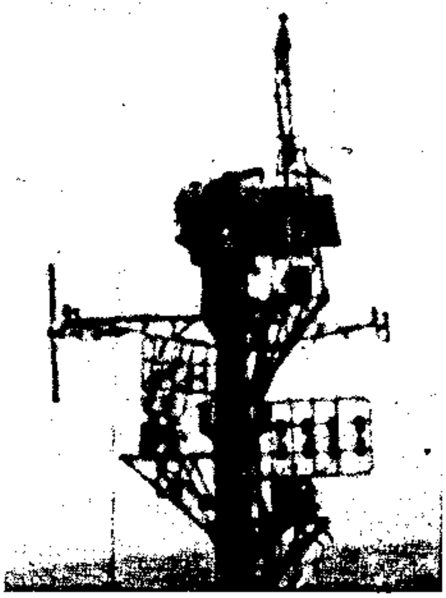
Jane's Weapon Systems has been officially informed that NATO designations for Soviet equipment are classified information, and it is not NATO policy to confirm, deny, or divulge such designations publicly. Consequently, all such published data must be regarded as unconfirmed and possibly subject to later amendment. Despite this, and because of the wide currency certain of these designations have acquired, where it is felt that NATO names can be assigned to equipments with reasonable certainty, *Jane's Weapon Systems* will adopt this practice. In those cases where a radar's NATO designation is unknown or uncertain, a *Jane's* name will be used until it has been identified.

On the following pages Soviet radars for which sufficient information has been secured to make possible an adequate description are covered by individual entries, other Soviet radars which have been identified but for which reliable data is lacking will be found in the list of naval radars (**1332.254**) in Section Four of this volume.

1329.253
SQUARE TIE NAVAL RADAR

DESCRIPTION:

Square Tie is a small lightweight search radar, probably operating in the X-band to provide short range air and surface search facilities. It is extensively fitted on Soviet vessels of the "Osa" class armed with anti ship missiles. The scanner is an elliptical paraboloid reflector illuminated by an overhung horn feed. Functions will include target detection and tracking for anti-ship missile direction and possible target designation for the Drum Tilt gun fire control radar carried by "Osa" class craft.



The masthead radar antenna group of an Osa I missile boat showing the Square Tie search radar and two other arrays believed to be designated Square Head. IFF or directional command link antennas for the Styx missile are possible functions for the latter

1595.253
SQUARE HEAD NAVAL RADAR
DESCRIPTION:
The antenna of this system consists of a broadside array of dipoles with a rectangular reflector/support frame measuring about 1.4 metres high by 2 metres wide. It was originally thought to be a long wavelength search radar of modest power, but later evidence suggests that its function is either that of an IFF interrogator antenna, or as a directional array for the transmission of guidance signals to surface-to-surface missiles. It is most frequently seen on Soviet missile carrying boats of the "Osa" class (but apparently not on craft of this class of the navies of countries friendly to the USSR), and these generally have two such arrays carried on sponsons fore and aft of the tubular mainmast. Some "Kotlin" class destroyers of the Soviet fleet carry four, and Square Head has been seen on vessels of the "Skory" class.

1897.253
POP GROUP FIRE CONTROL RADAR
DESCRIPTION:
Pop Group is the NATO code-name for the fire control radar group associated with the Soviet Navy's SAN-4 surface-to-air missile system (**2954.231**). The name probably has its origin in the fact that the launcher for this missile system pops up' from a silo-type housing preparatory to launching.

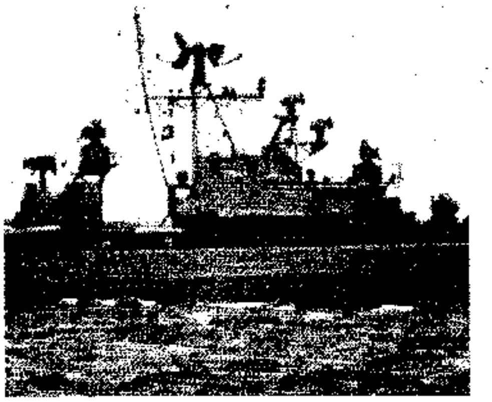
Few details have been obtained regarding the configuration or operation of the Pop Group radar as it is generally covered by canvas shrouds whenever photo-reconnaissance is a likely possibility.

However, it is known that at least two aerials are used for radar functions, with possibly a third antenna for the transmission of command signals to the missile. The arrangement appears to consist of a cube-shaped container with sides of about 2.2 metres in which is probably housed the bulk of the electronics such as transmitter/receiver units, power supplies, and turning gear, and on the top of this is a trainable radar head assembly. The latter unit, so far as can be ascertained from the limited evidence available, has a solid reflector parabolic antenna which is probably for target search and which may rotate independently of the rest of the radar head (which, as noted above, can be trained in azimuth). On the front face of the head are two circular arrays that are assumed to be for target tracking and missile guidance. Operating frequencies are likely to lie in that part of the spectrum contained within the C to X-band region.

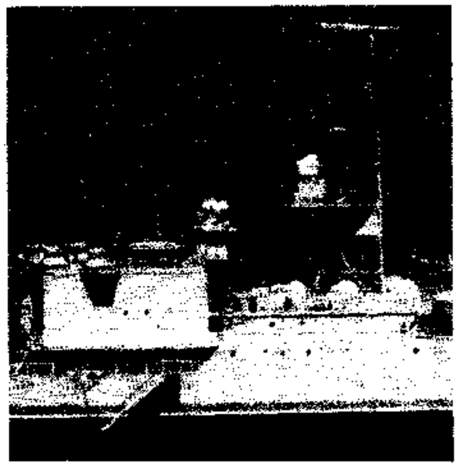
Since Pop Group was first detected on Soviet "Nanuchka" Class missile frigates in the late 1960s, it has been fitted to an increasing number of types of vessel of widely differing sizes. Another development is that whereas on the "Nanuchka" Pop Group was associated only with the SAN-4 missile system, in later fittings it apparently is also capable of directing small calibre automatic gun turrets as well to form a close-in air defence weapon system.

"Nanuchka" class ships have a single Pop Group installation on top of the bridge housing, and a similar arrangement is employed in the "Grisha" escorts, the SAN-4 launcher 'bin' being located in the forecastle on both types of vessel. The "Krivak" missile destroyers have SAN-4 installations fore and aft, with a Pop Group radar for each system, one on top of the bridgehouse and the other on a raised mounting amidships. "Kara" class missile cruisers have two SAN-4 systems, located one on each side of the mast and with their associated Pop Group radars a few feet aft in each case. Also adjacent to the Pop Group radars are two automatic anti-aircraft gun turrets on each side, and these would appear to be directed by the Pop Group radars to form (with the SAN-4 missile launchers) port and starboard integrated close-in autonomous air defence weapon systems.

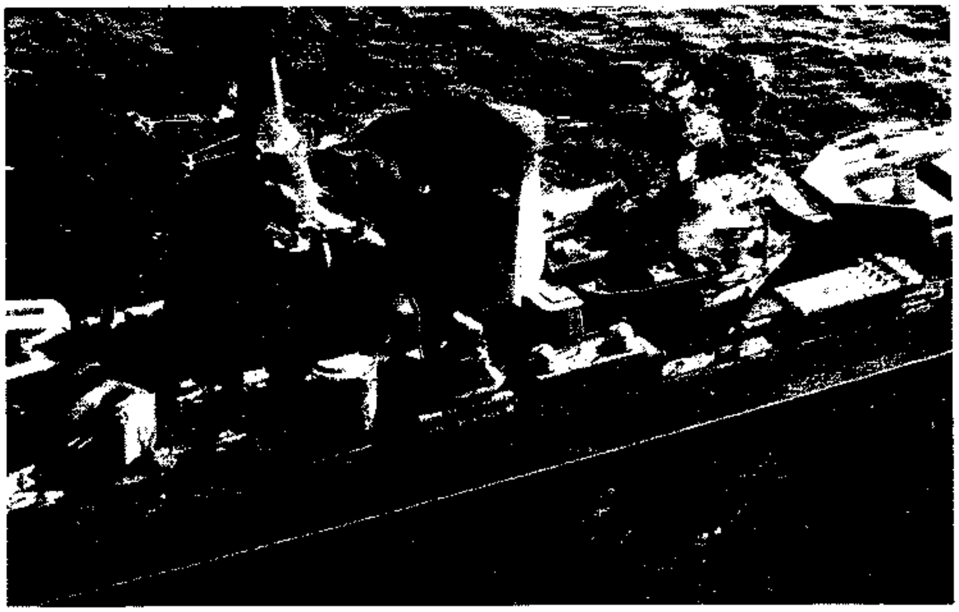
In the case of the converted "Sverdlov" cruisers, the largest vessels equipped with SAN-4, various arrangements exist. *Zhdanov* had its SAN-4 silo fitted in place of the original 'X' 152 mm gun turret, and the associated Pop Group radar was installed on a platform attached to the aft mast. The *Admiral Senyavin* has its SAN-4 installation incorporated in the helicopter hangar, with the Pop Group in the same position as on the *Zhdanov*. In the former ship, however, there are four automatic AA gun turrets mounted adjacent to the SAN-4 system. Associated with these guns are two Drum Tilt fire control radars. The exact relationship and operating arrangements made for the three radars, four turrets and twin SAN-4 launcher are not known but it is a reasonable assumption that they are intended for collective use to provide integrated air defence facilities.



Midships area of a "Krivak" class destroyer. The two Pop Group radar systems for the fore and aft SAN-4 installations are above the bridgehouse (right) and on the platform immediately aft of the slender lattice mast. Two Eye Bowl radars for surface-to-surface missile guidance are mounted above and behind the forward Pop Group. Aft of the other Pop Group, an Owl Screech fire control radar for the after turrets can be seen. Mounted on the tripod mast is the Head Net C height-finder search radar



The modified "Sverdlov" class cruiser, Admiral Senyavin. The top of the helicopter hangar has four automatic AA gun turrets and the top of the silo-type SAN-4 missile launcher projects through the hangar roof. Two Drum Tilt gun fire control radars are mounted on short towers and Pop Group SAN-4 guidance radar is carried on platform near base of tripod mast. Top of mast supports a pair of conical horn antennas for communications



The midships area of the "Kara" class cruiser, Nikolayev, showing the 'bin' type launcher for the SAN-4 missile system at the base of the mast. Shrouded Pop Group radar for this system is to right of SAN-4 mount. On top of mast is Top Sail surveillance radar, and numerous electronic warfare antennas protected by radomes can be seen on the mast structure. Complicated radar group to right of funnel is Head Light for the SAN-3 surface-to-air missile system the launcher for which is on extreme right

1319.253
HEAD NET B AIR SURVEILLANCE RADAR
DESCRIPTION:
This is a dual installation of the Head Net A radar (Entry No. **1318.253**) in which two scanners are mounted in a back-to-back configuration. One is tilted at an angle of about 15 degrees in elevation, in relation to the other scanner to provide separate high and low cover. Operating frequency probably lies within the S-band of the spectrum, although L-band is a possibility also.

Functions of the radar are air search and surveillance, and target designations for the fire control radars carried for the direction of surface-to-air missiles and guns.

This radar has been seen on a "Krupny" class destroyer (No. 229 – since renumbered), but does not appear to be in widespread use. The general mechanical arrangement is very similar to the Head Net (Entry No. **1320.253**), which is also a back-to-back system using dual Head Net A arrays, and it is possible that individual vessels have been converted from one version to the other. Latest information is that of the five "Krupny" class ships, *Gnevnyi* now has Head Net C and the others have a Head Net A. There are no known Head Net B installations.

1330.253
DRUM TILT FIRE CONTROL RADAR
Description:

This is a pedestal-mounted fire control radar which probably provides acquisition and tracking functions only for anti-aircraft guns. It is housed in a weather-proof container which is attached to the scanner assembly. Operating frequency is almost certainly in the X-band. It is principally fitted aboard "Osa" class missile boats, on a platform between the two aft missile launchers, for the direction of four 25 mm AA guns carried by these craft. Other craft fitted are Soviet "Shersen" class torpedo boats; "Stenka" class coastal escorts; and submarine chasers.

Soviet "Osa" class missile boats showing Square Tie search radar atop tubular mast, Drum Tilt gun fire control radar aft, and Square Head antennas on sponsons fore and aft of mast

1326.253
SUN VISOR FIRE CONTROL RADAR
Description:

Sun Visor is identified as a solid paraboloid scanner fixed to the front of a spherical shaped gun fire director station. Two types of director have been identified carrying this type of radar. These have the NATO code names Round Top and Wasp Head, and in the former the radar is carried near the top of the unit compared with a lower location on Wasp Head, which is stabilised. Span of the dish is estimated at approximately 2.2 metres, and the depth at 1.3 metres. Operating frequency is probably X- or C-band. The reflector is illuminated by a dielectric-enclosed feed carried on a solid boom structure projecting from over the upper edge of the reflectors. The disposition of these components suggests that surface target detection is the principal role of this radar.

Sun Visor control radar

Port and starboard Sun Visor fire control radar installations can be seen on the right of this photograph of a Sverdlov class cruiser. Also visible are five Egg Cup radars on gun turrets

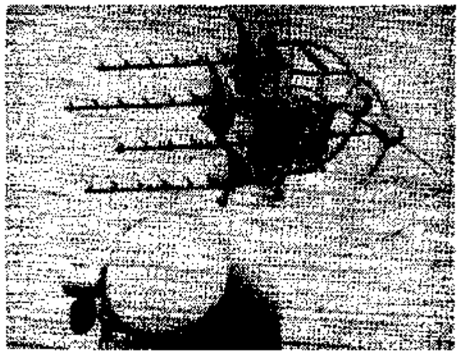
The fire director units on which Sun Visor is mounted are capable of 360 degrees rotation, but since they are manned units incorporating optical range-finding equipment also, it is unlikely that it is normally used for target search and surveillance on a continuous basis. A more likely mode of operation is for target co-ordinates to be passed to the system by another of the ship's radars and for the former to operate in a target acquisition and lock-on role to provide either range and bearing data for blind firing or to assist the operator in the training of optical sighting systems.

Sun Visor has been seen on certain vessels of the "Krupny" class of GMDs, the "Kanin" class, "Kotlin" class, and "Tallin" class, and "Sverdlov" class cruisers.

156.253
CYLINDER HEAD FIRE CONTROL RADAR
Description:

Cylinder Head is the NATO designation for a now obsolete, or obsolescent, gun director system based on an optical rangefinder. On top of the turret there is an array of four Yagi-type VHF/UHF antennas, presumably added to supplement the optical target information. The array apparently trains with the turret but has provision for independent motion in elevation. Cylinder Head directors are used in conjunction with the aft guns of Soviet "Skory" class destroyers and "Kola" class escorts.

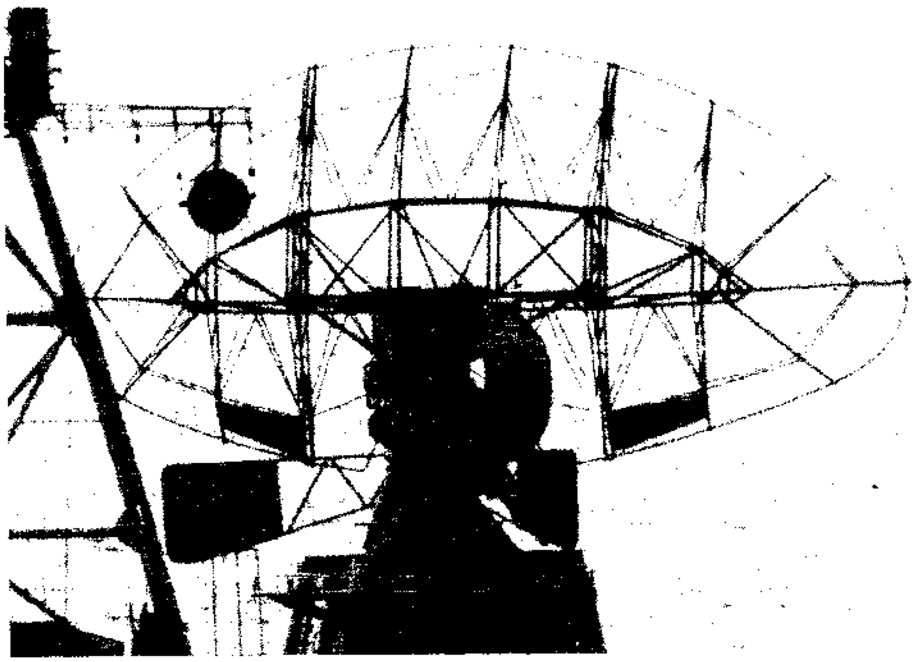
Yagi antenna array of Cylinder Head gun fire control system



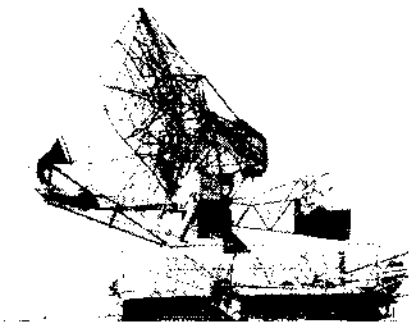
1608.253
BIG NET SEARCH RADAR
DESCRIPTION:

Big Net is a very large, long-range air surveillance radar operating in either the S or L band. The open lattice reflector is of elliptical parabolic form, illuminated by an underslung horn feed, carried on a solid boom. Behind the reflector are two balance vanes.

According to the latest information, all four of the "Kresta I" class of guided missile cruisers carry Big Net, on which ships it is mounted over the funnel. Some of the "Kashin" class of guided missile destroyer are fitted with this radar, in which cases it is mounted on a pylon type mast aft of the forward funnel. The cruiser *Dzerzhinski* has also been seen with Big Net.



Big Net long-range search radar installation on radar picket ship



Big Net long-range search radar

1605.253
FAN SONG E NAVAL RADAR
DESCRIPTION:

This is a shipboard version of the Guideline surface-to-air missile fire control and guidance radar (Entry No. **2868.153**) which is widely used by Soviet land forces. In place of the mobile housing used on land, the shipboard installation is mounted on a stabilised gun mount.

Fan Song E operates in the C-band range of frequencies. The antenna array consists of horizontal and vertical scan Lewis antennas, and three circular parabolic dishes. Two of the latter are for LORO (Lobe On Receive Only) ECCM, and the third dish is for command guidance purposes. Operation of Fan Song E is described more fully in Entry No. **2868.153**.

The only known fitting of this radar is on the Soviet Cruiser *Dzerzhinski*, on which ship the Fan Song E is mounted on a platform aft of the after funnel and forward of the twin Guideline missile launcher.

1607.253
HAIR NET NAVAL RADAR
DESCRIPTION:

Hair Net is a medium-range general purpose search and surveillance radar providing air and surface cover facilities. The antenna is of lightweight lattice construction with a reflector straight sides and upper edge but with a pronounced curve on the bottom edge. The horn feed is carried on a boom projecting from the lower edge of the reflector and supported by stays connected to the reflector. The typical Soviet balance vanes behind the scanner are a feature of this radar.

Hair Net does not appear to be widely fitted. Among fittings reported are the Soviet cruiser *Kirov*, and vessels of the "Tallin" and "Kotlin" classes.

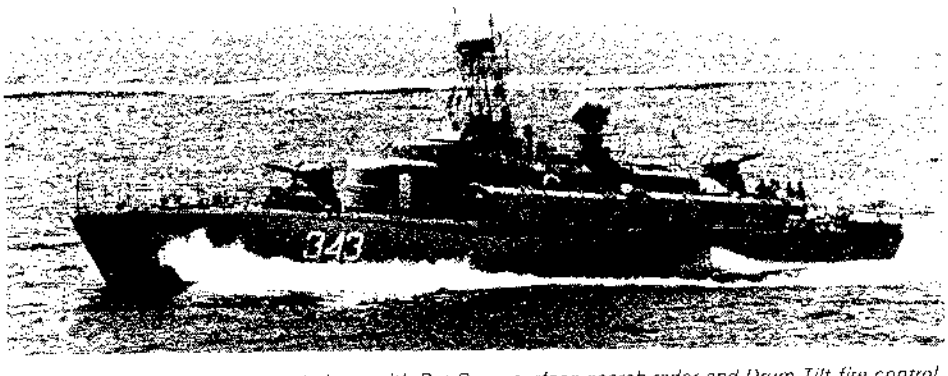
1609.253
PLINTH NET SEARCH RADAR
DESCRIPTION:

Plinth Net is a medium-range general-purpose search radar with an elliptical lattice reflector illuminated by an underslung boom-mounted feed horn. There are no balance vanes behind the scanner. The turning gear is housed in a tapered cylindrical mounting, from which the NATO name for this radar is derived. No reliable details of fittings for Plinth Net can be obtained and it is presumed obsolete.

1612.253
POT DRUM NAVAL RADAR
DESCRIPTION:

Pot Drum is a small surface search radar, probably operating in X-band and protected by a flat, slightly domed, radome from which its NATO code name is derived. Diameter of the radome is about 1.5 metres and the unit is typically installed at the mast head of small patrol boats. This radar is probably of conventional design with the possible exception of a rather higher than usual rate of scanner rotation and the inclusion of ECCM and perhaps a passive direction finding mode of operation. The transmitter/receiver is housed below decks. The display unit has a small CRT display (about 15 cms), so that short range operation of the radar is likely. In addition to surface target detection, Pot Drum probably is used for pilotage purposes also and may have a limited air warning capability.

Coastal escorts of the "Stenka" and "Kronstadt" classes are fitted with Pot Drum, as are torpedo boats of the "Shershen" class, some "P6" class boats, and the "Pchela" class of hydrofoil craft.



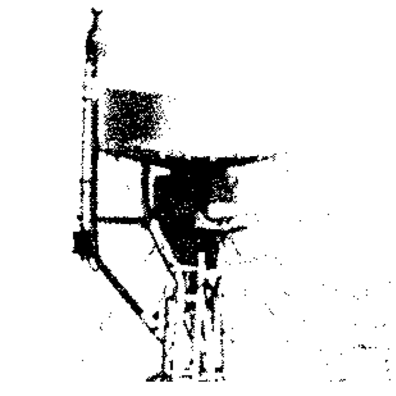
Soviet "Shershen" class torpedo boat with Pot Drum surface search radar and Drum Tilt fire control radars for guns

1613.253
POT HEAD NAVAL RADAR

DESCRIPTION:

Pot Head is similar in appearance to the Pot Drum surface search radar (Entry No. **1612.253**) but is slightly smaller with an estimated diameter of 1.2 metres. Another distinguishing feature is that the top of Pot Head is flatter than that of Pot Drum. The operating frequency is probably in the X-band and the main function will be that of surface target detection, with pilotage and limited air warning facilities as supplementary capabilities.

Fittings appear to be confined to torpedo boats of the "P6", "P8", and "P10" classes operated by the Soviet and East German Navies.



Pot Head short-range surface radar with IFF antenna

1324.253
SCOOP PAIR SURFACE TARGET RADARS

DESCRIPTION:

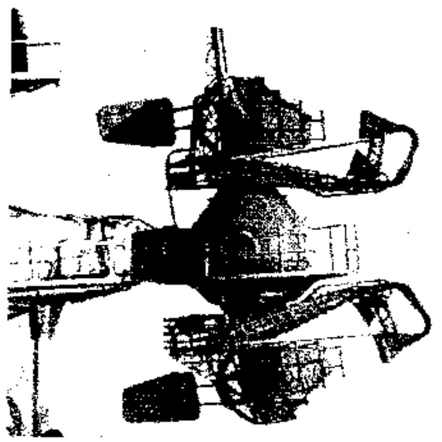
This radar system is a feature of Soviet vessels equipped with Shaddock surface-to-surface missile launcher tubes. It consists of two apparently identical radars mounted above and below a spherical housing supported at the end of a sponson. Photographs indicate that these sponsons, which are aligned with the ship's fore-and-aft axis, may include provision for rotating the radar group to provide stabilisation against roll motion, and there may also be pitch stabilisation but this is not known for certain.

The scanners are of open lattice construction and of essentially elliptical paraboloid form, although the contours are rather angular. They have quite a high span/depth ratio and the former dimensions is estimated at approximately 4.2 metres. They each have the typical Soviet balance vanes behind the scanners, in this case of almost square outline. Each scanner is illuminated by a double horn assembly carried on a boom, coming from beneath the scanner in the case of the upper radar of the group, and above in the case of the lower radar. The disposition of the horns suggests that they are arranged to provide maximum elevation coverage from the combined pair of radars. A further possibility for the use of double horns is that they are associated with special signal processing equipment to provide optimum target detection in the presence of sea clutter returns.

It is not known if the two radars comprising the Scoop Pair group are rotated in azimuth independently, although there is no mechanical reason why they should not.

Probable functions include surface search and target detection to provide range and bearing data for the Shaddock missile fire control system, and tracking of the missile after launch.

All Shaddock carrying Soviet vessels appear to be equipped with one or two Scoop Pairs, depending upon the Shaddock launching arrangements. "Kresta I" class guided missile cruisers have a single installation, high on the main 'tower', and this serves two twin launchers below, and on each side of the bridge. "Kynda" class ships have two groups, fore and aft, each serving a four-tube launcher.



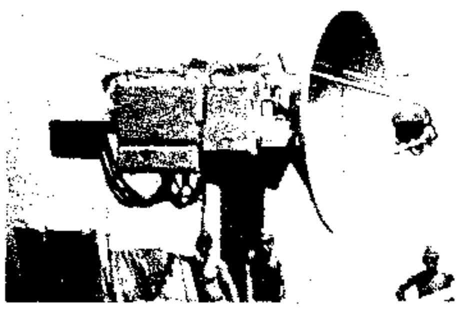
Scoop Pair radars for surface-to-surface Shaddock missiles. The projection above the upper scanner could be for IFF. The scanners can be seen to employ a solid reflector in front of which is a parallel grid, presumably to improve clutter rejection

1325.253
HAWK/OWL SCREECH FIRE CONTROL RADARS

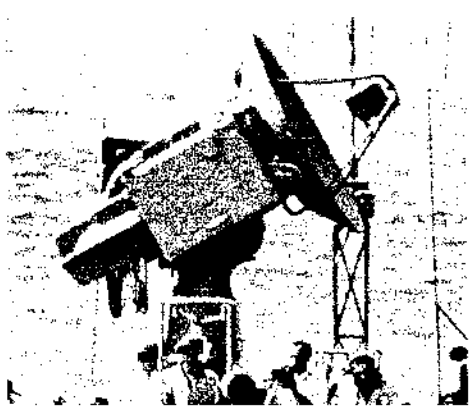
DESCRIPTION:

Owl Screech and Hawk Screech are fire control radars of conventional design, widely used in many classes of Soviet vessels. They are distinguished by a circular dish scanner, behind which are mounted fairly bulky housings which are assumed to contain transmitter and receiver, and probably turning and stabilisation gear. The complete radar is pedestal mounted. The scanner has a central feed supported by a four-leg structure. Feed arrangements could incorporate a rotating dipole to provide a conical-scan search pattern. Dish diameter is approximately 2 metres, with Owl Screech somewhat larger than Hawk Screech, and the operating frequency is probably in the C-band although X-band is also a possibility.

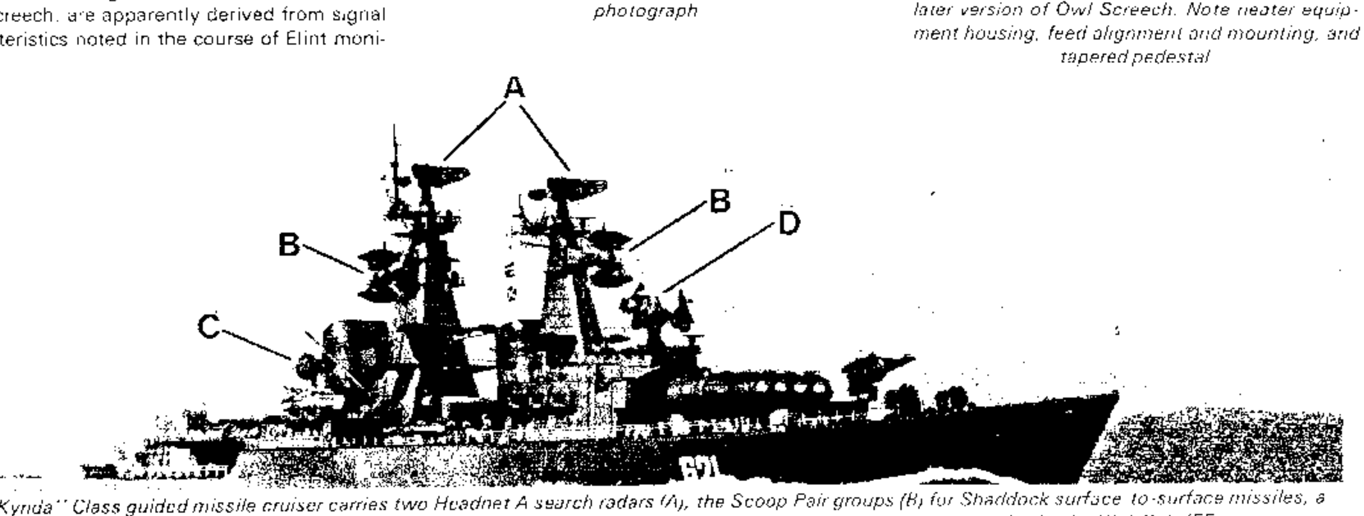
The NATO designations, Hawk Screech and Owl Screech, are apparently derived from signal characteristics noted in the course of Elint moni-



Gun fire control radar believed to carry the NATO designation Owl Screech. Note the angled feed housing, numerous separate equipment housings behind the reflector, tubular pedestal, and feed mounting, which distinguish this radar from that known as Hawk Screech, shown in an adjacent photograph



Gun fire control radar believed to carry the NATO designation Hawk Screech. This is thought to be a later version of Owl Screech. Note neater equipment housing, feed alignment and mounting, and tapered pedestal



"Kynda" Class guided missile cruiser carries two Headnet A search radars (A), the Scoop Pair groups (B) for Shaddock surface-to-surface missiles, a Peel group installation (D) for surface-to-air missiles, and an Owl Screech gun fire control radar (C). What is assumed to be the High Pole IFF antenna can be seen on the aft tower. Also visible are several pilotage and navigation radars and DF loops

toring. They appear to refer to two versions of the same basic radar, and close examination of photographs of this equipment does reveal external differences to support this. These visible variations do not as yet permit positive identification of either with one of the NATO names.

The two most obvious physical differences between the two types are in the arrangement of equipment behind the dish and in the mounting of the feed. One version, tentatively identified as Owl Screech, appears to be the earlier and the hardware behind the dish is contained in more numerous housings, giving a less tidy appearance than in the other version. Also, the four legs of the feed support are fixed to the dish at points nearer its centre than in the newer radar. The pedestals also differ, the older (Owl Screech?) being tubular, and the newer (Hawk Screech?) being slightly tapered. In the photographs studied by *Jane's Weapon Systems* it has been noticed that the feed housing in the Owl Screech version is at an angle of about 45 degrees, whereas in the other version it is orthogonally mounted. This may be a clue to the signal characteristics of the two types. There is one other feature, which is less obvious, that distinguishes the two types. That believed to be Hawk Screech has a small aperture in the dish, on the centre line and near the upper edge. This could be for a closed-circuit TV camera, and there is a small housing on the rear of the reflector. This could be used for optical target acquisition.

The principal function is that of gun fire director against aircraft targets, although this type probably also has a certain capability against surface targets, and possibly splash detection.

Classes of Soviet vessel seen equipped are: "Kynda" GMDs (2 sets), "Kashin" (2), "Krupny" (2), "Kotlin" (1 or 2), "Kildin" (2), "Tallin" escorts (2), "Mirka" escorts (1), and "Lama" class missile supply ships (2). Weapons associated with these various classes include: twin 76 mm anti-aircraft guns, quadruple 57 mm AA guns, twin 100 mm dual-purpose guns.

1606.253
HIGH LUNE NAVAL HEIGHT-FINDER RADAR

DESCRIPTION:

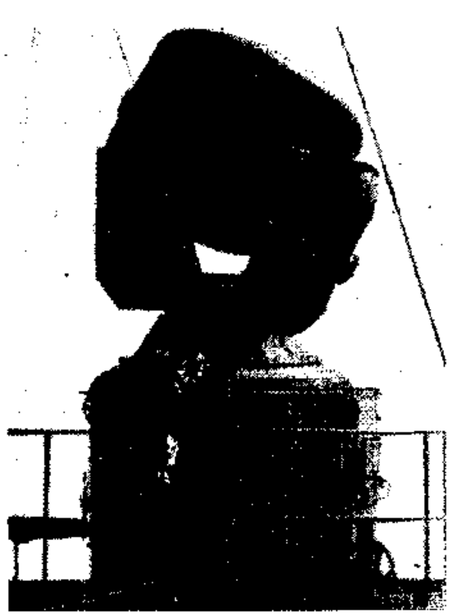
The High Lune is a shipboard height-finding radar of the nodding type, and the probable operating frequency is in the S-band. Nodding height-finders are seldom fitted on Soviet vessels, possibly because of the effects of ship's motion on the data obtained and High Lune is probably an adaptation of one of the Cake series of Soviet land-based radars. The reflector is a large (5 to 6 metres) elliptical assembly of lattice construction. It is not known if a stabilised mount is provided. The only known installation is on the cruiser *Dzerzhinski*, where it is used with the Fan Song E for operation of the Guideline high-level anti-aircraft missile system fitted on that vessel.

1611.253
MUFF COB FIRE CONTROL RADAR

DESCRIPTION:

The Muff Cob fire control is similar in general appearance to the Drum Tilt fire control radar (Entry No. **1330.253**), but the former has provision for elevation motion, being supported by a trunnion yoke carried on the traversing mounting. The operating frequency is probably in the C- or X-band part of the spectrum. Some drawings of Muff Cob show what appears to be an on-mounted TV or optical tracking subsystem, but this has not been confirmed.

In all the installations of Muff Cob studied, this radar is employed for gun fire control purposes only. On the helicopter carriers *Moskva* and *Leningrad* there are two Muff Cobs mounted high on each side of the main superstructure for direction of the twin 57 mm guns on either side of these ships. Both "Kresta I" and "Kresta II" classes of guided missile cruiser have two Muff Cobs each, carried on platforms on the sides of the funnel. These are for control of twin 57 mm guns on each side of "Kresta I" ships and twin 57 mm guns and two twin 30 mm guns on each side of "Kresta II" vessels. Some of the "Ugra" and "Lama" classes of support ships have two Muff Cob installations, and there are single fittings on ships of the "Poti" class of coastal escorts. The "T58" class of fleet minesweepers carry a single Muff Cob on top of the bridge house. Some "Polnocny" amphibious landing craft carry a Muff Cob for direction of twin 30 mm anti-aircraft guns.



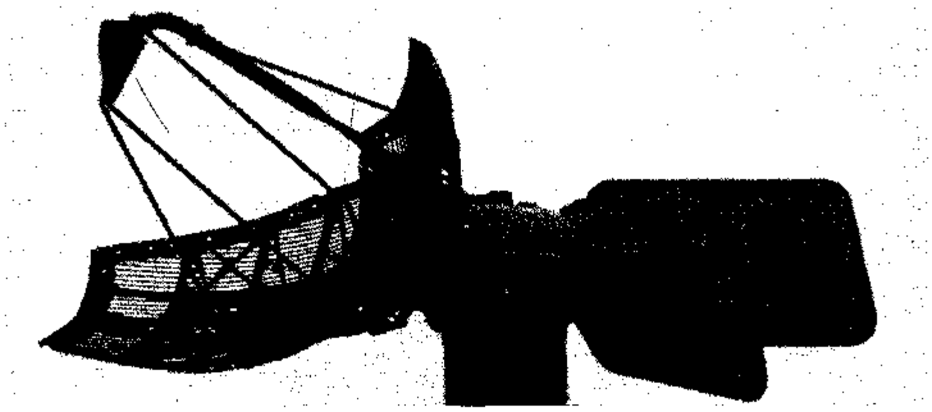
Muff Cob fire control radar

1322.253
SLIM NET SURFACE WARNING RADAR

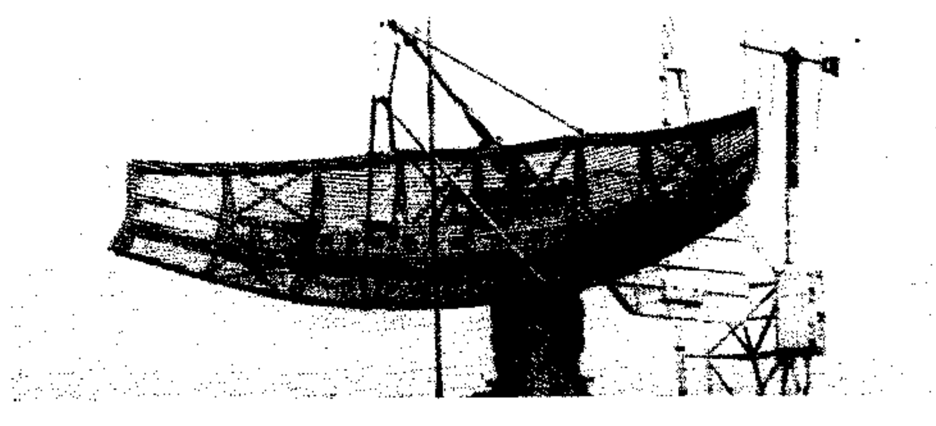
DESCRIPTION:

Slim Net is a surface warning, high definition, radar of generally conventional naval design, plus the typical Soviet characteristic of balancing vanes behind the scanner. The scanner is of open lattice construction and approximately 5.5 metres span and 1.8 metres maximum depth. The general shape is of a tapered rectangle, and the balance vanes also are rectangular. The horn feed is mounted on a boom overhanging the scanner. Operating frequency probably lies within the S-band of the spectrum.

Vessels seen with this radar include some ships of the "Kildin" class of guided missile destroyers (in which it may be associated with the Strela surface-to-surface missile launcher); "Kotlin" class destroyers; and "Tallin" class destroyers. In all three cases it is carried on top of the rear tripod mast. It is believed that some "Riga" class and "Peyta" class escorts have been equipped.



Slim Net search radar

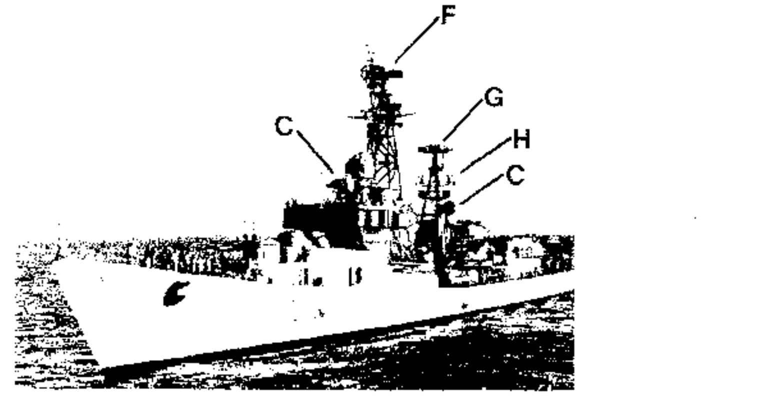


Slim Net scanner assembly, with Yard Rake rotating Yagi array (right)

1321.253
FLAT SPIN SURVEILLANCE RADAR
Description:

This is similar in general configuration to the Head Net A air surveillance radar but has a number of distinguishing features. It appears to be of approximately the same size but the scanner is more angular and deeper than that of Head Net A. The two 'butterfly' balance vanes are square tipped instead of round and are closer set to the mounting. The feed arrangements also differ, being carried on a shorter boom. Operating frequency is probably L- or S-band.

Among vessels fitted are certain of the "Riga" class of escorts, on which it is mounted on the mast; and certain "Kotlin" class destroyers.



"Kildin" class GMD with Flat Spin search radar (F), Slim Net radar (G), two Hawk / Owl Screech fire control radars (C), Square Head antennas (H), are mounted on the sponsons of both masts

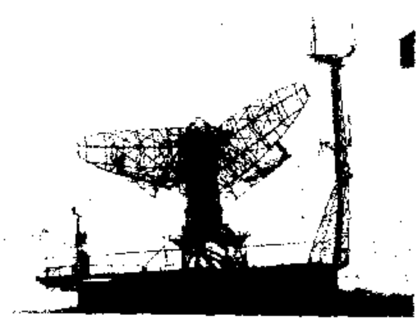
1320.253
HEAD NET C AIR SURVEILLANCE RADAR
Description:

This radar is apparently a back-to-back combination of two Head Net A scanners (Entry No. **1318.253**), similar to Head Net B (**1319.253**) but with the significant difference that one of the scanners has its aperture (i.e. its 'span' dimension) tilted from the horizontal by approximately 30 degrees. This has the effect of displacing the resulting fan-shaped elevation beam by the same amount from the vertical. This beam, in combination with the vertical beam produced by the companion scanner, thus provides the means for height-finding by the so-called 'V-beam' technique, such as is used in the American AN/TPS-34.

There are important differences, however, in the way in which these two radars employ this principle, apart from other variations between them. The most significant is that the US equipment has both beams (slant and vertical) radiating along a common azimuth, rotating in synchronism, whereas in the Head Net C the beams are separated in azimuth by 180 degrees – as a result of the back-to-back configuration employed.

In practice, the vertical beam fulfils the search function and the operator selects a target for which height data is required, and by placing a marker on this target (or similar technique) this places a range gate in the second (inclined) beam and excludes other targets. Computation to give a height readout can be performed by analogue or digital methods.

This radar has been seen on both "Kresta I and II" classes of guided missile cruisers, the *Moskva* and *Leningrad* cruiser helicopter ships, some "Kashin", "Kanin" and "Krupny" GMDs, and "Kotlin SAM II" GMDs. The newest class of vessel to carry Head Net C is the "Krivak" general purpose leader type.

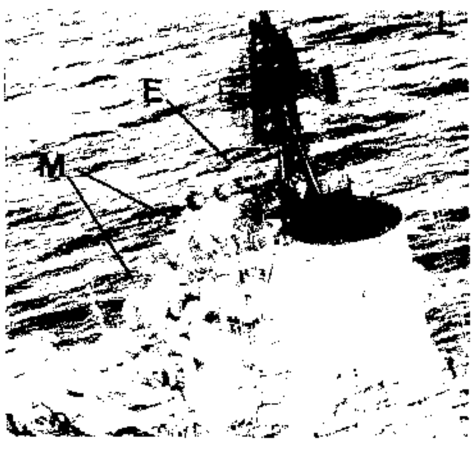


Head Net back to back three-dimensional air-surveillance radar on "Kresta II"

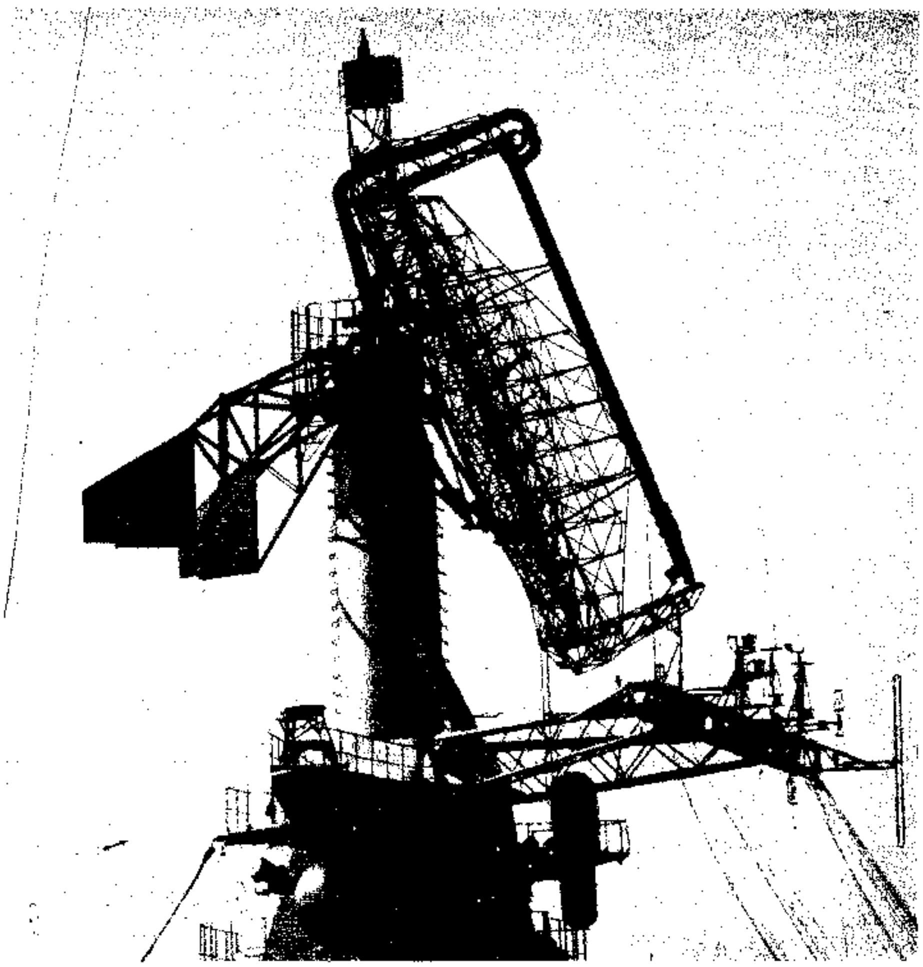
1327.253
TOP SAIL THREE-DIMENSIONAL RADAR
Description:

Top Sail is a very large air surveillance radar, first seen on the Soviet cruiser helicopter carrier, *Moskva*, and the sister ship *Leningrad*, but later on the new "Kresta II" and "Kara" classes of guided missile cruisers. In all installations the radar is mounted at the highest point of the vessel, in the case of the "Kresta II" class on a large diameter tubular pedestal atop the principal tower, and on the helicopter cruisers supported by a tubular tripod. In the "Kara" installation the scanner surmounts a typically Soviet pyramid shaped structure amidships.

The scanner is of ylindrical cross-section, the axis of which is tilted from the vertical at an angle of about 20 degrees. It is of lattice construction



The Top Sail air surveillance radar installation (L) on the carrier helicopter vessel, Moskva, also carried are Head Net C back to back radar (E) and Head Light group missile control radars (M)



Top Sail long-range air surveillance radar installation on "Kresta II" class missile cruiser. Note also the "thimble" radomes protecting Electronic Warfare antennas, NATO designation Side Globe

and has a frontal aspect of rhombic shape (estimated 5.5 m sides), with 'cropped' corners. Illumination of the reflector is by a linear radiating element located parallel to the reflector's cylindrical axis, and supported top and bottom. The feed appears to be from the upper end. It may consist of multiple horns to provide three dimensional air target data by the 'stacked beam' method, or some form of electronic scanning in elevation (such as the ridged waveguide) may be used to achieve the same result. Operating frequency is probably in the L-band with high transmitter power.

The photograph of a "Kresta II" Top Sail antenna shows what appears to be a second system of waveguide, of smaller dimensions than the main system, apparently feeding a horn at the top of the main illuminator. This might indicate dual band operation facilities for some purposes. There is a subsidiary antenna fixed to the top of the Top Sail scanner which could be for IFF. In addition to the two plates which are the most prominent feature of this secondary antenna there are also three dipoles. Near the bottom of the illuminator of the main Top Sail are what could be a similar group of three dipoles. The function of these elements has not been ascertained.

In all three classes of vessel equipped with Top Sail it is associated with similar radars, a Head Net C back-to-back 'V-beam' set, and Head Light group missile fire control director radars. The Top Sail is probably used for long range air surveillance and target designation.

1328.253
HEAD LIGHT GROUP
DESCRIPTION:

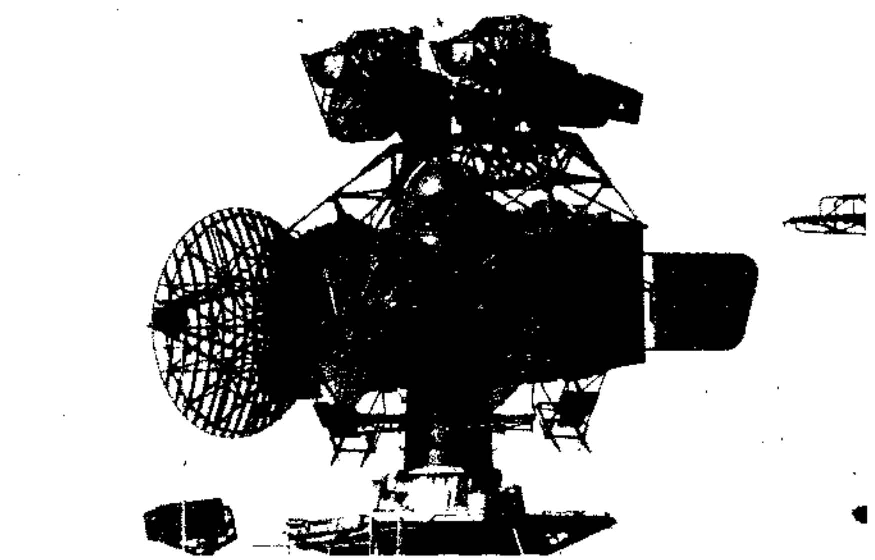
This group of radars was first seen on the cruiser helicopter carrier, *Moskva*, but has subsequently made its appearance on the "Kresta II" and "Kara" classes of guided missile cruisers. Two of these groups of radars are fitted, fore and aft on the "Kresta II" and "Kara" vessels, and two forward on the *Moskva*. In very general configuration, and possibly function to some degree, this group resembles the Peel Group missile control radar group for Goa surface-to-air missiles on other Soviet vessels. The Head Light group consists of a group of four radars, apparently comprising two identical pairs of equipment combined on a common mounting. There is a fifth, smaller dish, possibly fulfilling a command link or IFF function.

The four main reflectors of the group are circular dishes, of open mesh construction, one small and one large to each pair, with the smaller in the upper position, and all being disposed symmetrically about the central mounting pillar. Estimated dish sizes are 1.8 metres and 3.8 metres. The electronics for each radar, transmitter/receiver etc, are carried behind the individual reflectors and the whole assembly of four radars as supported from the top of the pedestal turning gear on a yoke structure of triangulated tube construction.

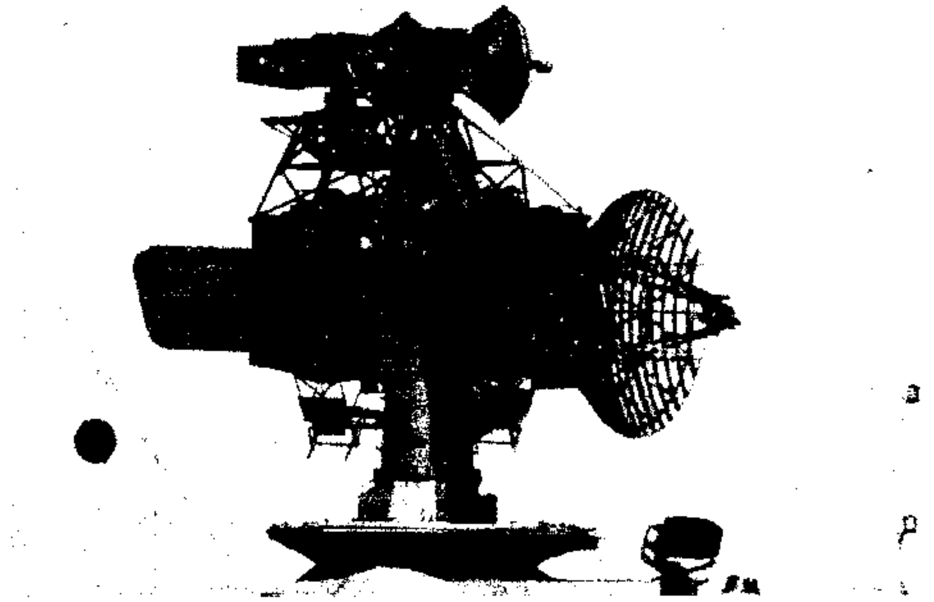
The whole assembly rotates in azimuth, and can also move in elevation. The two upper radars also appear to have provision for individual movement in both axes, possibly limited, and the dynamic balancing vanes fitted to them, could support this suggestion.

The upper dishes have unusually large feed arrangements which may be of the Cassegrain type, and the larger dishes appear to be front fed. Operating frequencies are probably X- and C-bands, respectively.

On the *Moskva* and *Leningrad* there is one Head Light group to each of two surface-to-air missile launchers, each for two missiles. On "Kresta II" class ships there is one Head Lamp group associated with similar launchers fore and aft. The arrangement on "Kara" class ships is similar.



The aft Head Light radar group on board a "Kresta II" Class guided missile cruiser. Note also the smaller surface search radar



The forward Head Lamp radar group of the "Kresta II" class guided missile cruiser

1331.253
STRUT CURVE SEARCH RADAR
DESCRIPTION:

Strut Curve is a medium range general purpose search radar, probably operating in the S-band to provide both air and surface search facilities. An elliptical lattice reflector is used, illuminated by a horn feed carrier by a boom projecting from the lower edge of the scanner. The boom is supported by two struts which attach to stays at the upper edge of the reflector. Somewhat unusual for Soviet naval radars, the Strut Curve has no balance vanes behind the reflector.

Soviet vessels fitted with Strut Curve include the "Poti" class of escorts and certain support ships.

Strut Curve search radar

Strut Curve antenna profile

1323.253
PEEL GROUP FIRE CONTROL RADAR

DESCRIPTION

This group comprises four distinct radars on a common mounting and is almost certainly associated with the Goa surface-to-air armament of Soviet vessels. All four scanners are of solid-reflector construction and of elliptical paraboloid shape. There are two large and two small scanners in each group, one each of each size being disposed with its major axis horizontal and the other vertical.

The central mounting has noticeably rounded proportions and appears to provide a common axis about which the group rotates in azimuth, and the forward side of this mounting is another large housing providing for rotation of the group in elevation. It cannot positively be ascertained if this provides for separate elevation rotation of the individual elements of the group. Viewed from the front, the large vertically disposed scanner is to the right of the central mounting and the other three scanners are to the left of it.

Although unrestricted rotation of the individual vertical and horizontal elements of the Peel Group is unlikely, sector scanning is probable for the performance of air target tracking. Target designation is probably provided by one of the Head Net series of air surveillance radars, and the Peel Group does not seem to have been designed to give a search capability.

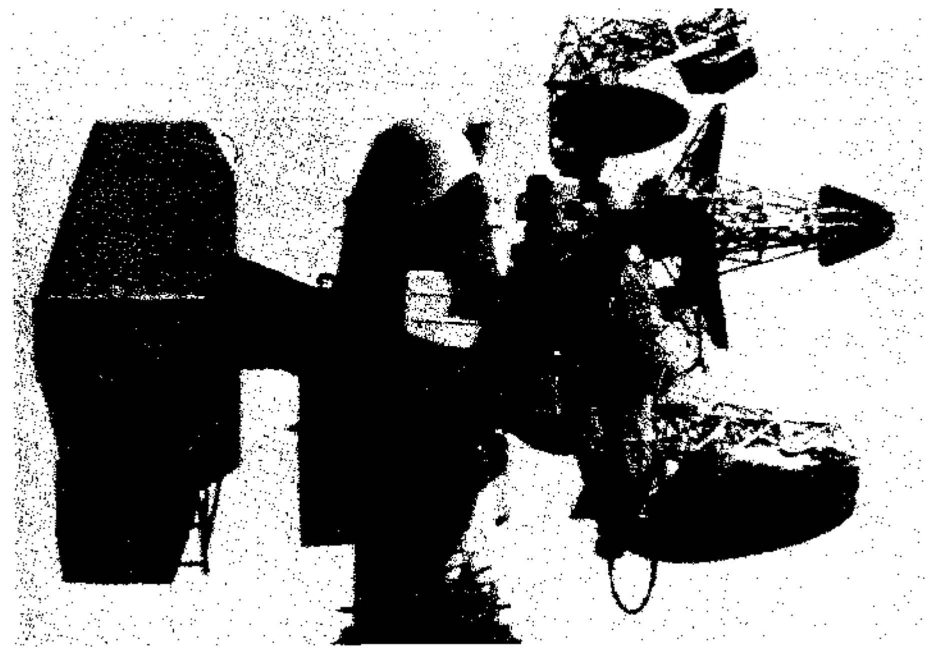
The feed arrangements are a matter of some conjecture. Those of the two smaller scanners are distinguished by large offset boom-mounted illuminator housing boxes the shape of which seems to suggest that they contain multiple horns. One feasible explanation for this is that a monopulse tracking technique is used, with separate radars for each co-ordinate, azimuth and elevation. Operating frequency of the two smaller radars of the group is probably in the X-band.

The feeds of the two larger radars, which probably operate in C-band, are smaller than those of the other two radars of the group and are not offset. The feed housings are of cylindrical form and may contain devices such as a quarter-wave plate to provide circular polarisation as an aid to higher weather penetration.

Information is too limited to draw firm conclusions concerning the functions of the individual elements of the Peel Group in tracking the target and directing the missile. A likely assessment is that the two larger scanners are employed for the longer range target acquisition and 'coarse' tracking, while the two smaller scanners provide precision tracking.

Between the large vertically oriented scanner and the central mounting a further unit of uncertain function is located. This could be a radiator for guidance signals to the missile until its own homing system comes into operation. It is also a reasonable assumption that some provisions for IFF are made within the system.

The normal deployment arrangements associate one Peel Group unit with one dual Goa surface-to-air missile launcher. "Kresta I" class guided missile cruisers have two installations, one forward above the bridge and the other aft, atop a short tower, and "Kashin" class GMDs are similarly fitted. The "Kynda" class GMDs have a Peel Group installation above the bridge, and on "Kotlin" class GMDs there is a Peel group on a square, tapered tower amidships.



Peel Group radar used on various classes of Soviet vessel for control of Goa surface-to-air missiles

1318.253
HEAD NET A AIR SURVEILLANCE RADAR

DESCRIPTION:

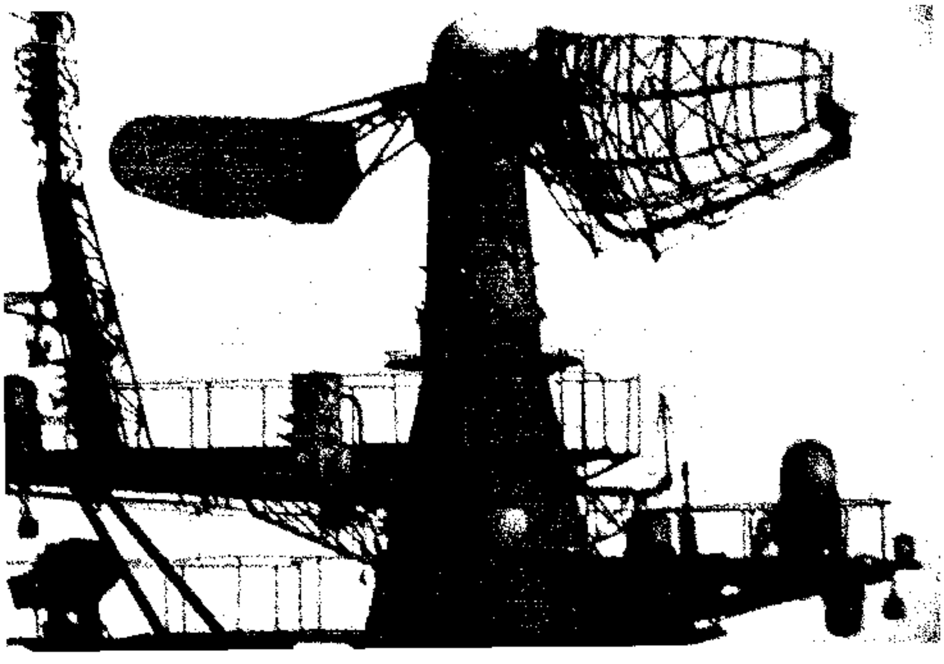
This appears to be the most widely fitted of the numerous radars employed by the Soviet Navy, and appears to be of fairly conventional construction. It has a large (about 6 m × 1.5 m) elliptical paraboloid reflector of open lattice construction. This is illuminated by a horn feed carried by a boom projecting from below the lower edge of the scanner. An unusual visual feature, compared with practice outside the USSR, is a pair of prominent 'butterfly' vanes extending behind the scanner which are for dynamic balancing.

The scanner mounting is also quite distinctive and has a rather 'lighthouse' like appearance, being quite regular and with a domed top. It is possible, though considered unlikely, that this accommodates some form of scanner stabilisation against ship's motion. It is possible that a relatively high rotation rate is employed.

Operating frequency is in either the L- or S-band, probably the latter. No details of the radiated power are available.

The principal function of the Head Net A is assumed to be air search and surveillance and it can be expected to provide target designation facilities for other, fire control radars for guns and missiles, carried by the vessel.

It is normally mounted on a mast-top location, or other high positions, and both single and double installations have been seen on various classes of Soviet vessel. "Kynda" and "Kashin" class guided missile destroyers have one on each of the two masts, the "Krupny" class GMD No 700 has a single installation on the mainmast; and a similar arrangement is used on certain "Kotlin" class destroyers.



Head Net A surveillance radar. Note also various ECM housings

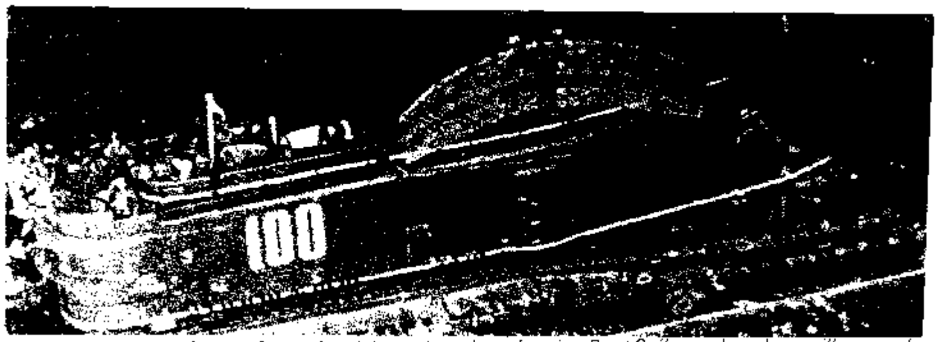
Head Net mountings and scanners are also employed in two types of dual installations. One is a back-to-back configuration (Entry No. **1319.253**) with one of the scanners at a larger elevation angle (about 15 degrees more than the companion scanner) to provide separate high and lower cover aerials. The second dual configuration (Entry No. **1320.253**) is also a back-to-back arrangement, but in this case one scanner is tilted laterally from the horizontal with the probable objective of providing a three-dimensional capability.

1507.253
BOAT SAIL SUBMARINE RADAR

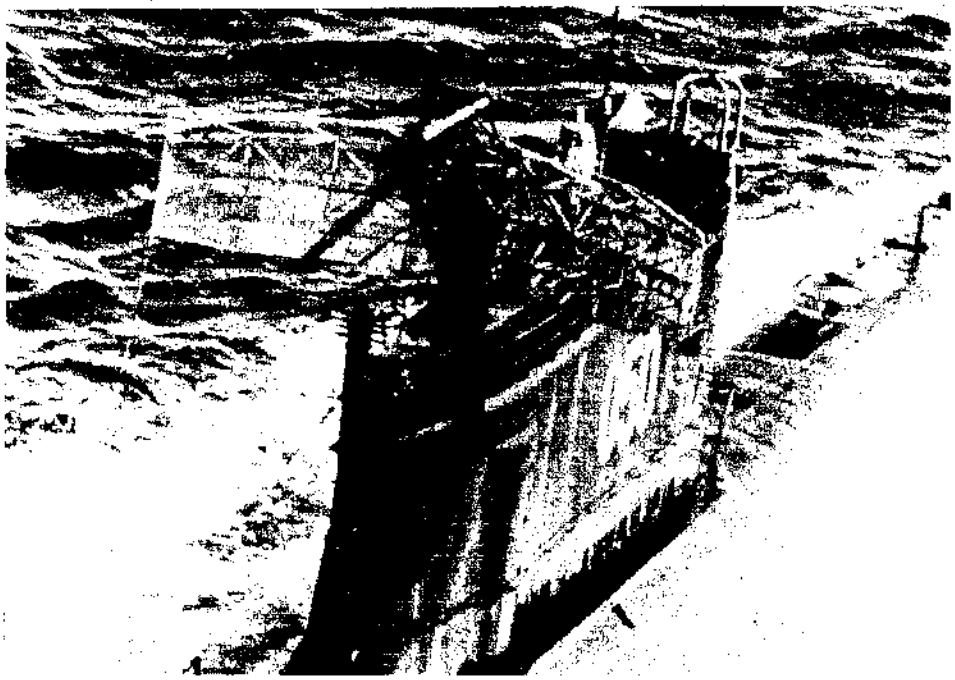
DESCRIPTION:

This is the search and surveillance radar employed on Soviet "W" Class/Canvas Bag radar picket submarines. The electrical and radio frequency characteristics of this equipment are probably fairly conventional, and the operating frequency is likely to lie within the S- or L-bands, and US sources have stated that pulse-width and PRF values are similar to those employed by American surface radars.

The mechanical problems entailed in making seaworthy what is essentially a surface vessel radar when installed on a submarine are the areas of greatest interest. From the photographs obtained it appears almost certain that there is no provision for retracting the scanner assembly into the conning tower for submerged passage. The waveguide feed is protected inside a heavy tube, at the scanner illuminating end presumably equipped with a sealing valve mechanism. It is not known if there are arrangements for folding the scanner to reduce drag when cruising submerged, though this would be an obvious advantage.



Soviet "W" Class/Canvas Bag radar picket submarine, showing Boat Sail search and surveillance radar. Note also partially retracted Stop Light passive receiving antenna ahead of Boat Sail scanner



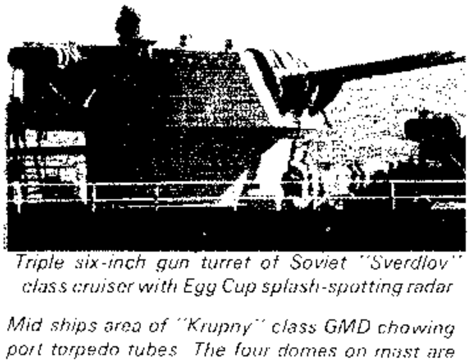
Boat Sail submarine radar installation on board a Soviet "W" class/Canvas Bag radar picket submarine. Note the Stop Light broad - band passive receiving antenna forward of the Boat Sail scanner. This retracts into the conning tower before submerging. There is a DF loop ahead of the Stop Light

1614.253
SKIN HEAD NAVAL RADAR

DESCRIPTION:

The Skin Head radar is principally associated with Soviet torpedo boats and its function is assumed to be surface target detection for use in association with torpedo fire control systems. Its appearance is characterised by a thimble shaped dome from which the NATO code-name is derived, and generally a mast head mounting. Diameter of the radome is estimated to be about 0.8 metres. The nature of the scanner assembly inside is not known but a high rotation rate is assumed. Operating frequency is probably in the X-band.

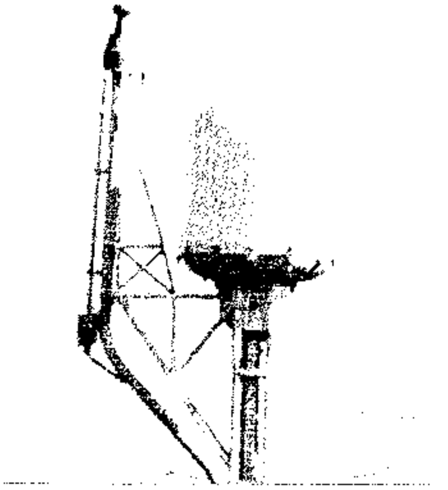
Although Skin Head is mostly associated with torpedo boats of the "P4" and "P6" classes, used by the Soviet and friendly navies, the 152 mm gun turrets of Soviet "Sverdlov" cruisers carry a radome of similar proportions (NATO code-name Egg Cup) which suggests that the same radar may be used for fall-of-shot measurement or other purposes on these ships.

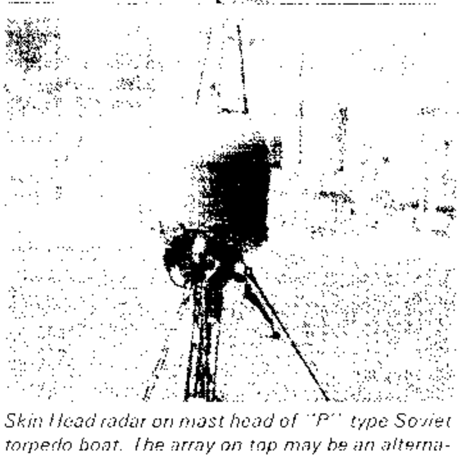


Triple six-inch gun turret of Soviet "Sverdlov" class cruiser with Egg Cup splash-spotting radar

Mid ships area of "Krupny" class GMD showing port torpedo tubes. The four domes on mast are possible alternative housings for electronic warfare equipment. Radar is Hawk Screech for gun fire control

Skin Head radar used for surface target detection on Soviet torpedo boats. Small antenna is for IFF





Skin Head radar on mast head of "P" type Soviet torpedo boat. The array on top may be an alternative IFF antenna

1610.253
TOP TROUGH SURVEILLANCE RADAR

DESCRIPTION:

Top Trough is one of the newest Soviet naval radars, and is apparently a high discrimination surface target detection system. The only known installations are on ships of the Soviet "Sverdlov" class of cruisers, presumably to provide target designation facilities for the 6 in (152 mm) surface guns, and 3.9 in (100 mm) dual purpose guns fitted on these vessels. At the time of printing this edition, not all ships of the class had been fitted, but known fittings include the ships carrying pennant numbers 818, 856 and 890.

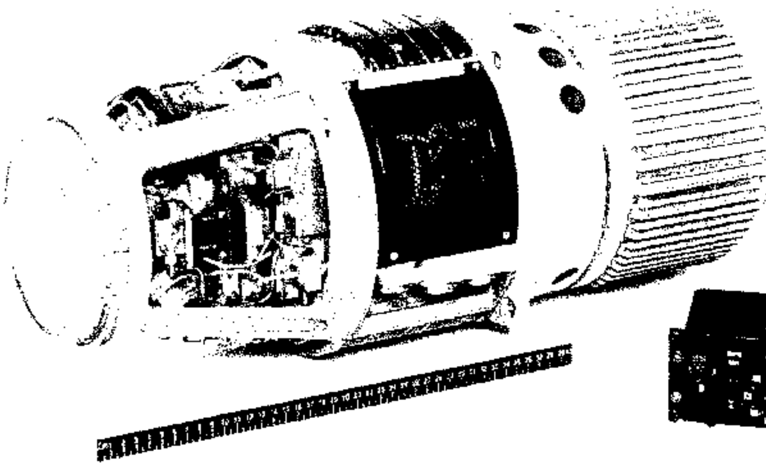
AIRBORNE RADAR

FRANCE

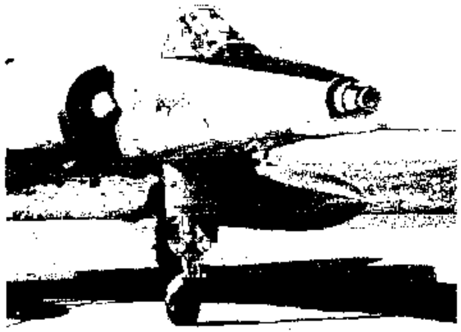
1793.353
ORB-31 AIRBORNE RADAR
DESCRIPTION:
The ORB 31 designation covers a series of X-band radars for use on helicopters or small aircraft, and the main functions are surface vessel detection, navigation, and also as a weather radar. The range of equipment includes two transmitter/receivers (12 and 30 kW), and several antenna options, from which installations appropriate to a variety of missions can be assembled. A typical system employs two transmitter/receivers, one for long range detection and the other for target tracking, two display units for pilot and observer, respectively, and a stabilised antenna.
DEVELOPMENT:
The ORB-31 was developed from the ORB-3 which was a license-built version of an Ekco weather radar.
STATUS:
The ORB 31 has been selected for use in French WG 13 helicopters.
MANUFACTURER:
Omera-Segid, 49, rue Ferdinand Berthoud, 95 Argenteuil, France.

1211.353
AIDA II FIRE CONTROL RADAR
DESCRIPTION:
The Aida II fire control radar is a miniaturised equipment designed for installation in light interceptors and aircraft with restricted accommodation in the nose. It is also suitable for pod mounting. It performs automatic search, acquisition and range tracking of targets (air or sea) within a cone of 18 degrees. It can also supply the surface range in the boresight axis. Used with a gyroscopic gun sight it will supply all the data necessary for interception and attack by guns, rockets, bombs or missiles, namely: range of the target or ground, angular position of an air or sea target with respect to the boresight axis, gravity drop and sensitivity corrections for air-to-air firing.
The aerial is fixed, and is of the lens type, giving a beamwidth of 18 degrees. Lens diameter is approximately 15 cm. Operating frequency is in the X-band, and transmitter power is between 80 and 100 kW. Overall weight of the system, with radome, is about 30 kg. Length is 65 cm, and maximum diameter 23.5 cm. The radar is mounted in the aircraft by a single nut 26 cm in diameter, and there is a metal ferrule supporting the radome attached to the airframe.
The radar is contained in a ventilated housing, with forced air circulation. Integrated circuits are used in the electronics, which include a magnetron as the microwave power source. The electronics are packaged in a number of interchangeable sub-assemblies – aerial and microwave sections, modulator/transmitter, receiver, search and range tracking circuits, sensitivity and gravity drop correction computer, power supply, and safety circuits. Built-in test facilities are provided.
The modular design of Aida II is also used to make available two optional versions of this radar. Version A provides for air-to-air and surface-to-air ranging without measurement of target angular position, and this model does not have Module 2 (air to ground ranging and off-axis angles). Version B provides for air-to-air and air-to-surface ranging (without angular target measurement) and air-to-ground ranging, this model being obtained by adding Module 1 to the 'A' version of



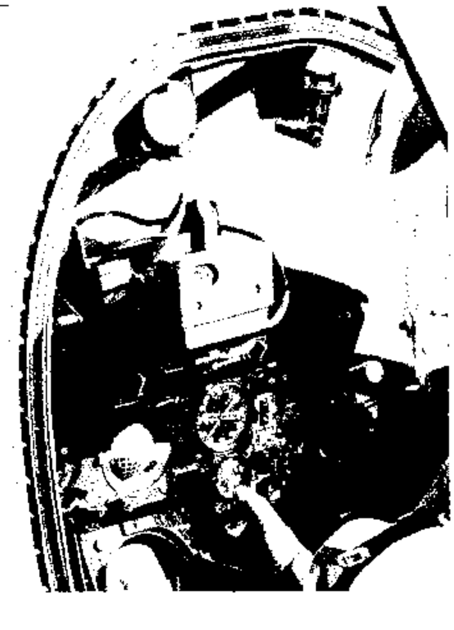
Aida II lightweight airborne ranging radar

Aida II.
The design also allows for the radar's use with missile firing and bombing computers. The former has provision for the control and firing of infra-red Sidewinder, AS-20, AS-30 and other missiles, in the air-to-air and air-to-surface modes, depending upon the missile used. The latter computer permits the processing of data necessary for bombing against sea or land targets.
DEVELOPMENT
The Aida II is a successor to the Aida fire control radars fitted in French Navy Etendard IV aircraft, and development work is understood to have commenced in the mid-1960s.
STATUS:
No details of production plans are known. Aida II has been installed in a Mirage 5 (the simplified version of the Mirage III), and another possible vehicle for this radar is the Jaguar strike aircraft. In 1971 an agreement was reached between EMD and Emerson Electric Company, in the USA, which gives the latter sales and manufacturing rights for Aida II in the US, Canada and US Military Assistance Programme markets. In return, EMD has rights to Emerson APQ-153 (Empire) and Emair radars outside those markets.
MANUFACTURER:
Electronique Marcel Dassault, 55, quai Carnot, 92-Saint Cloud, France.



Aida II radar installation in Mirage 5 aircraft

1051.353
CYRANO II AIRBORNE ATTACK RADAR (RA 537)
DESCRIPTION:
Airborne AI radar providing search, tracking and air to air interception modes, plus air to ground modes and terrain mapping. Monopulse, X band, set employing a Cassegrain scanner and with a transmitter peak power of 200 kW. Liquid-cooled and housed in a pressurised radome nose-cone. Head-down CRT and electro/optical head-up display pilot information displays are provided.
OPERATION:
Two scan patterns are available for the search phase of an attack, the broad sector scan covering plus and minus 60 degrees in azimuth and the reduced sector, plus and minus 30 degrees. This pattern can subsequently be changed to elliptical scanning for automatic lock-on to the target. When the target has been acquired, radar data is fed to an analogue computer which generates demand signals for presentation on HUD to provide the pilot with guidance for the optimum intercept conditions. The computer also calculates weapon firing time and generates break off guidance demand signals for presentation to the pilot.
For missile attacks, the radar interception computer ensures that the approach is such that the target cannot be beyond the radar detection volume. Missile collision is sought at the optimum firing time which is calculated by a second computer designated the firing zone computer.
A fourth scan pattern is employed for ranging in both the air-to-air and air-to-surface modes. In this the beam follows a circular pattern, centred on the aircraft axis.
Scan patterns and the various operating modes of the radar are selected from controls mounted on a radar control stick. This carries push buttons for adjusting aerial tilt, receiver gain control, lateral displacement of the reduced sector scan datum, ranging marker displacement control, and radar lock-on and unlock facilities.
Other operating modes provided include ground mapping (presumably with a 'beam-spoiler' to produce a cosecant-squared radiation pattern); terrain warning and clearance, using



Cyrano II installed in Mirage IIIE. The Head-up Display attack sight and radar CRT display unit can be seen

contour mapping and clearance plane techniques; ground ranging and navigational modes. The last of these modes incorporates a 'freeze' facility which enables the terrain picture at any instant to be retained on the radar screen.

DEVELOPMENT:

Development of Cyrano II was started by CSF (now part of the Thomson-CSF group) under French Government contract in 1960. The first prototype was completed in 1962 and the radar entered service in 1963.

STATUS:

Cyrano II is still in production and 1000 sets had been delivered by March 1974. It is fitted to Mirage III aircraft of the French Forces and those of a number of other nations.

MANUFACTURER:

Thomson-CSF, Division Equipements Avioniques et Spatiaux, 178, Bd Gabriel Péri, 92 240 Malakoff, France.

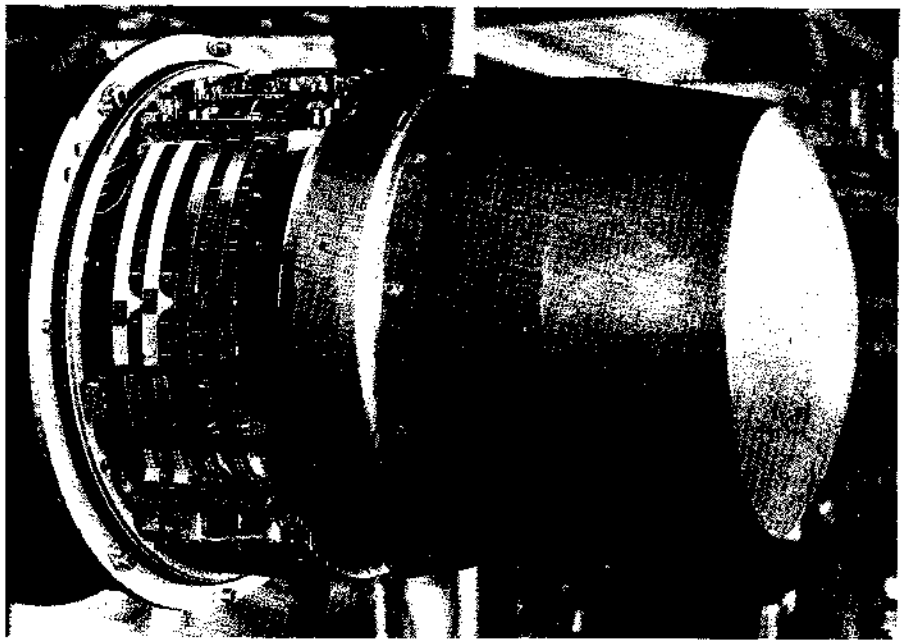
1052.353
CYRANO III FORWARD LOOKING RADAR (RA 538)

DESCRIPTION:

The Cyrano III designation embraces a range of nose radars which is also referred to by the manufacturers as the Cyrano 30 Series. Unlike the Cyrano I & II equipment, which was essentially designed for specific aircraft types (Mirage III), the 30 Series is intended to cater for numerous types of aircraft and a variety of operational roles.

This functional flexibility is achieved by the use of modular design, with a high degree of commonality and compatibility between units, and the availability of additional elements which can be incorporated either in the main radar pack or elsewhere in the aircraft to provide extra operational facilities.

Like Cyrano I and II, the RA 538 set is magnetron powered, but performance has been improved in a number of ways. Range has been increased, more sophisticated signal processing techniques are employed, such as doppler filtering to provide MTI facilities and improved performance in air-ground modes. Circuitry is now solid-state, and self-test facilities are provided. Operational frequency is in the X-band and peak transmitter power is 200 kW. A Cassegrain scanner system is used.



Cyrano III airborne radar

DEVELOPMENT:

Development was initiated by CSF (now a member of the Thomson-CSF group) as a private venture in 1967 and the first prototype was completed in 1968. Entry into service was in 1970.

Considerable use was made in the development of Cyrano III, of the experience in terrain following and obstacle avoidance radar techniques gained in the Cobra radar programme. This was conducted with French Government support and was largely an experimental project. There are no known production plans for Cobra.

STATUS:

The Cyrano III has been designed for modernisation of the fire control system of the Mirage IIIE. (Performance is believed to be very close to that of the Cyrano IV.)

MANUFACTURER:

Thomson-CSF, Division Equipements, Avioniques et Spatiaux, 178, Bd Gabriel Péri, 92 240 Malakoff, France.

1396.353
CYRANO IV ATTACK RADAR

DESCRIPTION:

The Cyrano IV is the latest development of the Cyrano series of airborne radars and is a multi-role equipment. In general appearance it is similar to the Cyrano III above, and has a similar wide range of functional options. It forms part of the Murol nav/attack system, the other elements of which are: Type 196E gunsight, air-to-ground attack computer Type 32D, laser range-finder Type TAV-38, navigation indicator Type LC 102. Other inputs to the system can include, doppler or inertial navigational data, altitude, and Air Data Computer.

Operational roles specified are: all-weather air interception and attack, with guns or missiles; air to ground attack, with guns, rockets or missiles; dive and pull-out bombing or low-level retarded bomb attacks; blind bombing.

STATUS:

Series production of one version is in progress for French l'Armée de l'Air F1 aircraft, and several versions for export for air-to-air and air-to-ground applications are in progress.

MANUFACTURER:

Thomson-CSF, Division Equipements Avioniques et Spatiaux, 178, Boulevard Gabriel Péri, 92 Malakoff, France.

CYRANO IV – 100 SERIES:

Thomson-CSF is understood to have in development a new family of modular digital radars under the above designation, for installation in export versions of the F1 M53 aircraft. Starting from a basic fire control radar, a multi-role capability (including terrain following) can be attained progressively by the incorporation of optional additional facilities.

1351.353
ORYX ATTACK RADAR

DESCRIPTION:

The EMD Oryx is a nose-mounted Ku-band attack radar providing facilities for air-to-air and air-to-surface attack, terrain mapping, and terrain following. Peak power is 100 kW and weight of the nose unit, including radome and structure is 90 kg. The receiver has a quoted overall noise factor of less than 10 dB and total gain of over 80 dB. AFC (Automatic Frequency Control) is provided over a range in excess of 60 MHz, and STC (Sensitivity Time Control) between 0.5 and 10 km.

The antenna is flat, slotted waveguide array, stabilised in pitch and roll, and with a maximum deflection of +60 degrees with respect to the aircraft axis. Antenna characteristics include a beamwidth of 12 degrees in azimuth and 2.8 degrees in elevation. Linear polarisation is employed, and average gain on the antenna axis is 28 dB. Monopulse facilities in azimuth and elevation are available in ranging modes of operation.

Inputs to the radar from other aircraft systems are roll and pitch data, angle of incidence, radio altimeter height, barometric height, vertical acceleration and ground or air speed.

OPERATION:

Operational modes listed by the manufacturer are: terrain following; ground mapping and navigational up-dating; air-superiority with guns and infra-red homing missiles (most semi-active radar homing missiles use X-band frequencies, and therefore are unsuitable for use with the Ku-band Oryx); bomb missions; and anti-shipping strikes.

In the terrain following mode, the beam is scanned in the vertical plane only, thus covering a volume ahead of the aircraft axis of 6 degrees left and right of the axis and plus 10 degrees and minus 30 degrees in elevation. Azimuth beamwidth (i.e. 12 degrees) is stated to be sufficient to enable crosswind effects to be neglected at operational flight speeds. It is not known what, if any, arrangements are made for turning flight at low levels, but EMD states that "in all cases, the clearance with respect to side obstacles remains sufficient".

Climb and descend demands for presentation to the pilot are based upon a computed 'protection profile', similar to that used in the Ferranti terrain following radar (Entry No. 1034.353, Janes Weapon Systems 1969-70). Any obstacles detected by the radar which penetrate this curve require an avoiding manoeuvre, and a computed demand signal is generated depending on the rate of obstacle penetration within the protection profile and a predetermined clearance value. The clearance value is dependent upon the selected clearance height, flight conditions, dive angle, load factor, and range and height of the obstacle with respect to the aircraft.

Both head-up and head-down CRT displays are employed in the terrain following mode. On the former, symbols are used to indicate pitch demands necessary to obtain the selected terrain clearance. This is repeated (in a different form) on the CRT which has a total of three separate but simultaneous displays, one above the other. Below the demand signals are an elevation/range presentation showing the radar profile ahead of the aircraft in comparison with the protection profile, and below that a lateral artificial horizon presentation.

In the ground mapping mode of operation, a 'one-beamwidth' (i.e. 2.8 degrees in azimuth and 12 degrees in elevation) scan pattern extending 60 degrees on each of the aircraft axis is used. This is presumably achieved by rotating the scanner sub-assembly in roll through 90 degrees from the terrain-following position, see photograph. There appear to be no provisions for depressing the boresight of the radar, which implies that in level flight at 1,000 metres the nearest ground ahead illuminated by the radar will be slightly less than 10 km from the aircraft's position.

A storage tube indicator is provided, and in the case of two-seat aircraft, the navigator is equipped with a high-definition remanent indicator CRT. Data presented in addition to the radar map includes a speed marker and updating reference marker. This mode cannot be used at the same time as the terrain following mode.

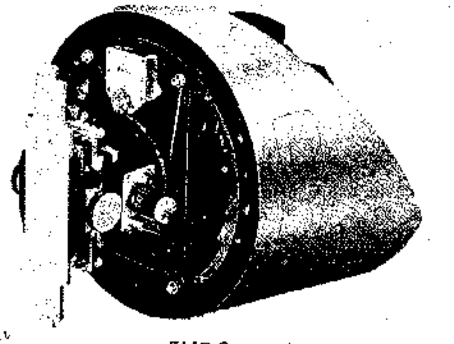
In the search phase of the air superiority mode, the pilot can select either wide or limited search scanner patterns. In the former, the scan pattern covers a zone of 12 degrees in elevation and ± 60 degrees in azimuth. These figures suggest that the scanner assembly is rotated so that the 12 degree dimension of the beamwidth is aligned with the vertical axis, with scanning taking place in azimuth. The head-down CRT display is used for target acquisition.

For the limited search pattern, the scanner is rotated through 90 degrees so that the 12 degree axis of the beam is aligned with the (lateral) horizontal and vertical scanning is used to produce a scanned zone 12 × 12 degrees. Display is by means of the head-up presentation, and target acquisition is automatic. A radio altimeter input is used to provide an altitude gate to prevent locking on to ground echoes.

In the tracking phase of the air superiority role, the scanner in elevation, echo position, compared with a tracking pulse, provides a lock-on pulse which stops the range search, and an error signal from the time discriminator which facilitates range slaving. A speed memory allows for tracking targets in the face of fluctuating or interrupted reception. Target range and angular deviations are presented on the head-up display.

DEVELOPMENT:

The Oryx is the latest in a line of development started in the mid-1960s with the Antilope. This was a private venture by EMD and was unsuccessfully proposed for a number of aircraft projects. This had a segment Cassegrain type scanner. At the 1969 Paris Air Show the Antilope II was shown, this having a flat slotted waveguide antenna in place of the Antilope I's Cassegrain system. The Oryx, revealed at the Paris Air Show in May 1971 is a further development of the Antilope II. Weights of the three models (nose unit only) are Antilope I – 160 kg, Antilope II – 70 kg, Oryx – 90 kg.



EMD Oryx radar

STATUS:

No production plans for this radar have ever been announced and the programme may now be moribund.

MANUFACTURER:

Electronique Marcel Dassault, 55, Quai Carnot, 92 St Cloud, France.

1672.353

AGAVE AIRBORNE RADAR

DESCRIPTION:

AGAVE is the definitive version of an airborne radar developed for use on naval aircraft, and which has evolved from the RH 370 helicopter radar (Entry No. **1395.353**, JANE'S WEAPON SYSTEMS 1972-73).

Basic functions of Vigie series radars are:

(1) Air-to-surface vessel search
(2) Target designation for the homing head of an active missile or to a sighting system
(3) Ground mapping
(4) Air-to-air search
(5) Automatic tracking of air or sea targets
(6) Ranging of air or surface targets

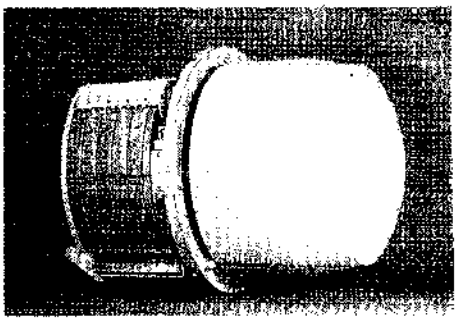
Additional optional functions are:

(7) Contour mapping
(8) Blind penetration
(9) X-band beacon reception
(10) Navigation up-dating and target designation to a bombing computer

The basic characteristics of the radar are: monopulse operation, X-band frequency, solid-state electronics using thick-film ICs, and built-in test facilities. In the ASV role a detection range of 22 to 35 nautical miles against a patrol boat target is claimed, and in the air target mode a fighter aircraft can be detected at ranges between 13 and 22 nautical miles. In both instances the exact range performance will depend upon the scanner size employed. To suit the more confined installation space in the nose of fighter aircraft, inverse Cassegrain scanners of several diameters are available. They are pitch and roll stabilised and have a scanning sector of 140 degrees.

STATUS:

The definitive AGAVE version has been ordered into production for installation in French Fleet Air Arm Super-Etendard aircraft. The programme is being conducted in collaboration with Electronique Marcel Dassault.



AGAVE airborne radar

MANUFACTURER:

Thomson-CSF, Division Equipements Avioniques et Spatiaux, 178 Bd Gabriel Péri, 92 240 Malakoff, France.

1352.353

SAIGA HELICOPTER RADAR

DESCRIPTION:

The EMD Saiga is a Ka-band radar designed to provide obstacle warning and avoidance facilities for helicopters flying at low levels. Peak output power at a frequency in the 35 GHz band is about 7 kW, and a pulse length of 0.2 microseconds is used. Overall noise figure for the system is quoted as being less than 13 dB. Weight of the radar with radome is 53 kg, and of the display unit 12 kg.

The antenna array consists of a pair of 44 cm diameter parabolic dishes with through feeds and sub-reflectors. These are mounted back-to-back within a gimbal ring which rotates about a vertical axis. This assembly is rotated at 660 rpm to provide azimuth scanning. The twin dish is supported within the gimbal ring with freedom to rotate about the horizontal axis. Rotation about this axis is controlled to provide pitch and roll stabilisation. Beamwidth of the scanner is 1.3 degrees and the limits of scan are greater than ±80 degrees in azimuth in respect of the fore-and-aft axis, and greater than ±10 degrees in elevation with respect to the velocity vector. The system can operate at speeds between 0 and 270 knots, and can provide a minimum clearance altitude of 30 metres.

OPERATIONS:

The principle function of the Saiga radar is obstacle avoidance to permit all-weather and night operations at low level, but it may also be used for navigational purposes and homing onto transponder beacons for tactical applications.

Saiga helicopter radar installation

In the obstacle avoidance mode, it will indicate pylons, overhead cables, etc in addition to high terrain. Avoidance manoeuvres are performed manually, using either of two display presentations available with Saiga. Both are CRT displays.

Type B (azimuth/distance) is a scan converted display with a maximum range of three nautical miles. This shows only dangerous obstacles to permit either lateral avoiding changes of course or braking manoeuvres. Solid lines on the display denote range and the braking distance is represented by a dotted horizontal line. Attitude information is given at the top of the display.

Type C (azimuth/elevation) presentation provides for either lateral or vertical avoiding action. Range scales of either one or three nautical miles can be selected. The desired clearance altitude is selected by the pilot. Dangerous obstacles are then displayed above a solid horizontal centre line on the display which represents the clearance attitude. Attitude information is displayed as in the Type B presentation.

DEVELOPMENT:

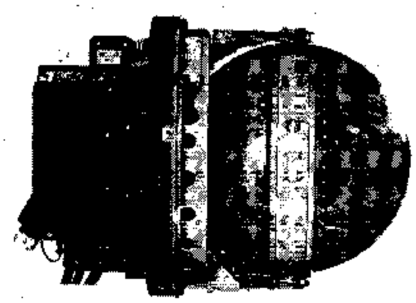
Development of the Saiga was started in the late 1960s.

STATUS:

Flight evaluations have been carried out by the French and US Services, but no production contracts are known to have been awarded.

MANUFACTURER:

Electronique Marcel Dassault, 55, Quai Carnot, 92-St Cloud, France.



Saiga helicopter radar

1674.353
NR-AI-3-A AIRBORNE IFF INTERROGATOR

DESCRIPTION:

The NR-AI-3-A system is based on the LMT ER-115-A transmitter/receiver unit. This incorporates a coder, one transmitter and one or two receivers. The respective operating frequencies are 1030 MHz and 1090 MHz. The equipment is designed to provide certain types of aircraft with secondary surveillance radar and IFF interrogation capabilities, and the possible Modes are 1, 2, 3/A and C, with Mode 4 if the system is equipped with a suitable coder and decoder. Up to four modes may be interlaced. Transmitter power can be selected at any one of three levels, 0.5 1, or 2 kW. Apart from the one transmitter tube, the equipment is all solid-state, and weighs 8 kg.

MANUFACTURER:

Le Matériel Téléphonique, 46/47, Quai Alphonse Le Gallo, 92103 Boulogne-Billancourt, France.

INTERNATIONAL

1784.353
AN/APS-503 AIRBORNE RADAR

DESCRIPTION:

The Canadian Department of Supply and Services has awarded a \$2.2 million contract for helicopter surveillance radars to a team made up of Litton Systems (Canada) Limited of Rexdale, Ontario, and AIL, a division of Cutler-Hammer, Deer Park, New York. The radars will be installed in CHSS-2 Sea King helicopters that are used for surveillance, and search and rescue missions. Under the terms of the contract AIL will design and deliver three preproduction prototypes and Litton Canada will manufacture the required 51 production radars in Canada.

The surveillance radars designed to search for surface targets will also display prominent terrain features as an aid to navigation. The combined system weight, including antenna, transmitter/receiver, a PPI display and the radar control units will be approximately 45 kg. The radar primarily designed to meet standards established by MIL-E-5400 will be modified to reflect the severe vibration environment in the helicopter.

Design plans for the helicopter search radar call for the antenna to be mounted on the top surface of the helicopter, to the aft of the main rotor drive assembly. It will provide 360 degrees of azimuth coverage by scanning its 61 cm antenna reflector at 30 rpm. A tilt adjustment up to 8 degrees will be provided to accommodate different beam depression angles. The antenna will be roll and pitch stabilised to take out attitude changes of the helicopter of up to 20 degrees from straight and level flight. The entire antenna assembly will be housed within a top-mounted radome.

The PPI will be an 18 cm diameter display and will weigh about 11 kg. The range scale of the PPI is adjustable from 1 up to 100 miles full scale. Radar returns will be presented with north or aircraft heading at the top of the display, and a heading strobe superimposed on the video return displaying the pointing direction of the helicopter. Adjustable range and bearing markets, coupled to digital readout indicators, will be provided to give an accurate location of selected targets.

The first pre-production prototype was scheduled for flight tests late in 1973 and delivery of production units is due to start in the Autumn of 1974.

The operating frequency (fixed) will be in the X-band, between 9.2 and 9.4 GHz, and the transmitter will have a peak output power of 50 kW. Pulse length and PRF will be 0.5 microsec and 400 Hz, respectively. The scanner will be stabilised in roll and pitch within limits of ±20 degrees and the Tilt control will provide a range of ±8 degrees. The rotation rate will be 30 rpm.

MANUFACTURERS:

AIL Division, Cutler-Hammer, Deer Park, New York, USA.

Litton Systems (Canada) Ltd, Rexdale, Ontario, Canada.

SWEDEN

1208.353
UAP 12 SERIES AIRBORNE ATTACK RADARS

DESCRIPTION.

Range of nose-mounted, forward-looking radars for search and fire control applications in interceptor aircraft. The radars in this series are pulse radar equipments operating in the X-band of the spectrum. There are four main units in each installation: aerial scanner; main electronics unit containing transmitter/receiver, power supplies etc; indicator; and control panel. All versions use a Cassegrain aerial with conical scan feed, although it is believed that a conventional dish aerial was employed at one stage of development of this range.

There are three variants of the UAP 12 Series, of which the UAP 12102 can be regarded as the basic version. This is also known as the PS-03/A and is widely fitted in Saab Draken B and D aircraft. The UAP 12201 version is a variant of the basic model, but intended for use in interceptors without a fire control computer. The UAP 12301 is a ground attack version with similar mechanical design to the UAP 12102, and operating in the monopulse mode.

OPERATION:

UAP 12102: The following operation modes are provided – search, acquisition, lock-on, and tracking. A space-stabilised search pattern is used for air target search with pilot option of narrow or broad scan in azimuth and two-or four-bar in elevation. The pilot also selects appropriate range limits. A B-scope presentation is used on the pilot's display during the search and acquisition phases.

During the tracking phase, conical scanning is used to track the target, and for this purpose the aerial has a feed which produces a conically rotating lobe in space. The covered volume is displayed for tactical information in the form of a jizzle band. The pilot locks the radar onto the target by placing a marker over the target echo on the indicator. This action stops the search pattern and initiates the automatic range and angle tracking phases. When automatic lock-on has been established, tactical information is displayed on the indicator.

UAP 12301: The following modes are provided – surface search (sea or ground), navigation, air target search, low level search (ground obstacles and aircraft flying at low level).

A monopulse, four lobe, aerial feed is used in this version, angular displacement of the target from the radar boresight being derived by signal processing of the four received signals, one from each lobe of the aerial pattern. Lobe-shaping is also applied, to further improve performance, in the horizontal plane during surface search, navigation and air target search modes. Lobe-shaping in the vertical plane is applied in the low level search mode.

For search operations against surface targets, the aerial performs a space-stabilised search pattern in azimuth with an angle of elevation determined by aircraft altitude. A sector-PPI presentation is used for all modes of operation and swept gain is employed during ground search for presentation of echoes at various ranges with the same intensity. A mapping mode is also available.

DEVELOPMENT:

This series of airborne radars represents the second generation of L M Ericsson equipments of this type, the first being those built for the Saab Lansen aircraft. Development was started in 1954 as a part of the Saab Draken programme.

STATUS:

The UAP 12102 (PS-03/A) version is fitted to J35B and D Draken aircraft of the Swedish Air Force.

MANUFACTURER:

Telefonaktiebolaget L M Ericsson, M I Division, S-43120, Möndial, Sweden.

1209.353
UAP 13 SERIES AIRBORNE ATTACK RADARS

DESCRIPTION:

This is a range of forward-looking airborne radars for air and ground attack roles, and there are five known variants. All are pulse radars operating in the X-band of the spectrum. The range is based upon an improved version of the UAP 12 Series described in Entry **No. 1208.353**. Improvements include increased power and additional facilities.

The basic model of the range is the UAP 13102, which is also designated PS-01/A. It is fitted to the Saab Draken J35F. The UAP 13103 (PS-011/A) is similar to the UAP 13102 but is designed to be used with the S71N infra-red search and track set. Both these models are intended for use in aircraft having a fire control computer. The two corresponding versions for aircraft without such computers are the UAP 13202 and UAP 13203, respectively. The fifth variant of this series is the UAP 13301 which is a search radar for ground attack aircraft. Mechanical design of this set is as the UAP 13102 but with fewer sub-units, and other features and functions are as the UAP 12301 (See entry No **1208.535**).

OPERATION:

The most important additional feature of the UAP 13102 compared with the UAP 12102 is the provision for slaving of missile radar and infra-red guidance systems to the aircraft radar. The operational modes (search, acquisition, lock-on, and tracking) and the display facilities are broadly similar. A 2-bar scanner search pattern is used in the elevation plane for the UAP 13102, and a choice of 2- or 4-bar in the UAP 13103.

DEVELOPMENT:

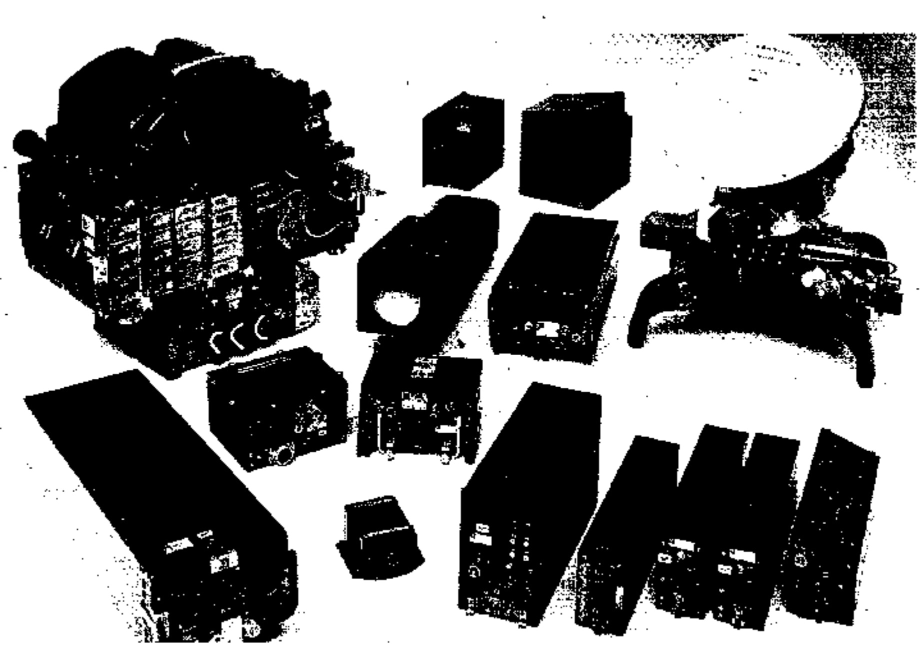
The UAP 13 Series is the outcome of continued development of the UAP 12 Series, and largely associated with the requirements of the J35F version of the Draken. The project started in 1959.

STATUS:

UAP 13102 and 13103 models are fitted to Swedish Air Force Draken aircraft, the latter variant of radar being the one used with the S71N infra-red search and track set.

MANUFACTURERS:

Telefonaktiebolaget L M Ericsson, M I Division, S-43120, Mölndal, Sweden.



The UAP 13104 radar installation for Finnish 35S Drakens

1210.353

UAP 1011 (PS-37/A) -AIRBORNE ATTACK RADAR

DESCRIPTION:

This is a multi-mode airborne attack radar, operating in the X-band, and using the monopulse technique. High output power is employed to provide long range performance. Cassegrain or parabolic dish scanners with fixed feed have been developed for this radar, but the latter is the preferred aerial system.

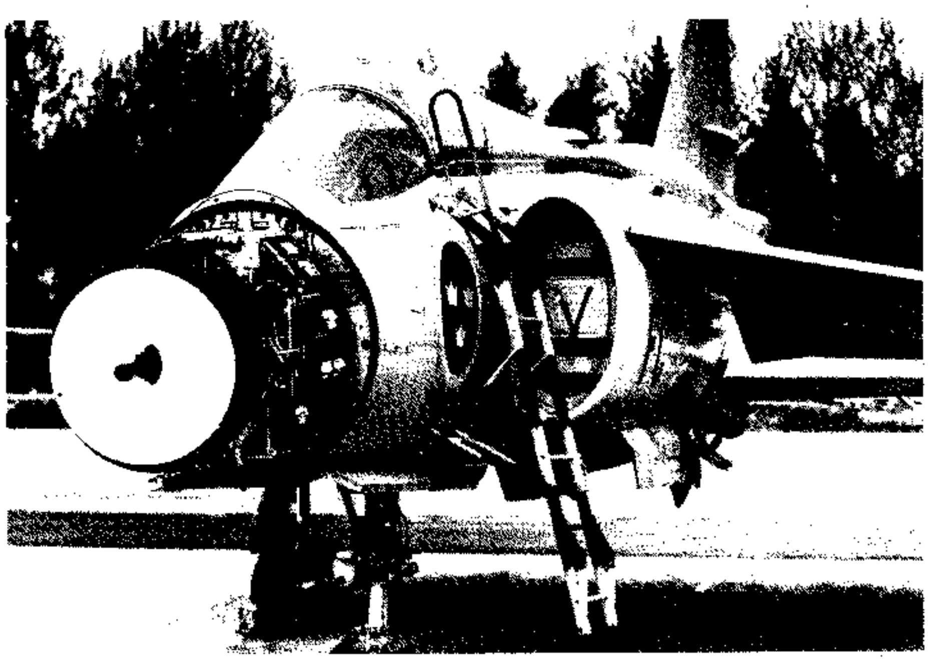
The UAP 1011 is an important element in the attack system of the Saab Viggen aircraft, and its design provides for considerable integration with the navigation, display, and the digital computer-based data processing sub-systems.
computer-based data processing sub-systems.

The radar is comprised of two main units, the electronics package and the scanner assembly. The former is made up of 13 replaceable units housed in a main assembly which carries the interconnecting cable looms. The division of electronic functions between the individual replaceable units has been arranged so that, as far as possible, related functions are housed within one unit, enabling the replacement of units to be effected without the need for subsequent trimming or adjustment. Each of the replaceable units contains between three and eight sub-units, which provide further facility for servicing.

With the exception of certain high-frequency devices, the UAP 1011 is a completely solid-state equipment. The mechanical design incorporates an hydraulic drive for the aerial scanning and stabilisation system, providing accurate and rapid movement over wide angles.

In the interest of high performance and optimum operational flexibility, including conditions of high interference (natural or ECM), elaborate signal processing facilities at both the radio-frequency and video levels are provided in the UAP 1011. Another technique employed to increase accuracy and resolution is lobe-shaping, which synthetically produces the effect of increased aerial aperture and reduced side-lobes.

In the Viggen installation both head-up and head-down display of radar information is provided, the data presented varying in accordance with the operational mode employed.



UAP 1011 radar in the 37 Viggen aircraft

OPERATION:

To comply with the requirements of operation of the Viggen by a single crew member (pilot), the UAP 1011 is designed for semi-automatic operation to reduce cockpit work-load. Facilities provided include: search, target acquisition, air target ranging, surface target ranging, obstacle warning fixed-point radar navigation, and terrain mapping. The system is designed to allow for terrain following by the addition of one unit.

Radar information is shown on the head-down display in the form of sector-PPI or B-scope presentation. This unit features a dual persistence CRT in which rapidly changing data (such as a radar map) is presented with a shorter persistence than alpha/numeric characters or other symbols. The latter can be used for the display of flight information or target designation, and are derived from a wave-form generator driven by the aircraft central digital computer.

DEVELOPMENT:

The UAP 1011 is the third generation of airborne radar equipment developed by L M Ericsson. Theoretical studies for a radar to meet the requirements of the Viggen were started in 1958, and ground tests on the first prototype took place in 1961. The first system-engineered model was built in 1965 and air tests began in 1966, with the radar fitted in a Lansen test-bed aircraft equipped with Viggen electronics. Verification tests in a Viggen took place in 1968, and production was ordered, starting in 1970. A new version for the Swedish fighter version of the Viggen (JA37) entered development in late 1971.

MANUFACTURER:

Telefonaktiebolaget L M Ericsson, M I Division S-43120, Mölndal, Sweden.

1741.353

DAX-100/200 SERIES AIRBORNE RADAR

DESCRIPTION:

The new radars being developed for the JA37 interceptor version of the Saab-Scania Viggen carry designations in the DAX series, the suffix number differing according to which prototype or test model is denoted. The eventual production version will have an entirely different designation. The advanced target search, acquisition and tracking system for the JA37 is based on the new radar, which is an X-band, all-weather search and fire control pulse-doppler equipment. Its specification calls for operation at all altitudes and attack angles, operation against all forms of background clutter (chaff, weather, etc) and incorporates high ECM resistance. The JA37 for which the radar is being developed will be armed with radar or infra-red guided missiles and guns.

The radar has a coherent high output power transmitter using a TWT and a newly developed Cassegrain antenna, with a two-gimbal motion system, giving extremely low side-lobe levels. Extensive use is made of digital techniques for signal and data processing, and the signal processor contains the doppler filtering and target tracking functions. Target data are extracted by software Kalman filtering in the processor, which by reprogramming can be adapted to changing ECM conditions. Moving ground targets are eliminated by appropriate waveform design, and the display has motion compensation to identify high- and low-speed targets. Built-in test facilities are provided.

The electronic display sub-system is the responsibility of the LMF subsidiary company SRA, and the type selected is an all-electronic arrangement comprising a digital processor and scan conversion driving CRT displays. The processor performs such data reduction tasks as correlation scan to scan, correlation between different sensor outputs, motion compensation, trail generation, and ECM processing. Depending upon circumstances, three presentation channels are available for use: head-up display for low level flight and close-in combat; head-down display for all-weather interception; and a tactical display electronic map for display of the combat situation and navigation.

DEVELOPMENT:

The DAX-100/200 radar is being developed by LME and SRA under contract on behalf of the Royal Swedish Air Force.

STATUS:

The first prototype began flight testing in a Saab Lansen testbed aircraft in April 1972 and by the end of that year 72 one-hour flights had been completed successfully. The same prototype has been used for ground tests also. In the course of 1973 further prototype models were brought into the programme.

MANUFACTURERS:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-431 20 Mölndal, Sweden.

Svenska Radio AB, Alströmerg 14, Fack, Stockholm, Sweden.

1785.353
UK AIRBORNE INTERCEPTION RADAR

DESCRIPTION:

In early 1974 it was announced that Marconi-Elliott Avionic Systems Ltd had been awarded a major contract for the initial phase of development of an advanced Airborne Interception Radar system for the RAF air defence version of the MRCA. The Electronic Systems Department of Ferranti Ltd will be major sub-contractor. The design of the new AI radar will draw on the latest technologies to provide a multi-mode system compatible with the size and weight limits of RAF air defence variants of MRCA and the operational requirements of the 1980s and beyond. A substantial part of the signal processing will be performed digitally, in addition to digital radar data handling. The new equipment will anticipate trends in offensive tactics, such as low-level penetration, use of ECM, etc, and will have the flexibility to operate as part of ground- or AEW-based control environments while retaining the capability for autonomous operation if these facilities are absent or degraded by enemy act on.

MANUFACTURERS:

Marconi-Elliott Avionic Systems Ltd, Airport Works, Rochester, Kent, England.

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

1740.353
EMI SEARCHWATER AIRBORNE RADAR

DESCRIPTION:

Searchwater is the commercial name of the airborne maritime search radar being developed by EMI Electronics for use by the RAF. The military designation and all but general technical details of the equipment remain classified information.

The operational requirements against which this radar is designed are the ability to detect small objects such as submarine 'snorts' and periscopes in high sea states; good long-radar and navigation facilities. The specification calls for performance which is generally well in advance of most contemporary equipment according to the designers. Detection of small targets in clutter at ranges in excess of present standards will be aided by the use of frequency agility, and a digital computer for signal processing. It has been stated that Searchwater will incorporate a unique system that will enable radar returns to be examined in detail. The result of each detection will be fed into the computer, and a history built up. The computer will also allow a large number of targets to be tracked simultaneously, thereby easing the operator's task.

Targets are displayed on a single, scan-converted, TV-type display giving a bright flicker-free presentation. A number of display modes are provided and can be selected by the operator to suit the operational situation. In the search mode a PPI display is used, or the target area can be examined by selecting another form of presentation giving a magnified display. Ranges, bearings, and other data are displayed in alpha-numeric form.

The control equipment can be arranged to suit varying installation and operational conditions, but in general the control and operation of the radar is shared between the operator and the computer. Three ranges and automatic sector scan of the antenna are provided. IFF is integrated into the radar display and control console, with active and passive code/decode facilities. Comprehensive ECCM are incorporated.

DEVELOPMENT:

Searchwater is under development by EMI Electronics Ltd in response to a UK MoD contract.

STATUS:

At prototype stage.

MANUFACTURER:

EMI Electronics Ltd, Radar and Equipment Division, Hayes, Middlesex, England.

1023.353
EMI SIDEWAYS LOOKING RECONNAISSANCE RADAR TYPE P391

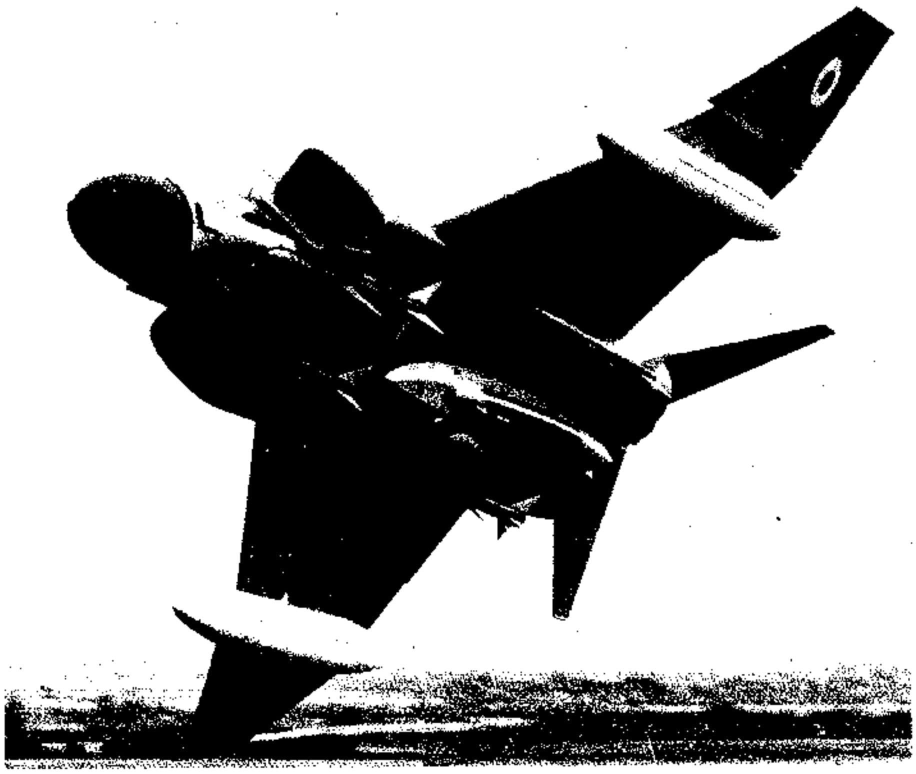
DESCRIPTION:

The Type P391 radar is a high definition equipment working in the Q(Ka) band. Two aerials are used for transmission and reception, one on each side. The resultant returns are recorded on 12.7 cm photographic film which is developed on return to base to provide a radar map of the terrain on each side of the path flown by the aircraft. The equipment is suitable for installation either in the aircraft itself or in a separate reconnaissance pack or pod.

The main units of the equipment are the transmitter/receiver, modulator, recorder, power units – one each for T/R and recorder, port and starboard aerials, and the control unit.

Aerials. Each aerial consists of an array of 12 slotted waveguides stacked vertically, the angle of fire in the horizontal plane being 4° away from the feed end. These are fed via a turret containing four microwave lenses, only one of which is in use at any time. These lenses control the phase and amplitude of the energy reaching the individual arrays in such a way as to give the required depression angles, together with some shaping of the nearside polar pattern to make it approximate to a cosecant squared law. Further correction and control of the overall sensitivity at each depression angle is applied by a swept gain system in the IF amplifiers.

Transmitter/Receiver Unit: This unit is housed in a cylindrical pressurised container and contains



Reconnaissance pod designed for RAF Phantom aircraft. It contains P391 radar, infra red linescan and cameras the magnetron, the RF output of which is fed via a duplexer to the RF switch. The RF switch, which is attached to the front of the T/R unit, connects the equipment alternatively to the port or starboard aerial at a rate of 237.5 Hz to give groups of 4 or 8 pulses on each side so that both sides may be recorded. Switching is achieved by the use of two ferrite rod Faraday rotators, the coils of which are driven by transistors in the unit. The switching is carried out just before the transmitter pulse so that no returns are lost.

Modulator: This is housed in a rectangular pressurised box and generates a 4 kV pulse of 230 kW peak power, duration 140 nanoseconds for driving the magnetron in the T/R unit. Power supplies are generated from the aircraft 3 phase 400 Hz supply.

Recorder: This is housed in a pressurised container, the major dimensions of which are dictated by the recording CRTs and optics. The CRTs used, type VX1711, have been specially developed to give the maximum overall resolution and to operate satisfactorily under vibration. Two such tubes are employed, each giving a 70 mm trace, images of which are focussed by high quality copying lenses on the film.

DEVELOPMENT:

Two types of linescan sideways looking radar were originally developed in collaboration by EMI and the Royal Radar Establishment for the TSR-2. One was an X-band equipment intended to fulfil a navigational role in addition to reconnaissance, and the other was the Q-band, high definition equipment, now designated P391. The P391 was incorporated in the reconnaissance pod developed for use with UK Phantoms.

STATUS:

In operational service with the RAF since 1970 at home and overseas.

MANUFACTURER:

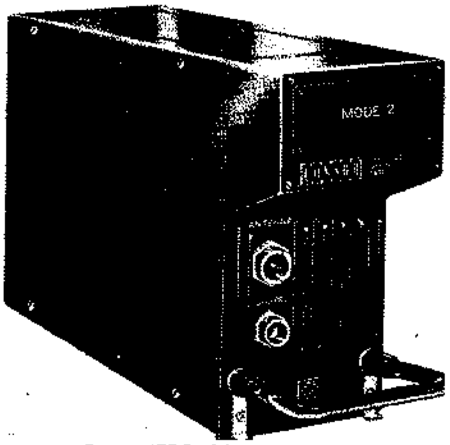
EMI Electronics Ltd, Hayes, Middlesex, England.

1572.353
COSSOR AIRBORNE IFF TRANSPONDERS

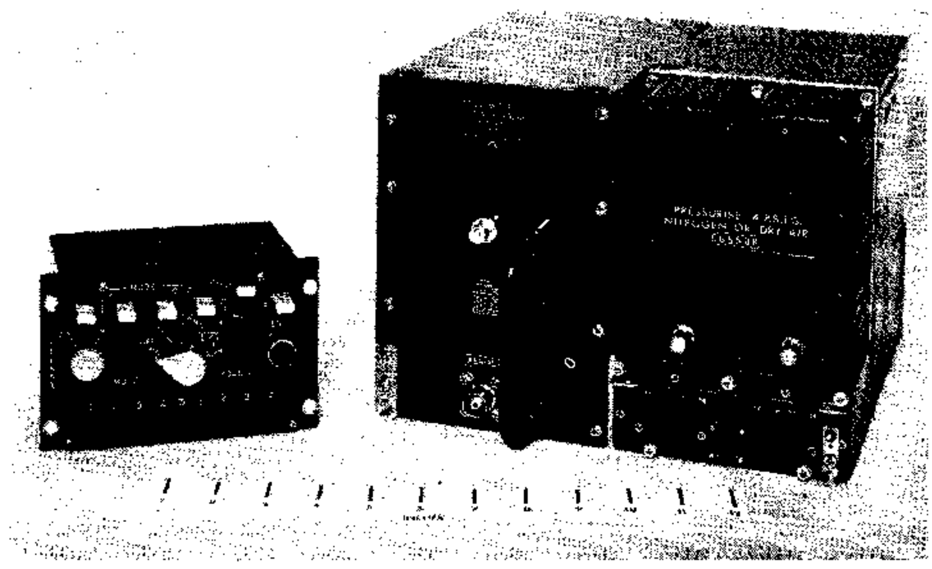
Cossor Electronics Limited are the prime suppliers of airborne IFF Transponders to the UK Government. Active in this field for many years, their current range of equipment includes microminiature IFF Mk.10(SIF) and SSR transponders conforming to the requirements of ICAO Annex 10 and STANAG 5017.

IFF1520

This transponder is designed for use in high performance military aircraft and is fitted to all first-line aircraft of the Royal Air Force and Royal Navy. Modes 1, 2, 3/A, B, C, and D, 4096 codes.



Cossor IFF 2720 transponder



Cossor SSR 1520 transponder with control unit

IFF 2720

Newly developed unit for military aircraft including strike-trainers and helicopters. Operating in modes 1, 2, 3/A, B and C and providing 4096 codes with provision for system expansion.

IFF 3000

Jointly developed with E.M.D. of France, this microminiature equipment is fitted to Belgian Mirage aircraft. Modes, 1, 2, 3/A, B and C, 4096 codes with provision for system expansion.

IFF 3100

Currently under development for high performance multi-role aircraft. Single package, microminiature equipment operating in modes 1, 2, 3/A and C with provision for system expansion.

MANUFACTURER:

Cossor Electronics Limited, The Pinnacles, Harlow, Essex, England.

1027.353
ARI 5955/ARI 5954 HELICOPTER TACTICAL RADAR

DESCRIPTION:

Airborne radar for ASV, ASW, MCM and SAR roles, designed specifically for helicopter installations. The ARI 5955 is the main radar set, capable of primary radar operation for the detection and location of air and surface targets. The ARI 5954 is a complementary transponder for use with the ARI 5955, and installation in friendly aircraft and surface craft to provide identification and increased range performance.

Operating frequency is in the X-band and a stabilised dish scanner is housed in a radome located on the upper surface of the fuselage, aft of the rotor pylon. Aerial tilt is adjustable from the radar operator's position, both above and below a horizontal datum. Receiver gain is adjustable, and variable swept gain facilities are provided. FTC (fixed time constant) operation can be switched in or out. A selection of range presentations, up to 50 nautical miles, is available.

The display unit employs a projection CRT in conjunction with a Schmidt optical system and field lens. This gives unusually high brightness over the 43 cm square plotting surface. An illuminated parallel-line protractor is incorporated.

The ARI 5955 transmitter/receiver unit has the following characteristics: X-band; transmitter peak power – 15 kW; pulse length – 0.5 microsecs; PRF – 400 Hz; IF frequency – 30 MHz; receiver noise factor – 10.5 dB max. The receiver includes a two-channel reception facility capable of being switched to receive either primary radar

ARI 5955/ARI 5954 tactical radar installation in Sea King helicopter, showing combined display/plotting console on left

returns or transponder responses.

The transponder has the following main features: interrogation frequency coverage – X-band; reply frequency – switched frequency X-band; IF pass-band 35-135 MHz; transmitter peak power – 100 watts; code pulse width 0.5 microsecs; dead time after interrogation and reply – 35 microsecs for single-pulse reply, 130 microsecs for coded reply; aerial beamwidth, azimuth – omni-directional, vertical – 30 deg; aerial gain 4 dB.

OPERATION:

Information displayed includes primary radar echoes from other aircraft, vessels and terrain up to a range of 50 n miles. Coded secondary radar responses from aircraft, helicopters or surface vessels equipped with the associated transponder units are also displayed. This secondary radar facility provides positive information and permits low-altitude helicopters to be plotted at much increased ranges in the presence of sea clutter. Both primary and secondary radar can be displayed separately or together. The range and bearing of sonar contacts are also indicated. The operator has the choice of three modes of presentation: conventional PPI, ground stabilised, ground stabilised with offset.

DEVELOPMENT:

Initial development was in response to a UK Government contract, and was conducted in collaboration with the Ministry of Technology.

STATUS:

The ARI 5955 entered RN service in 1968; it is known to form part of the Sea King ASW system (of which 82 have been ordered) and is assumed to be installed in all RN Wessex HAS 3 helicopters Production is continuing. Users, in addition to the RN, include the Australian, W. German, Norwegian, Indian and Italian Navies. Versions with two sizes of larger antenna are available. One such is being used for ice reconnaissance in Canada, the other being evaluated for an ASW helicopter with updated performance. Variants for use with missiles are under development.

MANUFACTURERS:

The MEL Equipment Company Ltd. Defence Systems and Avionics Division, Manor Royal, Crawley, Sussex, England.

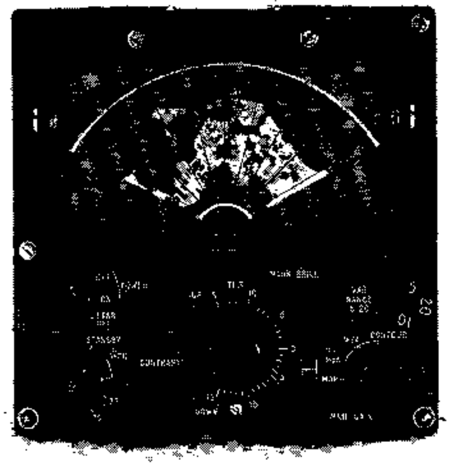
1028.353
E290M COMBINED TACTICAL AND WEATHER RADAR

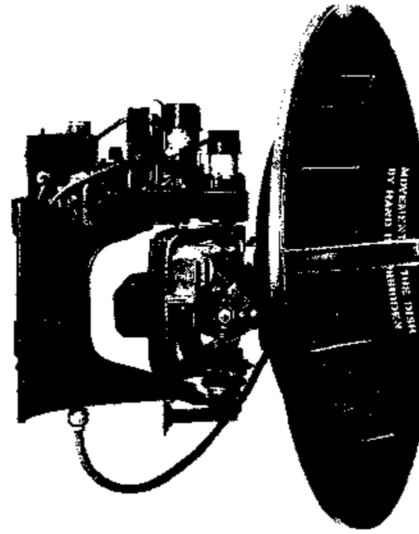
DESCRIPTION:

This is a military version of the widely used 'Ekco' E290 airborne weather radar with the addition of special features and facilities to suit it for a number of military roles. These include high definition terrain mapping and ASV (Air-to-Surface Vessel) functions.

The E290M systems are designed to provide not only long range weather and terrain mapping facilities, but also a special short range high resolution display, giving a capability in airborne approach and other roles, such as surface target detection. The duplicate type system is based on the E190/E290 duplicate system; it uses two Trans/Receivers, M3051B a 4 microsec 30 kW unit for long range weather and terrain mapping, and M3066A a ½ microsec 12 kW unit, which is especially intended for short range high resolution mapping.

The two Trans/Receivers are mounted side by side in a common tray with the Junction Box, which provides the unit changeover and cross switching facilities, at the rear. Either Trans/Receiver can be in operation with the other at warm standby or fully off. Thus long range surveillance is provided with the high power unit activated, and with rapid transfer facility the short pulse unit is available for the shorter range high resolution role. Should either Trans/Receiver unit fail each has a good performance in the other role, thus providing the in-flight reliability increase of a duplicate system, together with optimum long and short range characteristics.





Indicator and Scanner assembly for the Ekco E290M combined weather/tactical radar

The two Indicators M6300A, which can be operated simultaneously or alone, with either Trans/Receiver. Variants of E290M system are available employing one indicator and one Trans/Receiver, with Scanner type M2210 or M2267.

DEVELOPMENT:

Development was started as a private venture in 1966 and the first prototype was completed the same year. Entry into service followed in 1967.

STATUS:

The E290M system is now in service with the Canadian Defence Force. Over 100 systems have been delivered and are in service with the Canadian Defence Force and other Air Forces in fixed wing aircraft and helicopters. Variants for use with missiles under development.

MANUFACTURER:

The MEL Equipment Company Ltd., Defence Systems and Avionic Division, Manor Royal, Crawley, Sussex, England.

1031.353
AIRPASS I

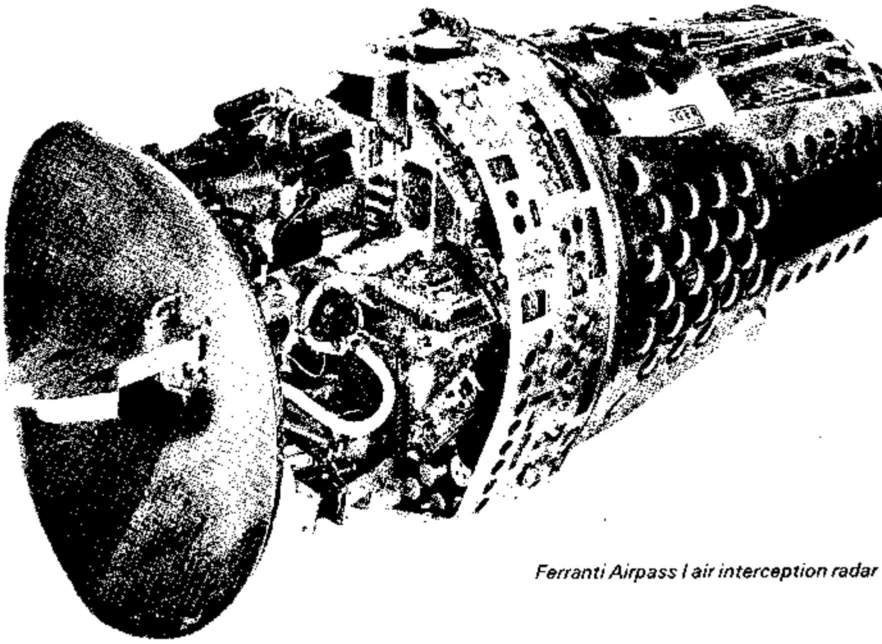
DESCRIPTION:

Forward-looking AI radar providing search tracking and ranging facilities. This equipment represents the later stage of development of AI radar using valved circuitry, now superseded by solid-state technology.

OPERATION:

Mechanical scanning of a twin-profile dish reflector with dual feeds is used to provide monopulse operation in the X-band sector of the radar spectrum. Constructional layout is designed to suit pod mounting of the radar within the nose air intake of interceptor aircraft. It is fully roll-stabilised.

Target search is carried out with the aid of a head-down display unit in the cockpit, with lock-on occurring once target identification has been achieved. The interceptor's approach course is calculated by a computer, which also determines launch point for the air-to-air missile selected by the pilot. Information from the computer is displayed to the pilot on a head-up display during the attack phase, permitting completely blind intercepts to be performed, if necessary. For targets of opportunity, where contact is made visually and little time is available, a radar ranging mode of operation can be employed. In this case, a search is carried out directly ahead of the aircraft, and lock-on is achieved on the first target detected. The range data may be used for either gun or missile attack. System weight is in the region of 113 kg.



Ferranti Airpass I air interception radar

The Airpass I has appeared in four versions: I, IB, IB(S) and I(SP). The IB is a developed version of the Airpass I providing increased countermeasure facilities and in which all attack information is displayed head-down. The export version of this equipment Airpass IB(S) also incorporates an air-to-surface capability for ground attack roles. Airpass I has been produced in a repackaged, short pack, version for export and is designated I(SP).

DEVELOPMENT:

Development of Airpass I by Ferranti under UK Government contract began in April 1954 and the first prototype was completed in March 1955. Entry into service with the RAF, installed in BAC Lightning aircraft took place early in1959, when it was claimed to be the first high-power monopulse AI radar to go into squadron service anywhere in the world. Work on the IB version started in November 1958, with first prototype completion in October 1960 and entry into service in December 1962. Production of Airpass I ceased October 1962, and of the IB in March 1969. A total of over 600 of all versions have been produced.

STATUS:

All known service installations have been in BAC Lightning interceptor aircraft of the following marks: F 1, F 2, F 3, F 6, F 1A, F 2A, F 53, T 4, T 5, T 55. Users include – Indian Air Force, Kuwait Air Force, RAF, Saudi Arabian Air Forces.

MANUFACTURERS:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

1032.353
AIRPASS III

DESCRIPTION:

Forward-looking attack radar providing long-range air-to-surface search, ground mapping, radar ranging and tracking, terrain warning and conventional weapon aiming.

This radar is the latest in the Airpass series of equipments now in service. Mechanical design is similar in many respects to Airpass I and the operating frequency is within the same part of the radar spectrum (X-band). A monopulse radiation pattern is employed for tracking modes of operation, and it can be assumed that for ground mapping and ranging modes of operation, cosecant-squared and pencil beams, respectively, can be employed. The dish scanner reflector and feed arrangements of the Airpass III differ from those of Airpass I. A Cassegrain System being used in the former. Manufacturer's weight is 104 kg.

OPERATION:

Operational functions also differ as a result of this radar having been designed specifically for use in RN Buccaneer strike aircraft. Ground mapping, long-range air-to-surface search and ranging, terrain warning, and the ability to cater for a wide variety of weapons and stores, and a range of missions profile illustrates this. A head-down display is provided for the second crew member, and attack and guidance information is presented to the pilot via an Elliott head-up display. A version of Airpass III for use in SAAF Buccaneers incorporates a monopulse resolution enhancement facility.

DEVELOPMENT:

Development of Airpass III by Ferranti under UK Govt. contract began in September 1957 and the first prototype was completed in early 1959. Entry into service was in January 1962. Over 250 sets have been ordered and production is continuing.

STATUS:

All installations are in either the S Mk 1, S Mk 2 or S 50 versions of the Buccaneer. Further research into possible improvements is in progress in connection with the future operation of Buccaneer aircraft by the RAF, and the intention to carry Martel missiles on this aircraft. Users of Airpass III – Royal Navy, Royal Air Force, and the South African Air Force.

MANUFACTURER:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

1033.353
AIRPASS II

DESCRIPTION:

Forward looking AI radar, based on Airpass I and providing similar operational modes, but with the addition of air-to-ground fire control and bomb aiming functions. Development was for use in dual-purpose interceptor/strike aircraft. Provision is also made for ground mapping, terrain clearance and avoidance and certain other modes of operation. It is reported to be somewhat smaller and lighter than Airpass I.

DEVELOPMENT:

Development of Airpass II from Airpass I was undertaken by Ferranti as a private venture.

STATUS:

Among aircraft types for which this equipment was proposed were the Mirage IIIs and Draken. No production contracts have been announced.

MANUFACTURERS:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

1216.353
FERRANTI STRIKE & TERRAIN FOLLOWING RADAR

DESCRIPTION:

This radar is the developed version of the Ferranti Forward-Looking Radar, described in JANE'S WEAPON SYSTEMS, 1969-70 in Entry No. **1034.353** (p.477), and details of its operation, particularly in the terrain following mode appear there.

Principal characteristics include X-band transmitting frequency and a peak power of 70 kW. Two pulse lengths are employed: 2.3 microseconds at 400 pulse/sec for long-range mapping and 0.3 microseconds at 1500 pulse/sec for medium-range mapping and 0.5 microseconds at 3,000 pulse/sec for short-range mapping, terrain following, and radar ranging.

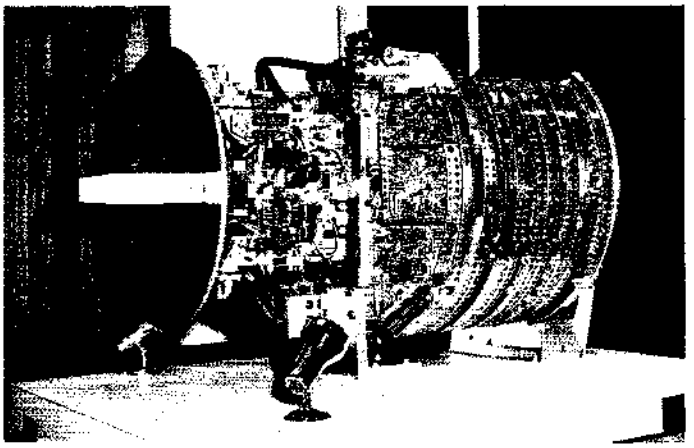
The aerial is a single plane monopulse unit with a 50.8 cm diameter dish and 4.6 degree beamwidth, or as required to suit the installation. Scan angles for mapping and beacon homing are ±55 degrees in azimuth and ±20 degrees in elevation, and vice versa for the other modes. Weight of the radar head is 91 kg and of the indicator 13.6 kg. Overall length is 103.25 cm, and maximum diameter 61 cm.

OPERATION:

The Ferranti SATF radar has the following principal modes of operation:

Terrain Following:

This provides facilities for: selection of any clearance height over all terrain between 60 and 300 metres; extension of minimum selectable clearance height down to 30 metres over water and flat ground; space stabilised steering outputs for manual control; duplicated pitch rate demand for autopilot coupling; speed range of 350 knots to Mach 1.0 without need for adjustment of parameters; full performance in turns of 45 degrees of bank at Mach 0.9; continuous automatic in-flight system test; and a manoeuvre monitor that ensures that terrain following demands are obeyed.



The Ferranti Forward Looking Radar. Originally developed for the TSR-2 strike aircraft

Radar Ranging:

The design caters for accurate ranging with particular emphasis on accuracy at low grazing angles consistent with the delivery of retarded stores from very low level. Successful ranging against airfield runway intersections has been achieved and the SATF has demonstrated its ability to lock-on at ranges in excess of 12 km. Lock-on has been accomplished and held during attacks on grazing angles as low as 3 degrees.

Ground Mapping:

Facilities in this mode include five range scales covering 0.36 km at 1 : 500,000 scale (with expansion to 1 : 15,000) if desired to 0.180 km at 1 : 2,000,000 scale; fan beam for short ranges by means of automatic spoiling; electronic marker for position fixing; track and ground stabilisation of display; monopulse resolution enhancement for improved azimuth discrimination.

Beacon Homing:

This facility gives assistance in identifying landing grounds or datum positions, in addition to rendezvous for flight refuelling or other exercises. Long pulse length is available for selective beacon interrogation. Ranges out to 180 km.

DEVELOPMENT:

Details of the early history of this radar were given in Entry **1034.353**. Five models have been flown on a Ferranti test programme using Buccaneer and Canberra aircraft. Several hundred sorties were flown over varied terrain and over 8,000 km were covered at a specified height of 60 metres. On one sortie, 320 km were flown in safety at 30 metres.

Continuing development is related to the use of frequency agility, which will (a) reduce ground and target glint, leading to better terrain definition and higher air-to-surface ranging accuracies, (b) reduction of sea clutter for improved target detection, (c) wide-band transmission to provide additional ECM protection.

MANUFACTURERS:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

1224.353
PTR 820 AIRBORNE IFF

DESCRIPTION:

Lightweight L-band transmitter/receiver unit, together with an associated encoder-decoder and control unit, designed to provide certain aircraft with IFF interrogation facilities in Modes 1, 2, 3/A, B, C and D. Interlaced mode operation using any three modes is available. Mode selection is from the control unit, or the modulator can be triggered by an external pulse train. Passive decoding is to customer requirements.

Digital shift registers, using silicon integrated circuits are employed in the encode and decode sections, eliminating bulky and temperature-dependent delay lines. Solid-state digital defruiters use pulse-to-pulse validation techniques to ensure reliable operation in the presence of PRF jitter. A modular range store is used which can be matched to SSR range and mode requirements. The PTR 820 includes self-test facilities.

DEVELOPMENT:

Development was carried out by Plessey under UK Government contract, and was started in 1967. The first prototype was completed in mid-1969.

STATUS:

HS 801 Nimrod maritime aircraft of RAF Strike Command are equipped with the PTR 820, which was due to enter service in December 1970. 75 units had been ordered and five delivered at May, 1970. Foreign sales are pending.

MANUFACTURER:

The Plessey Co. Ltd., Vicarage Lane, Ilford, Essex, England.

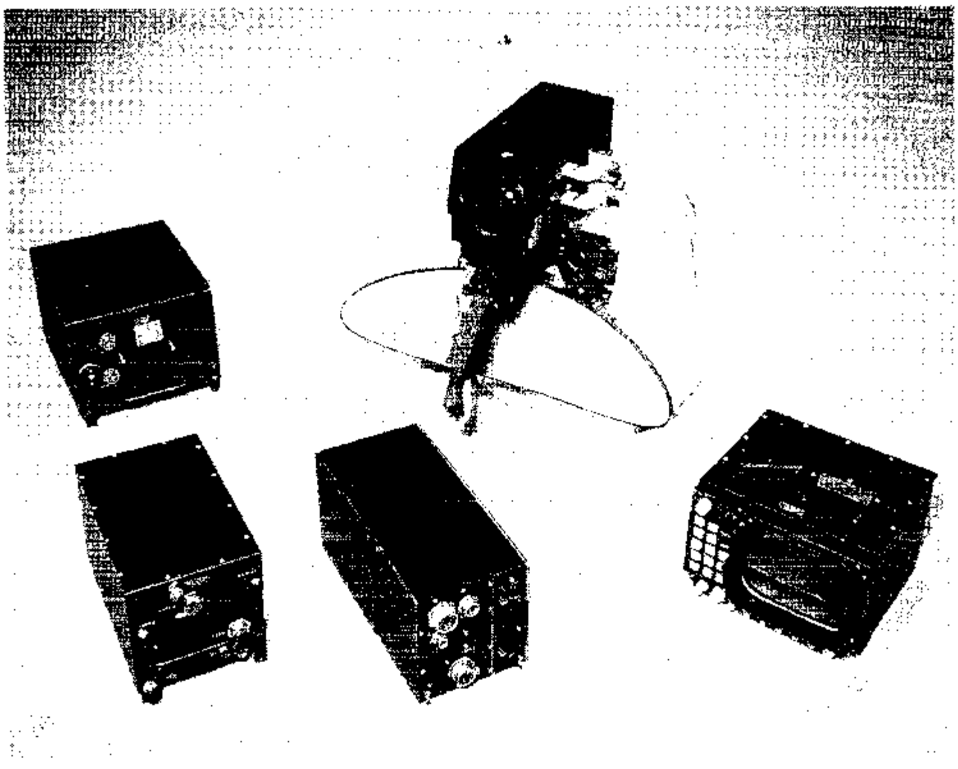
1342.353
FERRANTI SEASPRAY HELICOPTER ASV RADAR

DESCRIPTION:

Seaspray was specifically developed, and has been ordered, for the Royal Navy's Westland Lynx helicopter, in which application it carries the designation ARI 5979. The equipment has been designed to detect the track small high-speed surface craft of the type increasingly used as platforms for anti-shipping missiles. Other possible applications include general maritime surveillance.

The system comprises a scanner assembly, a display and control unit, transmitter, receiver, processor, and cooling matrix. System weight is less than 66 kg. The system operates at X-band frequencies with a transmitter power in excess of 90 kW, and employs frequency agility operation. This is employed for reasons of improved detection of targets in sea and weather clutter and ECM conditions, and also improves bearing resolution by reducing the effect of target 'glint'. Built-in test facilities are incorporated.

The scanner assembly is designed for housing in a nose radome in the aircraft, and is capable of providing for either wide-angle (90 deg left and right of the aircraft datum) or limited scans. The Observer is provided with a scan-converted, bright TV type display unit, on which target range and bearing information is displayed in alphanumeric form in addition to plan position indication of radar returns. In addition to the display controls, this unit also carries push-buttons for radar operational mode selection and other functions.



Seaspray naval helicopter radar system

OPERATION:

Two principal operational modes are provided: Search and Track, and Transponder Beacon. In the former mode either wide-angle or limited sector scans may be employed, depending on the phases of the various operations. Either scan might be used for the detection of surface targets while the sector scan would be used for extra performance and to provide a higher data rate prior to target tracking. Three range scales can be selected with automatic switching of the pulse-length.

In the tracking phase, the monopulse technique is used in azimuth to provide high angular accuracy.

In the Transponder/Beacon mode the display of friendly transponder beacons is provided, for tactical purposes and for operations such as station keeping and homing.

No official information has been obtained, but the Seaspray system also includes provisions for the control of the CL834 helicopter anti-shipping weapon under development for the Royal Navy. (Entry No. **1530.321**).

DEVELOPMENT:

Development was carried out under British Government contract to meet a RN requirement. A simpler variant of Seaspray, named Stalker, for users who do not have a requirement for all the sophisticated facilities of the former, is known to be under development. It will be cheaper and simpler, but will incorporate modes which make it attractive for use on general purpose helicopters.

STATUS:

First official announcement of the Seaspray was made at the Paris Air Show in May 1971, and flight trials have now been successfully completed. Production for the RN has started.

MANUFACTURER:

Ferranti Ltd, Electronic Systems Dept, Ferry Road, Edinburgh EH5 2XS, Scotland.

THE UNITED STATES OF AMERICA

1765.353
APG-63 AIRBORNE RADAR

DESCRIPTION:

The APG-63 is an advanced multi-mode nose radar installed in the USAF F-15 supersonic fighter aircraft (**1669.302**). It is a pulse doppler system thought to operate on a number of (selectable) frequencies in the X band. Little in the way of technical or mechanical information has been revealed, but some details of the APG-63's operational features have been published.

Radar information is digitally processed and there are two types of display employed: one is a small CRT located at the upper left-hand corner of the instrument panel and called the VSD (Vertical Situation Display); the other is the Head-Up Display (HUD). In general, the VSD is employed for the longer-range, initial stages of an interception, while the HUD is for use during actual engagements or close-in encounters.

The VDU presents the pilot with a 'cleaned' synthetic display of computer processed radar video data, together with alpha-numerics and symbols.

Controls for the APG-63 are located at three positions in the cockpit. The main control panel is on the console on the left side of the pilot. This console also carries the two throttles and key radar operating controls are located on them. The third location for radar controls is the aircraft control stick.

Mounted on the main control panel are switches for power, frequency channel selection, selection of various antenna scan patterns in azimuth and elevation, range, display control, and mode selector switches. The main mode selector has positions for four air-to-air modes, three air-to-ground modes, and 'Beacon' for homing and rendezvous use of the radar. A separate selector switch for the SPL Mode has OFF, MAN TRK (Manual Track), SNIFF (passive, open receiver operation), and FLOOD (probably a target illumination mode). A two-position switch provides for manual or automatic mode control. The latter mode is mostly applicable to the air-to-air roles of the APG 63, and this function enables the pilot to operate the radar according to the changing circumstances of an engagement whilst keeping his hands on the control stick and throttles. Controls on the latter are the antenna elevation adjuster, target designator button IFF interrogate button, and the weapon selector. The last of these is a three-position switch that enables the pilot to select either medium or short-range air-to-air missiles

(Sparrow or Sidewinder) or guns. Having made his selection, the information displayed on the VSD and HUD is programmed to the appropriate format automatically and radar scan patterns are similarly adjusted automatically to suit the weapon chosen.

Typical alpha-numeric information that can be presented on the VSD are target altitude, ground-speed, heading, range, aspect angle, closure rate, and g-force. Ground-speed and g-force data give valuable indications of the kind of target being tracked. A satisfactory response to an IFF interrogation is indicated by a symbol displayed on the VSD.

An automatic acquisition switch on the aircraft control stick enables the pilot to lock the radar onto targets within the 10 nautical mile range. There are two modes: in the boresight mode, the radar locks onto the first target that enters the aircraft boresight, as designated by the gun reticle on the HUD; the second, called super-search, locks the radar onto the first target that comes within the HUD field of view.

MANUFACTURER:

Hughes Aircraft Company, Los Angeles, California 90009, USA.

1585.353
AWACS RADAR

DESCRIPTION:

The Airborne Warning And Control System is intended to provide for early detection of airborne targets and control of interceptor aircraft, from an airborne platform (see Entry No. **1304.302** Section Two, F3). Aircraft of this type will be used in both tactical theatres and for continental defence. Major requirements are long range and the ability to detect and track low-level targets against a background of sea or ground clutter.

The radome contains, in a back-to-back configuration, a primary radar antenna and a separate secondary (IFF) array. Normal search rotation rate is 6 rpm, but during en route and standby flight the array can be rotated at ¼ rpm, in a so-called 'exercise' mode. This is for such purposes as slip-ring cleaning etc. Hydraulic drive is used.

The principal techniques adopted to achieve good target discrimination in the presence of severe surface clutter are those of MTI and maximum reduction of antenna side-lobes. The target signal is further enhanced by narrow-band doppler filtering to obtain high detection probability.

The high-PRF pulse doppler technique developed by Westinghouse has been used in production radars for aircraft and missile system applications.

In many of these systems, the high relative speeds between radar and target provide enough doppler shift to completely separate target return from background clutter. Therefore, in these applications there is no need to minimize background clutter with low-sidelobe antennas because target returns are well separated from the clutter spectrum. Large doppler separation of targets and clutter also permits relaxation of signal generation and processing requirements.

However, in the AWACS application, both high and low relative-speed target detection is required. Since low-speed target returns are not separated from the sidelobe ground clutter, techniques to minimize this clutter and maintain high sensitivity in the small residual clutter are necessary.

The transmitted radar signal is a train of coherent RF pulses at the high PRF and the frequency spectrum for that signal consists of a series of lines separated by the PRF and centered at the RF carrier frequency. The envelope of the lines of the spectrum is determined by the shape of the transmitted pulses. If the envelope of the pulses is rectangular the lines are weighted by the $(\sin x)/x$ function.

The frequency spectrum of the return signal from each target or ground scatterer also consists of a series of lines separated by the PRF, but the spectrum is centered at the RF carrier frequency plus a doppler shift. The composite signal return consists of signals from both targets and ground.

The ground returns, or clutter, appear at a variety of frequencies depending upon the radial velocity of the point on the ground relative to the radar platform. Thus, clutter frequency is proportional to the cosine of the angle between the line of sight to the point on the ground and the platform flight vector. The clutter return from ground at the horizon directly along the radar platform flight vector, with a relative velocity equal to plus the radar platform velocity, and the return from the horizon directly opposite the flight vector with a relative velocity equal to minus the radar platform velocity, define the maximum extent of the clutter spectrum.

Main beam clutter, which results from the antenna's main-lobe ground illumination, is the largest clutter return. The frequency of main-beam clutter varies as the cosine of the antenna azimuth angle relative to the velocity vector of the aircraft; thus, main-beam cutter frequency moves through the entire clutter spectrum as a 360-degree scan is performed. The main-beam clutter return is rejected in the receiver by means of recursive delay line cancellation techniques. Briefly, this is done by passing the received RF signal return through a first mixer whose local oscillator frequency is varied to maintain a constant difference from the frequency of main-beam clutter. The mixing action that results translates the main-beam clutter signal to a constant intermediate frequency (IF), which is then translated to zero frequency by a second mixing operation. That signal is converted to digital form and processed by a cancellation network that severely attenuates signal at zero frequency (and multiples of the PRF) and passes all other signals.

The other much smaller clutter returns, termed sidelobe clutter, result from ground illumination by sidelobes of the antenna. The clutter return from ground directly below the radar (altitude line) has zero relative velocity with respect to the radar platform and therefore has no doppler shift and appears at carrier frequency.

Moving Target Detection. The doppler shift of a target reflection is determined by the radial speed of the target relative to the radar platform. An approaching target provides a positive doppler shift equivalent to the vector sum of its velocity and the radar platform's velocity; a target being overtaken has a positive doppler shift proportional to the difference between target and platform velocity. The PRF is selected to be high enough so that the separation between spectrum lines is greater than the extent of sidelobe clutter. The

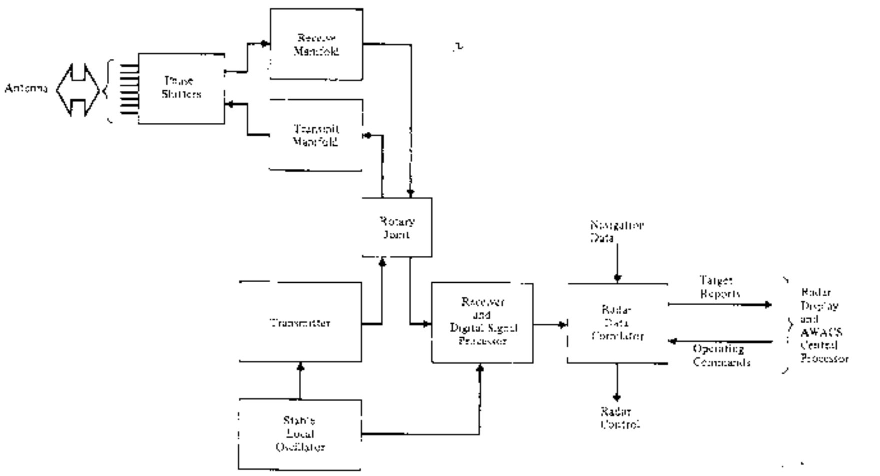


Figure 1

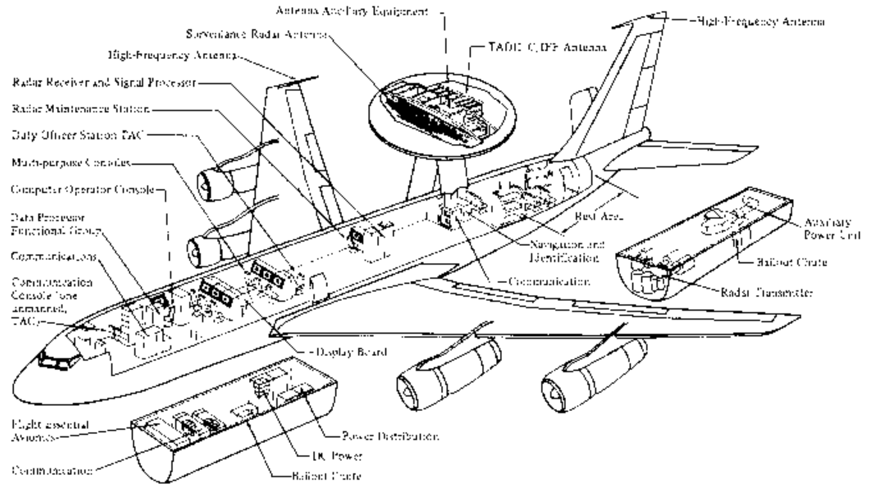
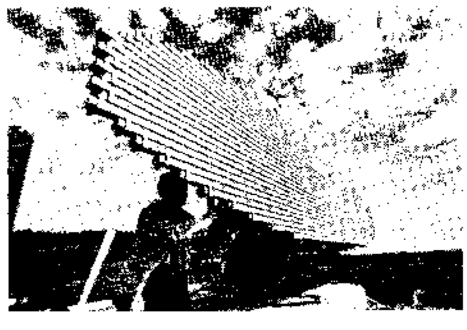


General arrangement of equipment as planned for production AWACS



AWACS antenna array

selection of a PRF based on this criterion produces unambiguous sidelobe clutter returns because the clutter associated with each PRF line never overlaps the returns from other lines. This has advantages in maintaining a low false alarm rate because clutter breakthroughs can produce false alarms only at the true velocity rather than at other ambiguous velocities.

Two basic requirements of the AWACS radar can be described in terms of the return signal spectrum. First, extremely stable signal generation and processing are necessary to permit cancellation of the main-beam clutter signal in frequency and degrade target detection capability at other frequencies. The improvements in signal generation capability necessary for AWACS have been made through advances in circuit components including oscillator crystals and transmitter tubes. The signal processing advances were made possible by the application of digital signal processing and A/D converter development to the AWACS problem.

Second, low antenna sidelobes are necessary to minimise sidelobe clutter return and avoid reduction in detection performance for target returns that fall within the sidelobe clutter region. To prevent this masking of target returns, the antenna and radome are designed for extremely low sidelobe radiation. In addition to minimising sidelobe clutter, the low side-lobes also help maintain radar performance in the presence of external electromagnetic interference.

Range Measurement. Because of the high PRF of the pulse doppler waveform, the time between successive pulses corresponds to only a few miles of range. Therefore, unambiguous range must be developed by the use of multiple PRF s. Two (or more) PRF s are transmitted sequentially in groups called bursts as the antenna beam is scanned over a target. The PRF s are chosen to have some common submultiple frequency which is much lower than either PRF. (This occurs if the PRF s are obtained by dividing a common clock frequency by relatively prime numbers.) The transmitted pulse trains are compared in a coincidence detector to obtain the common submultiple frequency. Similarly, comparison of the return pulses in a coincidence detector produces the same submultiple frequency delayed in time by the target range delay. In the AWACS radar, range delay is calculated digitally from the ambiguous range measurements made in each of three PRF s.

Range Rate Measurement. Range rate, or velocity, is measured in the AWACS radar by measuring the doppler shift of a target return. The return signals, after being converted to digital form and passed through the main-beam clutter canceller, are analysed by Fourier analysis. This transform divides the signal into frequency components that relate directly to target velocity. Since the doppler shift for higher velocity targets is sufficient to produce an ambiguity (with signals from adjacent PRF lines), unambiguous velocity is developed by using the multiple PRF s in a manner analogous to that used for range.

Elevation Angle. The pulse doppler operation of the radar also permits the measurement of elevation angle, which is used in the AWACS central processor to determine target height. That measurement is made by rapid electronic scanning of the antenna beam in elevation as the antenna scans mechanically in azimuth by means of rotation of the entire rotodome. The amplitude modulation that results from electronic scanning is processed in the receiver to determine time of peak signal return, which is then used to calculate target elevation angle.

The low-PRF pulse operation of radar, which provides sufficient time interval between pulse transmissions to prevent ambiguities in range, is more conventional in nature than the high-PRF mode. The AWACS radar design permits simultaneous operation of low- and high-PRF modes. The transmit waveform for pulse operation consists of a long linear FM-modulated pulse at low PRF, which is tailored to efficiently use the average power capability of the transmitter and antenna. The long pulse transmission is at a different RF frequency than the pulse doppler transmission and is spaced between the high-PRF bursts. The long pulse is compressed on receive by a separate receiver, which uses a dispersive delay line to form a narrow pulse that is processed to provide range accuracy and resolution.

The Radar Equipment

A block diagram of the Brassboard radar, which is the basic configuration now being further developed in the Full Scale Development phase, is shown in Fig. 1. The transmitter, located in the airplane fuselage, includes a stable local oscillator that provides the high degree of phase stability required for main-beam clutter rejection. Two amplifier stages raise the stable local oscillator signal to a level sufficient to drive the power amplifier, which is a wideband klystron.

The transmitter signal is fed up the rotodome strut to the antenna via a highpower rotary joint that provides signal continuity across the rotating-stationary interface.

The signal is passed through the transmit manifold, which divides it into 28 signals that have the proper amplitude weighting for low sidelobes. Those signals are passed through electronic phase shifters (which provide electronic scanning) and are radiated from the antenna. The antenna face is a planar array of slotted waveguides. The slot design provides the proper signal distribution across the array face for low sidelobes. A non-resonant antenna design is used to achieve low sidelobes simultaneously with broad operating bandwidth, an important feature for minimising the effects of external interference. The antenna provides both the height-finding function and space stabilisation, which is the positioning of the antenna beam to compensate for aircraft roll and pitch.

Target reflections received by the antenna pass through electronic phase shifters, are collected in the receive manifold, and are fed through the rotary joint to the pulse and pulse doppler receivers. Receiver processing includes analogue-to-digital signal conversion, recursive clutter cancellation, and frequency analysis of the signal returns by a fast Fourier transform filter bank. A constant false alarm rate (CFAR) is obtained at the output of the filter bank by adaptive circuits that provide detection thresholds which adjust automatically to changing receiver noise levels or sidelobe clutter amplitudes.

The radar data correlator is a high-speed programmable computer that performs overall radar management as well as processing detection data to form digitally formatted target reports. The reports, which include range, range rate, azimuth, elevation, and signal-to-noise ratio, are passed to radar displays and to the AWACS central processor. The central processor correlates the reports over successive scans to form target tracks. Radar control is accomplished by operating commands from the central computer or by commands from the radar operator console.

AWACS EC-137D radar test-bed aircraft

The radar design incorporates extensive ECCM (Electronic counter-countermeasures) to minimise the efforts of enemy ECM. Also, an inherent feature of the radar design is its flexibility to accommodate future growth through software control. With software control, processing is accomplished with programmed instructions rather than specific hardwired arrangements of circuitry. Thus, a function or process can be changed merely by altering the programmeof instructions rather than changing hardware. Characteristics under software control include target correlation algorithms, antenna beam positioning, system timing, CFAR processing, target report characteristics, and radar performance monitoring.

STATUS:

The US Secretary of Defence reported in March 1974 that flight demonstrations of 'brass-board' AWACS in the USA and Europe in 1973 had confirmed the high potential of the system to meet the requirement for long-range airborne surveillance and warning, and positive and precise control of tactical air forces. It was therefore proposed in the Fiscal Year 1975 Defence Budget that AWACS engineering and development be continued and the first 12 aircraft procured in FY 1975. A final production decision was planned for December 1974, and a total of about $770 million for the R&D and procurement was sought. The tentative plan is for a total of 34 E-3A aircraft to be bought, 12 more in FY 1976 and the last seven in FY 1977. The second batch of 12 would be fully configured for the tactical mission, whereas the first 12 would not.

MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

1037.353
AN/APN-170 TERRAIN FOLLOWING RADAR

DESCRIPTION:

Small, lightweight airborne radar designed to provide terrain avoidance/following facilities for aircraft, missiles or drones.

Construction is modular, and the overall configuration is cylindrical to permit installation either within the vehicle or as an attached pod. Solid-state circuitry is employed, and computation is analogue. There are no moving parts, the aerial being fixed, and the radar beam has a fixed boresight aligned with the aircraft datum. No CRT display is provided, a simple cockpit-mounted indicator being used to give warning of terrain in the flight path, or a 'fly-up' demand signal. Operating frequency is in the Ku-band.

OPERATION:

Terrain range information from the aerial is fed to the analogue computer where it is correlated with flight characteristics and altimeter input. Continuous flight instructions are presented to the pilot through the cockpit display meter, or to the autopilot.

Using the APN-170, a pilot may fly manually, rely on an autopilot, or use an autopilot/manual override system. For pilot-controlled flight, the computer feeds data into the cockpit meter display, which instructs the pilot to climb or let down to maintain a fixed altitude above the ground, yet avoid all obstacles.

In the automatic mode, the altimeter and forward-looking radar feed information to the computer, which in turn issues commands for the automatic control of the aircraft.

A special warning feature provides complete and continuous system check by sending an RF signal into the wave-guide feed and then through the system. If a failure occurs, a warning light alerts the pilot. Failure during automatic flight results in an automatic climb command to the autopilot.

DEVELOPMENT:

Origin of the system lies in a USAF contract dating back to 1958 for a feasibility study of the low altitude control of a supersonic missile. Subsequent development, involving test flying in B-25 and B-58 aircraft turned to aircraft applications production engineering design started in 1962.

STATUS:

No firm details of deployment of the APN-170 are available, but it is believed that a number were purchased by the RAF a few years ago, when aircraft of the V-bomber force were given a limited low-level capability.

AN/APN-170 Characteristics:
Frequency: Ku-band
Peak power: 10 kW
Aerial diameter: 20.3 cm
Mode: Monopulse
Length: 84 cm
Diameter: 20.3 cm
Weight: 13.6 kg

MANUFACTURER:

General Dynamics Corporation, Electronics Division, 3302, Pacific Highway, PO Box 127, San Diego, California 92112, USA.

1568.353
NASARR AIRBORNE RADAR

DESCRIPTION.

The NASARR (North American Search And Ranging Radar) is the nose radar installation for the F-104 Starfighter aircraft used by five NATO and other nations. It has been produced in two main versions designated F-15 and R-21G. The system provides target search, acquisition, and attack facilities, and supplies range, range rate, azimuth and elevation angles, and line-of-sight rates to the armament control and missile launch computer. Operating frequency is in the X-band, and monopulse techniques are used. Later versions include terrain avoidance and mapping functions, and the system may also be used for ground attack.

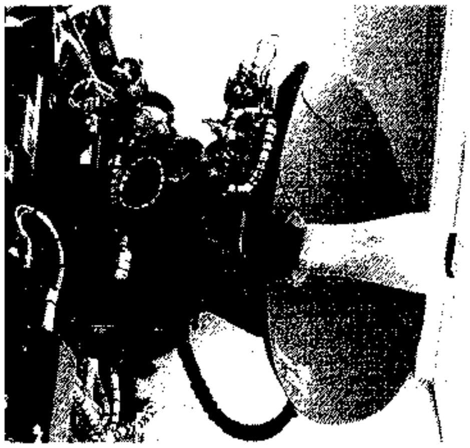
The basic NASARR carries the designation F-15A, and this was the subject of a very large collaborative international production programme, parallel to the joint production of the Starfighter for five NATO nations – Belgium, Canada, West Germany, Italy, and the Netherlands. The F-15J is fitted to Japanese F-104, and this version of the radar is produced in Japan under licence. The R21-G is a solid-state version of the F-15 developed for the Italian Air Force, and produced in Italy.

DEVELOPMENT:

Initial development was undertaken in the late 1950s by the Autonetics Division of North American Aviation (now North American Rockwell). In the mid-1960s, the R-21G version, and a new solid-state processor for retrofit to existing F-15A radars were developed by Autonetics.

STATUS:

Between 1000 and 2000 sets of all versions have been produced, and production is still continuing, although probably at a reduced rate.



F-15 NASARR radar for F-104 aircraft

1489.353
APQ-92 AIRBORNE RADAR

DESCRIPTION:

The AN/APQ-92 is the search radar carried by the A-6A all-weather attack aircraft of the US Navy. It is a 'shared aperture' system, being used in conjunction with APQ-112 target tracking radar (Entry No. **1490.353**), facilities on Modes 1, 2, 3/A, B, C, and D. Interlaced mode operation using any three modes is available. Mode selection is from the control unit, or the modulator can be ranging.

A far higher data rate than is usually associated with mechanically scanned air borne radars is achieved by means of a phased interferometer which eliminates the need for mechanical scanning in the elevation plane. The interferometer produces a vertical fan pattern of between 35 and 50 degrees, which, when swept in azimuth, covers the solid angle that would have to be swept by a raster scan if a pencil beam were used.

Selected targets are designated to the APQ-112 radar which is housed in the same radome, below the APQ-92

DEVELOPMENT:

Since introduction in the early 1960s, the APQ-92 has been the subject of a number of modification and improvement programmes. These include the substitution of solid-state circuitry for some part of the systems, changes in the display arrangements, and improvements to the MTI. At a later stage some of the APQ-112 subsystems were integrated in the APQ-92, enabling the latter to perform a three-axis tracking function. A new multi-mode radar (APQ-148) has been developed which combines the functions of the APQ-92 and APQ-112. This is described in Entry No. **1567.353**.

MANUFACTURER:

Norden Division, United Aircraft Corporation, Helen Street, Norwalk, Connecticut 06852, USA.

7014.353
AN/APQ-97 MAPPING RADAR

DESCRIPTION:

Side-looking radar was developed for high resolution mapping of military targets.

OPERATION:

The system operates in the Ka frequency band, 33-36 GHz. Normal slant range is of the order of 16-20 km. The mapping system includes the radar and its control console, a gyro-stabilised aerial sub-system, a recording sub-system, an onboard photographic darkroom and a light table for viewing the photographic record. The aircraft is also equipped for on site radar maintenance and equipment alignment.

The aerial of the side-looking radar is mounted on the side or base of the aircraft's fuselage, where it is freed from the restraints of the nose dimensions. The aerial is aligned with the longitudinal axis of the aircraft, so that the downward pointing radar beam is directed outward from the line of flight at an angle of 90 degrees. With this orientation, the aperture can be increased considerably, and the resolution improved accordingly. Azimuth scan consists of the aircraft carrying the fixed aerial past the strip of terrain being mapped.

The radar echoes from each azimuth increment are amplified in the receiver and used as the intensity modulation input to the cathode ray tube. A 15 m long, 23 cm wide strip of photographic film passing in front of the tube records the light signal on the tube face and stores it until a scan has been completed. The speed of the film is synchronised to the ground speed of the aircraft to record line-by-line the image of the ground displayed on the tube face.

As an aid to the interpretation of various terrain features, which may depolarise the transmitted signal in a non-uniform manner, the mapping system comprises two aerials and two radar receivers. One aerial is used for transmission and for the reception of echoes having the same polarisation as the transmitted signal. The second aerial is used for the reception of signals that have become cross-polarised.

Each aerial feeds one of the receivers, and each receiver provides the imagery on one-half of the film strip. Because of the non-uniform effects on signal polarisation, the imagery may stand out more clearly on one half of the film display than on the other. The dual receiver technique permits side-by-side examination of the two records.

DEVELOPMENT:

The AN/APQ-97 mapping radar was developed for the US Department of Defence by the Westinghouse Electric Corporation.

MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

1490.353
APQ-112 AIRBORNE RADAR

DESCRIPTION:

The AN/APQ-112 is an airborne target radar associated with the APQ-92 (Entry No. **1489.353**) in the US Navy A-6A all-weather attack aircraft. It operates with that radar on a 'shared aperture' basis and is housed in the same radome, below the APQ-92. It provides facilities for tracking both surface and air targets which are detected and designated by the APQ-92. It also provides, as a back-up, certain facilities such as terrain avoidance, mapping, air-to-air and air-to-ground ranging, and weapon guidance. MTI facilities are incorporated.

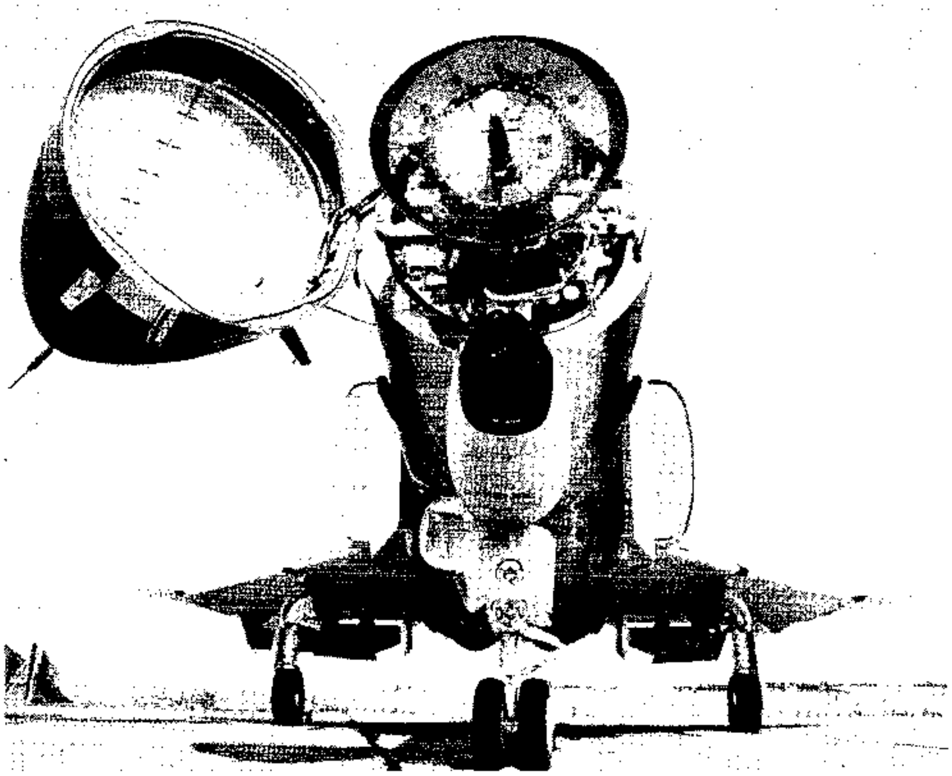
DEVELOPMENT:

The APQ-112 was introduced in the early 1960s. Subsequent development work has been directed towards integrating APQ-112 elements and function into the companion APQ-92 with the object of eliminating the APQ-112 as a discrete equipment. A new multi-mode radar (APQ-148) has been developed which combines the functions of the APQ-92 and APQ-112. This is described in Entry No. **1567.353**.

MANUFACTURER:

Norden Division, United Aircraft Corporation, Helen Street, Norwalk, Connecticut 06852, USA.

1310.353
AN/APQ-120 FIRE CONTROL RADAR
DESCRIPTION:
This is the latest in the APQ series of aircraft fire control radars produced by Westinghouse for the various versions of the F-4 Phantom. In 1959/60 the first of this series, the APQ-72, was delivered to the US Navy in the F-4B which remains a fundamental item in the US Fleet's interceptor and tactical aircraft inventory. Participation by the USAF in the Phantom aircraft programme from 1962 onwards resulted in three versions of the initial weapons control radar – the APQ-100 in the F-4C, APQ-109 in the F-4D, and now the APQ-120. The various versions which followed the APQ-72 were all the result of advancing performance and air-to-ground operational mode requirements additional to the original air interception functions.
The APQ-120, now in full production for the F-4E, also offers considerable improvements in weight (290 kg), volume, performance, and reliability through the use of solid-state circuitry. It is also designed to operate reliably in close proximity to the nose-gun installation of the F-4E.
MANUFACTURER:
Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.



Westinghouse APQ-120 installation in F-4 aircraft

1487.353
APQ-122 AIRBORNE RADAR
DESCRIPTION:
The AN/APQ-122 is a dual-frequency nose radar developed by Texas Instruments for use in the USAF AWADS (Adverse Weather Aerial Delivery System) programme for installation in C-130E transport aircraft. The radar is used for terrain avoidance/following and for navigational use in supply dropping missions.
Operation in the X-band is employed for long-range navigation and weather avoidance/penetration, and Ka-band frequencies are used for short-range high resolution performance for terrain avoidance and dropping zone location.
DEVELOPMENT:
Development was undertaken by Texas Instruments under USAF contract.
MANUFACTURER:
Texas Instruments Inc. PO Box 6015, MS240, Dallas, Texas 75222, USA.

APQ-122 radar installed in nose of C-130E of AWADS programme

1401.353
APQ-137 Airborne radar
DESCRIPTION:
The APQ-137 is a lightweight Ka-band high definition radar designed to provide for the detection of ground targets from the air. It has MTI facilities for locating moving targets against background clutter, and the MTI threshold and other parameters can be adjusted during operation.
The APQ-137B is used in pod-mounted form in the US Army SMASH programme (Entry No. **1400.302**) in which it is used in conjunction with a forward looking Infra-Red Sensor on board a number of modified AH-1G Hueycobra helicopters for night operations.
Operating frequency is 34.5 GHz and peak power is 25 kW, giving a maximum range of about 18 km. Pulse-length is 0.25 microsec and the PRF is 4,000 pps. It is reported to employ an externally coherent doppler technique of signal processing. Detection speed range of the MTI system is 3 to 30 kph.

Search and target ranging modes of operation are possible, with a cosecant-squared beam pattern for the former and a pencil beam for the latter. A 40 degree sector is canned during search.
A 13 cm diameter CRT display is provided, with B-scan presentation of data. Three range scale settings are provided.
DEVELOPMENT:
Development of the APQ-137 began as a private venture by Emerson Electric, under the designation Motardes which derives from "Moving Target Detection System", but was later supported by the US Army.

STATUS:
Three prototype SMASH Hueycobras equipped with the APQ-137B were delivered to the Army for acceptance trials in early 1971.
MANUFACTURER:
Emerson Electric Company, Electronics and Space Division, 8100 Florissant Avenue, St. Louis, Missouri 63136, USA.

1486.353
APQ-139 AIRBORNE RADAR
DESCRIPTION:
The AN/APQ 139 is a forward-Looking radar developed by Texas Instruments for use in 12 specially-equipped B 57G aircraft employed in the USAF Tropic Moon 3 Programme in Vietnam. This programme had as its principal objective improved night interdiction capabilities.
Operating frequency of the APQ-139 is in the Ku-band, and functions include terrain mapping and terrain avoidance in addition to the main offensive role of detecting slow-moving targets on the ground. For this last function, which is reported to be capable of detecting targets with speeds down to 4.8 km/h, a digital MTI system is used. The processor for this contains 2.54 cm diameter silicon ships, each carrying between 200 and 250 gates. These circuits act as shift registers to perform the storage function of the MTI system.
The airborne MTI accepts radar video and discriminates between fixed and moving ground targets, the latter being presented on the PPI at a higher intensity than the radar map produced. Range of the equipment in this mode is about 16 km.
In Tropic Moon 3 B-57G aircraft, the APQ-139 is associated with forward-looking infra red, low light-level TV, and a laser range-finder.

DEVELOPMENT.
Development was undertaken by Texas Instruments from 1967 to 1969 and acceptance tests of the B-57G Tropic Moon aircraft took place in 1970. The overall programme cost over $50-million. In December 1970 one of the twelve aircraft converted for Tropic Moon 3 was shot down by ground fire in Laos.

MANUFACTURER:
Texas Instruments Inc, PO Box 5474, MS240, Dallas, Texas 75222, USA.

1488.353
APQ-140 AIRBORNE RADAR
DESCRIPTION:
The AN/APQ-140 is a multi-mode phased array forward looking radar. In place of a mechanically steered reflector, beam steering and formation is accomplished by electronic scanning. This technique offers the possibility of mechanical simplicity allied to greater flexibility and increased capabilities.

Of the two generic types of airborne phased arrays, the APQ-140 is of the reflective variety in which a matrix of individual elements (3,800) which are capable of controlled variation of phase are illuminated from the front. The beam formation and steering functions are effected by computer control of the individual elements so that the combined effect on the energy they reflect is the generation of a beam which is capable of being steered at rates impossible by mechanical means.

The phase shifting elements are ferrite rod devices located within control coils, the driver amplifiers for which are also located within each individual element. The amplifiers are solid-state units and a single phase-shift element measures about 12 cm × 16 mm diameter. The complete array of 3,800 elements measures approximately 72 cm diameter. The computer used for phase-shift/beam steering is believed to be the Honeywell Alert (Entry No. **1451.063**).

Illumination of the array is by means of a circular ridged horn supported about 75 cm ahead of the phase-shifter mounting. The horn is fed by six waveguides. Linear or circular polarisation of signals can be employed. Operating frequency is in the Ku-band and it is believed that there are facilities for frequency-agile operation.

DEVELOPMENT:
Development of the APQ-140, and other electronically scanned radars, began under the sponsorship of the USAF Avionics Laboratory, Wright-Patterson AFB, Ohio, in 1965. Raytheon first produced an X-band experimental model. Flight evaluation of the Ku-band APQ-140 began in the first half of 1971 in a USAF KC-135 aircraft at Wright-Patterson AFB.

STATUS:
A possible platform for the APQ-140 is the B-1 bomber in its later versions.

APQ-140 Multi-mode phased array radar test installation on Boeing KC-135 aircraft

MANUFACTURER:
Raytheon Company, Missile Systems Division, Hartwell Road, Bedford, Mass. 01730, USA.

1567.353
APQ-148 MULTI-MODE RADAR
DESCRIPTION:
The AN/APQ-148 is a Ku-band airborne multi-mode radar specially developed to combine the functions of two radars previously required by US Navy A-6E all-weather attack aircraft, in a single radar. These two radars are the APQ-92 (search, and terrain avoidance/following) and the APQ-112 (target tracking and ranging). Functions performed by the APQ-148 include:
Search,
Ground mapping,
Tracking and ranging of fixed or moving targets,
Terrain avoidance or terrain following, and
Beacon detection and tracking.

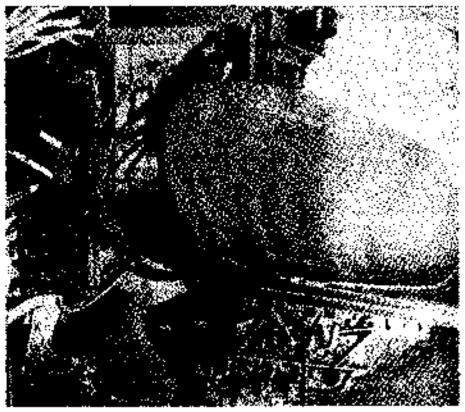
The 'track-while-scan' capability provides simultaneous range, azimuth, and evaluation data for weapon delivery. As in other systems, range and azimuth markers must be placed on the target, but elevation data is available on a continuous basis and is derived from a separate phase interferometer array carried below the main scanner dish. The latter has a width of about 1 metre and is illuminated by a conventional horn feed, to produce monopulse beams in azimuth.

The beams have a cosecant-squared profile in evaluation, and this with the interferometer elevation data provided, eliminates the need for mechanical scanning in the elevation plane. The interferometer array consists of two adjacent rows of 32 horns and moves with the main dish. Energy reflected from ground targets arrives at the upper and lower rows with a time difference which is measured by phase comparison techniques and translated into angular information.

There are two cockpit displays in the A-6E installation, a 5-inch (127 mm) storage tube unit for the pilot, and a 7-inch (178 mm) direct view radar indicator for the navigator/bomb aimer. Terrain data from the radar system also is presented on a vertical display for the pilot. The system is started to incorporate comprehensive built-in test facilities. System weight is about 230 kg.

DEVELOPMENT:
Norden was awarded a $18-million development contract in August 1969 after proposing the addition of track-while-scan facilities to the APQ-92. This called for five pre-production prototypes. The first was delivered in 1970-71.

STATUS:
In the summer of 1971 Norden received a $5,946,000 contract for the delivery of 13 systems, and the first production equipment was handed over in Augut 1971. Two other production contracts, the latest in February, 1972, brought the total number ordered to 84 sets. Some will be used as retrofit equipment in A-6A aircraft.

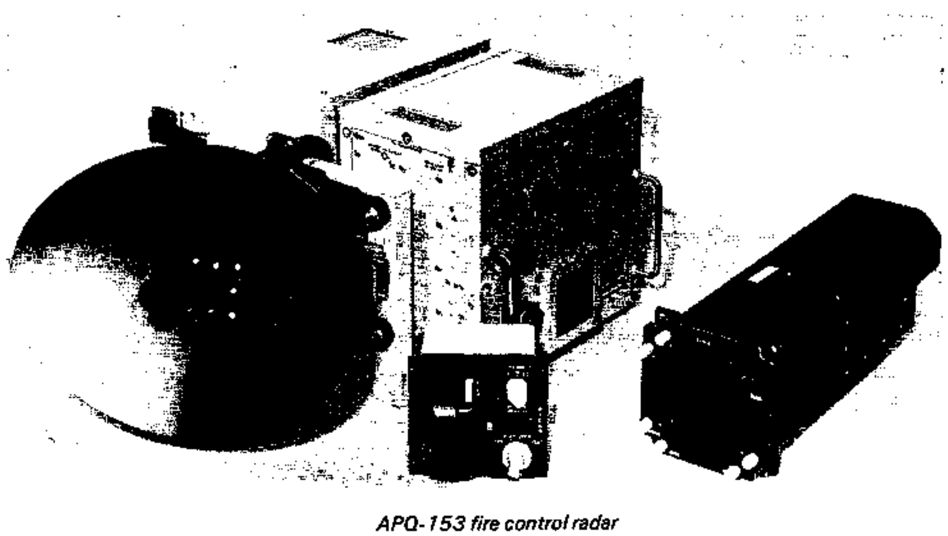


APQ-148 multi-mode radar for A-6E aircraft. Note interforometer array beneath main dish. The horn feed for the latter is not shown in this picture; it projects forward from the assembly above the upper edge of the dish

MANUFACTURER:
Norden Division, United Aircraft Corporation, Norwalk, Connecticut, USA.

1675.353
AN/APQ-153 FIRE CONTROL RADAR
DESCRIPTION:
The AN/APQ-153 is a lightweight search and range tracking radar used aboard F-5E aircraft. This system operates in the X-band frequency range and provides stabilised search, automatic acquisition and target illumination, and automatic target ranging with boresight steering in the missile mode for heads-down launch of the Sidewinder AIM-9 series missiles. In the gunnery modes, the radar automatically provides range and range-rate outputs for targets within the sight lead angle computation envelope.

The system comprises five main units: scanner assembly, receiver-transmitter, radar processor, indicator and set control. Combined weight is 50 kg (110 pounds). The scanner is a parabolic 30 × 40 cm (12 × 16 inch) dish with horizontal polarisation. The indicator uses a 5-inch (127 mm) direct view storage tube and provides a "B" type



APQ-153 fire control radar

search display and a lock-on missile mode display.

OPERATION:

The APQ-153 has the following principal modes of operation:

Search Mode:

In search operation, a 7 degree elevation beamwidth is stepped up 3 degrees at the right azimuth limit and down 3 degrees at the left azimuth limit, providing a two bar scan coverage of 10 degrees in elevation. This two bar 10 degree coverage can be adjusted ± 45 degrees in elevation by the pilot. Azimuth search coverage i±+45 degrees. The search pattern is space stabilised for aircraft pitch and roll motion to allow searching a given volume of space and to prevent loss of the target and/or smearing of the display. Range of search coverage extends to 20 nautical miles (37 km).

Boresight Missile Mode:

The missile mode enables the pilot to lock-on to targets out to 10 nautical miles (19 km) and provides aircraft steering information to align the acquisition envelope of the AIM-9 missile with the target. Once a target has been acquired and lock-on occurs, azimuth and elevation steering data is provided on the indicator display in the form of a target steering bar. The aircraft is flown toward the bar to align it within the allowable AIM error circle scribed on the overlay. Missile acquisition occurs when the steering bar is within the allowable AIM error circle and the IN-RANGE indicator is illuminated.

Air-to-Air Gunnery Modes:

There are two air-to-air gunnery modes in the APQ-153, Dogfight and AA1/AA2. Both are external commands to the radar. The gunnery modes are heads-up and the radar automatically provides range and range rate information to the sight. Activation of a gunnery mode causes the scanner to align to a boresight in azimuth and 4.7 degrees down in elevation. The range gate will automatically slew from 500 feet to 6,000 feet at 30,000 feet per second (152 to 1,830 metres at 9,100 m/sec). Acquisition is automatic for the first target encountered.

STATUS:

Currently in production for use abroad Northrop F-5E aircraft.

MANUFACTURER:

Emerson Electric Co, Electronics and Space Division, St Louis, Missouri, USA.

1484.353
APS-94D SIDEWAYS LOOKING RADAR

DESCRIPTION:

The AN/APS-94D is an X-band sideways-looking airborne radar (SLAR) carried by US Army OV-1 Mohawk aircraft used for battlefield and forward area reconnsissance and surveillance. The radar also has survey and mapping applications.

The aircraft installation comprises five main sub-assemblies:

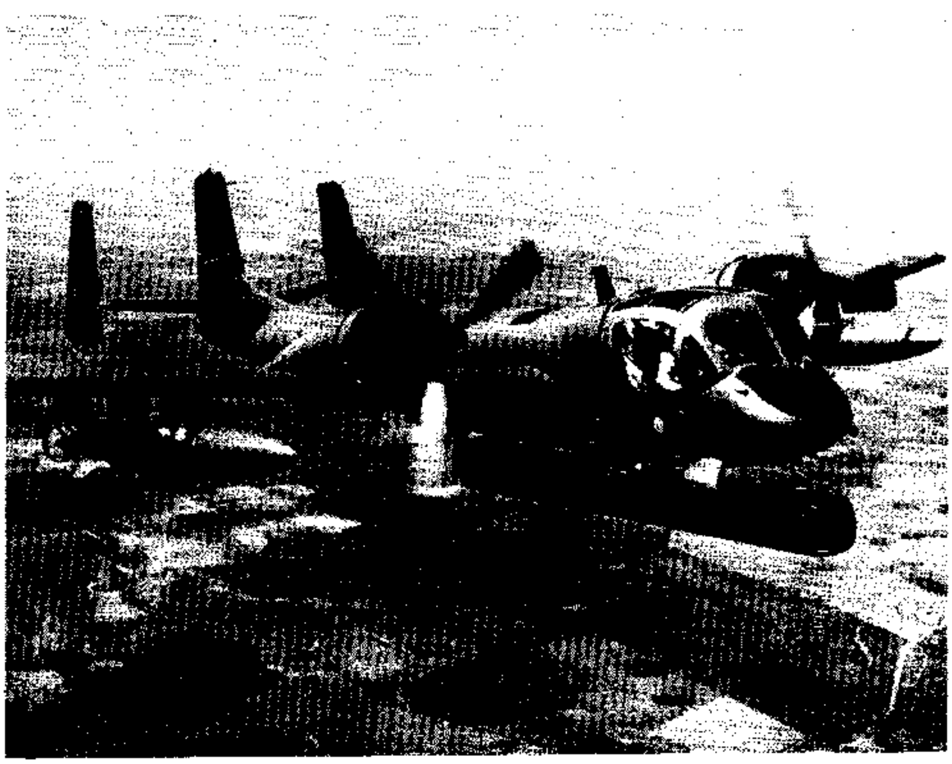
Antenna
Receiver/transmitter
Signal Processor
Interconnecting box
Cockpit Complex

The antenna unit consists of a pod (in the case of the Mohawk; other configurations are possible) containing two slotted waveguide arrays mounted back-to-back on a gyro-stabilised assembly that pivots at the centre. In flight, the antenna arrays are yaw stabilised to preserve the quality of the radar picture.

The receiver/transmitter is tunable within a portion of the radar X-band. It is located in the Mohawk equipment bay, with the signal processor and the interconnecting box. The antenna and other units can be simply removed and replaced on the aircraft to permit its use for alternative duties at short notice. Apart from high-power microwave devices, and certain display components, the APS-94D is of solid-state design.

The cockpit complex consists of the units necessary for operator control of the radar, recording and presentation of the data gathered. Two radar area maps are available to the operator. One depicts the entire sensed area, including all detected ground targets as though they are stationary; this is called the fixed target map. The other radar map shows detected moving targets and displays them against a suppressed background map of the area, this being the moving target map.

An area of up to 100 km on each side of the aircraft can be mapped when both of the antenna arrays are in use. Either one can be selected if it is desired to map only one side. A range control determines the width of the target area to be mapped and presented on the photo-radar map. This control has three settings corresponding to 25, 50 and 100 km wide scans by each antenna, and when used in conjunction with the antenna switch to select either left, right, or both arrays, maps corresponding to four standard scales can be presented on the display, 1:250,000, 1:500,000, 1:1 million, and 1:2 million. Provisions are made for the insertion of fiducial markers and other data.



AN/APS-94D Sideways looking radar mounted on a US Army OV-1 Mohawk

DEVELOPMENT:

The AN/APS-94D was developed under contract to the US Army Electronics Command.

STATUS:

In service on US Army OV-1 Mohawk reconnaissance aircraft. The APS-94D has also been fitted in an Argus of the Canadian Forces and installations have been made in B-26 and P-3 aircraft and the UH-1 helicopter.

MANUFACTURER:

Motorola Inc, Government Electronics Division, 8201 East McDowell Road, Scottsdale, Arizona 85252, USA.

1781.353
AN/APS-96 RADAR

DESCRIPTION:

The APS-96 radar is the search radar carried by the E-2A and E-2B AEW aircraft. It is a high-power radar which operates in conjunction with the APS-143 antenna group and the CP-413/ASA-27 computer detector to detect fighter type aircraft at long ranges from altitudes of 20,000 to 30,000 feet in the presence of strong sea clutter.

The radar incorporates the TACCAR technique for clutter rejection and coherent matched filter pulse compression which makes possible the transmission of high average power while retaining the resolution capability and reduced clutter effects of a short pulse system.

The CP-413/ASA-27 computer detector performs automatic detection and height finding computations for the radar. Other functions include beam-splitting, co-ordinate conversion, active and passive IFF decoding and formation of digital target reports for use of the tracking and intercept computer.

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

1782.353
AN/APS-111 (XN-1) RADAR

DESCRIPTION:

A study and breadboard hardware programme for modifying the APS-96 radar to provide overland detection capability resulted in two models of the APS-111 (XN-1) radar. This radar was flight tested by the Grumann Aerospace Corporation in an E-2 aircraft from 1964 to 1968. Some of the features incorporated were as follows:

1. An improved IF vector canceller (double delay line) to further reduce the high clutter level from ground returns.
2. An improved TACCAR circuit to better resolve the frequency shift of clutter due to

platform motion.
3. A displaced phase centre antenna (DPCA) and addition of a monoplexer to resolve variation in frequency shift across the beam width.
4. A stable local oscillator to improve internal stability.
5. New techniques in sidelobe suppression.

STATUS:
Not known.

MANUFACTURER:
General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

1485.353
APS-116 AIRBORNE RADAR

DESCRIPTION:
The AN/APS-116 is the ASV (air to Surface Vessel) search radar which is being developed for the new S-3A USN carrier borne ASW aircraft (Entry No. **1403.302**). At this stage, few details of the equipment have been made available beyond the fact that it will operate in the X-band and will be housed in a nose radome. The transmitter uses a high-power travelling wave tube, but otherwise the radar is essentially all solid-state. Other general features are high power, broad band-width and high scanning rate. It will be integrated with the aircraft's ASW data processing and display system, and can be expected to provide for mapping, schnorkel detection, cloud and collision warning, in addition to the ASV mode. The location and scanner arrangements shown by Lockheed, prime contractors for the S-3A, indicate an azimuth coverage of about 200 degrees ahead of the aircraft.

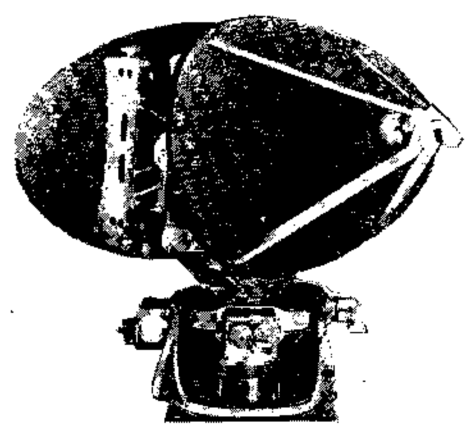
DEVELOPMENT:
The APS-116 is being developed by Texas Instruments under contract to the US Naval Air Development Centre. Development models began laboratory and airborne tests in 1969.

MANUFACTURER:
Texas Instruments Inc. PO Box 5474, MS240, Dallas, Texas 75222, USA.

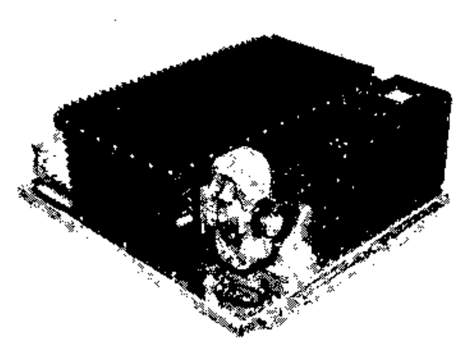
1311.353
AN/APS-119(XN-1) AIRBORNE SURFACE SEARCH RADAR

DESCRIPTION:
The APS-119 is a forward-looking radar for use in maritime aircraft for the detection and location of very small targets on the surface of the sea. It may also be used for navigation and weather avoidance purposes. Its principal characteristics are:

Frequency: 8.5 to 9.0 GHz
Transmitter output: 250 kW peak
PRF: 7.0, 3.5, 1.75, 0.875 and 0.44 KHz
Pulse widths: 0.1, 0.2, 0.4, 0.8 microsec
Aerial gain: 34 dB
Azimuth beamwidth: 2.4 deg
Elevation beamwidth: 4.0 deg
Rotation rate: 30, 60, 120, 240 and 300 rpm
Polarisation: Horizontal, vertical or circular
Receiver noise figure: 8 dB



AN/APS-119 Scanner assembly



AN/APS-119 Transmitter/receiver

The pedestal assembly located in the radome contains the scanner, pedestal, vertical reference, servo-amplifiers and receiver; the transmitter assembly contains the modulator-transmitter and its power supplies; the synchroniser contains the system and display timing generators and the video processor; the scan-converter contains the display generating equipment; the radar operator's and navigator's console have displays and controls; and there is a pilot's display.

The antenna consists of back-to-back 103 cm by 61 cm paraboloidal reflectors illuminated by centre-fed, Cutler-type feeds. The azimuth beam width is 2.4 degrees while the elevation beam width is 4 degrees. The antenna pedestal assembly is a light-weight four-axis unit derived from a design used in a number of AIL tracking and surveillance radars.

The radar console control panel and the navigator control panel determine the operating modes of the radar and the associated video processing, as well as the positioning of the track designators on the displays. The radar, navigator, and pilot displays provide the monitoring function of the received video.

The radar operator's console is equpped with a main display consisting of a 25 cm diameter CRT providing a TV-raster presentation. The display can be orientated with aircraft heading or ground stabilised relative to either aircraft track or magnetic North. The display is corrected for aircraft altitude. Ranges of 10, 20, 40, 80 and 160 miles can be selected. There is a 12.7 cm diameter auxiliary display at this position and this is a DVST unit offering a choice of either PPI presentation or B-scope (azimuth/range) of a 60 degree sector of the main display. The centre of the sector is controlled by one of two target designators. Range is 20 per cent of that displayed on the main display. Controls are provided for varying all antenna, receiver, transmitter, scan-converter and display parameters for which there are optional values. There is also provision for the control of the positions of two target designators and readout of these positions in either polar or cartesian coordinates.

The navigator's console has the same functions as that of the radar operator with the exceptions that a 12.7 cm diameter CRT is provided; only one target designator is available: scanner rate, PRF and pulse-width are automatically set to preset values for each range-scale setting selected.

The pilot's display is identical to the navigator's display and is mainly for monitoring purposes.

A more detailed description of the APS-119 appeared in the 1971-72 edition of JANE'S WEAPON SYSTEMS.

DEVELOPMENT:
A $1.46 million contract was awarded to the AIL division of Cutler-Hammer for the development of the APS-119 in July 1970. This calls for two prototypes. The first APS-119 (XN-1) has been extensively shore tested at the US Coast Guard's Electronics Engineering Centre in Wildwood, New Jersey during 1972, and it began flight tests in early 1973. Development was undertaken on behalf of the US Coast Guard but the equipment has obvious application to other US Forces.

MANUFACTURER:
AIL Division of Cutler-Hammer, Deer Park, Long Island, New York 11729, USA.

1783.353
AN/APS-120 RADAR

DESCRIPTION:
The APS-120 radar is currently in production for the E-2C aircraft. It operates in conjunction with the OL-93/AP radar detector processor (RDP) and APS-171 antenna group incorporating many of the techniques proven in the APS-111 (XN-1) flight test programme to detect targets at even longer ranges and in more severe clutter environments than the APS-96.

It also incorporates a new, more stable and reliable co-axitron transmitter to enhance its operation. Advance design efficiencies allow all these features to be incorporated into a more reliable and maintainable system that takes no more weight or space than the APS-96 Radar and Computer Detector installation.

The RDP links the radar to the tracking and intercept computer performing automatic detection and providing digital target reports. It integrates the signal, provides an adaptive threshold to maintain a constant false alarm rate (CFAR), performs azimuth beam-splitting and a preliminary sorting for target reports to the computer.

ADVANCED RADAR PROCESSING SUBSYSTEM (ARPS)

ARPS is an APS-120 improvement which combines increased sensitivity in noise and clutter with sophisticated false alarm control and major ECCM advances to provide the E-2 system with a truly automatic overland capability. Two sets of ARPS hardware exist and are presently in flight test at Grumman. After successful flight test, ARPS is expected to be incorporated into new E-2 production aircraft and is capable of being retrofit into existing E-2C aircraft.

MANUFACTURER:
General Electric Company, Aircraft Equipment Division, French Road, Utica, New York 13503, USA.

APX-83 AIRBORNE IFF INTERROGATOR

DESCRIPTION:

The AN/APX-83 is an airborne IFF interrogator which is being installed in EC-121 Airborne Early Warning aircraft to upgrade their surveillance capability. Each aircraft will be equipped with an interrogator system and control/indicator equipment groups for each operator position in the aircraft. Each group will semi-automatically process and display IFF responses from aircraft, ships, and ground transponders within the EC-121 interrogation range. There are provisions for expansion to a fully automated processing and display system.

A complete equipment set consists of: either a Synchroniser/Coder or Coder, Decoder, Decoder Controls, Decode Displays, Interrogator Control, Receiver/Transmitter and RF Switch.

The Coder interfaces with the associated radar, R-T unit, RF Switch, Decoder, Decoder Control, and the aircraft's APX-72 transponder. It accepts an external pre-trigger from the associated radar set and generates synchronous pulse-pairs and SLS pulses. These pulses are sent to the R-T Unit for modulation of the RF signals. A sync-trigger is sent to the Decoder for range correlation of replies. Mode Coding on a per Sweep basis is done on two data lines which are also connected to the Decoder. Video is steered through the Coder to the Decoder.

The Decoder accepts raw video and mode triggers from the Coder and generates bracket decodes, delayed raw video and identity or altitude data for processing by the Decoder Control.

The following functions are performed:

(1) Reply detection
(2) Garble sensing
(3) Altitude conversion
(4) Emergency detection and alarm
(5) Identification of position (I/P or SPI)

The Decoder Control receives the digital data and sync triggers, bracket video, and raw video from the Decoder. It performs two different types of filtering: Passive decoding and Active decoding. The former is accomplished by six sets of thumbwheel switches. A target whose mode and code combination is dialled into any one of the thumbwheel sets causes its bracket decode video to be stretched on the PPI. Two degrees of stretching (narrow and wide) are available in order to sort out the six sets.

Active decoding is accomplished by generating an area gate around an unknown IFF target by means of a range "marker" on the PPI and a hand held switch which is activated just prior to the radar sweep passing through the target of interest. When the target is thus acquired, its code replies to the interrogation modes are transferred for display by the Decode Indicator.

The Indicator accepts the Active decode target code and/or altitude data from the Decoder Control, and displays it for approximately one scan period (8 to 15 seconds) on a set of numeric readouts. It also displays the current interrogation modes. A military or civil emergency or communication failure causes one of three alarm lights to flash.

The Interrogator Control is a small box which performs the control functions for the IFF Interrogator Receiver.

STATUS:

A Department of Defense contract worth $3.3 million was awarded in January 1971 for an undisclosed number of APX-83 equipments for installation in EC-121 early warning aircraft.

MANUFACTURER:

AIL Division, Cutler-Hammer, Deer Park, Long Island, New York 11729, USA.

1100.353
AN/AWG-9 AIRBORNE MISSILE CONTROL SYSTEM

DESCRIPTION:

This is the aircraft-fitted element of the Phoenix (AIM-54A) missile system (which see) developed for the US Navy F-14 aircraft. It comprises a fire control and target illuminating radar, infra-red tracker, digital computers and displays. Provision is also made for the acceptance of data link information from NTDS (Naval Tactical Data System) and ATDS (Airborne Tactical Data System) for target designation and other functions.

For on-board target acquisition, the AMCS includes a long range, high-power pulse doppler radar. This system has a "look down" capability that enables it to pick moving targets out of the ground clutter that normally obscures targets in a conventional radar.

In addition to its long range, the AMCS was intended to introduce into the fleet for the first time in an aircraft, the ability to track many targets at once, with computer-aided selection of target priority. The system is designed for virtually simultaneous launch and for simultaneous guidance of up to six missiles against separate targets.

The radar aerial is a planar, slotted-plate array, and represents a significant step forward in design. It is claimed to be the largest circular aerial ever built for airborne operations, with a high aperture efficiency for increased radar range.

The principal weapon is the long range Phoenix, AIM-54A (Entry No. **1099.331**) air-to-air missile, but the AWG-9 system can be used also for launching AIM-7E/F Sparrow missiles (Entry No. **1106.331**), AIM-9G Sidewinder (Entry No. **1308.331**), and control of an M-61 Vulcan gun.

OPERATION:

The AMCS uses the pulse doppler radar as its primary target sensor, a parallel infra-red (IR) target sensor, a multi-purpose digital computer, and associated control and display subsystems. The pulse doppler radar system represents several years of development in transmitter tubes, crystal filters and planar array aerial techniques to enable the long range requirements of Phoenix to be met. A low noise parametric amplifier in the receiver section contributes to this long range capability. Advanced doppler techniques make look-down target acquisition possible. A flexible, high capacity computer permits simultaneous track of a large number of targets and aids the missile control officer (MCO) in the assignment of kill priorities and in missile firing.

The IR target detector system complements the AI radar's operation. In conjunction with the radar, and slaved to it, the IR subsystem has the angular resolution to count the individual elements of a raid that to the radar might appear as a single blip. Alternately, the IR subsystem can contribute high-altitude surveillance when the radar is occupied with attacks at low level. The sensor is especially effective against small, high-speed targets that present a very small cross section to the radar.

Target detection, tracking and ranging functions for all F-14 air-to-air weapon configurations (6 × Phoenix; 6 × Sparrow; a mixture of these; plus 4 × Sidewinder: and the 20 mm Vulcan cannon) are handled by the AWG-9 radar. It can operate in either pulse-doppler or conventional pulse modes. A separate TWT provides CW illuminating energy for the semi-active homing Sparrow (AIM-7E). Time-sharing techniques allow up to six Phoenix missiles to be given pulse-doppler mid-course guidance simultaneously. The passive IR search and acquisition set is capable of independent operation.

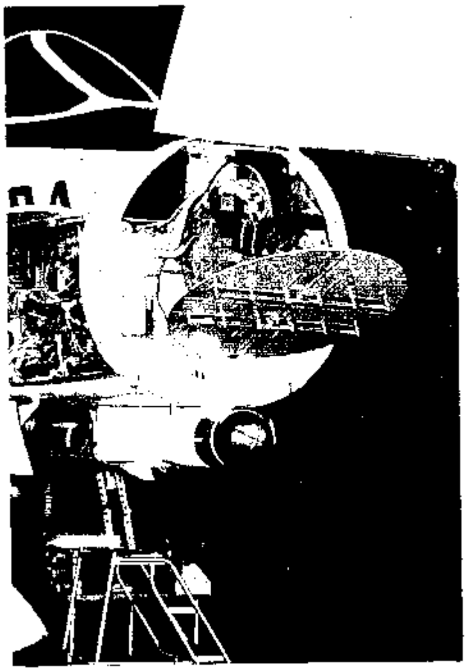
Data processing in the AWG-9 AMCS is performed by a general purpose digital computer that features high speed operation and a large memory capacity in an extremely compact package. The Control Data Corporation computer keeps track of targets detected by the radar while the radar continues to search. Based on pre programmed logic the computer evaluates threats, generates steering information for the pilot, and paints a complete tactical situation for the MCO by designating friendly and hostile targets in standard NTDS symbology, all based on data generated either internally or obtained through external data links.

For control of the Phoenix weapon system, the aircraft's Missile Control Officer is provided with two CRT display units. One, a 12.7 cm diameter unit, is used as a multi-mode display for the presentation of raw radar and I/R derived target information, while a larger (25.4 cm dia) unit is used for the display of processed data.

The latter includes target track information alpha-numeric and symbolic data obtained via data link from other units of a naval force, and IFF returns. The display is also used as a computer read-out device for the presentation of computer-recommended missile/target assignments.

DEVELOPMENT:

The AWG-9 AMCS is related to the AN/ASG-18 developed by Hughes for the YF-12A Mach 3 interceptor, and it is believed that considerable similarity in concept and technology exists between the two systems.



Phoenix missile and AWG-9 weapon control system installed in F-14 aircraft

After cancellation of the USN F-111B, the AWG-9 system was selected for development for the F-14A aircraft. Among changes made were provision for controlling weapons additional to Phoenix (Sparrow) Sidewinder, and Vulcan 20 mm cannon), additional operational modes for 'dog-fight' missions, and a reduction in overall weight. The first test model was delivered to the US Navy in February 1970.

Sea trials of the AWG-9 were carried out by the US Navy in the latter part of 1972 to assess the feasibility of its use in a multiple target ship's air defence system.

STATUS:

Extensive trials of the AWG 9 system with the Phoenix weapon system were run in 1972 and continued into 1973, achieving a success rate of 70 per cent or better. This included multiple target engagements. In Spring 1973, 160 sets had been ordered for the USN of which 63 had been completed by March 1973.

MANUFACTURER:

Hughes Aircraft Company, Culver City, California 90230, USA.

1673.353
WESTINGHOUSE WX SERIES FIRE CONTROL RADARS

DESCRIPTION:

The Westinghouse WX Series is a private venture project for the development of a range of forward radars for fighter and attack aircraft, based on the use of modular design. The latter feature is intended to enable radars appropriate to varying roles and with differing degrees of sophistication to be constructed from mostly standard units, with consequent cost benefits.

The 'base' model of the range is the WX-200 and this is a pulse-doppler equipment intended for air-to-air combat purposes. Beyond a provisional system weight of about 350 lb (160 kg), without cockpit display, few specific details have been revealed, but the following general design characteristics are known. A travelling wave tube will be used in the transmitter to provide wide bandwidth, a high peak-to-average power ratio, and to permit the adoption of frequency agility techniques of ECM.

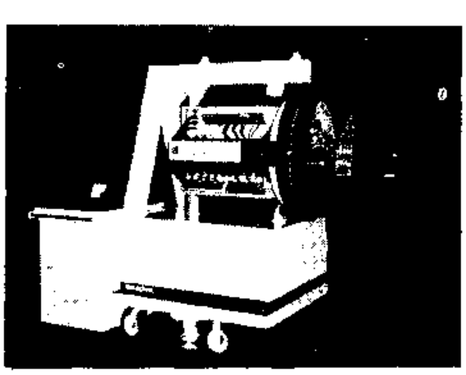
Wherever possible digital circuitry is used, with incoming returns being converted to digital format as near the receiver front end as convenient. The receiver employs a parametric amplifier. A Cassegrain scanner is employed to eliminate the cost, weight and reliability considerations of a rotary joint. The scanner itself is not stabilised, this function being performed electronically to provide a stabilised cockpit display, the data presumably being derived from the aircraft's own attitude sensors.

The Westinghouse development plan is to evolve other radars from the WX-200 which are both simpler and more sophisticated than the base model, which has been decided on for engineering development. The other models would be achieved either by the addition of modules to provide extra desired operational features, or simplification of the basic WX-200 to satisfy less elaborate requirements. The company has given a number of provisional designations to other models which could be developed in the WX series.

The WX-150 is a reduced power version of the WX-200. By adding data processing capacity to provide beam sharpening for high resolution ground mapping, the WX-200 would become the WX-300 for air-to-air and air-to-ground roles. The WX-400 would be a higher power version, without air-to-ground facilities but capable of long-range AI missions. A lightweight, lower cost, non-coherent pulse version would carry the designation WX-60 and a simple, lightweight pulse mapping radar would be the WX-50.

STATUS:

Construction of two WX-200 prototypes was started in 1972, the first of which began engineering tests in August of that year. The US Air Force Avionics Laboratory has announced that it will flight test the WX-200 in conjunction with Air Force Aeronautical Systems Division and the Naval Air Systems Command. These tests will start in Autumn 1974.



Westinghouse WX-200 radar

MANUFACTURER:

Westinghouse Defence and Electronic Systems Centre, Baltimore, Maryland, USA.

1676.353
AN/UPD-4 SIDE LOOKING RADAR SYSTEM

DESCRIPTION:

The AN/UPD-4 side-looking Radar System consists of an airborne, synthetic aperture, side-looking radar set, officially designated AN/APD-10 Radar Mapping Set, and a ground-based ES-83A Correlator-Processor Set, and AN/APM-321 test bench set. The complete system forms an advanced design, all-weather, tactical and strategic reconnaissance sensor that records, line-by-line, on 241 mm-wide photographic film, the doppler phase histories of signal returns from terrain features and targets, both moving and stationary, illuminated by the transmitted X-band radar energy. This data film later is automatically processed and correlated in the ground-based ES-83A to produce a high-resolution image film for viewing.

This reconnaissance sensor provides:

(1) High-resolution data collection, both in azimuth and range, of terrain features and moving and stationary targets from very high and very low altitudes, over a wide range of ground speeds, from either side of the aircraft and without flying directly over the areas of interest.

(2) A variety of operating modes, allowing specific missions to be carefully planned for optimum.results and executed and a minimum possibility of detection and interspecific missions to be carefully planned for optimum results and executed with a minimum possibility of detection and interception.

(3) Moving target indication (MTI) modes that enable detection and separate display of moving objects within the area under surveillance.

(4) A sea search mode for detecting maritime traffic with a resolution sufficient to tentatively determine the size and type of ships.

(5) Built-in test equipment for in-flight performance checks of the airborne radar and associated systems identifies and isolates malfunctions, allowing modification of mission plans so the flight often can be continued.

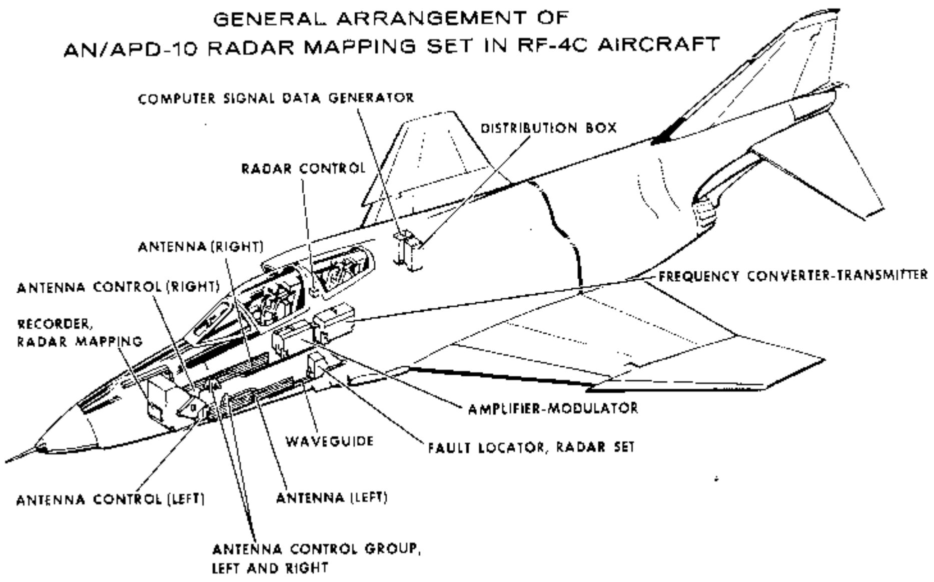
The AN/UPD-4 was specifically designed to be compatible with other sophisticated equipment to provide the near real-time, all-weather total reconnaissance capabilities essential in dynamic operational situations. When coupled to an air-to-ground data link, the radar mapping video information and associated coded data can be transmitted directly to a mapping recorder mounted on the ground-based ES-83A Correlator-Processor. The duplicate data film thus produced is processed and correlated immediately, providing an image film for viewing shortly after the aircraft time-over-target. A light table mounted on the correlator-processor and a high-power microscope supplied with the operator's kit allows the image film to be viewed and areas of special interest carefully scrutinised as the final film emerges from the machine.

The airborne AN/APD-10 Radar Mapping Set was originally designed for installation in the RF-4C aircraft as shown in the accompanying diagram. However, with minor modifications, the modules can be installed internally, or partially pod mounted, in other types of aircraft. Each unit is described briefly in the following paragraphs.

The left and right antennas are multi-element, phased, linear waveguide arrays designed to radiate a vertical pattern with a narrow azimuthal beam width. Except for mounting provisions, the antennas are identical, RF energy is carried to and from the antennas by a length of waveguide that bisects the elements and forms a power divider. The antennas are mounted on servo-actuated gimbals, allowing a limited movement in four axes: tilt, azimuth, roll and pitch. Signals supplied by the computer-signal data generator determine the initial look angle of the antennas. This look angle is maintained constant during flight by an electronic control system that receives error signals from the aircraft inertial navigation system and gimbal-mounted gyroscopes and accelerometers. These signals are amplified and applied to solenoid values that control the flow of hydraulic fluid to the gimbal-positioning servos.

The frequency converter-transmitter contains the circuits that generate the stable radio frequency used for phase looking and producing the X-band radar signals. The module also contains the transmit-receive and antenna switching components, supplies the swept frequency for modulating the transmitted pulses, amplifies the reflected X-band signals, and converts the received radio frequency to intermediate frequency. The amplifier-modulator is a high-power, RF pulse amplifier. After amplification, the RF pulses are returned to the frequency converter-transmitter and routed to the left or right antenna for transmission.

The computer-signal data generator receives



APD-10 side-looking radar installation information relative to the aircraft velocity and mode, and uses these data to establish the radar pulse repetition frequency (PRF). The unit generates the basic timing reference signals required throughout the system, and demodulates incoming IF signals against offset reference signals to obtain the MTI (moving target indication) and FTI (fixed target indication) video. The computer-signal data generator also contains the circuits that develop the motion compensation and clutterlock signals used for correcting, respectively short term and long term motions of the aircraft.

The radar mapping recorder contains the optical, electronic and electromechanical assemblies required to record the radar video data and associated coded data on 241 mm-wide photographic film. These data are displayed on two five-inch cathode ray tubes as four intensity modulated traces, one for each of the radar operating channels. The light energy from the CRT traces is transferred by two mirror assemblies and four recording lenses which focus the images on the film. Also recorded at the centre of the data film are mode strips that convey essential operational information such as the reconnaissance mode used during the mission. These mode stripes are interrupted at intervals corresponding to approximately five miles (8 km) of ground travel to display a multi-element data block containing coded information pertinent to the mission, such as aircraft number, flight location and date. The photographic film is contained in a two section, light-tight magazine that fits securely into the mapping recorder. During operation, the film passes over two recording drums, one for each pair of traces. To ensure the azimuth accuracy of the recorded terrain features and targets, the film speed-of-travel is carefully controlled to maintain a fixed relationship to the aircraft ground speed.

The radar set control mounts the switches required to turn the airborne radar system on and off and select the desired mode of operation. It also mounts the BITE SEL switch and indicator that enable the operator to check the performance of the radar set line replaceable units and other aircraft systems that supply inputs to the radar mapping central.

The ground-based ES-83A Correlator Processor contains the electro-mechanical optical and chemical components required to process automatically the data film exposed in the radar mapping recorder, optically correlate the resultant imagery and expose it onto the image film, then process and dry the image film. Three basic operating configurations are available.

The RCP configuration is used when a mapping recorder mounted on the correlator-processor receives the radar data from the aircraft via a data link system. The exposed, but unprocessed data film is fed directly into the correlator-processor at a synchronised speed, chemically developed in the data film processing tanks, and dried. The film then enters the optical correlating section, which utili es a laser light source and sophisticated lens system to focus the recorded doppler phase histories and coded data onto a second strip film, travelling through the correlating area. This film also is automatically processed and dried, and emerges from the correlator-processor as the final image film.

When operated in CP configuration, the light-tight magazine containing the exposed but undeveloped data film is removed from the airborne mapping recorder and loaded into the correlator-processor. The data film is then processed and used to produce the final image film in the same manner as in the RCP configuration.

In the TBP configuration, previously processed data film is loaded into the correlator-processor for correlation only. The data film processing and drying operations of the machine are bypassed, the pre-processed film proceeding directly to the optical correlating section where it is used for producing the final image film.

Operation:

The information recorded on the flight data film is a history of the velocity relationship between the aircraft and the ground target. This velocity relationship is represented by the doppler frequency which is generated as the relative velocity between the aircraft and the ground target changes. This doppler frequency recording provides an unambiguous representation of frequency change only if the aircraft maintains a relatively fixed flight path while illuminating the target. Translational motions due to wind gusts or steering transients cause velocity changes, which must be cancelled if target ambiguities are to be avoided. To provide this cancellation, the radar system is equipped with motion compensation circuitry that senses translational motion, and generates electronic correction to the doppler frequency before it is recorded. Two sensing devices are used:

(1) Linear accelerometers mounted on the antenna gimbaling system sense motion in both the vertical and lateral directions. The accelerometer outputs are fed to a vector computer which calculates the slant range or radial velocity change.
(2) A clutterlock circuitry compares the doppler phase of the actual radar energy received from one transmission with the phase of the energy received from the previous transmission. A phase difference will exist if translational motion has occurred.

For most effective operation, the AN/UPD-4 side-looking Radar System requires inputs from the aircraft inertial navigation system (INS), the high altitude radar altimeter (HARA) and the aircraft camera parameter control (APC). For high-altitude operation or during weather conditions that prevent visual observations of the initial points, other navigational aids, such as the forward looking radar (FLR) in conjunction with the Tactical Air Navigation (TACAN), must be used. In addition, when the mission plan allows straight and level flight, the autopilot system, properly adjusted to eliminate over-correction and oscillation, will be engaged.

The inertial navigation system provides the radar antenna gimbaling system with stabilisation signals in the pitch, roll and yaw axes as necessary to maintain the antenna array parallel with the line of flight. The INS also supplies ground speed signals which are the basis for nearly all system timing and film drive control. The high altitude radar altimeter provides signals indicating the position of the aircraft above the terrain. The radar system uses this information to position the antenna array, and to scale the accelerometer outputs used in the motion compensation network. The aircraft camera parameter control provides the fiducial pulse which starts the generation of the range marks that are applied to the data film every five miles. This fiducial pulse is also used to trigger the Auxiliary Data Annotation Set (ADAS), causing the ADAS information to be displayed on the data film. During correlation, the range marks and ADAS information are transferred to the final image film. The range marks occur at intervals corresponding to five nautical miles along track, appearing as a series of reference marks spaced across the image film at slant range increments of 0.5 nautical miles. These marks are used during interpretation to relate imagery details to actual map or ground distances. The data block, which follows the corresponding range marks by approximately five nautical miles (8 km) and is printed at the edge of the image film, indicates the direction of flight and the look direction (left or right). The block also provides important auxiliary information such as the radar mode of operation, the location and time of the flight, and the aircraft altitude, heading and altitude.

The AN/UPD-4 has several modes of operation, providing a variety of standoff distances, altitudes, ground speeds, and the option of recording only fixed target imagery (FTI) or both FTI and moving target imagery (MTI). In addition, imaging of the terrain at either side of the flight path can be obtained at the discretion of the system operator.

The final imagery is recorded on the 241 mm-wide film in four channels at a scale of 1:100,000 for all modes. In the azimuth (along track) direction, targets and terrain features are imaged in terms of distance travelled by the aircraft, and so represent true ground separations. In the range (across track) direction, the imagery is recorded in slant range or the distance from the aircraft to the target. Through simple geometry, slant ranges can be converted to ground ranges. The system operator can indicate areas of special interest during the flight by pressing a switch, thus placing an arrow in the margin of the film adjacent to the imaged area.

Status:

This system is in operation with some USAF RF-4C aircraft. Deliveries of UPD-4 radars for all 24 RF-4Es for the Japanese Air Self Defence Forces began in November 1974.

Manufacturer:

Goodyear Aerospace Corporation, Arizona Division, Litchfield Park, Arizona 85340, USA.

1706.353
HUGHES COBRA RADAR

Description:

The Cobra radar is a pulse doppler system configured for air-to-air combat in an air superiority role, while also providing capability for highly effective air-to-ground weapon delivery, air patrol, and airborne intercept missions.

It is designed to be effective in these missions independent of ground clutter at any altitude, target aspect angle-target attitude and radar look angles. Air-to-ground ranging is provided for weapon delivery, as well as all-weather capability and mission effectiveness in normal ECM environments.

A high resolution ground mapping capability is provided to aid in ground target identification and navigational up-grading. The radar has heads-up auto-acquisition modes for dogfight encounters, a look-down and look-up capability, and digital scan converter-CRT display equipment for bright, fade-free target data presentation. It is capable of directing the firing of all current armament, including guns, missiles and guided bombs.

An integral part of the system is a programmable radar processor which is a small, general purpose digital computer that provides complete radar configuration control for the various operational modes, management of the built-in test functions and antenna servo control.

The COBRA system is a coherent radar utilising programmable digital processing and featuring a clean-scope presentation. The transmitter is an X-band, low peak power, high duty cycle design that permits air-cooling, with commensurate weight and maintenance advantages. In the radar processor, doppler filtering provides for rejection of clutter and of unwanted ground moving targets and for detection of desired airborne targets.

After a thorough study and analysis of both array and reflector antenna designs, Hughes selected a flat-plate, or planar array, electrically driven antenna for the P-530 Cobra radar. Of all antenna candidates, the planar array provides for maximum radar system range because it makes the most efficient use of the available space within the aircraft nose radome.

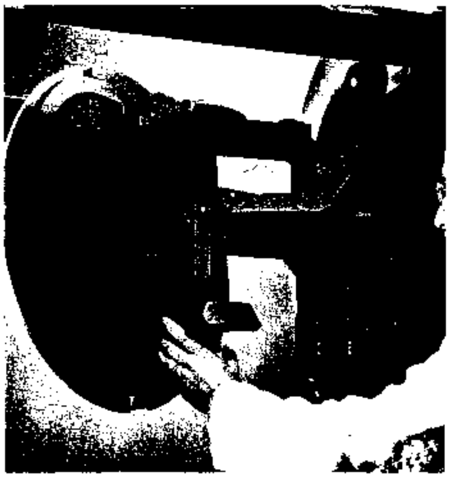
Among the many considerations that led to the design choice is the fact that the centre of gravity of a planar array is very close to the centre of gimbal rotation. This feature minimises the antenna moment of inertia and also allows the maximum radiating aperture area for a given gimbal and radome combination. As a consequence, the useful aperture area of a planar array for the Cobra radar is nearly 10% larger than that of, for example, a reflector antenna of the polarisation-twisting Cassegrain type, and a significant radar range advantage results.

In addition, the aperture distribution of a planar array is extremely controllable, and this allows the realisation of the ideal aperture excitation for a given sidelobe requirement. Such precise aperture distribution control is difficult to achieve in an optically-fed reflector antenna because of the inherent inflexibility of the primary feed pattern.

Both lightweight and high reliability result from a unique thermal design for printed circuit board modules developed for modern radars and incorporated in the COBRA radar. Modules are formed by sandwiching a lightweight aluminium heat exchanger core between two printed wiring boards. Cooling air passes directly through the core and has a very short thermal path to the components mounted on the wiring boards. The resulting high efficiency heat dissipation permits either exceptionally high component packaging densities or the use of more modern packaging techniques which, in turn, results in reduced weight. Moreover, efficient cooling to reduce the operation junction temperatures is the single most effective means of lowering semiconductor device failure rates.

DEVELOPMENT:

Development of the Cobra radar was initiated as a company-funded venture by Hughes to meet the attack radar requirements of new generation tactical fighter aircraft such as the Northrop P-530 Cobra.



Hughes Cobra radar antenna and waveguide layout

LOOK TWO AIRBORNE RADAR

DESCRIPTION:

Look Two is the NATO designation for an X-band Soviet bombing and navigation radar system. No mechanical or technical details are available beyond the signal characteristics which have been obtained by 'Western' Elint (Electronic Intelligence) operations. These include operating frequencies in the band 9245 to 9508 MHz, with frequency agility capability and four PRFs: 320-360, 619-632, 1247-1253, and 1871-1879 pps. Presumably, pulse-length is also varied, changes being made according to operating mode and height.

1476.353

PUFF BALL AIRBORNE RADAR

DESCRIPTION:

PuffBall is the NATO designation given to an X-band Soviet search radar which has been stated to equip the Bison long-range, four-jet reconnaissance/bomber. It is also probably fitted in certain versions of the Badger and Bear. Its principal function is long-range surface mapping, and among its uses may be the direction of air-launched missiles such as Kangaroo, Kennel, Kelt and Kipper.

American reports state that Puff Ball has facilities for providing friendly surface-to-surface missile batteries with target designation services, and that this is accomplished by transmitting via a data link the relative positions of target and missile battery as presented on the radar PPI display.

Puff Ball PRFs are 414-418 and 621-628 pps.

1477.353

SCAN FIX AIRBORNE RADAR

DESCRIPTION:

Scan Fix is the NATO designation given to the AI (Airborne Intercept) radar fitted to MiG-17 and MiG-19 interceptors. Like those aircraft, the Scan Fix must be considered obsolescent. Both X-band and S-band versions are believed to have been produced. The latter equipped the Frescoe series of MiG-17s, while the MiG-19 Farmer A, C and D version were given X-band models. American reports confusingly state that both versions employ fixed scans. This may mean that there is no antenna stabilisation, or that the radars may provide only target ranging and illumination facilities.

1478.353

SHORT HORN AIRBORNE RADAR

DESCRIPTION:

Short Horn is the NATO designation given to an airborne bombing and navigation radar, which, from the Elint (Electronic Intelligence) data available, appears to be an example of some of the latest Soviet radar technology. The operating frequency is in the Ku-band, between 14 and 15 GHz, and there are frequency agility and frequency diversity facilities. There are four PRF/pulse-width combinations for various operational modes: 313-316/1.0-1.8, 496-504/0.5-1.4, 624-626/0.4-1.3, and 1249-1253/0.01-0.9 pps/microsecs. Both circular and sector scans have been recorded.

No information is available on the physical configuration or of the aircraft equipped with Short Horn but the parameters above suggest that its uses include ASV (air-to-Service Vessel) and maritime applications. One possible platform for this radar is the Hormone ASW helicopter carried aboard Moskva and Leningrad.

1479.353

SCAN ODD AIRBORNE RADAR

DESCRIPTION:

Scan Odd is the NATO designation for the AI radar fitted in MiG-19, Farmer B, Soviet interceptors. It is an X-band set, operating at frequencies between 9,300 and 9,400 MHz. This is apparently a later equipment than the Scan Fix AI radar, and is reputed to have an unusually complex scan pattern. There are differing PRFs for search and tracking modes of operation.

1480.353

SCAN THREE AIRBORNE RADAR

DESCRIPTION:

Scan Three is the NATO designation for the AI radar fitted in the Yak-25, Flashlight, Soviet interceptor aircraft. It operates in the same frequency band, X-band between 9,300 and 9,400 MHz as the Scan Odd radar (Entry No. **1479.353**). Three scan patterns for different operational modes, have been detected and Scan Three is reported to employ a very high pulse repetition frequency. The Yak-25 was introduced in 1955 and this radar is now presumably obsolete.

1481.353

SKIP SPIN AIRBORNE RADAR

DESCRIPTION:

Skip Spin is the NATO designation for the AI radar installed in Su-11, Flagon-A, and Yak-28P, Firebar interceptors. Introduction took place in the mid-1960s. The operating frequency is in the X-band, and estimated transmitter power is in the region of 100 kW, giving a reported range of 40 km. The frequency has been quoted as being between 8690 and 8995 MHz, pulse width about 0.5 microsecond, and PRF 2700-3000 pps.

The Flagon-A and Firebar interceptors generally are armed with Anab air-to-air missiles (Entry No. **1144.331**), (though the infra-red homing Atoll (Entry No. **1146.331**) is also carried) and therefore Skip Spin can be assumed to provide search and tracking modes for both these weapons, and target illumination for the radar homing version of Anab.

1482.353

SPIN SCAN AIRBORNE RADAR

DESCRIPTION:

Spin Scan is the NATO designation given to a series of AI radars. They are believed to operate at X-band frequencies, and to have a transmitter power in the 100 kW region.

Soviet aircraft fitted with Spin Scan radars are the D and F models of the MiG-21, Fishbed interceptor, and the Su-9, Fishpot B. In all cases, the radar installation is of the type where it is housed in an aerodynamic pod in the nose air intake of the aircraft. These differ in size, that of the Fishbed D being larger than the Fishbed F version. Spin Scan A/B fitted in Fishbed D and Fishpot B, has two PRFs, 825-950 pps for search, and 1750-1850 pps for the intercept and tracking modes. A rotating scan pattern is employed.

1714.353
MODEL 100 NAVAL DF SET
DESCRIPTION:
The Model 100 is a shipboard direction finding, intercept and surveillance system covering the frequency range 10 kHz to 180 MHz.

The Model 100 DF Set operates on the principle of resolving the electromagnetic field at the antenna location into a set of orthogonal vectors which are then amplified and applied to the plates of a cathode ray tube, so as to trace a bearing line indicating the azimuth of arrival of the signal.

Two antennas are used: one for the LF to HF ranges and one for VHF. The LF/HF antenna derives the DF vectors from a pair of multiturn, switched loops while the sense is obtained from a set of balanced dipoles. The VHF antenna comprises 16 separate monopole elements which can be arranged as crossed-Adcock and parallel dipole arrays in both the horizontal and the vertical plane of polarisation. The VHF antenna is constructed around a hollow column which permits the passage of cable to the LF/HF antenna and to an aircraft warning light, located uppermost.

The DF signal vectors are amplified by two identical receiver channels which are accurately matched in phase and gain under all conditions of tuning and signal strength. A third channel, matched in phase only and equipped with a separate AGC, serves to amplify the omnidirectional sense signal which is applied to the grid of the CRT to blank out the unwanted half of the bearing trace.

In addition to the instantaneous single-signal DF mode, the receiver can be operated in a panoramic mode (amplitude/frequency display), or in a wide-band sweep mode, allowing the operator to see simultaneously the bearings and frequencies of all the signals present within the search band. This "3-D" display is made possible by using colour modulation as the frequency parameter.

A phantom omnidirectional audio output is available at all times for intelligence interception purposes. This monitor channel can be tuned to any of the signals within the sweep band without disrupting the panoramic bearing display.

Digital, automatic tuning (local or remote), is derived from a phase-locked frequency synthesiser fitted with an oven stabilised frequency standard. The synthesizer is designed for fast access manual tuning, using the 3-DEK decade reed switches which are gear-interlocked to count up or down automatically. The tuning frequency is indicated directly by the decade knobs and in addition there is a projection-type luminous readout which can be duplicated in a remote location.

The Radio Direction Finder measures the velocity vector of the electromagnetic field as seen at the antenna site, hence successful radio DF on board a ship depends to a great extent on the location of the antenna. The instrumental accuracy of the Model 100 DF Set itself is ± 1 degree for ground-propagated waves. Additional bearing errors will be caused by re-radiation from the ship's superstructure. Most of these errors can be eliminated by calibration, the repeatability of reading the bearing being of the same order as the instrumental accuracy.

The VLF-VHF Direction Finder is intended to replace the older HF/DF sets and extend their operational range and usefulness. However, the new operational concept of combining DF, surveillance and monitoring, offers the possibility of equipping smaller vessels with DF, where the Model 100 DF Set can also perform the functions of communication and navigation. With a suitable mast and grounding installation, the Model 100 forms a basis of fixed land station where the bearing accuracy may approach that of the set alone.

The equipment is also produced in a land-mobile configuration, under the designation Model 109, to form a complete two-man vehicle-mounted DF and surveillance unit.

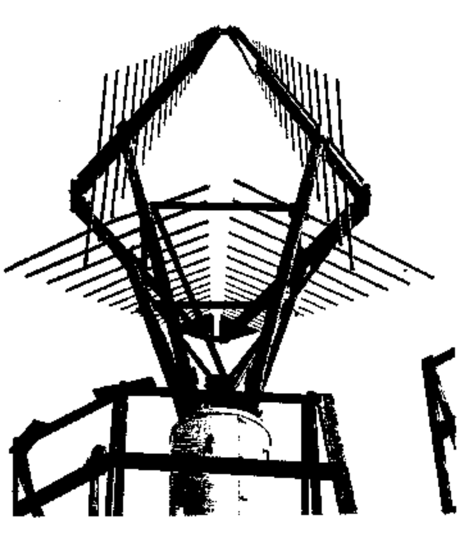
1718.053
ND210 and ND260 MONITORING EQUIPMENT
DESCRIPTION:
Monitoring Equipment, ND210 or ND260, by Rohde & Schwarz, instantaneously shows the occupation of the frequency range 170-470 MHz (ND210) or 450-1,000 MHz (ND260). The equipment consists of a panoramic receiver, fade-in unit and switch unit. The overall frequency range is displayed in five bands of 60 MHz (ND210) or 110 MHz (ND260) on the screen of the panoramic receiver. A signal occurring in the reception range appears on the signal scale as an intensity-modulated line. A crystal spectrum with 10-MHz spacing is displayed as a marker scale under the signal scale, permitting rapid course determination of the received signal frequency. When the tuning position of a connected receiver is superimposed on the marker scale and brought to coincidence with the received signal, the receiver can be used to identify the received signal (aural modulation monitoring, accurate frequency determination).

The standard version permits up to five monitoring receivers to be connected via the switch unit. A multicoupler for the operation of the five receivers from one antenna is built into the switch unit. In conjunction with other equipment from the Rohde & Schwarz range, such as frequency counter, Analyskop or lobe-scanning direction finder, versatile monitoring systems can be set up for a range of operational requirements.
MANUFACTURER:
Rohde & Schwarz, 8000 München 80, Mühldorfstrasse 15, West Germany.



Log-periodic antenna array of Rohde and Schwarz monitoring equipment

1901.053
ROHDE & SCHWARZ DIRECTION FINDING EQUIPMENT
DESCRIPTION:
Rohde & Schwarz produce a comprehensive range of radio and electronic direction finding equipment, embodying a variety of techniques and covering most of the spectrum. Some of this equipment is reviewed in the following paragraphs.

Directional information is supplied by DF antenna systems consisting of several elements. The phase differences between these elements are either evaluated direct, or represented in the form of radiation patterns by connecting several antenna elements into groups. Particularly good results are obtained with antenna systems whose dimensions are large in comparison with the wavelength, ie, wide-aperture systems, since they can considerably reduce the bearing errors in an interference field.

Direction finders operating on the Doppler principle are frequently used in the VHF and UHF ranges. In these cases, the DF antenna system consists of a large number of vertical dipoles (16 to 32) arranged in a circle with a diameter of a few wavelengths. To simulate the rotation of a single dipole about a circle, the individual elements are cyclically scanned, thereby resulting in a frequency modulation of the incoming signal which can be automatically evaluated. Triangulation systems with unattended direction finders can be realized by using accessory remote frequency-control or remote bearing-transmission equipment.

The Doppler-type Wide-Aperture Direction Finders NP 7 and NP 8 are available for the VHF range and the NP 9 for the UHF range. The DF antenna systems frequently used in the HF range (1.5 to 30 MHz) have four to eight equidistantly distributed elements with the opposite elements connected out of phase. With these Adcock configurations, the voltages obtained at the IF outputs of a two-channel receiver connected, if necessary, via a synchro resolver, are proportional to the sine or cosine of the bearing azimuth. This permits a simple bearing indication to be represented on a CRT screen as a radial beam. Rohde & Schwarz use the Adcock Direction Finder SFP 5000 in detection systems for the HF range.

Wideband radio detection in the higher frequency ranges is carried out by means of wideband direction finders, which often use log-periodic dipole antennas. Mobile systems in particular use active loop antennas, crossed-loop ferrite antennas, or antennas camouflaged as luggage racks in conjunction with the SFP 5000 direction finder.

The NP 12 Rotating Direction Finder covers the range 80 to 1,300 MHz (special model PA 003 with smaller mobile antenna: 25 to 1,300 MHz). Two pairs of log-periodic antennas, or, with the PA 003, active loop antennas, are used for vertical and horizontal polarization and are suitable for minimum-signal (differentiating circuit) and maximum-signal direction finding. The bearing diagram is represented on the screen of a cathode-ray tube, a manually adjustable bearing graticule being used for determining the exact azimuth. The DF antenna can be halted and adjusted for directional reception.

In the case of bearings on signals of short duration, where a complete antenna rotation or scanning cycle takes too long, fixed directional antenna configurations are used comprising, say, six log-periodic antennas each with an angular spacing of 60 degrees. In the simplest case, each of the antennas has a cardioid pattern.

By finding the difference between every two of the output voltages of the four-channel receiver into which these antennas are operating, the sine or cosine of the bearing azimuth is obtained in the form of a DC voltage. The azimuth indication is represented as a well-defined radial line on the screen of a cathode-ray tube by converting this voltage into a sawtooth waveform. Like the Doppler-type direction finder, both wideband DF systems can be operated with a programmable receiver in largely automated assemblies using digital transmission equipment.

It is also possible to use the DF Triangulation System NZ 181/6 for displaying the transmitter position in such triangulation systems. In this case, the triangulation display of up to four beams is recorded with a small TV camera placed before the screen of a cathode-ray tube and shown together with a map of the area concerned on a TV monitor.

A computer-controlled DF system designed by Rohde & Schwarz receives RF transmissions in the frequency range 10 KHz to 30 MHz and locates the respective transmitter, if necessary, by triangulation. The system is devised such that it can be assembled and extended in stages, particular importance being attached to the possibility of adding equipment without making other equipment redundant. The complete version contains the following main components: one or more radio monitoring stations with as many radio monitoring positions as required, a command and evaluation centre and DF stations depending in number on the size and nature of the area being monitored. The individual radio monitoring and DF stations are interconnected by an AF and data transmission system via the command and evaluation centre.

At the monitoring positions, the equipment is arranged for ease of operation in twin consoles. The Antenna HA 230/403, consisting of three single dipoles, is used. The most suitable dipole is connected to the input of the Communication Receiver EK 47 or EK 049 via the antenna selector. Using Telegraphy Demodulator NZ 47, all signals in the frequency range 10 kHz to 30 MHz with a field strength of 1 V/m can be amplified and demodulated. Tape recording equipment is provided for the storage of the modulation information. The assembly also contains an AF junction panel to which the telephone set can be connected, and a control unit for linking the monitoring position and central station or DF station. The received signals present at the monitoring position can moreover be transmitted from a command centre to the DF stations via this control unit, thereby ensuring that all stations used for the bearing determination take the bearings of the same transmitter.

On detection of an unknown signal by the monitoring position, the operator can depress a bearing request button for connection to the central station, where the frequency and type of modulation of the unknown signal are indicated on a data display unit. It is also possible to aurally monitor the AF signal. The operator at the monitoring position and his counterpart at the central station can speak to one other. If the line to the central station is occupied, it can be cleared by means of a priority button. The Data Terminal System NT 100 and VFT Equipment WT 402, for example, are used for transmission of the data and AF. The remote-transmission network consists of four-wire telephony channels (300 to 3,400 Hz according to CCITT). These telephony channels can be switched via carrier-frequency lines, radio links, or duplex shortwave links.

The central station includes evaluation desks, a control centre with interface, the AF distribution network and the data transmission equipment. The evaluation desks contain a data display unit for indication of the DF frequency, the direction finders in use, the bearings taken, and for monitoring the data input. The individual units include an alphanumeric keyboard for control command inputting, data stores, an alphanumeric printer for printing out the screen contents of the data display unit, a telephone set for monitoring the modulation of the connected monitoring position and for dealing with the radiotelephone traffic to the interception and DF operators, and a DF Triangulation System NZ 181, which projects the bearings onto a 50 cm × 70 cm transparent map. A process computer with peripherals centrally controls the data distribution and storage processes as well as the data display units, the DF Triangulation System and the AF switching network.

When a bearing is to be taken, three or four DF stations are connected via the communication system to the respective monitoring position from a given operator's position. The direction finders are automatically adjusted from the central station to the frequency and type of modulation. The DF operators merely have to adjust the cursor to the DF beam. After operation of a button, the bearing information is sent to the central station, where the results of up to four direction finders appear in analogue form on DF triangulation display units. These displays can be switched simultaneously to several observation posts by means of TV monitors or a TV close-up projector. The DF results can also be printed out at the operator's position; all data can be stored and made available when required by the computer. A possible application is the monitoring of maritime traffic, enabling the course of a ship to be tracked over a considerable length of time.

EZF/EZFU RADIO RECONNAISSANCE & MONITORING SYSTEM

DESCRIPTION:

The Frequency/Time-Domain Analyzer Analyskop EZF and the UHF Tuner EZFU are the main units of assemblies for radio monitoring and reconnaissance in the frequency range from 6 kHz to 2700 MHz. The assembly permits the display of frequency spectra as well as time-domain display of modulation. For radio monitoring, the EZF analyses the signals as to frequency, modulation spectrum, modulation depth and spurious emissions.

The combination Analyskop EZF + UHF Tuner EZFU can be used to perform the following monitoring tasks:

(1) Detection of unknown signals by sweeping the entire frequency range from 6 kHz to 2700 MHz. The sensitivity is approximately 0.5 µV with a resolution of 1 kHz.
(2) Monitoring of particular frequency subranges of selectable width between 1400 MHz and 6 kHz.
(3) Rapid determination of frequency and amplitude of an unknown signal by electronically superimposed, parallax-free, calibrated frequency markers and level line. The seven-digit counter reads out the frequency with a resolution of 10 Hz to 1 kHz.
(4) Investigation of modulation spectra of individual signals with seven selectable resolving bandwidths from 300 kHz to 50 Hz.
(5) The Analyskop can be used as a monitoring receiver with AM and FM demodulation and seven selectable IF bandwidths.
(6) It is possible to superimpose the tuning frequency of the receiver section as a bright-up marker on the spectral display. After switching over to time-domain display the signal may immediately be monitored aurally.
(7) The Analyskop contains a facility for automatic identification of spurious signals in the spectral display so that they are excluded from evaluation.
(8) A recorder adapter permits the spectrograms displayed on the screen with frequency markers and level lines to be recorded on an XY or YT recorder at sweep times of up to three minutes.

With a combination of two EZF's and one EZFU it is possible to observe the spectral display and at the same time aurally monitor the test result. After selection of a certain frequency band between 30 and 2700 MHz and switching over to synchronised operation, a signal to be selected from the upper EZF is brought to coincide with the centre marker. The sweep width and resolution can be chosen according to the requirements of the radio services and channel spacings. Aural monitoring is possible on the lower EZF which either operates as a receiver or as a narrowband analyzer. The band display on the upper EZF is preserved but may be varied without interrupting aural monitoring.

Other operating capabilities are provided by combining two EZF's, such as simultaneous monitoring of two frequency channels within a band analysis of two frequency channels. Moreover, it is possible to sweep the band of interest at a high sweep speed and at the same time record the entire band or a part of it on an XY recorder. If the lower EZF is also adjusted for band sweeping the signal to be monitored can be marked by intensity modulation. It is then not necessary to make it coincide with the centre marker of the upper EZF.

MANUFACTURER:
Rohde & Schwarz, D-8000, München 80, Mühldorfstrasse 15, Federal Republic of Germany.

CHARACTERISTICS:

Input frequency range	I	II	III	IV	V	VI
Input frequency:	6 kHz–1.3 MHz	60 kHz–13 MHz	100 kHz–130 MHz	150–170 MHz	30–1400 MHz	1300–2700 MHz
Amplitude error:	± 0.5 dB, max	± 0.5 dB, max	± 1 dB, max	± 0.5 dB, max	± 1 dB, max	up to 2500 MHz: + 2 dB, max. up to 2700 MHz: —3 dB, max.
Sensitivity: (S + N = 2N at 1 kHz resol.)	0.5 V	≦ 1 V	≦ 1.5 V	≦ 1 V	≦ 2 V	≦ 2 V
Maximum sweep width:	200 kHz	2 MHz	130 MHz	20 MHz	1400 MHz	1400 MHz
Input attenuator:			continuous ≧ 60 dB		50 dB in 10-dB steps	
Level measurement range:			(operating range 146 dB)		absolute: + 10 to —122 dBm	
IF attenuator:	continuous 100 dB, with level line tracking					
Tuning:	int. osc. in EZFU for ranges I, II, III, V, VI; 7-digit counter; ranges I-III also via plug-in crystals or ext. osc.					
Input impedance:	for all ranges 50 ohms, VSWR ≦ 1.5					

Frequency-domain measurements:								
Sweep width:	1400 / – / 20 MHz	20 MHz	6 MHz	2 MHz	600 kHz	200 kHz	60 kHz	6 kHz
Resolution:	fixed (300 kHz) or any other freq.	300 kHz	100 kHz	30 kHz	10 kHz	3 kHz	1 kHz	50 Hz
Frequency markers:	for sweep widths ≦ 20 Mhz: marker spectrum with centre marker; EZFU for sweep widths 20 MHz: shiftable marker							

1903.053

ND 210 & ND 260 RADIO MONITORING EQUIPMENTS

DESCRIPTION:

Rohde & Schwarz supply two types of monitoring systems, differing only in frequency range, for the detection of unknown signals during frequency-band monitoring and radio reconnaissance.

Type ND 210 including Panoramic Receiver
Type ED 210, frequency range 170 – 470 MHz; and
Type ND 260 including Panoramic Receiver
Type ED 260 frequency range 450 – 1000 MHz.

These systems provide a permanent and rapid monitor display over relatively wide frequency ranges. Used in conjunction with monitoring receivers, they permit frequency determination and analysis of discrete signals. They are composed of the following units:

Panoramic Receiver	ED 210 or ED 260
Fade-in Unit	NZ 211/3
Switch Unit	NZ 212
Multicoupler	NV 3301-1 or NV 3401-1
AC Adapter Unit	NZ 210/3

The heart of the system is the Panoramic Receiver, on whose screen the received signals are displayed as an intensity record over five ranges of 60 MHz or 110 MHz width. A crystal spectrum and/or an external frequency marker can be written into the marker scales displayed below the signal scales. By means of the Fade-in Unit the tuning position of a connected receiver (selected with the Switch Unit) can thus be indicated and the receiver tuned to the signal detected by the panoramic receiver.

The tuning position can also be transferred to further receivers, for example for monitoring purposes.

The Panoramic Receiver provides a clear picture of the frequency-band occupancy in five ranges of equal width. The ranges can be selected individually or in any combination. The frequency sweep through each range (displayed line) takes about 1.5 msec. The Monitoring Receiver Type ESUM with standby unit is suitable for operation in conjunction with the Panoramic Receiver. Any external receiver must have a local-oscillator output with adequately flat frequency response and low harmonic content. If several receivers with range-dependent first IF are used, range selection for the Fade-in Unit is possible from the receivers via remote-control lines. The range selectors of the receivers should preferably be provided with remote-control contacts.

CHARACTERISTICS:

Frequency range:

ND 210	170-470 MHz
ND 260	450-1000 MHz

Antenna connection:

Nominal impedance	50 ohms
VSWR:	≦ 2
Gain via Multicoupler:	1.5 ± 1 dB (ND 210) 1.5 ± 1.5 dB (ND 260)
Permissible oscillator reradiation of receivers:	≦ 25 V into 50 ohms
Power supply:	24 V DC ± 10% or 110/220 V AC ± 10%, 45 – 480 Hz, 220 W or 260 VA
Nominal temperature:	+ 10 to + 40°C
Operating temperature:	—20 to + 50°C
Shelf temperature:	—40 to + 70°C
Dimensions, weight:	484 mm × 488 mm × 453 mm, 80 kg

MANUFACTURER:

Rohde & Schwarz, D-8000 München 80, Mühldorfstrasse 15, Federal Republic of Germany.

MM/SPR-A NAVAL RADAR INTERCEPT SYSTEM

DESCRIPTION:

MM/SPR-A is a shipboard medium-sensitivity radar intercept equipment comprising three units: antenna assembly, receiver/display unit and power supply. Frequency coverage is continuous from 1.0 to 10.5 GHz. The system is designed for either autonomous use on smaller vessels or to provide 100 per cent detection probability as a complement to high-sensitivity intercept systems using rotating antenna systems on board larger ships.

Four fixed antennas are used on the MM/SPR-A, and the reception sectors of the four overlap to ensure that 360 degree azimuth cover is given. This omni-directional detection capability is associated with "wide-open" reception circuits (crystal-video channels). Thus the system is non-selective in respect of direction and frequency.

Bearing information is obtained by comparing the amplitude of a signal as received by adjacent antennas of the array. Each antenna element of the array is followed by a filter, a crystal protection device and detector, and a video channel which drives one of the deflection plates of the display unit CRT. Any received radar signal within the frequency coverage of the system automatically results in a bearing trace showing the direction of arrival on the CRT.

STATUS:

In production and installed on Italian Navy and other ships.

MANUFACTURER:

Elettronica SpA, Via Tiburtina KM 13,700, 00131 Roma, Italy.

NORWAY

1857.253
SR-1-A RADAR SEARCH RECEIVER

DESCRIPTION:

The SR-1-A is a radar intercept equipment of the "wide open" receiver type and is suitable for fitting in ships of frigate size and above. The equipment comprises two major units – the antenna assembly, and the display/control console – together with several other small electronics cabinets. The antenna unit consists of two separate units combined in a single assembly: a "spinner" type directional antenna with a protective radome, and a fixed omni-directional octagonal array of horns. The console has the necessary controls for operation of the system and the principal display elements are three CRTs which provide the requisite display functions for direction finding, pulse analysis, and frequency measurement functions, respectively. A separate warning indicator which provides for radar warning and coarse directional information is incorporated and this can be located remotely from the display console.

CHARACTERISTICS:

Frequency coverage: 2.5 to 18 GHz
Frequency measurement: to better than ± 1% with automatic and instantaneous indication
PRF measurement: 200 Hz to 10 kHz
Pulse-width range: 0.2 to 10 microsec
Polarisation:
Warning section: Any
Spinner antenna: Circular
Bearing accuracy:
Spinner antenna: ±3.5° relative or true
Omni-antenna: ± 22.5° relative

Assuming line of sight to a 50 kW radiator with a 36 dB antenna gain, the SR-1-A provides omni-directional warning to a range of 150 nm (280 km) and directional intercept up to 800 nm (1,480 km).

OPERATION:

Signals intercepted by the spinner antenna produce radius vectors on the D/F CRT, and when the antenna is rotating, a deflection pattern of multiple radial lines results on the face of the CRT. The length of these lines will have a pronounced maximum in the direction of the intercepted radar source. This can be read off as either a relative bearing or a true bearing. The spinner antenna can be operated at any speed up to 500 RPM. Whatever speed is selected is automatically varied about the mean to ensure that rotational synchronism between the SR-1-A antenna and that of transmitting antennas does not lead to loss of intercept probability. Provision is made for stopping the spinner antenna in any chosen bearing and for manual directional control from the console.

The SR-1-A can be fitted with a directional responder as a customer option. The purpose of this is to aid the operator in his task under heavy radar traffic conditions by excluding signals from within a sector, the direction and extent of which can be selected at will. The SR-1-A has been designed for one-man operation.

DEVELOPMENT:

The SR-1-A was developed by the Norwegian Defence Research Establishment in collaboration with NERA Bergen. Production and marketing responsibilities rest with the latter organisation.

MANUFACTURER:

NERA AS, Division Bergen, PO Box 53, N-5032 MINDE, Norway.

1860.253
VR-2 PORTABLE RADAR SEARCH RECEIVER

DESCRIPTION:

The VR-2 is a portable, handheld receiver with a frequency coverage of 2.5 GHz to 11 GHz. It has facilities for discriminating between X- and S-band, and there is a possibility of obtaining determination of bearing within + 2° in the X-band. The VR-2 has proved itself a very valuable piece of equipment on small, fast boats operating in coastal waters. It may also serve as a low cost supplement to the larger search receivers.

The receiver can be mounted on a special tripod fitted with a compass for land-based use, or with a special clamping arrangement for securing the receiver to a ship's railing. The receiver may be rotated in the clamping device which is fitted with a scale for determination of bearing.

As a companion to the VR-2, an accessory analysis unit (Type 3KT22) has been developed, providing the following facilities:

Determination of PRF to within ±6%
Approximate determination of radar antenna RPM
Test of the VR-2 battery
Test of the VR-2 proper
Intercom between the VR-2 operator and other relevant personnel

DEVELOPMENT:

Development of the VR-2 was undertaken jointly by the Norwegian Defence Research Establishment and NERA. Development of the Type 3KT22 analysis unit was by NERA in response to a Royal Norwegian Navy requirement.

MANUFACTURER:

NERA AS, Division Bergen, PO Box 53, N-5032 MINDE, Norway.

1858.253
VR-30 SERIES RADAR SEARCH RECEIVERS

DESCRIPTION:

The VR-30 Series of equipments forms a range radar search systems of modular design suitable for installation on board small, fast surface vessels where space and weight considerations are of prime importance. Submarine versions are produced also. The design is based on a building block principle which enables a user to progress from a very simple warning set giving acoustic and visual alarm, with an indication only of frequency band, to a system that will give instantaneous information on bearing to the transmitter, PRF and pulse width. In addition to frequency band warning lamps, the VR-30 acoustic warning device provides a special J-band intercept warning note, easily distinguishable from that denoting an X-, C-, or S-band intercept. As now available, the VR-30 Series comprises five versions, VR-30, VR-31, VR-32, VR-33, and VR-34. A suffix letter denotes the surface or submarine version of each model, C or B, respectively. The five models are formed by various combinations of three types of antenna and four display and data output arrangements, as shown in the following table:-

	VR-30	VR-31	VR-32	VR-33	VR34
Omni Antenna	•		•		
Horn Antenna		•	•	•	
Directional Antenna				•	•
Band Indicator	•		•	•	•
Warning Display		•	•	•	
CRT		•	•	•	
Bearing Indicator				•	•

The horn antenna unit consists of an octagonal array containing four horns (one each for the S, C, X and J-bands) in each of the eight sectors, and this unit also contains the appropriate detectors and video amplifiers. (A smaller version covering the S, C and X-bands only is also available.) This unit provides coarse bearing information. The directional antenna is a broadband, highly directional unit which is steered by remote control from the operator's console to establish the direction of arrival of intercepted radar signals. The display and indication facilities listed in the table above are not necessarily discrete items of equipment and dependent upon the SR-30 Series model concerned one or more of them will be combined within a single item of hardware. The following brief description of the SR-33 system, which incorporates them all, should make this clear.

TYPE VR-33:

This version employs the horn antenna array and the directional antenna. The former provides coarse bearing data, whilst the latter with its associated RF filters provides for accurate bearing determination and enables the frequency band to be established. The operator is free to choose either antenna system when analysing signals on the CRT of the indicator unit.

The indicator unit contains two displays, a double beam CRT for determination of PRF and pulse-width, and a warning display giving an approximate bearing of an intercept as well as an indication of the relevant frequency band. Optionally the warning display can be fitted with a gyro-stabilised azimuth scale. Any of the four frequency bands can be selected from the directional antenna for analysis, or any of the eight sectors of the octagonal array can be switched out. The warning display comprises a group of indicator lamps arranged radially to represent the eight sectors of the octagonal antenna array. The outermost lamps of each radial are the warning indicators, whilst the others are arranged to denote the frequency (S, C, X or J-band). The latter lamps light only when the directional antenna has been steered to the relevant bearing. When this is done, a separate numeric indicator gives a readout of the fine bearing measurement thus obtained. This procedure is further aided by arranging for the intensity of the bearing indicator readout display to vary with increasing or decreasing signal strength, which enables the operator to accurately aim the antenna at the required signal source.

VR-30 SERIES CHARACTERISTICS:

Frequency coverage: 2.5 to 18 GHz +
Polarisation of signals: Any
PRF measurement: 200 Hz to 10 kHz
Pulse-width range: 0.2 to 10 microsec
Bearing accuracy:
Directional antenna: ± 2°
Omni antenna: ±22.5°
Frequency band indication: S, C, X and J-band
Sensitivity: better than 0.3 mW/m²

MANUFACTURER:

NERA AS, Division Bergen, PO Box 53, N-5032 MINDE, Norway.

1859.253
VR-1-B/C RADAR SEARCH RECEIVERS
DESCRIPTION:

The VR-1 equipment is a passive radar search receiver for use on submarines (VR-1-B) or smaller surface vessels (VR-1-C). It is designed to provide radar warning facilities together with limited signal analysis capability. Pulsed radar transmissions of any polarisation within the frequency range 2.5 to 18 GHz are automatically identified with respect to direction and PRF or pulse-length and shape. As the receiver is "wide open" all the time, both in respect of frequency and direction, flash signals also are received. High sensitivity facilitates reception of transmissions originating from beyond the radar horizon. The VR-1 maintains full sensitivity during operation of own radars as provision is made for blanking out the amplifiers for the duration of the "main bang" from these systems. The VR-1-B is specially designed for submarine fitting and has a pressure-tight antenna for mounting at the top of a periscopic mast, and this is capable of withstanding pressures equivalent to a depth of 320 metres. The VR-1-C is intended for use aboard smaller surface vessels and is equipped with a lightweight antenna consisting of two identical halves for mounting around a mast. Apart from this difference, the VR-1-C and VR-1-B are identical.

VR-1-B/C CHARACTERISTICS:
Frequency coverage: 2.5 to 18 GHz
Polarisation of signals: Any
PRF measurement: 200 Hz to 10 kHz
Pulse-width range: 0.2 to 10 microsec
Bearing accuracy: + 22.5° or better
Typical sensitivity: 0.3 mW/m² or —46 dBm (B-band)

The antenna unit is an octagonal array of horns, each segment having a pair of horns for each frequency band, these being disposed for vertical and horizontal polarisation. Each horn has a crystal detector. Video signals are fed to an eight-channel solid-state video pre-amplifier before passing to the indicator unit for display and analysis. The amplified video from each channel is fed separately to the warning indicator display. The indicator unit has a 5-inch (127 mm) CRT on which alternative displays can be selected for both presentation of pulse-width and for PRF. Audio analysis facilities are provided also.

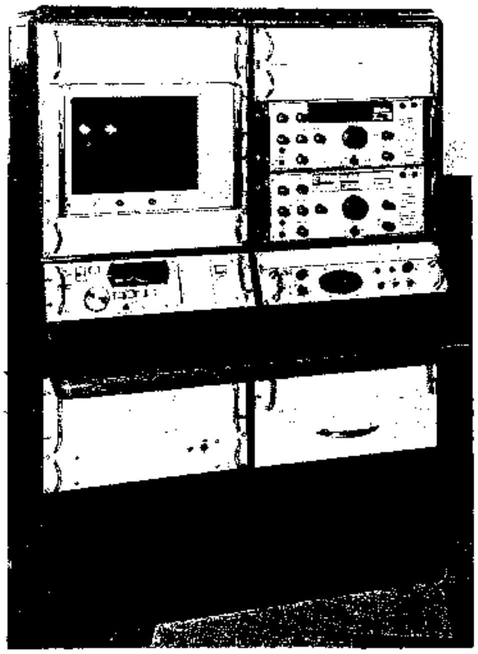
1712.153
PLESSEY HF MONITORING AND DF SYSTEM
DESCRIPTION:

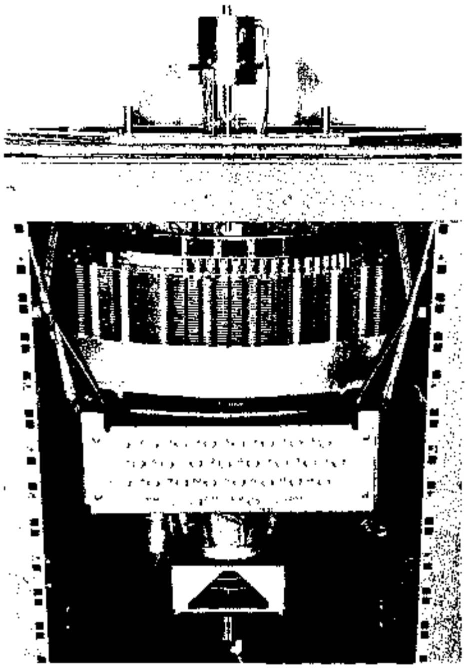
This system is produced in several configurations, appropriate to varying operational requirements, for the reception, monitoring, direction finding, and in some cases analysis of radio signals in the HF band 1.5 to 30 MHz. In those instances where the full frequency coverage is not required, some items of equipment such as part of the antenna array are omitted. The following description relates principally to the complete system.

The main elements of the system are the PVS1120A multiple beam HF receiving antenna system and the PVS 860 Series direction finding equipment. Additional equipment is used as required to provide those extra facilities such as analysis and recording to suit specific operational needs.

The PVS1120A antenna array consists of two sets of 24 monopoles equally spaced on 150 metre and 50 metre diameter circles respectively. The outer ring (PVS890A) covers the band 1.5-10 MHz and the inner (PVS880A) the band 8-30 MHz, and either may be employed on its own if the other frequency coverage is not required. Sets of electrically equal feeder cables carry antenna signals to beam-forming networks at the centre of the circle, and the net effect of the array is 360-degree cover in azimuth and 24 simultaneous 15-degree wide beams. Each of these beams can be fed to a number of monitor receivers.



Plessey PV871 Bearing and Display Console



Goniometer assembly of Plessey HF monitoring and direction finding system

The addition of the PVS 860 Series HF direction finding systems to the multi-beam antenna array provides accurate information on the azimuthal direction of arrival of any given signal. This facility is obtained independently of the 24 beams available from the antenna systems for normal receiver operation. The complete system functions by connecting the 24 outputs from the antenna system to the stater of a goniometer and scanning by a continuously revolving rotor, using capacitative coupling. At any particular instant, outputs from a group of eight adjacent antennas are coupled to the rotor and are phased and combined to give optimum response in a direction dependent upon the physical position of the eight antennas in the complete system. There are two DF outputs from the rotor, one being the sum of all eight antenna outputs and the other being the difference between two theoretically equal halves of the group. The result is the continuous scanning of the full 360 degree coverage, yielding at any instant, 'sum' and 'difference' outputs optimised for a directional normal to the sector formed by the coupled group of eight antennas.

The rotor outputs are connected to two receivers and the IF outputs relative to the required RF are displayed on the face of a CRT. This display also shows the amplitude of the sum and difference outputs, back-to-back, over the sector being scanned, the coincidence of maximum 'sum' signal and minimum 'difference' amplitudes indicating the bearing of the signal being examined.

As mentioned above, there are a number of equipment variations on the basic configuration just described, and to any of these certain additional items of equipment can be connected to provide whatever degree of sophistication in signal collection and analysis is required.

STATUS:
Systems of this type have been supplied to a number of unspecified users in Australia, Canada, Denmark, Sweden and the UK.

MANUFACTURER:
The Plessey Radio Company Ltd, West Leigh, Havant, Hants, England.

1707.253
SUSIE ECM RECEIVER SYSTEM
DESCRIPTION:

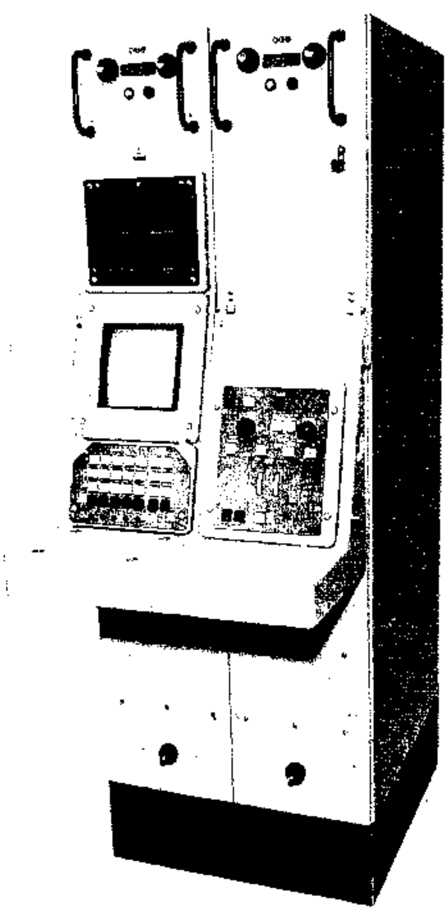
This passive intercept receiver is designed to detect all types of pulsed radar transmission and automatically present the received signals on a tactical situation display for assessment by the operator. The equipment may be left unattended and will give an alarm when signals of a preselected type or bearing are intercepted.

A situation display gives instantaneously a correlated pulse width/bearing indication together with frequency band simultaneously for all detectable signals. Thus the total radar environment is at all times shown without intervention by the operator. Signals may be selected by a strobe controlled by the operator for automatic readout of signal parameters or for automatic tracking, blanking or warning. The equipment is all solid state (except CRT and lamps), employs digital techniques, and is of modular construction. It has considerable stretch potential to provide for more sophisticated requirements.

The basic SUSIE equipment provides coverage from 2-18 GHz in four bands. Additional coverage in the range 1-40 GHz can be provided. The aerial system for SUSIE has no moving parts and can be supplied for mounting either on a platform or integrated into the mast structure.

STATUS:
In production and ordered for several navies.

MANUFACTURER:
The MEL Equipment Company Ltd, Manor Royal, Crawley, Sussex, England.



Operator console of SUSIE

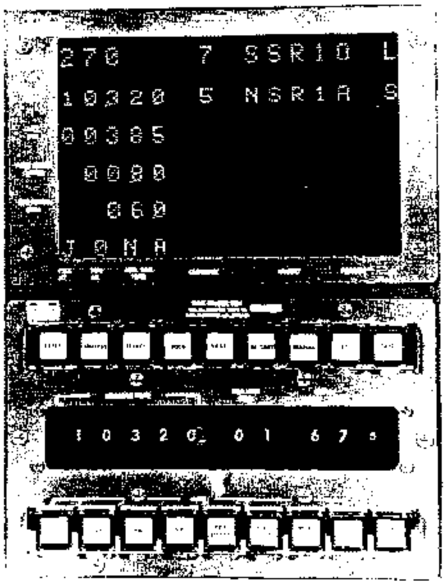
1743.263
SARIE – SEMI AUTOMATIC RADAR IDENTIFICATION EQUIPMENT

DESCRIPTION:
Because in the present environment the rate of radar intercepts can be high and the time that can be permitted to elapse between intercept and threat evaluation may be only a matter of seconds, speed and capacity are all-important in the modern identification system. Dependence upon operator reference to known radar parameters is thus unacceptably time-consuming and automatic identification is essential. It is to meet this type of operational requirement that the SARIE system has been produced. This system produces a solution to the problem by providing the results of automatic comparison of intercepted signal characteristics with a flexible dictionary of radar parameters in approximately 0.1 second. The equipment is also a useful tool in extending the existing library of data by analysing previously unrecorded transmissions.

The equipment consists of a display unit, control unit, and a data processing unit. The latter houses the dictionary, logic circuitry, punched tape reader and power supply. It can be remotely sited, as access is needed only for maintenance or to modify the dictionary contents. Dimensions are 785 × 710 × 230 mm and the weight 62 kg. The Display and Control Unit carries all the essential controls for operation of the system and the electronic display panel. Separate location of the control and display sections, to suit CIC or EW room requirements, can be accommodated if desired.

SARIE can be used with any EW receiver, accepting the video signal derived from the intercepted transmission. It automatically measures the PRF, pulse width and scan period with high accuracy, and detects the presence of PRF jitter. The equipment also accepts data on frequency, frequency agility modulation type and scan type for use in identification. This additional data, where available from the EW receiver, can be accepted automatically, or it may be entered manually by the operator from the control panel. The library is capable of storing parameter information on 475 radar types. The dictionary contents will be selected by the user to suit the anticipated operational requirements, and can be readily modified by means of the punched tape input.

The display presents data in alpha-numeric form, and typical information displayed includes the parameters of the intercepted signal, the results of the automatic comparison with the stored data to give possible identification(s) of the signal and the associated platform. Each comparative identification is given an automatic confidence level figure. The operator is able to select intercepts for identification.



SARIE Control Unit and Display Unit

EMI Electronics Ltd, Radar and Equipment Division, Hayes, Middlesex, England.

1877.253
EMI SIGNAL SELECTION AND PULSE ANALYSIS EQUIPMENT

DESCRIPTION:
The Signal Selection and Pulse Analysis Equipment has been designed to extend the capabilities of existing electronic warfare intercept receivers by providing an automatic analysis of the pulse width and pulse repetition frequency parameters of intercepted radar transmissions.

The inputs necessary are the demodulated pulse signals derived from the intercept receivers. A band selector switch is provided to allow for processing of four alternative signal inputs. The selected signals are fed to an octant selector stage and also to a threshold detector. The threshold detector stage includes a preset control (located on the front panel) to allow an operator to make a setting for optimum signal/noise conditions. The octant selector compares the selected input signal with the output from the threshold detector. When correlation occurs the signal from the selected octant is fed to the analysis circuits.

The first parameter to be analysed is the pulse repetition frequency. This is achieved by measuring the pulse interval. Several examinations of pulse intervals are made, each subsequent one is compared with the former. If these subsequent measurements are within a tolerance of ±2%, the pulse interval is directly converted into PRF. The PRF measurement is made in the range 100 Hz to 9999 Hz with the following accuracy.

± 1% at 100 Hz
± 0.2% at 1000 Hz
± 1% at 9999 Hz

These parameters are displayed on four numeric display tubes giving visible characters 13 mm high. A reset switch is provided for either automatic resetting (adjustable over the range 0.5 to 5 seconds) or manual reset, so that the read out may be retained.

The pulse width measurement is made on one of the pulses selected for PRF conversion and is effected in the range 0.1 to 9.9 μs with an accuracy of ±0.1 μs, but it is not displayed until the PRF measurement has been satisfactorily completed. The automatic and manual reset facilities provided for the PRF measuring circuits also operate on the pulse width measuring circuits. The measured result of pulse width is also displayed on two separate numeric tubes. In addition to the display tubes, facilities are incorporated for audio monitoring of the selected signal. Facilities are also provided for supplying the results of the analysis to a remote strip-line printer so that a permanent record may be obtained.

DEVELOPMENT:

The equipment has been developed by EMI Electronics Ltd., Hayes, Middlesex in conjunction with the Admiralty Surface Weapons Establishment for introduction into Royal Naval service.

MANUFACTURER:

Radar & Equipment Division, EMI Electronics Ltd., Hayes, Middlesex, England.

1341.253
DECCA RDL SERIES RADAR DETECTION EQUIPMENT

DESCRIPTION:

The purpose of this equipment is to detect radar transmissions and so provide warning of the approach of surface ships, submarines or other weapon platforms employing radar controlled weapon systems.

Although designed primarily for surface ships, versions of this equipment are now available for submarines, aircraft or vehicle use.

The RDL Series provides reception in the frequency bands 1 to 18 GHz dependent upon the particular version selected, and may be used in combinations to suit various tactical roles.

RDL-1BC:

A typical system for use on a fast patrol boat is the RDL-1BC, which provides instantaneous bearing, automatic pulse analysis and alarm, together with measurement of frequency band. Frequency coverage is from E to I band. The equipment comprises an antenna, a bearing display, a control unit, a power unit and a pre-pulse unit, all of which, apart from the display tubes, are solid state. The antenna is light and compact, and has been designed in two halves to wrap around a mast or other mounting and thus avoid the coveted mast head position.

The bearing measurement system employs a circular array of eight wide-band antennas spaced at 45° intervals in azimuth. For each antenna there is a radio frequency filter, a solid state crystal protection device, a crystal detector and integrated video pre-amplifier. The eight video signals are taken down the mast by way of sealed connectors and coaxial cables. This, and the absence of RF feeders, ensures easy installation to new or retrofitted vessels, The signals are fed to the bearing display when they are suitably amplified and pulse-lengthened before being applied to the deflection amplifiers of the display tube. A voltage controlled attenuate signals from the ship's own radars when pre-pulses are received from a pre-pulse unit. The pre-pulse unit accepts signals from the ships radars, transponders and IFF transmitters and combines them into a single blanking pulse which renders the RDL equipment inoperative during transmission. To enable the signals to be represented as a true bearing an input on the display from the ship's gyro compass is available for azimuth stabilisation.

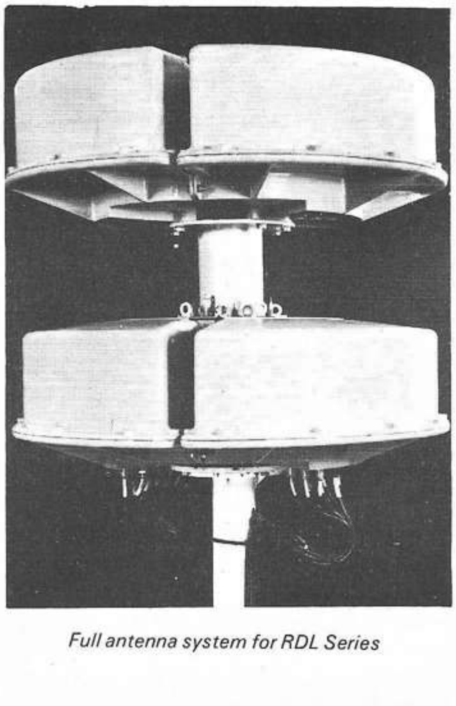
A second antenna array mounted below the bearing measurement array, consists of another set of eight antennas, also spaced at 45° in azimuth. Both the antenna arrays are located in a single radome and are supplied in all versions of the RDL series. In the more complex systems the lower array is used for frequency and pulse analysis purposes. In the case of this system it is used to provide frequency band identification in any one of eight switched azimuth sectors.

APC-1C:

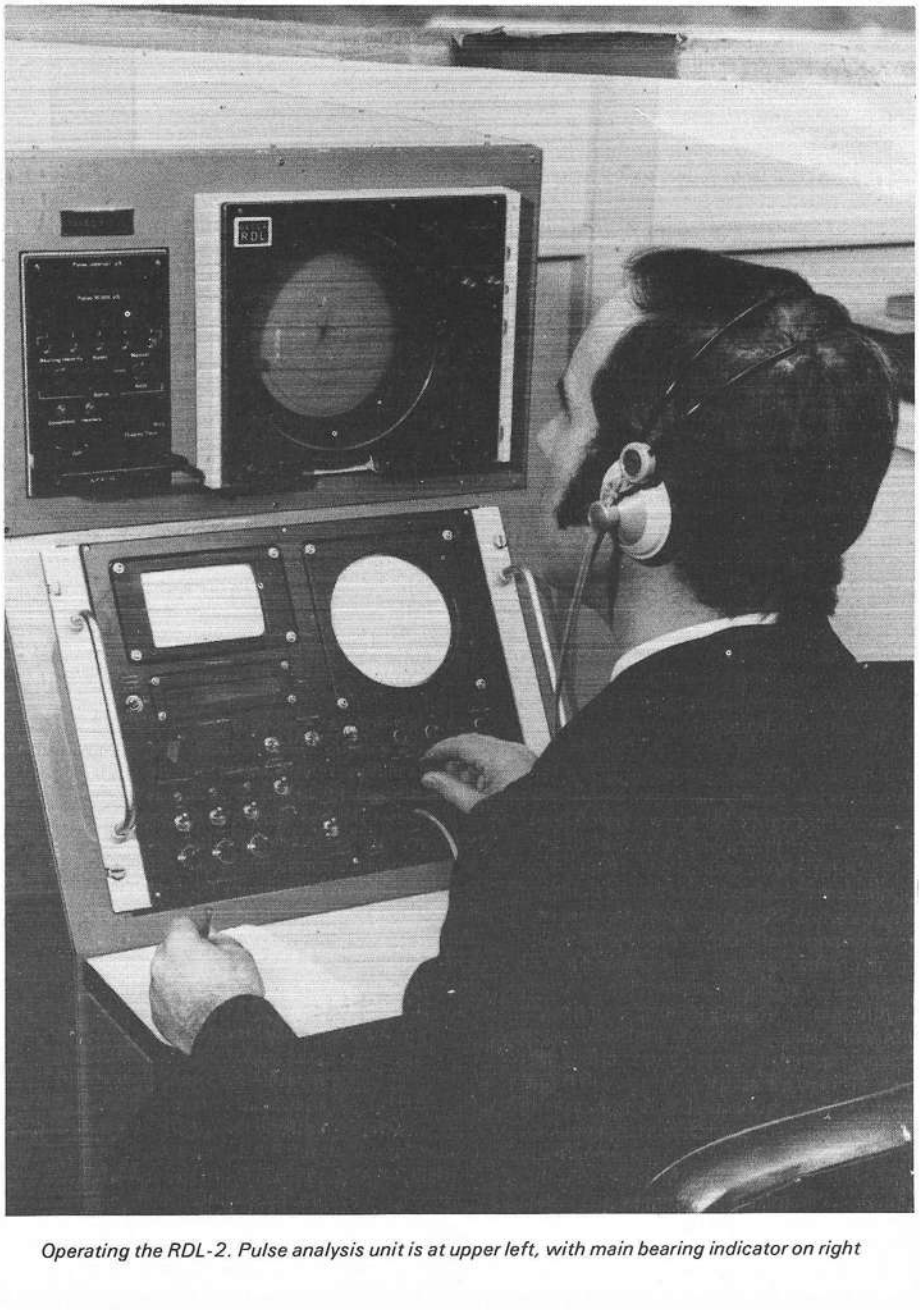
The Automatic Pulse Analyser APA-1C is a self-contained unit which may be used with any suitable EW receiving equipment. Used with the RDL-1BC, the unit provides an automatic digital readout of the pulse parameters of all signals or those selected from the switched lower antenna array. The unit is completely automatic and requires minimal operator skill or attention. For Elint purposes a line printer can be used to give a fast permanent record of the measured parameters of the intercepted radar transmissions.

There are also facilities available for the pulse parameters of up to five sets of independent radar transmissions to be set into the unit by plugging in printed circuit cards. When a signal is received which falls within these parameters, the operator is warned by the illumination of a solid state lamp or other remote triggered alarm, that a hostile transmission is present. The unit is completely solid state and employs LED numerical indicators.

The complete equipment is controlled by a master control unit, which enables the operator to display and analyse the intercepted signals in



Full antenna system for RDL Series



Operating the RDL-2. Pulse analysis unit is at upper left, with main bearing indicator on right various ways. He may, for example, display and analyse on the APA-1C *all* the signals intercepted and thereby obtain a complete picture of signal activity. Alternatively he can select and analyse only those signals on a particular bearing sector. A third and tactically important mode enables only alarm signals which appear on the APA-1C to be identified on the bearing display. An audio output enables radar signals to be recorded for off-line analysis or for subsequent use with operator training simulators.

APC-1C CHARACTERISTICS:

Pulse Interval Range: 10 μ S to 10 mS
Pulse Interval Accuracy: ± 1 u S
Pulse Width Range: 50 nS to 100 uS
Pulse Width Accuracy: ± 50 nS
Speed of Response: Readout on third pulse

RDL for Larger Ships:

Add-on units are available which convert the RDL-1BC equipment to meet the more exacting requirements of larger ships. The RDL-2ABC equipment has all the facilities of the RDL-1BC and in addition provides frequency measurement, visual pulse analysis and RF amplification in the analysis channel. The latter increases the range and permits better use of analysis facilities. The equipment consists of the units described previously and in addition contains an RF amplifier unit, a frequency and pulse analyser, and additional power supply units.

The antenna is identical to the RDL-1BC unit but contains additional components to upgrade the performance. The initial simple system can therefore be readily converted to the more comprehensive system.

The RF amplifier unit, RA-1 is fitted beneath the antenna. It contains components associated with the frequency measurement receiver and a broadband travelling wave tube which increases the sensitivity of the analysis channel. Again the intercepted signals are displayed on a standard bearing display unit and can be analysed automatically on the APA-1C.

The measurement of frequency and further pulse analysis is required for more sophisticated intelligence purposes or where active countermeasures are being considered. Several methods of frequency measurement are open to the designer, for instance IFM, (Instantaneous frequency measurement), superhetrodyne techniques and YIG (Yittrium Iron Garnet) filters. The YIG solution was adopted for RDL series equipment since it offered the best combination of performance and reliability related to cost.

In the RDL system, frequency is displayed panoramically with signals appearing as vertical deflections on the horizontal frequency scale. The operator must first select the azimuth sector containing the required signal and the band he requires to sweep. Then he may select one of two modes, auto-stop or auto-pause. In the auto-stop mode, the receiver stops sweeping automatically on signal reception and the radio frequency is indicated digitally.

In the auto-pause mode the system provides an overall picture of signal frequency activity on the selected band in the selected azimuth sector. Provision for selecting narrower frequency bands enables the system to have a high probability of intercept in that band although the whole frequency range can be swept if required.

Other facilities permit further expansion of the frequency bands, fine tuning of the received signal to obtain better frequency accuracy and the suppression, if required, of up to three specific frequencies. This enables the operator to prevent the receiver from stopping automatically on the friendly signals or those already analysed.

The RDL-2ABC system contains, in addition, a visual pulse analyser with a dual trace display. This enables two ranges of either pulse width of pulse repetition frequency to be measured visually against an illuminated graticule. This display also enables pulse peculiarities to be identified, including jittered PRF.

Elements of the RDL series, RDL-5 and RDL-6 provide for the addition of a D-band capability. All facilities available for the RDL-2 series are either useable or available as additions for signals in this frequency band. Similarly RDL-7 and RDL-8 equipment extend the system capability up to band J8.

The system RDL-2ABC 6AC 8AC covers the full 1 GHz to 18 GHz band with frequency measurement and automatic pulse analysis over the whole range. This equipment, with the addition of standard peripheral units such as computer injection panels, printers and recorders, represents a system comprehensive enough to fulfil the most stringent requirements, but is nevertheless only a few steps away from the simplest tactical system in the series.

DEVELOPMENT:

Design and development started in 1968, as a private venture.

STATUS:

Production. RDL Series in service or on order for 15 navies.

MANUFACTURERS:

Decca Radar Limited, Lyon Road, Hersham, Walton-on-Thames, Surrey, England.

1876.053
HWR-2 RADAR WARNING RECEIVER

DESCRIPTION:

This is a miniature warning receiver, designed specifically for use in environments such as helicopters and small patrol craft where space and weight are invariably at a premium and the installation of sophisticated Electronic Warfare equipment is uneconomical. In its basic form the receiver is handheld and operates completely independently of available supplies and mounting arrangements (although it may be hard-mounted in rotary wing aircraft and surface ships).

Held by a pistol-grip handle, it can be used to locate pulsed radar transmissions of any frequency in the range 2 GHz to 11 GHz. The presence of a radar transmission is indicated by listening to the audio note of the transmitted PRF on a headset. The electronic circuits are housed in a cast metal case designed to withstand rugged service conditions.

All controls are grouped on the rear face of the receiver with the single multiway connector for electrical interfaces. Using the Handheld Receiver, an operator may assess the following characteristics of a radar signal:

Bearing:

By scanning the receiver in azimuth and noting the direction of maximum signal volume in the headset, the bearing of a radar may be ascertained to an accuracy of approximately $\pm 10°$.

Polarisation:

By twisting the receiver for maximum signal volume, an assessment may be made of the radar polarisation. When the receiver is held normally with the handle pointing downwards the antenna polarisation is linear at 45°, and thus horizontal, vertical and circular polarisation may be received. The receiver polarisation is indicated by an arrow on the back of the case.

Frequency Band:

By operating the Band switch from the All position to the High position, an assessment may be made of the radar frequency band. If the signal is in X-band, then it will remain audible, if it is S-band, it will be suppressed.

Scan Pattern:

The audible sequence gives a very good indication of the type of radar scan e.g. continuously rotating, sector scanning etc.

PRF:

An experienced operator will be able to discern quite accurate information about the radar PRF from the audible note.

Range and Power:

The relative intensity of a received set of signals provides some indication of their range and power. The sensitivity of the receiver may be reduced by 15 dB by operation of the sensitivity control from High to Low.

STATUS:

In production and delivered to various users

ALE-37 CHAFF DISPENSER

DESCRIPTION:

The AN/ALE-37 is a high-capacity chaff dispenser for large area coverage, and although not officially confirmed, it is assumed to be internally carried by the seeding aircraft. It is capable of dispensing chaff or expendable jammers for anti-radar purposes, or flares. The probable use for this equipment is not so much self defence for the seeding aircraft as an element of full-scale EW support for a large-scale bomber attack or other large formation operation. Although it cannot be confirmed, it is probable that there are provisions in the equipment for programmed shot dispensing of the chaff or other stores, and that a range of radar frequency bands can be handled.

STATUS:

Believed to be in development during 1973.

1905.393
ALE-39 ECM DISPENSER

DESCRIPTION:

The ALE-39 ECM dispenser developed as a replacement for the ALE-29B equipment. The latter has been deployed on almost all types of US Navy tactical aircraft, and is capable of dispensing both chaff and flares. However, it has to be preprogrammed on the ground, before take-off: the ALE-39 allows the pilot to select from the cockpit, while airborne, whether a chaff cartridge or a flare for IR missile defence is dispensed. The system also will have the capability for selection and ejection of expendable jammers when these are operationally available. The ALE-39 is intended for self-protection of tactical aircraft such as the A-4, A-6, A-7 and F-4 types. Development was completed and the ALE 39 was released for production in October 1972.

MANUFACTURER:

Goodyear Aerospace Corporation, Lichfield Park, Arizona 85340, USA.

1906.393
ALE-40 CHAFF DISPENSER

DESCRIPTION:

The ALE-40 is a radar counter-measure chaff dispensing equipment that can be carried on aircraft external stores pylons without preventing the use of these pylons for their primary purpose of carrying missiles or other munitions. This is achieved by mounting honey-comb type container/dispensers on the vertical sides of the wing pylons. Each such container can house 30 cartridge ejected chaff packages which are expelled rearward from the container. The packages are rectangular in section to conform with the container, and they can be loaded with either RR 170A/AL aluminium-coated glass or RR-170B/AL aluminium foil chaff. Measurements of chaff packages are 23 × 23 mm square × approximately 16 cm long and each incorporates its own ejector cartridge. A complete equipment set consists of four launcher containers which, in the case of the F-4 aircraft, are located on the inboard wing pylons.

MANUFACTURER:

Tracor, Inc., 6500 Tracor Lane, Austin, Texas 78721, USA.

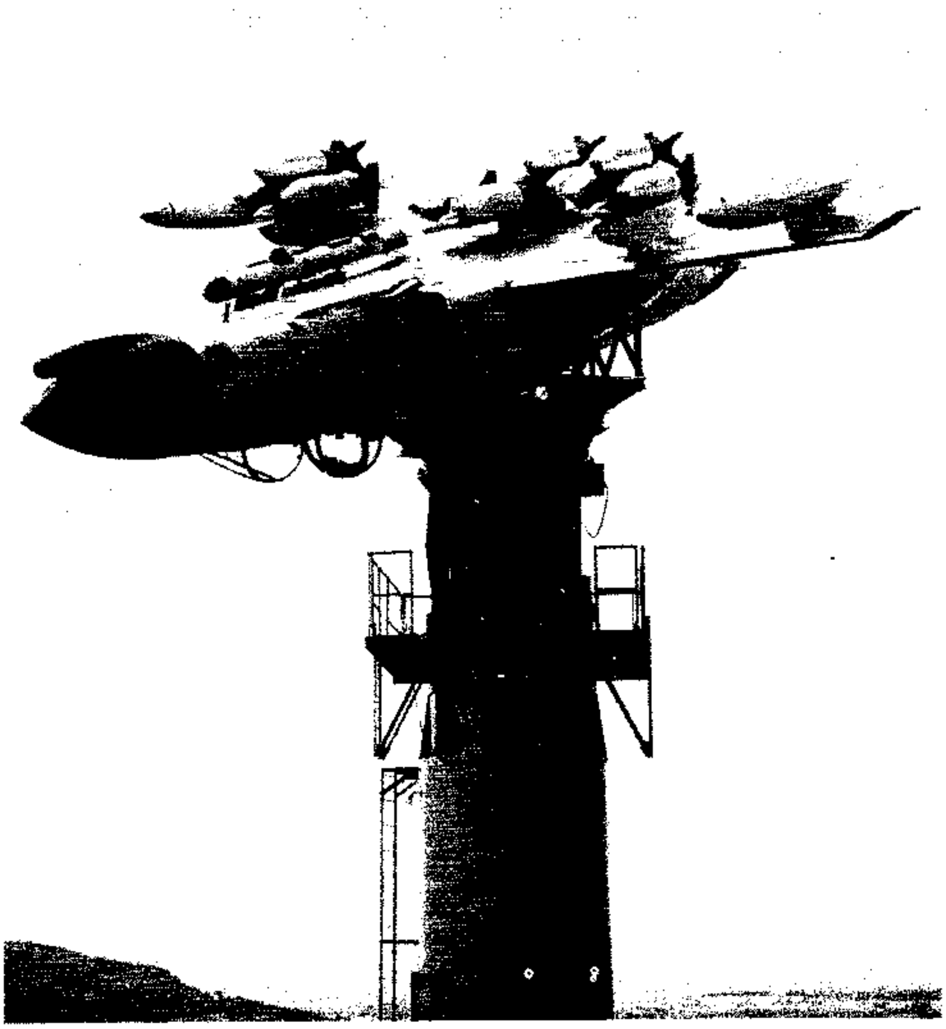
1907.393
ALQ-87 ECM POD

DESCRIPTION:

The AN/ALQ-87 is one of the later jamming pods to emerge from the long-running QRC-160 programme (c 1960-1965), and was the '-8' model of that series. (The '-1' became the ALQ-71 S-band noise jammer, and the '-2' was the X-band ALQ-72.) The broadening range of threats and frequencies employed, which were encountered by the USAF in SE Asia led to an examination of new countermeasures and the requisite technical means to extend jamming frequency coverage. Among the latter, the backward wave oscillator was adopted for the QRC-160-8 which had the ability to cover the C-band. This version was designated the ALQ-87. It later was given an X-band capability, in late 1968, followed in 1969 by another upward frequency increment into the Ku-band. This pod had barrage jamming capabilities against both land-based threats and interceptor AI radars.

MANUFACTURER:

General Electric Company, Aerospace Electronic Systems Department, French Road, Utica, New York 13503, USA.



A salvaged F-4B aircraft, installed on a test rig at Rome, NY, Air Development Centre is used for the evaluation of the ALQ-87 countermeasures pod on centre-line of fuselage

1908.393
ALQ-99 ECM EQUIPMENT

DESCRIPTION:

The AN/ALQ-99 is a large and sophisticated tactical noise jamming system forming the major portion of the US Navy EA-6B ECM aircraft's operational payload. It comprises five external pods, each capable of housing two very high powered jamming transmitters, a tracking receiver, the requisite aerials and a ram air turbine to provide electrical power. Other associated equipment is housed in the large fin-top blister of the EA-6B, and in the aircraft itself there is further ALQ-99 equipment which includes a digital computer and display and control facilities for two operating crew members.

The pods are detachable from the aircraft and are capable of housing various combinations of transmitters and receivers to cover any desired frequency bands. These can be arranged to provide an aircraft with any combination of duplicated and different operating bands, within the total capacity of the equipment and as required by operational necessities.

System Integration Receivers are responsible for monitoring the threat situation (ie opposing radar transmissions) and the outputs of the ALQ 99 transmitters, to ensure that the systems respond to valid threats and not to the aircraft's own transmissions. The SIR system receivers and antennas are housed in the fin blister. An IBM 4 Pi general purpose digital computer inside the aircraft carries out processing for the tactical jamming system as well as performing a navigational function. The latter facility enables the computer to perform a transmission beam steering (or transmission blanking) function so that jamming radiation can be restricted to a given 30-degree azimuth sector. The computer also interfaces with the SIR and display sub-systems.

Of three possible operating modes for the ALQ-99, in the automatic mode the computer performs the sorting of detected signals and directs the selection and activation of jamming against threats. In this mode, the two operators monitor system operation. In the semi-automatic mode, the computer identifies and indicates threats and the operators select and initiate ECM actions. In the manual mode the operators each search their apportioned parts of the spectrum, identify threats and assign jammers to them.

STATUS:

In service with USN EA-6B aircraft. An internally located version of the ALQ-99 is under consideration by the USAF for use in the projected EF-111A ECM aircraft. It is envisaged that this would incorporate a number of improvements, among them: (1) reduced search time for receivers to search the radar bands and identify enemy signals; (2) an increase in the number of radars that can be jammed by each ALQ-99 transmitter by increasing the jamming bandwidth and generating (modulated?) instead of (noise?) jamming signals; (3) increased operational flexibility by permitting several jammers with different frequency coverage to employ the same exciter, or signal source; and (4) further extra operational flexibility by adding omni-directional antennas to permit selection of either directional or omni-directional transmissions. Note. The words in brackets in the above passage have been substituted for the word 'Deleted' which appeared in the original document. It is believed, also, that the EF-111A version of the ALQ-99 would employ more transmitters than that used on the EA-6B.

ALQ-100 ECM EQUIPMENT

DESCRIPTION:

The AN/ALQ-100 is an internally-mounted Deception Electronic Counter-Measures (DECM) equipment fitted in US Navy A-4, EA-6B and A-7 aircraft. It is a multiple-band, repeater-type track breaking jammer and operates in conjunction with the aircraft's threat warning receiver. No official details have been revealed but it is thought that the ALQ-100 responds to detection of a radar signal associated with a known Soviet AA missile threat by high-power, broad-band noise jamming in the same radar band, or in the DECM mode by repeating the threat radar's signals after a delay to deceive the system and break track.

An advanced version of the ALQ-100 was procured by the US Navy under an updating programme called PRIDE, and a contract valued at over $38-million was awarded in August 1972.

MANUFACTURER:

Sanders Associates, Inc, Daniel Webster Highway, South, Nashua, New Hampshire 03060, USA.

ALQ-101 ECM PODS

DESCRIPTION:

The AN/ALQ-101 designation embraces a large family of jamming pods with varying capabilities, and which have evolved over a period of about eight years. The USAF project Sesame Seed of 1966 called for proposals for a range of modular jamming pods, and this led first to a contract for five QRC-335A prototypes and eventually to production of 155 pods designated QRC-335A/101-1. Deliveries commenced in 1967 and were completed by Summer 1968. This version was a fore and aft-facing jammer covering the S-and C-bands, and during the production run the nomenclature was changed to ALQ-101A.

The ALQ-101(V)3 model which followed was a more powerful version covering the same frequency bands, and 71 were produced. An option for a further 60 was overtaken by rapid changes in the threats to be countered, which resulted in an updating programme to add X-band capabilities. This model became the ALQ-101(V)4 and a total of 324 pods were procured, of which 60 represented the option on (V)3 models.

The ALQ-101(V)6 model followed in the Fiscal Year 1970 funding, this version having a further extension of its frequency coverage. A total of 58 pods were delivered to the USAF.

All of the above versions of the ALQ-101 were of circular cross-section and were about 25 cm in diameter, the first QRC-335A model having been approximately 230 cm long and the three succeeding versions about 390 cm in length. The final model of the series, the ALQ-101(V)8, was the first of the so-called 'gondola' type in which the underside of the pod has throughout its length a trough-shaped compartment which considerably increases the available volume of the pod without serious increase in cross-sectional area. This model enlarged the frequency coverage once again and also incorporated other improvements to provide "full capability", or the ability to counter all known anti-aircraft threats. Earlier ALQ-101 pods were retrospectively updated to (V)8 standard and a total of more than 300 was procured. This final model of ALQ-101 is approximately equivalent to the ALQ-119 which followed after the USAF awarded a contract in 1970.

One other derivative of the original QRC-335 pod which should be mentioned. This is the ALQ-105 which consisted of a repackaged version that amounted to a longitudinal splitting of the pod, the two halves being grafted onto the sides of the F-105 fighter-bomber aircraft. About 90 were produced.

ALQ-119 ECM POD

DESCRIPTION:

The AN/ALQ-119 is a dual-mode jammer pod which was developed for the USAF to provide "full-capability" protection for strike aircraft. By full-capability is meant a complement of countermeasures against known AA threats. Various types of aircraft can be equipped with the ALQ-119 but the principal model is the F-4 Phantom. It is reported to be a three-band equipment, and qualifies for dual-mode status by virtue facilities for both noise jamming and repeater deception jamming.

When initiated as QRC-522 in 1970, the equipment was given extended frequency capabilities and enhanced modulation performance to become the USAF production version designated

ALQ-119. The three frequency bands covered by the equipment have not been disclosed but are probably X-, C-, and S-band.

DEVELOPMENT:

Development was initiated by QRC-522 and R & D was carried out by Westinghouse. In 1970 a contract for 20 prototype pods was awarded. It entered service in Vietnam in 1972.

STATUS:

Between 600 and 700 ALQ-119 pods have been produced and in July 1974 the rate of production was running at about 20 pods per month. This figure was expected to increase to around 45 per month as production of the older ALQ-101 pod tapered off and stopped. In March 1974, a total procurement of 122 ALQ-119s was funded for FY 1975. Reportedly, this equipment was among EW hardware supplied to Israel during the 1973 conflict.

Under the USAF Compass Matrix project, the ALQ-119 is to be provided with a computer-controlled energy management system, by means of which the power radiated by the pod, in terms of frequency, type of signal etc, will be automatically controlled in accordance with the threat situation encountered.

MANUFACTURER:

Aerospace and Electronic Systems, Westinghouse Electric Corporation, Baltimore, Maryland 21203, USA.

ALQ-119 ECM Pod produced by Westinghouse

1912.393
ALQ-123 INFRA-RED COUNTER-MEASURES

DESCRIPTION:

The AN/ALQ-123 is an airborne infra-red jamming equipment, developed to provide aircraft with protection from IR-homing missiles, particularly surface-to-air weapons such as the Soviet SA-7, Grail. It is a pod-mounted equipment and is powered by a ram-air turbine, and was designed for carriage on A-6 and A-7 type attack aircraft. Modification of the system for internal installation in the tail of fighter aircraft has been given some consideration by the US Navy.

The ALQ-123 is not an IRCM of the flare dispensing type (which is a known technique of decoying IR-homing missiles), and it is understood to comprise a method of generating a series of fuel-air aerosols behind the aircraft and causing them to ignite at appropriate intervals to confuse or break the lock-on of an IR seeking missile.

STATUS:

Development had been completed by March 1973 and operation evaluation followed with production examples two or three months later. The system is now in the US inventory.

MANUFACTURER:

Xerox Corporation, Electro-Optical Systems, 300 N. Halstead Street, Pasadena, California 91107, USA.

1913.393
ALQ-126 ECM EQUIPMENT

DESCRIPTION:

The AN/ALQ-126 is a Deception Electronic Counter-Measures (DECM) equipment developed under the US Navy's Charger Blue EW updating programme. It provides a wider coverage of radar frequency bands than the ALQ-100, upon which it is based, and was initiated in response to the new threats represented by recently introduced Soviet anti-aircraft missiles and gun systems.

The ALQ-126 is internally fitted in US Navy tactical aircraft such as the A-7, A-6 and RA-5, and is intended to progressively replace the ALQ-100 In addition to increased frequency coverage, the ALQ-126 incorporates improved deception techniques, more modern construction, packaging and cooling arrangements.

STATUS:

The USN Fiscal Year 1974 Budget sought funds amounting to over $53-million to provide ALQ-126 equipment for 219 aircraft. Production had commenced by June 1973. Later in 1973, it was announced that a total of almost 1300 sets were to be acquired by the USN at an estimated cost of $225-million. A small quantity for use on Royal Netherlands Air Force F-104 aircraft was ordered in 1974.

MANUFACTURER:

Sanders Associates, Inc., Daniel Webster Highway, South, Nashua, New Hampshire 03060, USA.

1914.393
ALQ-130 ECM EQUIPMENT

DESCRIPTION:

The AN/ALQ-130 is a tactical communications jamming equipment for use by US Navy fighter and attack aircraft, including A-4, A-6, A-7, and F-4 types. The principal function is probably the disruption of the communications links associated with enemy air defence networks and surface-to-air missile formations. The jamming may include broad-band electrical and/or acoustic noise or spot frequency jamming, but the former is probably more likely.

Development of the ALQ-130 was initiated as an updating programme for the ALQ-92 tactical communications jammer, which on the USN EA-6B is internally mounted, suggesting that the ALQ-130 also will be carried this way.

MANUFACTURER:

AIL Division, Cutler-Hammer, Deer Park, Long Island, New York 11729, USA.

1915.393
ALQ-131 ECM POD

DESCRIPTION:

The AN/ALQ-131 is an advanced ECM, jamming pod being developed under Programme Element 64739F which covers protective systems for the F-4 and F-105 aircraft types. Dimensions of the ALQ-131 are: length, 437 cm × 25 cm deep × 30 cm wide, and weight 377 kg. It is a modular equipment, described in US defence circles as a full-capability-plus system, and is based on the use of a digital computer contained within the pod. There are eight different modules for one version of the pod, providing for jamming of all known anti-aircraft missile system frequency bands. Another module is a radar warning receiver, which, in conjunction with the pod's self-contained digital processor, enables threat evaluation to be carried out autonomously without recourse to internal aircraft analysis equipment.

DEVELOPMENT:

Development was undertaken in response to a USAF RFP, (QRC-559) in the 1971-72 period, when proposals were put up by a number of US industry teams. That headed by Westinghouse was chosen to develop the ALQ-131. Other members of this team were Motorola and Dalmo Victor, the former handling the lower-band portion of the equipment, and the latter being responsible for the digital processor and warning receivers.

The programme was halted briefly in March 1973 when Westinghouse and the USAF embarked on a cost-cutting exercise, but it was re-started in the following May. Development continued in 1974.

STATUS:

Supplemental funds to increase the pace of ALQ-131 and its associated support equipment during FY 1975 to the extent of $5.4-million. Estimated cost per copy of production models is $400,000 and the first 25 pods of an anticipated initial purchase of 100 was reported in March 1974. First flight test were due in Summer, 1974.

MANUFACTURER:

Aerospace and Electronic Systems, Westinghouse Electric Corporation, Baltimore, Maryland 21203, USA.

1916.393
ALQ-133 ELINT EQUIPMENT

DESCRIPTION:

The AN/ALQ-133 is a tactical Elint system which is under development to be used by the US Army to convert a number of OV-1 reconnaissance aircraft for emitter detection and location missions. OV-1 Mohawk aircraft converted in this way will bear the new designation EV-1. The ALQ-133 has also been proposed for use in a number of A-10 tactical aircraft.

The EV-1 configuration of the ALQ-133 consists of two pods containing Elint receivers needed to cover a frequency range extending probably from VHF or UHF up to 18 GHz, and equipped with the appropriate broad-band antennas; and data processing equipment housed in the aircraft fuselage. The pod antennas will be phased interferometer elements, capable of providing direction-of-arrival measurements over a 90-degree sector abeam of the aircraft to a typical accuracy of 0.5 degree. If some degradation of bearing accuracy is acceptable, the coverage sector can be enlarged to 120 degrees.

The data processor is responsible for control of the search receivers, analysis of intercepted signals and comparison of these against a file of known hostile radar characteristics. Other data processing options include housing this part of the equipment in a third pod (this is proposed for the A-10), and locating it on the ground, the raw Elint being passed from the aircraft by data link.

STATUS:

In May 1974 funds amounting to $5.7-million were being sought by the Army for six ALQ-133 electronic surveillance radar target locator systems. At that time, two pre-production models were under construction, plus a third for military qualification testing, under a separate development contract worth about $8 million. Completion was due in late 1974.

MANUFACTURER:

United Technology Laboratories, 410 Kirby, Garland, Texas 75042, USA.

1917.353
ALR-45 ECM EQUIPMENT

DESCRIPTION:

The AN/ALR-45 is an aircraft radar warning and direction finding receiver which is fitted to most types of US Navy tactical aircraft. It is similar to the earlier APR-25 warning receiver but provides for high-speed, digital processing of threat data as well as having a wider frequency coverage. Few details of the ALR-45 have been released but it has been described as a wide-open, broad-band receiver covering a frequency range of 2 GHz to over 14 GHz.

Four cavity-backed planar spiral antennas are used, each with its own pre-amplifier and interface unit linking it to the central receiver and processor.

MANUFACTURER:

Itek Corporation, Applied Technology Division, 3410 Hillview Avenue, Stanford Industrial Park, Palo Alto, California, 94304, USA.

1862.353
ALR-47 RADAR HOMING AND WARNING SYSTEM

DESCRIPTION:

The AN/ALR-47 Counter-measures Receiving Set has been developed for the US Navy's newest ASW aircraft, the S-3A Viking (Entry No. **1403.302**) and is representative of the latest practice in RHAW equipment. In the Viking the ALR-47 obtains emitter signature and directional data which is fed into the aircraft's general-purpose digital computer for display on a multi-function display console. Among new features of the ALR-47 are automatic operation with variable control for frequency band limits, speed of tuning, and signal selection. Fixed antennas are used (4 in each wing-tip), superhet receivers, and a digital processor.

Twin narrow-band receivers are incorporated in each ALR-47, and these incorporate an IF discriminator, out-of-band rejection logic, and voltage controlled oscillators which are tuned directly by computer control. The receiver channels are designed for high sensitivity and there is logarithmic compression of video outputs.

The characteristics of video outputs from four monopulse receiver channels are derived in a signal comparator which converts the data to digital format. All subsequent signal processing is performed digitally under computer control.

The two antenna groups are each comprised of two pairs of cavity backed planar spiral broad-band antennas, arranged in a near orthogonal disposition for monopulse direction finding.

Control of the ALR-47 system is by means of computer programs which provide for receiver tuning, signal processing, and initiating warnings of significant contacts or known threats identified by stored signal characteristics. Provision is made for human intervention and manipulation of the software in the course of a mission to meet specific operational needs. Examples of this are facilities for filtering out unwanted signals of various types so that the overall processing and display load is reduced. Similarly parameters such as scan speed and frequency scanning limits, PRF, pulse-length or bearing limits may all be varied at the discretion of the operator.

STATUS:

In production for the USN S-3A Viking ASW aircraft.

MANUFACTURER:

IBM, Federal Systems Division, 10215 Fernwood Road, Bethesda, Maryland 20034, USA.

1918.353
ALR-50 ECM EQUIPMENT

DESCRIPTION:

The AN/ALR-50 is a surface-to-air missile alert and launch warning receiver set. Official details of its frequency coverage range have not been released but the ALR-50's coverage is believed to provide for warning of the radars associated with such Soviet surface-to-air missiles as the latest SA-6 Gainful as well as the earlier SA-2 and SA-3 weapons. It is possible, however, that whereas systems of this type (ALR-50) normally provide the aircrew with some indication of the status of the threat (Eg, search, tracking, lock-on etc), in the case of the SA-6 Gainful the use of as many as five bands for this missile's associated radars may prevent the ALR-50 from providing complete threat status information.

STATUS:

Development completed, in service with various US Navy aircraft types, including: A-4, RA-5, A-6, A-7, F-4 and F-8.

MANUFACTURER:

The Magnavox Company, 1700, Magnavox Way, Fort Wayne, Indiana 46804, USA.

1919.353
ALR-52 ECM RECEIVER

DESCRIPTION:

The AN/ALR-52 is a multi-band IFM (Instantaneous Frequency Measuring) receiver for airborne or land mobile applications. A naval variant is produced also under the nomenclature AW/WLR-11. Typical systems cover the microwave frequency band from 0.5 GHz to 18 GHz, using receiver modules that cover octave-bandwidths. Additional capabilities include provision for selection of a particular signal or frequency band, blanking of signals which are of no further interest, separation of interleaved pulse trains, measurement of radar parameters, analysis of CW as well as pulse signals, and direction-of-arrival (DF) measurement. The complete equipment provides for two operator positions, each equipped with a control unit and a display. The two IFM control units are capable of complete control over any band selected. If the same band is selected by both units, the video processing unit gives priority control to one position only. All intercepted signals, however, are presented on the displays at both positions.

A modified version of the ALR-52 has been developed and deployed, in which one of the operator positions has been replaced by an interface unit to link the IFM receiver with a digital computer. This system also employs a 1 to 18 GHz DF antenna system. The computer uses the data to 'tag' every received pulse with its frequency, pulse-width, time-of-arrival and azimuth. This information is stored and used to develop an emitter parameter.

STATUS:

The US Navy placed a contract for $2.1-million in March 1972 for ALR-52 equipments, and the shipborne version, WLR-11, also is in service.

MANUFACTURER:

ARGO Systems, 1069 East Meadow Circle, Palo Alto, California 94303, USA.

1863.363
DSA-20 DIGITAL SIGNAL ANALYSER

DESCRIPTION:

The DSA-20 is a digital signal analyser designed as a direct replacement for the analogue, hard-wired type of analyser used in Radar Homing and Warning Systems (RHAW) such as the ALR-45, APR-25, APR-36, and APR-107. The DSA-20 is interposed between the existing RHAW receiver(s) and threat display and bearing indicators, and no aircraft modifications are called for. A major benefit claimed for this equipment is the improved presentation of information on the RHAW azimuth indicator. In place of the conventional families of radial lines for each emitter detected, the DSA-20 provides alpha-numeric symbols for each class of contact, and the digital system permits priority allocation by push-button so that overlapping threats may be separated and unwanted signals cleared from the display. The use of digital processing offers another significant advantage in that changes in threat signatures that have been detected by Elint operations can be inserted rapidly into the RHAW, with far less delay than is possible with hard-wired, analogue analysers.

STATUS:

In production for the USAF.

MANUFACTURER:

Dalmo Victor, 1515 Industrial Way, Belmont, California 94002, USA.

1861.053
SYLVANIA EW ANTENNAS

DESCRIPTION:

The Electronic Systems Group of GTE Sylvania, Inc has developed and produces a wide range of special antennas for electronic warfare applications and in the following paragraphs the salient features of major examples of this range are listed.

AN-10B Broadband Horn:

This is a microwave horn antenna for which high, and near-constant, efficiency over an operating frequency spectrum of more than 10:1 is claimed. This is achieved by locating a dielectric phase-correcting lens in the flared section of a double-ridged horn. The frequency range is 1 – 11 GHz and linear, horizontal or vertical polarisation is acceptable. The nominal gain (over an isotropic source) is specified as 2 to 20 dB.

AN-10C Broadband Horn:

The AN-10C is a compact microwave horn with a frequency coverage of 2 – 11 GHz. The antenna is basically a double-ridged horn with a solid-dielectric, phase-correcting lens located in the horn aperture. Weight is less than 0.6 kg and the gain 6 to 17 dB.

AN-10E Broadband Horn:

This microwave horn provides high efficiency over a band of 0.5 to 4 GHz. A double-ridged horn, the AN-10E represents a compact UHF unit for ECM, tracking, and surveillance. Gain is 8 to 14.5 dB.

AN-10F Broadband Horn:

The AN-10F is another example of the double-ridged horn with a dielectric phase-correcting lens in the horn aperture. Its frequency range is 3 to 18 GHz, with gain specified as 6 to 20 dB. Applications are ECM, tracking, surveillance, etc. and it may be used either as the main radiating or receiving element or as the feed for a parabolic reflector.

AN-13 High-gain Omni-directional Antennas:

This range of omni-directional antennas has been developed for signal acquisition and side-lobe suppression applications. The basic construction is that of a biconical horn, with metal grids or meander lines in the aperture, yielding 45-degree slant linear or circular polarisation, respectively. The polariser grids also serve as a structural support and protective radome. A large biconical antenna aperture gives narrow elevation beamwidths and relatively high gain. The various frequency ranges of the series are denoted by suffix letters and numbers which follow the basic AN-13 model, as shown in the following table. All models from AN-13A to AN-13D have 45-degree slant polarisation, while those from AN-13E to AN-13GZ have circular polarisation.

Model No.	Frequency (GHz)	Beamwidth (Elev)
AN-13A	1-4	30
AN-13A2	0.25-0.5	20
AN-13A3	0.5-1	20
AN-13A4	1-2	20
AN-13B	4-12	15
AN-13B2	8-12	30
AN-13B3	3-18	100 to 25
AN-13C	12-18	60 to 29
AN-13D	17-26.5	55 to 22
AN-13E	12-18	40
AN-13E2	7.5-16.5	40
AN-13E3	8-12	20
AN-13E4	12-18	20
AN-13E5	10-18	40 to 20
AN-13F	7-17.5	−10 to +30
AN-13G	2-4	20
AN-13G2	4-8	20

AN-15 Conical Log Spiral Antennas:

These are produced by means of a three-dimensional printed-circuit technique for generating precision log spirals on dielectric cones. These conical log spirals maintain essentially constant radiation pattern performance with low polarisation axial ratio over several octaves of bandwidth. They have been designed for use as reflector feeds, primary radiation, and array elements. The tip diameter of the conical spirals is typically 0.1 wavelength of the highest operating frequency. The base diameter is normally about 0.3 wavelength of the bottom cut-off frequency, for small cone-angles. For large cone-angles the latter value becomes 0.4 wavelength.

Model	Cone-angle	Freq. (GHz)	Half Power Beamwidth
AN-15A	25	0.05-1.0	80
AN-15B	15	0.5-1.0	70
AN-15C	10	1.0-2.0	70
AN-15D	10	2.0-4.0	70
AN-15E	10	4.0-8.0	70
AN-15F	10	8.0-12.0	70
AN-15G	10	12.0-18.0	75
AN-15H	15	1.0-4.0	80
AN-15I	25	2.3-11.0	80
AN-15J	25	1.0-8.0	80
AN-15K	30	1.0-12.0	90
AN-15L	30	0.5-4.0	90
AN-15M	30	4.0-12.0	90
AN-15N	20	1.0-4.0	120
AN-15O	20	4.0-8.0	120
AN-15P	20	8.0-18.0	120

AN-16 Cavity-backed Spiral Antenna:

The AN-16 is a precision cavity-backed, planar-spiral antenna covering a frequency band of 2 to 18 GHz. Antennas of this type track one another extremely well when associated, in both amplitude and phase, this applying not only in the on-axis situation but up to ± 30 degrees off the antenna axis.

AN-18 Dual-polarised Horn Antennas:

A number of broadband, quadruple-ridged horn antennas have been developed covering frequencies in the range 50 MHz to 18 GHz. Horns of this type, covering frequency bands of up to 8:1, have two orthoganal probe feeds. Through a polarisation switching network, two orthogonal linear polarisations and left- and right-hand circular polarisations can be obtained. Isolation between probes is greater than 30 dB. Phase imbalance between probes is less than 10 degrees and the amplitude imbalance less than 1 dB across the frequency band of interest. This series of antennas was designed for use in reconnaissance and surveillance of signals of unknown polarity.

AN-23 Lindenblad Antennas:

GTE Sylvania has developed printed circuit board circularly polarised omni-directional Lindenblad antennas to cover octave frequency bands. Five different units are available in the 0.5 to 12 GHz range. They are produced as complete sealed units, with integral radome, and are suitable for airborne use in intercept/collection and other applications.

AN-34 Conical Spiral Array:

Under this designation a series of conical-spiral antenna arrays for broad-band, high-accuracy tracking and direction-finding is produced. Features of such arrays include circular polarisation, low polarisation axial ratio, frequency-independent performance, small bore-sight shift, and phase and amplitude tracking among antennas. An antenna array for two-channel monopulse operation consists of two conical-spiral antennas arranged in the frequency-independent manner and a magic-T which provides the sum and difference output. The one Sigma DF accuracy of such an array over an azimuth sector of 45 degrees (±15 degrees in elevation) is better than 1.5 degrees over an octave bandwidth.

MANUFACTURER:

GTE Sylvania Inc., Electronic Systems Group, Western Division, 100, Furguson Drive, Mountain View, California 94040, USA.

1887.153
FAIRS ELINT SYSTEM

DESCRIPTION:

The Fairchild Automatic Intercept and Response System (FAIRS) is a multi-site/multi-purpose electromagnetic data acquisition and processing system. The basic FAIRS concept is to acquire and process data from a number of remote sites or mobile units and provide pre-processed data to a central command centre or remote users for decision making. The collection system is extremely flexible and expandable. The entire system may consist of a single site or may be composed of a dozen or so fixed stations, land mobile units, or airborne platforms.

Features of the FAIRS concept which make it extremely flexible include:

The system utilizes off-the-shelf subsystem components.

Subsystem components are basic building blocks and can be easily configured or reconfigured.

The system can perform many tasks simultaneously.

Changes in system mission profiles are essentially software changes and do not require new hardware.

A wide frequency range, 5 kHz to 12.5 GHz, can be covered.

Site-to-site command and control require only telephone lines; traffic on data links is minimized by utilizing site computers to perform functions asynchronously.

Direction finding (DF) may be accomplished from a single site or from multiple sites for improved probability of location.

DF is possible at frequencies as low as 500 kHz.

Fairchild Space and Defence Systems Division's BRT/MXB Series Broadband Receiving System is capable of being remotely controlled, either by special circuitry or directly from a digital computer. All functions of the BRT/MXB, such as attenuator setting, frequency selection (by digitally controlled frequency synthesis), and bandwidth (continuously variable from 500 Hz to 20 MHz) are remotely controllable. Thus, the BRT/MXB can be the key element in receiving systems which completely adapt to the electromagnetic environment at the antenna terminals.

The state-of-the-art in direction-finding antenna now makes possible broadband electronically-steerable arrays which provide simultaneously good sensitivity, rapid response, and accurate direction finding.

The completely computer-controlled receiver, coupled with electronically-steerable surveillance and direction-finding antennas, makes possible high-speed systems for detection, identification of signals, and location of the source of the emitter. A system which uses a digital computer to directly control receivers, antennas (both surveillance and direction-finding), signal processing equipment, data transmission, and other necessary functions can be provided with presently available state-of-the-art components.

In addition, computer-controlled data communications make possible direct communications between computers at remote operational sites and a central command computer. Thus, a complete system of operational sites and a command and control centre all tied together by data links are readily attainable and can provide a high level of effectiveness in detection, identification, and location of radio frequency emitters.

The FAIRS system has been designed to provide a wide range of flexibility. One of the specific tasks which can conveniently be performed by the system is frequency management. With the appropriate input, output, and storage units, the computer can perform a number of tasks needed for proper frequency allocation and scheduling.

This portion of the FAIRS systems provides communication command and control functions which allow the system to perform automatic DF and surveillance. It also performs message switching and priority selection for the FAIRS system, and can perform analytical work on a time-shared basis. As part of the overall mission of FAIRS and the user agency, frequency management capability has been incorporated into the FAIRS system. Both software and hardware to accomplish the desired task are provided.

MANUFACTURER:

Fairchild Space and Defence Systems, 300, Robbins Lane, Syosset, Long Island,. New York 11791, USA.

1886.153
BRT/MXB SERIES BROADBAND RECEIVING EQUIPMENT

DESCRIPTION:

The Fairchild BRT/MXB Series Programmed Receiving System is a digitally controlled receiver and signal processor that operates over the frequency range of 5 kHz to 12.5 GHz. The system may be utilised under computer control for completely automatic data acquisition, or under manual control for field use and special applications.

The receiver features direct digital control of all receiver functions. Digital frequency control of the receiver is by BCD groups. Control of all functions, such as frequency, bandwidth, detector functions, and receiver overall sensitivity, may either be selected using BCD digital inputs or using manual controls on the front panel of the receiver. TTL logic is used for interfacing with the BRT/MXB Series Receiver.

The heart of the BRT/MXB Programmed Receiving System is a stable frequency synthesizer that provides local oscillator drive for the various frequency conversions. The use of a synthesised local oscillator provides for an extremely stable receiver, as well as convenient digital control of frequency. The BRT/MXB Series has an extremely broad tuning range, covering more than five decades. It also has a wide range of overall system bandwidths from 500 Hz to 20 MHz. The wide range of selectable bandwidths allows the system to be utilised as a narrowband receiving system or a broadband receiving system. A unique continuously variable bandwidth is a standard feature of the BRT/MXB Programmed Receiving System. A number of detectors are available for demodulation and analysis of the received signal.

In the computer mode, the BRT/MXB System is capable of extremely fast data acquisition and analysis. Both digital and analogue outputs are available at the rear of the receiving system. These include IF, video, and detected outputs. Standard detectors are peak, average, AM, and FM. An audio output is available for aural analysis and signal identification.

The system is designed to operate conveniently with a 16 bit mini-computer. A standard interface between a BRT-35 and a mini-computer requires four input/output channels for both control and data acquisition. Programming of the BRT/MXB System, utilizing a computer, is simple and straightforward. Computer languages, such as FORTRAN, BASIC, ASSEMBLER, AND ALGOL are all compatible with standard mini-computers and the BRT/MXB Series Receiver Systems.

MANUFACTURER:

Fairchild Space and Defence Systems, 300, Robbins Lane, Syosset, Long Island, New York 11791, USA.

1872.153
R-200 INSTANTANEOUS FREQUENCY MEASURING RECEIVER

DESCRIPTION:

The R-200 IFMR provides an automatic surveillance capability over the frequency spectrum from 0.5 to 18.0 GHz in six bands, while simultaneously indicating the presence of specific preset signals. The six bands may be operated simultaneously or singly, and displayed on instantaneous panoramic displays of conventional appearance. The system control function can be set to activate an alarm upon the receipt of a preset frequency, or upon the receipt of any signal whose amplitude exceeds the detection threshold.

The R-200 is composed of the following modules:

R-200P	Processor Unit
R-200D	Display Unit
R-200I	Intercept Alert Unit
R-200A1	RF Unit C Band (0.5 – 1 GHz)
R-200A2	RF Unit D Band (1 – 2 GHz)
R-200A3	RF Unit E & F Bands (2 – 4 GHz)
R-200A4	RF Unit G & H Bands (4 – 8 GHz)
R-200A5	RF Unit I & J Bands (8 – 12 GHz)
R-200A6	RF Unit J Band (12 – 18 GHz)

The RF Unit consists of the RF amplifier driving the phase comparator discriminator. Dual out-of-phase signals from the discriminator are used by the video circuits to produce two signal related functional outputs: (1) A-function, a voltage proportional to the input signal amplitude, and (2) F-function, a voltage proportional to the input signal frequency.

The A and F signals are then processed for display, signal intercept or alert alarm. The A and F signals may be coupled into the Intercept Alert Unit to extract frequency, PRF and scan data for each signal. The Intercept Alert Unit is programmable to detect specific signals matching preset parameters of frequency, PRF and scan type.

The R-200 can display RF, signal strength and PRF on intercepted signals contemporaneously for rapid operator assessment. Each intercepted pulse paints a signal strength strobe with a bright dot at its tip for strength analysis. In addition, a PRF circuit paints a strobe extension, again with a bright dot at its tip, to indicate the PRF of each intercepted signal. It is thus possible to identify tracking radars quickly on the basis of PRF and RF at a glance.

If a detailed analysis of a signal is desired, the cursor can be manually positioned over the signal of interest and the associated video modulation is made available at a front panel jack. The selected signal is also presented to a headphone jack for monitoring. The headphone circuit can be connected so as to monitor all signals present.

A built-in alarm system also enables the cursor to be preset to a specific RF channel of interest. If a signal should appear in that channel the alarm is activated. An alternative mode causes the alarm to sound when any signal is intercepted, regardless of frequency.

The rectilinear display is convenient for identifying frequency jumping emitters, FM modulations, PRF jitters, PRF inter-leaving, antenna scan characteristics, and many other signal parameters.

Specification

Frequency coverage: 0.5 to 18 GHz, in 6 bands
Sensitivity (20 dB S/N): −55 dBm to −15 dBm adjustable
Frequency accuracy: ±1% of indicated frequency
Frequency resolution: ±10 MHz
Single pulse intercept probability: 100%
Dynamic range (automatic): 60 dB
Minimum pulse width: 0.1 sec
Maximum pulse width: 100 sec
Maximum PRF: 50 kHz

MANUFACTURER:

Scope Electronics Inc., 1860 Michael Faraday Drive, Renton, Virginia 22070, USA.

1874.153
RD-280 RECEIVER AND DISPLAY

DESCRIPTION:

The RD-280 is a versatile HF/VHF receiver used for reception of AM, FM, SSB (USB and LSB), and CW in the frequency range 2 to 80 MHz. It is designed for either manual control or computer control of frequency, mode, bandwidth, AGC, AFC, and signal seeking. Various equipment options are offered.

A precision digital synthesiser provides 100 Hz channel spacing, and the tuned frequency is displayed in 100 Hz increments on a 6-digit front panel "nixie" tube display. The synthesizer can be controlled to any accuracy desired by an external standard, or the internal ovenless temperature-compensated crystal oscillator can be used to provide the necessary reference with a stability of 1 part in 10^6. A fail-safe feature automatically switches control from external to internal in event of failure of the external signal. Manual scanning, or frequency control, is accomplished by two toggle switches and a dual-concentric control. The toggle switches control the "tens" MHz and "units" MHz digits, and the dual-concentric knob provides a fast scan and slow scan control of the remaining four digits (the dual knob actually controls all 6 digits, but use of the toggle switches speeds up large frequency changes). The receiver has two audio outputs including a headphone jack, and an IF output for external use.

The optional additional facilities available in module form are listed below.

PANORAMIC DISPLAY

A front panel 25 × 76 mm waveform display is used to monitor the spectrum of either pre-IF or post-IF received signals. Resolution, sweep width and sweep rate are determined by front panel controls. In the automatic mode, display parameters are set in accordance with the mode, bandwidth, and frequency controls.

Resolution	*Sweep Rate*	*Sweep Width*
500 Hz	1 per sec	1, 4, 10, 60,
50 Hz	4 per sec	or AUTO
AUTO	AUTO	

One sweep width is equivalent to one IF bandwidth.

COMPUTER CONTROL INTERFACE

The digital interface serves as a link between the receiver and a remote computer or controller, converting the serially encoded computer data to the parallel language of the receiver. The interface serves a dual function: (1) It allows the computer to select the frequency, bandwidth and mode of the receiver (together with AGC and AFC control when required), and (2) it provides the computer with complete status information of the receiver.

Signal seeking and slewing can also be computer controlled. Parity check is provided on the incoming and outgoing control words. This feature is most useful when remote control is required by means of long distance telemetry links. The receiver rejects an invalid word and provides for an error signal indicating presence of the invalid word.

BANDWIDTH FILTERS

The basic receiver is supplied with two of the following bandwidth filters with the remainder available as options: 400 Hz, 1 kHz, 4 kHz, 10 kHz, 60 kHz, and a special differential delay filter of 2.2 kHz bandwidth which is intended for receiving data. The filter in use is selected by means of front panel pushbuttons. In all receivers the bandwidth is automatically set for 2.7 kHz when using SSB modes.

SQUELCH

The squelch option provides a means of identifying signals above a preset threshold. The threshold is either manually selected or, when used in conjunction with the indefinite hold AGC option, automatically selected. The manual preset level has a range of 60 dB in 10 dB steps and a vernier range of ±15 dB.

INDEFINITE-HOLD AGC

This option provides a method of improving the retention of a weak signal. Once a signal is in the passband, the AGC INDEF HOLD ON pushbutton is depressed and the receiver gain is limited indefinitely at whatever level is attained at that instant. AGC action above this level is still maintained. Indefinite hold is cancelled whenever the AGC INDEF HOLD OFF release button is depressed, restoring AGC action to all signals within the dynamic range of the receiver. When used in conjunction with the AFC sample/hold, this option provides for automatic tracking of level and frequency for intermittent signals.

SIGNAL SEEKING

This option provides automatic signal searching when used in conjunction with the squelch module. Searching for signals exceeding the squelch threshold is performed at an integer increment identical to the selected IF bandwidth.

RD-280 Receiver

Signal acquisition is indicated by an illuminated sign on the front panel. Signal seeking can be initiated either by remote control or by front panel pushbutton.

Specification:

Receiver Range: 2-80 MHz
Channel Spacing: 100 Hz with additional fine tune for infinite resolution
Operating Modes: CW, LSB, USB, AM, FM
Bandwidths: 0.4 kHz, 4 kHz, 2.7 kHz (SSB), 60 kHz (additional bandwidths optional)
Noise Figure: Better than 13.5 dB
Dynamic Range, 3 dB Desensitisation: 85 dB above 10 dB (S+N)/N at 100 kHz removed [4 kHz bandwidth]
Intermodulation Distortion: 80 dB below one of two 10 mV undesired signals outside the IF passband but within the RF passband
Spurious Responses: Typically 90 dB down
Frequency Readout: 6-digit nixie display
AGC:
Variation: Less than 6 dB variation for inputs from 10 dB (S+N)/N to +10 dBm
Attack Time: 15 ms maximum
Decay Time: 325 ms slow decay followed by 1-1/2 second exponential decay
MGC: Minimum range 124 dB
BFO: Functional in CW mode. Adjustment range ± 2 kHz min.

MANUFACTURER:

Cincinnati Electronics Corporation, 2630 Glendale-Milford Road, Cincinnati, Ohio 45241, USA.

1875.153
R-281 SEARCH RECEIVER

DESCRIPTION:

The R-281 Computer-Controlled Search Receiver is a 2-80 MHz digitally controlled swept receiver capable of being swept in discrete increments over programmable frequency segments within its frequency range. The remotely selectable IF bandwidths vary from 1 kHz to 60 kHz. The output of the receiver is a log-video signal which may be externally analyzed on a display console. Complete control of frequency sweep range and IF bandwidth is accomplished by placing a digital word in the receiver. Injection signals required within the receiver are generated by a direct digital frequency synthesizer which assures overall system stability equal to that of the external standard. In the event that the external standard is not present, automatic operation will continue with reference maintained by an internal standard with a stability of 1 part in 10^6.

External control of the RF gain is provided with a range of 30 dB. The receiver digital interface serves as a link between the receiver and a remote computer or controller, converting the serially encoded computer data to the parallel language of the receiver. The interface serves a dual function: (1) It allows the computer to select the frequency and bandwidth of the receiver; and (2) it acts as a working register and memory for internal control and operation of the receiver.

Specification:

Frequency Range: 2–80 MHz
Bandwidth: 1, 2, 4, 6, 10, 20, 40, 60 kHz
Channel Spacing: 1 kHz
RF Gain – Remote: 30 dB
Remote Digital Control:
Frequency
IF Bandwidth
Frequency step increment
Noise Figure: Better than 13.5 dB
Dynamic Range, 3 dB Desensitisation: 85 dB above 10 dB (S+N)/N at 100 kHz removed (4 kHz BW)
Intermodulation Distortion: 80 dB below two 10 mV undesired signals outside the IF passband but within the RF passband
Spurious Responses: Typically 90 dB down
Local Oscillator Radiation: Less than 1 μV at the receiver input port
Outputs:
Video output
0.15 V max w/noise
1.0 V w/max signal input
Detector:
Logarithmic amplifier
80 dB input range
20 dB output range
Linearity ± 2 dB
Frequency Scanning:
Scan Rate:
2048 steps/sec (1, 2, 4 kHz Bandwidths)
512 steps/sec (6, 10, 20, 40, 60 kHz Bandwidths)
Switching Speed: 100 μs (60 kHz Bandwidth)
Increment Step: Equal to IF Bandwidth 1, 2, 4, 6 kHz (6 kHz Bandwidth Only)
Sweep Width: Controlled by increment step pulses

MANUFACTURER:

Cincinnati Electronics Corporation, 2630 Glendale-Milford Road, Cincinnati, Ohio 45241, USA.

1873.153
MODEL R-1437 RECEIVER

DESCRIPTION:

The Sylvania Model R-1437 is a solid-state, hand-portable panoramic VHF receiver. It weighs less than 12 kg (without accessories) and may be carried and operated by one man. It may also be vehicle- or aircraft-mounted. The internal battery supply is recharged automatically when the unit is operated from an external power source. The receiver handles AM, FM and CW signals.

The receiver tunes automatically or manually between 25 and 85 MHz, in two electronically switched bands. Separate but simultaneous displays of each band appear on the face of a cathode-ray tube. The setting of the manual tuning control is indicated by a coincidence step in the appropriate trace. The operator may examine any portion of the swept frequency range by switching to sector sweep. Sector width is variable by means of a manual control. Sweep rate is manually adjustable from 0.1 to 40 sweeps per second.

To monitor a particular signal, the operator adjusts the Main Tune control to bring the coincidence step to the chosen signal on the spectrum display. Then he switches to manual tuning for adjustment with the Main and Fine Tune controls, and monitors the signal through headphones. A separate output is provided for feeding an external recorder. A tuning dial indicates the signal frequency within one per cent, or within ±100 kHz if the internal calibrator is employed. This calibrator places audible and visible markers every 2 MHz throughout the receiver's spectrum. A front-panel switch permits choice of a demountable whip antenna, an external 50-ohm antenna, or the calibrator.

The operator may select AGC or manual gain control for AM signals, and may select either of two IF bandwidths, 75 kHz (mainly for FM signals) or 12 kHz. The bands 25-to-45 MHz and 45-to-85 MHz are covered by separate internal tuners, each having its own RF amplifier, mixer, oscillator and buffer stages. A master sweep generator tunes both, and switches them alternately into and out of the antenna-IF path. The same sweep generator controls the CRT display. The AM-CW detector and FM limiter-discriminator are manually selected. The recording output amplifier is fed directly by either detector; the headphone amplifier is fed through a 3 kHz filter.

The battery supply consists of 10 nickel-cadmium cells, which provide 8 hours' normal operation when fully charged. Full recharging in the slow-charge mode takes about 50 hours.

Specification:
Frequency Range: 25 to 85 MHz in two overlapping bands
Detection Modes: AM, FM, CW
Panoramic Display: 25 × 76 mm cathode-ray tube, simultaneous display of both bands
Tuning: Automatic or manual
Outputs: 600-ohm headphone. 600-ohm external recorder
Antenna: Side-mounted whip or 50-ohm external
Tuning Accuracy: +1 percent (±100 kHz with calibrator)
Tuning Indication: Front-panel digital indicator
Sensitivity: −110 dBm for tangential signal at recorder output
Intermediate Frequency: 10.7 MHz (±1 percent)
IF Bandwidth: 12 kHz or 75 kHz selectable at front panel
IF Rejection: 60 dB (minimum)
Image Rejection: 60 dB (minimum)
Sweep: Full-range or sector
Sweep Speed: Continuously variable, 0.1-40 sweeps per second
Calibration: Harmonics of a 2-MHz crystal

MANUFACTURER:

Sylvania Electronic Systems, PO Box 188, Mountain View, California 94042, USA.

1888.153
MODEL 3600 MICROWAVE RECEIVING SYSTEM

DESCRIPTION:

The Model 3600 Microwave Receiving System has been developed as a low-cost, multiband equipment to cover the range 0.5 to 18 GHz. The design allows for a number of additional equipment options which include spectrum displays, falling raster displays, pulse analysis displays and frequency synthesiser local oscillators. The main receiver section consists of the RF tuners, junction box, IF processor, and a control and display panel. Interfaces are buffered and signal conditioning circuits are all contained within the basic receiver assemblies.

Six independent tuners are used, with microwave ICs for the double balanced mixer, bandpass filters, and the 160 MHz IF pre-amplifier. YIF-tuned local oscillators are employed with matched preselectors.

The IF processor conditions a 160 MHz IF signal received from the remote RF tuners for signal analysis. Detected video signals drive CRT displays and perform signal analyses such as auto/cross correlation, pulse analysis, modulation analysis, and signal-in-noise processing by means of peripheral equipment.

All control functions of the Model 3600 are carried out digitally. A fully automatic receiving system is available which uses a digital minicomputer to provide the parameters normally selected by the operators. In addition to setting initial receiver operating conditions, the computer program organises data collection from the receiver outputs and performs analysis on received signals. Signal analysis includes measurement of frequency, amplitude and modulation characteristics together with direction and time of arrival. Normal computer programming of the system can effect other emitter parameter measurement and storage, such as high priority signal alarms, and computer-controlled ECM initiation.

Specification:

RF Tuner	Frequency Range (GHz)
36001A	0.5 to 1.0
36002A	1.0 to 2.0
36003A	2.0 to 4.0
36004A	4.0 to 8.0
36005A	8.0 to 12.4
36006A	12.4 to 18.0

Frequency Tuning Modes:
Full Band Sweep: Digitally Tuned Across Entire Frequency Band
Sector Sweep: Sector Widths of 100, 200, 400 and 800 MHz with the Centre of the Sector Positioned Digitally with the Manual Tuning Shaft Encoder.
Manual Tune: Digitally-tuned by the Rotation of n Incremental Shaft Encoder. Manual Tuning is Bidirectional
IF Bandwidths: 20 MHz, 5 MHz, 1 MHz
Tuning Increments for Sweep Mode:
20 MHz Bandwidth: 10 MHz Steps
5 MHz Bandwidth: 1 MHz Steps
1 MHz Bandwidth: 500 kHz Steps
Tuning Increments for Manual Tuning:
Fine Tune: 1 MHz/500 kHz Steps
Coarse Tune: 10 MHz Steps
Sector Sweep Width Selections:
100 MHz (±50 MHz fo)
200 MHz (±100 MHz fo)
400 MHz (±200 MHz fo)
800 MHz (±400 MHz fo)
Spurious-free dynamic range: 70 dB
Image rejection: 70 dB
IF rejection: 90 dB
LO radiation: −100 dBm
Frequency accuracy: 0.2%
Sweep rate: 100 GHz/sec
Signal detection: CW, AM, Pulse, FM
RF input VSWR: 1.3:1 max
Receiver outputs: Log Video, Linear Video, Stretched Log Video, FM Video, Horizontal Sweep Voltage, Blanking, IF frequency
Control: Digital with Integral Computer Interface
Frequency readout: Integral Five-Digit LED display

MANUFACTURER:

American Electronic Laboratories, PO Box 552, Lansdale, Philadelphia 19446, USA.

1716.053
WJ-1240 RECEIVING SYSTEM

DESCRIPTION:

The WJ-1240 is a computer-controlled receiving system for reconnaissance and surveillance applications over the radio frequency band 0.1 to 40 GHz, and it also has independent digital tuner control and parallel video display. The equipment consists of a modular integrated electronics package comprising the computerised WJ-1240 receiver itself, display and controls, and a direction finding antenna system.

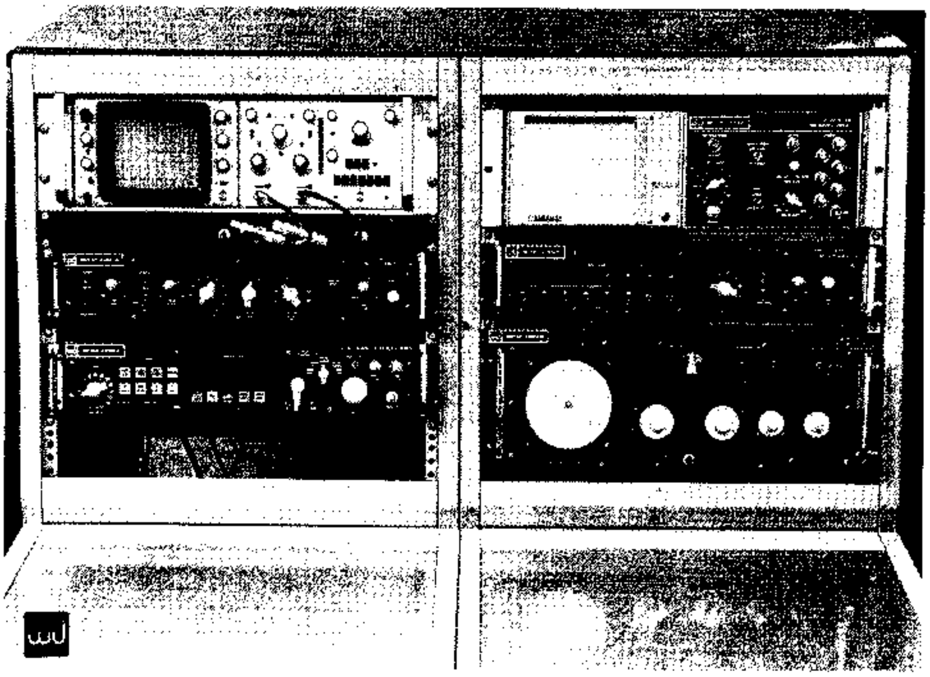
Independent tuner control permits multiple situation surveillance and provides independent video outputs for each tuner. This control operates in the absence of the computer for manual systems or as a standby mode of operation in computer-controlled versions. A Refresh Display with adjustable decay time retains singlepulse signals for detailed visual observation. Display traces are automatically scaled during sector scan.

Several antenna assemblies may be used with the WJ-1240 depending upon the total frequency coverage demanded. The WJ-8312 provides direction-finding facilities over the range 0.1 to 18 GHz. Other Watkins-Johnson arrays which can be employed are the L4/A (40-550 MHz), L/5A (12-40 GHz), and the L/6A.

The WJ-8312 consists of a rigid box structure supported on the turning gear pedestal and carrying a series of microwave receiver horns. Intercepted signals are directed into the horns (which are of dimensions appropriate to the frequency bands covered) by a flat plate reflector which rotates with the whole assembly. This reflector carries at its upper edge a log-periodic array for reception of the lower frequencies.

MANUFACTURER:

Watkins-Johnson Company, 3333 Hillview Avenue, Stanford Industrial Park, Palo Alto, California 94304, USA.



WJ1240 Receiving system console

1381.053
L-3/A-WJ-1140 MICROWAVE DIRECTION FINDING SYSTEM

DESCRIPTION:

This is an integrated microwave direction-finding (DF) system, produced by the combination of the L-3/A broadband DF antenna system and the WJ-1140 modular microwave receiving system.

The broadband DF antenna system (L-3/A) is designed to function as a component of an electro-mechanical reconnaissance system when used in conjunction with the WJ-1140 receiver system. The L-3/A provides a visual display of the direction of arrival (DOA) of incoming RF signals that have been processed through the receiving portion of the overall DF system.

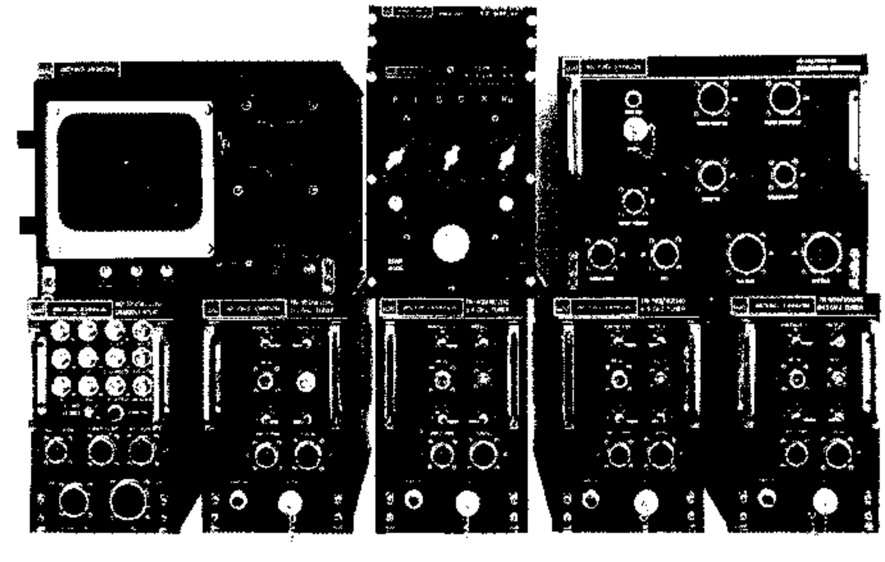
Lightweight and compact mechanical packaging makes the L-3/A suitable for usage in airborne configurations as well as for shipboard and fixed/mobile ground installations. The frequency coverage of this antenna system is 550 MHz to 12.4 GHz in five bands. Variable azimuth rotation sweep from 0 to 1,000 rpm is accomplished through a control on the console. A fixed rotation rate of 2,000 rpm can also be selected.

In addition, the antenna can be steered to any desired azimuth point by a manual control knob located on the indicator. The radiation patterns of the antenna are relatively broad, with circular polarisation. This offers an optimum compromise between probability of signal intercept, direction-finding accuracy and gain. The RF output of the L-3/A system is entirely compatible with the WJ-1140 and the interface is accomplished through the use of standard RF coaxial cabling and connectors.

The WJ-1140 receiving system offers a wide variety of options, both in hardware and usage. The design of the basic receiving system consists of RF tuners to cover desired frequency ranges, a demodulator, a control unit and a numeric frequency display. In addition, an array of peripheral display and control equipment is available for modular arrangements, appropriate to the mission to be performed.

Used in conjunction with the L-3/A, the WJ-1140 would involve RF tuners covering the ranges 550-1,000 MHz, 1,000-2,000 MHz, 2,000-4,000 MHz, 4,000-8,000 MHz and/or 8,000-12,400 MHz. Signals acquired by the L-3/A are simultaneously available at all times to the WJ-1140 tuners without the requirement of RF band switching. Incoming signals are then processed through the appropriate tuners and mixed down to an IF frequency of 160 MHz for processing by the demodulator.

In the next steps, demodulator output appears as a logarithmic video, a linear video and a display video signal of choice. The display video signal, enhanced by video amplifiers to boost its level for display purposes, is fed to the indicator unit of the L-3/A, which in turn provides a polar display and is slaved to the rotation of the antenna itself. The display video provided by the WJ-1140 is then superimposed on the rotating cursor of the indicator unit and DOA is read directly from the compass rose on the display.



WJ1140 Microwave DF System equipment comprising; top row (l to r): display/control unit, receiver control (with RF display on top), computer interface unit; bottom row (l to r): demodulator, four tuner units covering 1 to 12 GHz

By the use of another broadband antenna system, the L/5A, frequency coverage is extended from 12GHz to 40 GHz. This has similar pedestal and turning gear to the L3/A, but instead of rotating horn elements, the L5/A has fixed horns near the centre of rotation, directed up on a spinning reflector plate which is responsible for 360-degree azimuth coverage. To extend frequency coverage downward a companion antenna/receiver combination (L4/A/RS-160) is available covering the band 40 to 550 MHz.

MANUFACTURER:

Watkins-Johnson Company, 3333 Hillview Avenue, Stanford Industrial Park, Palo Alto, California 94304, USA.

1382.063
WJ-1007 MICROWAVE COLLECTION SYSTEM

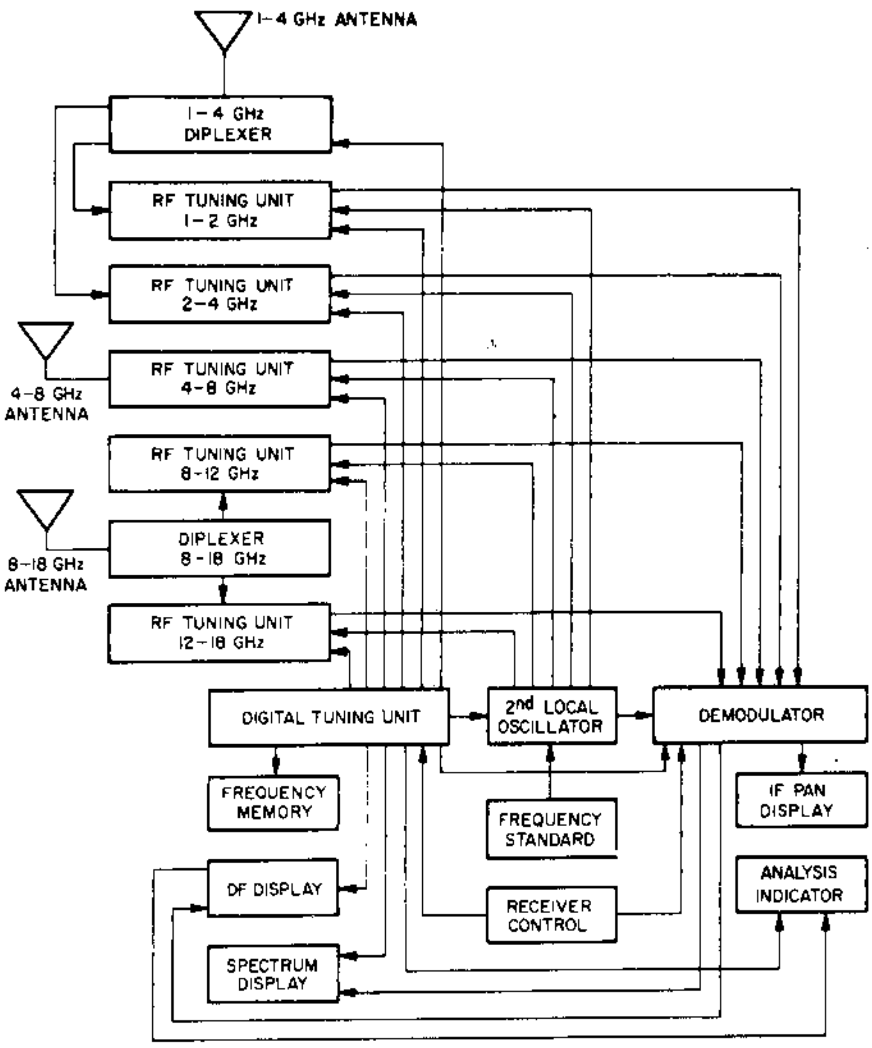
DESCRIPTION:

This system is a microwave electromagnetic surveillance system capable of receiving, detecting and analysing state-of-the art of electromagnetic emissions in the frequency range 1 to 18 GHz, and is designed for either airborne, shipborne or ground-based electronic intelligence or radio frequency interference missions.

Basically four signal functions are provided by the WJ-1007: acquisition, control, analysis and recording. Each function is represented by one or more modules. The system is capable of detecting and categorising the parameters of currently used types of electromagnetic emission. The system sweeps the entire 1 to 18 GHz frequency spectrum in one operation. There are five frequency bands (1 to 2, 2 to 4, 4 to 8, 8 to 12 and 12 to 18 GHz). There is no mechanical tuning involved within these bands, nor mechanical switching required between bands. Fully-electronic tuning is a result of incorporation of YIG filters as preselectors and in oscillators. A memory module is included to permit programming the spectrum so that certain frequencies may be recalled or bands of frequencies automatically locked out.

The WJ-1007 uses a superheterodyne receiver with high sensitivity. A spectrum display unit, which is one of the several presentations available, gives a panoramic display of the complete frequency range. A multi-gun CRT provides five separate amplitude-versus-frequency traces which the operator can view.

When the system detects a signal of interest, the operator can operate a lock-on facility which will cause the receiver to cease sweeping and lock-on to the particular signal. Once the receiver is locked-on to such a signal the panoramic display sweeps automatically to the analysis mode and presents an enlarged time display showing repetitive pulsed signals on five separate traces. At the same time digital displays indicate transmitted frequency, pulse width and pulse repetitive period. The operator can, if desired, record RF frequency, pulse width, pulse repetitive period, time, latitude, longitude and true bearing, by suitable operation of the controls.



Block diagram of WT-1007 microwave collection system

OPERATION:

Five RF Tuning Units process incoming signals and provide the first conversion to a nominal 250 MHz IF output (190-310 MHz). One tuning unit is used for each of the microwave bands (L, C, S, X and Ku). The tuning units contain a YIG preselector and postselector to provide image and spurious response rejection for the first IF conversion A travelling-wave-tube amplifier is provided between the YIG filters to insure adequate low-noise amplification. A local oscillator is provided to tune each band in 100 MHz increments.

The passband of the YIG (yttrium-iron garnet) filters is controlled electromagnetically. The RF energy for each band is fed through separate YIG filters and travelling-wave-tube amplifiers. These amplifiers provide the receiver with an extremely low noise figure. The outputs from the amplifiers are then coupled to another bank of YIG filters to provide an additional stage of postselection prior to being fed to the first mixer-preamplifiers.

The mixer-preamplifiers use balanced mixers and solid-state preamplifiers providing the 250 MHz IF output frequency at a power gain of 25 dB. Their output is fed to an IF commutator switch located in the Demodulator Unit. Oscillator injection is supplied by YIG-tuned harmonic generators which are driven by the Local Oscillator Synthesizer Unit. C and X band harmonic generators are each followed by a travelling-wave-tube amplifier to increase the output level, and a BWO is used for Ku band. L and S band harmonic generators are coupled directly to the mixer stages without additional amplification.

The Local Oscillator Synthesizer Unit produces the basic oscillator frequencies for both first and second conversion. The output fed to the harmonic generators in the RF Tuning Units (first conversion) is fixed at 100 MHz. The second output is fed to the second conversion circuitry in the Demodulator Unit. This output is stepped from 260 to 360 MHz in 100 kHz increments.

The Frequency Memory Unit is used primarily to provide automatic bandwidth lock-out capability for the receiver system. It may be programmed to lock-out up to 20 MHz segments of the spectrum which are of no interest, whether signals are present or not. This equipment has a word organised memory with storage for 18 frequencies to 0.1 MHz resolution. Although used to control the receiver system its operation is subordinate to the Digital Tuning Unit (through which it has its only physical and functional interface). The memory has four mutually exclusive modes of operation. Three of these modes enable the operator to alter or sample the contents of the memory. The fourth mode, sweep, performs the bandwidth lock-out function.

The bandwidth lock-out function enables the operator to quickly scan for new signals without having to personally discern between new and old signals, and to prevent his having to continually restart the sweep every time an old signal is encountered. It performs this function by overriding signal intercepts whose frequencies lie within the bandwidth limits stored within the 18 memory cells. When an intercept occurs, the memory is interrogated, and a comparison made between the frequencies in storage and the present intercept frequency of the sweep counter. If a coincidence occurs, a resumé sweep gate is generated that automatically causes the receiver to continue its sweeping. On demand, the operator may select any frequency memory location and load the contents into the sweep counter. This automatically sets up the receiver to the desired frequency.

Direction finding facilities (rotating antennas and display unit) can be added to the system.

Watkins-Johnson Company, 3333 Hillview Avenue, Stanford Industrial Park, Palo Alto, California 94304, USA.

1372.063
AIL TYPE 707 SPECTRUM ANALYSER

DESCRIPTION:

This is a solid state instrument whose measurement capabilities lie in the 10 kHz to 40 GHz frequency band. Within this range full display scans are possible from 10 GHz to less than 10 kHz. A unique feature of this unit is the incorporation of an internal tracking pre-selector, which rejects all erroneous signals by 80 dB. This technique eliminates the usual clutter witnessed on spectrum analysers. A further feature is the ability to display simultaneously, on the 10 cm square screen, signals whose amplitudes vary by as much as 100 dB and their frequencies by as little as 1 kHz. Also, the signal frequency is displayed on a light emitting diode (LED) read-out to within ±0.2 per cent.

Of significance during spectrum surveillance work is the 10 GHz scan width enabling the S, C and X bands, ie 2 to 12 GHz, to be viewed simultaneously.

By use of the instrument, valuable information can be gained in the time domain, for example low PRFs, pulse rise times and modulation envelopes. For this application the scan width can be set to zero for any scan time between 10 microsecs/cm to 1 sec/cm.

OPERATION:

The instrument operates in two modes – a wide and a narrow scan mode. In the former it is a swept-front-end double conversion receiver. In the narrow scan mode a microwave VCO is automatically phase-locked to a crystal reference. The IF is then swept by a stable VHF VCO. At scan widths below 1 MHz/cm, an automatic phase-lock eliminates the need for switches, meters and tuning beat controls.

DEVELOPMENT:

This is the commercial version of equipment which had its origins in electronic warfare.

MANUFACTURER:

AILTECH a Cutler-Hammer Company. Farmingdale, New York 11735, USA.

1717.053

AN/GLR-9 RECEIVING SYSTEM

DESCRIPTION:

The AN/GLR-9 is a wide-band signal intercept and monitoring system, with a frequency coverage, in various versions of the equipment, extending from the HF band up to the radar X-band. The basic equipment comprises three common units, Signal Display Unit, Powered Housing Unit, and Signal Processing Unit, to which are added such RF Tuning Heads as are required to fulfil the operational function. In some instances more than one Powered Housing Unit (PHU) will be needed to contain Signal Display and RF Tuning Heads required. A suffix code to the equipment designation denotes the frequency coverage, as follows:

AN/GLR-9 (V): 20-1000 MHz
AN/GLR-9 (V)2: 20-300 MHz
AN/GLR-9 (V)3: 30-300 MHz
AN/GLR-9 (V)4: 250-1000 MHz
AN/GLR-9 (V)5: 1000-4000 MHz
AN/GLR-9 (V)6: 20-4000 MHz

Control of the system is effected from the Signal Processing Unit, the functions of which include:

(1) Selection of RF Tuning Heads.
(2) Routing of SDU output from the RF Tuning Head in use to the input of the signal display unit.
(3) Selection of IF bandwidth.
(4) Selection of mode of operation – AM, FM, CW or pulse, for the signal format to be processed.
(5) To provide audio and video outputs from the demodulated signal.
(6) Switching of input from a common antenna to the operating RF tuning head.

There is a wide range of plug-in RF Tuning Heads, and designation and frequency coverage are as listed below:

SH-200P-1: 20-45 MHz
SH-201P-1: 30-100 MHz
SH-202P-1: 90-300 MHz
SH-203P-1: 250-500 MHz
SH-204P-1: 490-1000 MHz
SH-205P-1: 990-2000 MHz
SH-206P-1: 1990-4000 MHz
SH-207P-1: 4.7 GHz (C-band)
SH-208P-1: 7.12 (GHz (X-band)
SH-270P: 20.70 MHz
SH-271P: 55-260 MHz
SH-272P: 225-400 MHz

Under the designation ESH-200 Series, a range of electronically swept RF tuning heads is available. They provide the same frequency coverage as the SH-200 Series units listed above and the prefix letter 'E' differentiates between the two models.

RECONNAISSANCE AND SURVEILLANCE EQUIPMENT

FRANCE

1070.353

CYCLOPE AIRBORNE INFRA-RED RECONNAISSANCE SYSTEM

DESCRIPTION:

Small, lightweight, passive infra-red line-scan reconnaissance equipment developed for aircraft, pod or drone installation. I/R photography from heights between 200 and 400 metres is possible with the Cyclope system, and a band of terrain which is covered by an angle of view of 60 degrees on each side of the aircraft or drone can be surveyed.

The system operates in the middle region of the I/R band and the quoted thermal resolution is 0.25 deg C. Mechanical means are used for scanning and analysis. Provision is made for either immediate or delayed radio transmission of data, image recording, and image reconstruction on 70 mm film at a ground processing station.

The only other details so far revealed are a weight of 12 kg and volume of 20 dm^3.

SUPER CYCLOPE

In 1973 a Super Cyclope equipment had entered development. It is described as a second-generation system operating in the 8-12 microns band, suitable for use in either aircraft or RPVs or reconnaissance missiles. A catadioptric optical system is used, other parameters including the following:

Field of view: ±60°
Resolving power: ±1.25 mrad for V/H of 1·6
V/H ratio: from 0.3 sec^{-1} to 3.2 sec^{-1}
Thermal resolution: better than 0.3°C
Roll stabilisation: ±15°

Data obtained by the Super Cyclope is normally collected on board by a high-resolution photographic unit (1,800 points per line), but it can also be recorded on board by magnetic tape or transmitted in real time back to a ground station.

DEVELOPMENT:

Developed and designed by SAT under French Ministry of Armed Forces contract.

STATUS:

The system had entered French Air Force operational service in Mirage III RD recce aircraft by the end of 1971.

MANUFACTURER:

Société Anonyme de Télécommunications, 41, rue Cantagrel, 75624 Paris, France.

1868.163

PATRICIA RECONNAISSANCE DATA PROCESSING SYSTEM

DESCRIPTION:

The operational purpose of the Patricia system is to accelerate the processing, co-ordination, and interpretation of aerial reconnaissance data obtained by a variety of sensors. These can include airborne cameras, infra-red linescan, side-looking radar, and other recorded data. This objective is achieved principally by the adoption of computer techniques and advanced display methods. In addition to expediting the selection of photographs of designated targets and the rapid preparation of a preliminary mission report, Patricia can also be applied to the planning and preparation of missions.

The system is built into air-transportable shelters and consists of:

(1) A photographic shelter which is used for all film developing and printing work.
(2) A technical shelter which is mostly occupied by the central processor and interface unit which controls and supervises all of the system's equipment.
(3) A selection shelter where the file of each target to be processed is compiled before being transmitted to the interpreters.
(4) Between one and six interpretation shelters for the final analysis of the pictures preparatory to drafting of the final interpretation report.

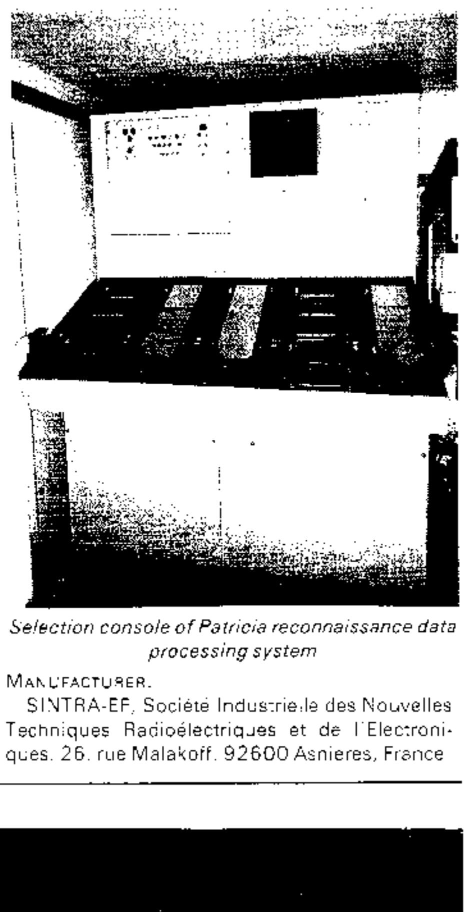
The last of these operations is facilitated by provisions in the Patricia system for the simultaneous display of pictures and data from various sources, and a projected map showing the target area and orientation vector of the aircraft responsible for each set of pictures.

Specific data sources and sensors whose informations are accepted by the system include cameras using film (perforated or not) up to 240 mm wide, infra-red linescan analysers, side-looking radar, pilot's voice recorder, and data gathered by an airborne flight data adapter which is interfaced with the aircraft's navigation computer, altimeter, etc. The airborne equipment includes a cassette recorder on which for a full 1 hr 30 min mission are recorded in digital form.

Two types of console are employed in the ground component of the system, a selection console and the interpretation consoles. The former can simultaneously display up to five strips of standard 5-inch (127 mm) film × 492 mm and has a projected map area measuring 240 × 240 mm. The interpretation consoles have a 1,128 × 500 mm light table, projected map screen of 240 × 240 mm, a history picture projector screen 340 × 340 mm, and a silhouette projection screen of 280 × 280 mm. Storage facilities have an archive capacity of 15,000 target file sheets.

DEVELOPMENT:

Development was carried out for the French DTCA (Direction Technique des Constructions Aéronautique).



Selection console of Patricia reconnaissance data processing system

ORPHEUS AERIAL RECONNAISSANCE SYSTEM

DESCRIPTION:

The Orpheus system has been designed to air force requirements for a tactical reconnaissance system to provide aerial reconnaissance during night and day, at low and medium high altitudes, to be operated with modern high performance fighter bomber strike attack aircraft, requiring a minimum of engineering changes to the aircraft, and without jeopardising the FBA/S capability of the aircraft.

The system comprises a number of reconnaissance sensors housed in an external pod. The pod design is based on the shape and size of the standard napalm fire bomb, its aero-dynamic characteristics and range/fuel consumption penalties being very similar.

A standard aircraft weapon station will carry the system. The recce system is jettisonable in case of emergencies. The external reconnaissance system including all sensors and an air-conditioning system operates independently of the aircraft and is only dependent on the aircraft's electrical power supply system, fixed frequency or not, thus requiring only minor aircraft engineering changes for power cabling, cockpit control panel and V/H signal connection.

R Neth AF Starfighter carrying "Old Delft" Orpheus reconnaissance pod

Reconnaissance sensors are the "Old Delft" far-infra-red linescanner with a 120 degrees scan angle, and four or five aerial cameras providing horizon-to-horizon coverage and forward-looking capability.

The autonomous character of the reconnaissance system's pod concept has, as operational advantages:

(1) A very short reaction time, since unloading of the film magazines of scanner and cameras has been optimised through the use of a quick-disconnect access door, a rotatable scanner and snap-on type film magazines. All films of a standard type can be processed automatically, allowing for the transmission of first phase PI-mission reports within 30

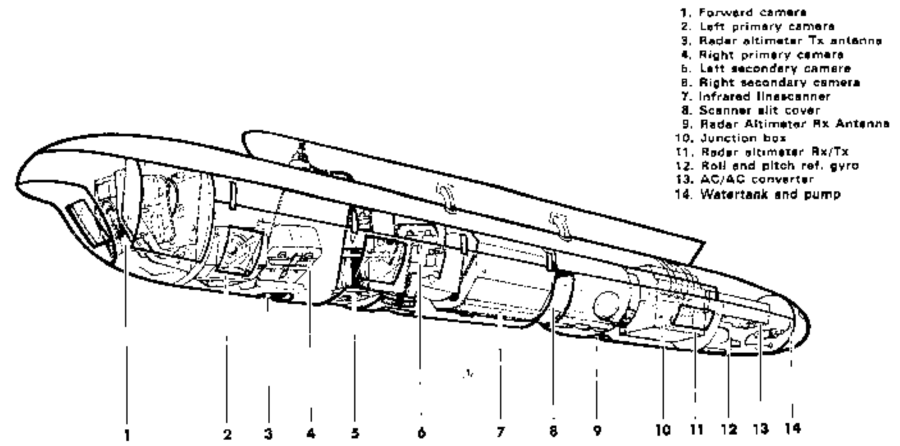
minutes after engine shut down.

(2) The recce-system turn-around and pre-flight inspection is completed well within the time required for the aircraft itself; in-between flight adjustments are not necessary, nor is any special ground equipment required for daily servicing.

(3) Aircraft down-time, required for maintenance and repair of the recce-system has been minimized through the fast exchange possibility of components or modules as a flight line operation, requiring no re-alignment.

(4) Recce-system down-time resulting from aircraft unserviceability has been minimized through a simple system of recce-pod to aircraft bombrack snap-on operation, so as to match serviceable recce systems with available combat-ready aircraft within 30 minutes.

The standard recce-system for the Royal Netherlands Air Force consists of a roll-stabilized "Old Delft" IRLS-5 linescanner (see Entry No. **1709.353**) complete with build-in cooling unit and five TA-8M aerial cameras (see Entry No. **1711.353**), one camera housed in the nose of the pod in forward-oblique position, the other four cameras mounted on a roll-damped camera rack, of which the two primary cameras are in a fixed side-oblique position, while the two secondary cameras can be pre-positioned either high-oblique or split-vertical. The slightly altered version for the Italian Air Force consists of an "Old Delft" IRLS-5 linescanner, a Fairchild panoramic camera and three TA-8M cameras, one camera in forward-oblique position and the two secondary cameras in either high-oblique or split-vertical position. A junction box, radar altimeter, static frequency converter, and an air conditioning system are also installed in the pod.



Arrangement of equipment in Orpheus reconnaissance pod

Full control of the recce-system operations and the system status-monitoring including failure indications, are centralised in the cockpit on a simple control panel. Initiation of the operation of the cameras and the linescanner is established by pressing the trigger switch located on the pilot's control stick's grip. BITE is incorporated for pre-flight checks.

Main characteristics:

Overall dimensions of loaded pod are:

Length: 375.0 cm

Max Diameter: 47.2 cm

Weight: Max 400 kg, depending on sensors used

DEVELOPMENT:

Development of the Orpheus system started in late 1966. Final evaluation flights were carried out in June 1972 by the Air Forces concerned. Two prototypes and two pre-serial models had been built by early 1973.

STATUS:

An order for the serial production was awarded to De Oude Delft by the Royal Netherlands Air Force in August 1972, with Fokker/VFW as sub-contractor for the external pods. Contract negotiations with the Italian Air Force for the serial production of their version of the Orpheus system were finalised in November 1973.

MANUFACTURER:

N.V. Optische Industrie "De Oude Delft", van Miereveltlaan 9, Delft, Holland.

1709.353

IRLS-5 INFRA-RED LINESCAN

DESCRIPTION:

De Oude Delft has developed to requirements of the Royal Netherlands Air Force a far-infra-red linescanner primarily for use as an aerial reconnaissance sensor housed in an external recce-pod, or to be installed within an aircraft.

TThe IRLS-5 linescanner makes use of a rotating 3-sided mirror, achieving a 100% scan efficiency by using two optical channels alternately. The optical switching from one optical channel to the other is arranged by a mirror-chopper mounted on the axis of the scan-mirror. As a result, the detector is always looking at the ground and prevented from looking into the scanner interior between the useful scans, thus, no dead-time between the scans is achieved and a minimum bandwidth of the signal processing is required.

Rotating at 12,000 revolutions per minute, three scanlines are produced per revolution with continuous reception of useful IR-radiation, thus providing 600 scans per second. The angular opening of the scanning beam gives an instantaneous field of view of two milliradians square. The scan angle of 120° perpendicular to the flight path can be placed in 3 positions: vertical, left oblique or right oblique. The scan angle position is controlled in flight from the cockpit by the pilot within 1 second, without interrupting the scanning motions.

The signal recording on film, always the most critical part of a scanning type image-forming device, is realized by utilising the "Old Delft" variable slitlength recorder, which device makes signal registration with contiguous, non-overlapping or under-lapping recording lines possible, as a result of which optimal contrast transfer and signal presentation over the total range of filmspeeds are reached for a very large V/H range.

The recorder head contains three channels, used consecutively. The recording spot is defined by a slit, which is illuminated by a glow modular lamp, and imaged on the moving film at a reduction of approx 17. The three optical beams are folded into the recorder head by means of mirrors and prisms. The complete recording system is mechanically linked to the scan rotor to guarantee perfect synchronism with the rotating scan system. The slit control unit is non-rotating and controlled by a servo system in relation to the variable film speed.

The V/H-range of the IRLS-5 linescanner (still classified data), will cover reconnaissance flights at sonic and subsonic speeds at very low altitude as well as medium-high altitudes, making this linescanner a very flexible sensor from a reconnaissance mission point of view.

To prevent degradation of the ultimate film results through a change in the V/H-ratio, the IRLS-5 is provided with an automatic V/H-adjustment, which may be overruled by the pilot.

The IRLS-5 is completely roll-stabilised for both slow roll and fast turbulence induced roll motions, referenced to a vertical gyro incorporated in the system. Provisions for the recording of certain flight data on the film, such as heading, time, etc, are incorporated in the scanner recording system. The "Old Delft" linescanner is equipped with built-in interchangeable infra-red detector packages; each detector package including a closed-cycle cooling engine, a getterpump, a helium pressure gauge, an IR-detector, a pre-amplifier and an elapsed time indicator.

The IR-detector packages can be supplied:

(a) As a standard: a mercurium-doped germanium detector package (Ge:Hg), covering the 8-14 micron wave-length region, providing for a noise equivalent temperature difference of 0.10°-0.15°C, measured at the output of the pre-amplifier under room ambient conditions. Operating temperature of the Ge:Hg detector is 35°K or less, which temperature is reached in a cool-down time of approx 10 minutes, after which a "cooler ready" signal is provided.

(b) As optional: a photovoltaic indium antimonide (In:Sb) detector package, covering the 3-5 micron wave-length region, providing for a noise equivalent temperature difference of 0.5°C or better.

Interchanging the same type of detector package is a flightline operation which can be performed within 30 minutes and requires no adjustments. Interchanging a Ge:Hg detector package by an In:Sb detector package, and vice-versa, is not a flightline operation as the germanium optics have to be replaced as well to guarantee optimal performance.

Main characteristics:

Scan rate: 600 scans per second

Scan angle: 120° perpendicular to flightpath

Angular resolution: 2 mrad

Thermal resolution: 0.10° —0.15°

Exchangeable detector packages in 8-14 or 3-5.5 micron spectral region; integral closed cycle cooler requires no refill between 90 days maintenance periods.

Recorder with variable slit-length adaptation for optimum display.

Recording on standard 70 mm photographic film, flight data recording on edge of film.

Film transport speed and slit length control unit are automatically varied according to V/H-ratio.

Roll stabilization, functioning over a range of 80° with respect to the vertical.

Automatic failure indications.

Snap-on type film magazines, containing 100 ft (30 m) of 70 mm normal base perforated film.

Power requirement: 2.65 kVA

Dimensions, with cooling units:

Length: 90 cm

Width: 35 cm

Shape: Cylindrical

Weight, including loaded film magazine and complete detector package: 85 kg

DEVELOPMENT:

Development started late in 1966 under a Netherlands Government development contract. First actual flights were performed in May 1969. Military evaluation and qualification were finalised mid-1972.

STATUS:

In serial production for the Royal Netherlands Air Force and for the Italian Air Force.

MANUFACTURER:

N.V. Optische Industrie "De Oude Delft", van Miereveltlaan 9, PO Box 72, Delft, Holland.

1710.353
TA/7M2 AERIAL CAMERA

DESCRIPTION:

The TA-7M2 photo reconnaissance camera system was designed to meet the different requirements for tactical aerial daylight reconnaissance, from very low to high altitudes, requiring only minor modifications to adapt the camera to the operational requirements. Normally three cameras are mounted in such a configuration that an optimum terrain coverage is assured. This camera system is fully controlled from the cockpit.

Each camera consists of a camera body, a data recorder, a film magazine, and interchangeable Deltamar objectives with removable yellow filters.

The frame rate (exposure frequency), which is related to aircraft speed and altitude, V/H-ratio, is selected by the pilot during flight. The shutter speed is automatically coupled with the selected frame rate, while the diaphragm presetting is automatically coupled with the existing shutter speed. The diaphragm is varied from minimum to maximum opening by means of a very sensitive photo sensor, looking at the image plane inside the camera.

The important feature of image motion compensation (IMC) at flying speeds of Mach 1 or more at low altitudes of 100 feet is realized by the continuous film transport. The motion blur is dependent on overlap. The shutter type used is the "Old Delft" microsecond double rotary disc focal plane shutter, easily removable for night photography with flash light, and easily interchangeable to modify the camera into another configuration, providing for continuously variable shutter speeds.

Main characteristics:

Automatic exposure control for each camera independently

Cycling rates: 1.5 to 15 frames per second

Exposure times: 1/500 to 1/9000 second (1/15,000 second on request)

Continuous film transport for IMC

Film size: 70 mm perforated film up to 100 feet length for approximately 450 exposures

Frame size: 57 × 57 mm (2¼" × 2¼")

Density control: automatic iris control

Data recording: in space between successive frames

External speed control junction box for 3-camera configuration

Dimensions (max overall with film magazine and f.70 mm objective): 190 × 200 × 225 mm

Weight, incl 100 feet film, yellow filter and f.70 objective: 6.8 kg

Power requirement: approximately 100 W

Deltamar Objective lenses (optical data):

Lens type (Deltamar):	38/3.2	52/2.7		
Focal length (mm):	38	52		
Relative aperture:	f/3.2	f/2.7		
Field of view:	72°	56.5°		
64/1.8	70/1.6	100/1.4	150/2.8/	
64	70	100	150	
f/1.8	f/1.6	f/1.4	f/2.8	
48°	44.4°	31.5°	21.0°	

STATUS:

Camera systems have been produced in mass, and are still in operational use with the photo reconnaissance squadrons of Italy, the Netherlands and West Germany with the RF-104G and Fiat G-91 aircraft.

MANUFACTURERS:

N.V. Optische Industrie "De Oude Delft", van Miereveltlaan 9, P.O. Box 72, Delft, Holland.

1711.153
TA-8M2 AERIAL CAMERA

DESCRIPTION:

The TA-8M photo reconnaissance camera is a further development of the TA-7M2 (Entry No **1710.353**), in that all the electronic control elements are now incorporated inside the camera body, making an external speed control box superfluous. This type of camera is used as one of the daylight sensors of the "Orpheus" aerial reconnaissance system (Entry No **1708.353**). The camera is of a compact construction and relatively simple design, yet incorporating all features for modern aerial photography. It is easy to maintain and fitted for adaption in several types of aircraft.

Main characteristics:

Typical frame rate: 0.25 to 5 frames per second, or 0.5 to 10 frames per second

Frame rate is variable by a factor of 20 under automatic or manual control

Automatic exposure control for each camera independently

Exposure time: 1/180 sec to 1/7,200 sec

Diaphragm system: automatically controlled, operating directly on the brightness of the actual image plane

Continuous film transport for IMC

Film size: standard 70 mm perforated film on 100 feet core

Frame size: 57 × 57 mm

Film sensitivity: 100-800 ASA

Data recording: between successive frames

Dimensions (overall): 190 × 200 × 220 mm

Weight: 6 kg with loaded magazine

Power requirements: less than 150 W

Objective lenses used with "Orpheus" system:

in forward-oblique position: Deltamar 70/1.6

in primary side-oblique position: Deltamar 70/1.6

in secondary high-oblique position: Deltamar 100/1.4 or 150/2.8

in split-vertical position: Deltamar 52/2.7 70/1.6 100/1.4 or 150/2.8

DEVELOPMENT:

Prototypes were flight tested in 1969; military evaluation and qualification programmes were finalised mid-1972.

STATUS:

In serial production for the Royal Netherlands Air Force, the Italian Air Force, and for the Italian Light Aviation Group

MANUFACTURERS:

N.V. Optische Industrie "De Oude Delft", van Miereveltlaan 9, P.O. Box 72, Delft, Holland.

THE UNITED KINGDOM

1864.353
JAGUAR RECONNAISSANCE POD

DESCRIPTION:

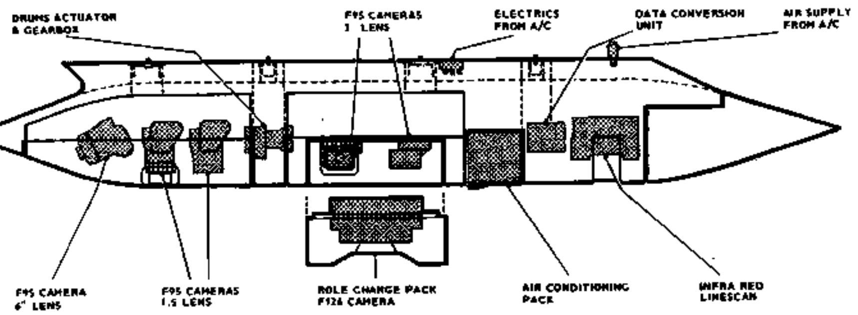
Designed to RAF requirements by BAC especially for the Jaguar, the reconnaissance pod is carried beneath the centre fuselage and is attached by two ejector release units. There are also electrical and pipe connections for air conditioning.

Horizon-to-horizon cover is provided by optical reconnaissance cameras. In addition, infra-red linescan (IRLS) is incorporated to give the aircraft an additional daylight, poor weather and night reconnaissance capability.

A data conversion unit inside the reconnaissance pod takes data from the aircraft's digital computer, which is used to control the navigation and weapon-aiming systems. It then converts it to produce latitude and longitude references on the reconnaissance pictures.

Cameras are installed in two rotatable drums within the pod. The rear drum carries alternative modules, enabling the complete pod to be converted simply and quickly from low to medium altitude operations. In the operating position, the cameras view the ground below through optically ground glass windows. For low-level sorties, the rear camera drum contains two high-oblique across-track Vinten F95 Mark 10 cameras with 3-inch (76 mm) n2 lenses. The alternative module for medium altitude reconnaissance houses an F126 camera with a 6-inch (152 mm) f5.6 lens.

The front rotating camera drum, which is common for low- and medium-altitude missions, contains two low-oblique across-track F95 Mark 10 cameras with 1.5-inch (38 mm) f2.8 lenses and one forward-looking oblique F95 Mark 7 camera with 6-inch (152 mm) f28 lens. In addition to position references being fed through the data conversion unit on to the film, the Jaguar reconnaissance pod has a facility that enables the pilot to annotate with an event marker when he flies over an area of particular interest.



General arrangement of Jaguar reconnaissance pod

Attaching the pod to the fuselage of a Jaguar is a quick and simple procedure, with the aid of a special ground handling trolley.

STATUS:

In production.

MANUFACTURER:

British Aircraft Corporation, Weybridge, Surrey, England.

1865.353
VINTEN RECONNAISSANCE PODS

DESCRIPTION:

The Vinten camera company has developed and produced a number of detachable reconnaissance pods suitable for use with a number of combat aircraft types to permit their use in either role. Examples of aircraft for which Vinten pods have been produced are the Mirage III, F-104, BAC 167, and Saab 105. Three types of pod are briefly detailed below. Mostly, they have been designed to accommodate various combinations of the Vinten range of reconnaissance cameras, but the layout is sufficiently flexible to permit the installation of other sensors when required, such as infra-red linescan or TV sighting equipment.

Vicon 18 Pod:

Standard day reconnaissance system providing 180-degree cover, with additional forward-looking camera or TV sighting camera.

Standard Fit: One forward-facing 70 mm Type 360 or 518 camera (or TV camera); four 70 mm Type 360 or 518 cameras in cross-track configuration for 180° cover

Performance: Mach 0.85 at low level. 5g acceleration

Dimensions: 2.9 m × 45 cm (dia)

Weight: 172 kg (complete)

Vicon Pod 25:

Infra-red pod for low light or night reconnaissance providing 120-degree cover.

Standard Fit: Three Type 591 cameras in the cross-track configuration; camera junction unit; EC&G infra-red flash system Type LS 129A

Performance: Mach 0.9 at low level. 5g+ acceleration

Dimensions: 4.27 m × 48 cm (dia)

Weight: 190 kg

General Purpose Lightweight Pod:

For light aircraft. Can be fitted with four Type 360 cameras or one Type 750 panoramic camera. Both installations provide 180° cross-track cover

Performance: 500 knots at low level

Dimensions: 2.44 m × 50 cm (dia)

Weights: 46 kg (Type 750); 71 kg (4 × Type 360)

STATUS:

In production for various aircraft types. The Vicon 18 is currently in service with numerous air forces.

MANUFACTURER:

W. Vinten Ltd, Western Way, Bury St. Edmonds, Suffolk, England.

1866.353
VINTEN AIRBORNE CAMERAS

DESCRIPTION:

A wide range of airborne reconnaissance cameras has been developed by the Vinten concern. The principal current models are described in the following paragraphs.

Type 591:

The Type 591 camera is designed for high speed low level, low light or night photography using visible or infra-red electronic flash illumination. The use of a 75 mm f1.5 Leitz lens coupled with the high performance of this camera allows an installation of three cameras to provide a cross-track cover of 116° with a 2° side-lap at speeds of up to 600 knots at 60 m. The special large lens aperture ensures maximum benefit from the illumination system whilst maintaining high resolution and minimum vignetting.

The camera(s) fan is ideally controlled by a velocity/height (V/H) computer, ensuring the correct framing speed and image compensation rate throughout the V/H range. An alternative control with manual settings can be used in place of the computer. All inputs from the computer or manual unit are fed to the fan of cameras via a special camera junction unit. The film magazine has a 30 m capacity (500 frames) being sufficient for a line search of 43.4 km (27 miles) at 60 m (200 ft) (10% overlap). The camera and control system is simple to operate and maintenance is minimal. It can be installed in an external pod combined with an IR illumination system, or can be internally mounted in the aircraft.

Type 591 Specification:

70 mm film:

Format: 55.5 mm × 57 mm

High-speed positive action between-lens shutter

Automatic exposure control

Framing speed: 1 to 10 fps fully variable

100 ft magazine with vacuum film pressure plate

Image motion compensation: 195-510 mm/second

Shutter speed maximum: 1/500 second

Overlap (under pilot control): 10% or 55%

Data: Frame identification counter and event marker

Lens unit: 75 mm f1.5 mm Leitz

Type 690:

A 114 mm × 114 mm format camera using 127 mm double perforated film, Type 690 represents a logical evolution of the Type 790 and 890 cameras produced by Vinten for advanced high-speed reconnaissance. These latter cameras embody a 114 mm × 57 mm format, again on double perforated 127 mm film, as programmed for the SAAB S37 Viggen aircraft. The shutter and film transport technology developed for these "half frame" cameras lends itself well to the larger format of the 690 enabling the design to be based upon well-proven principles. A further notable feature developed for the 790/890 series of cameras and incorporated within the 690 system is the facility to synchronise the exposure of all cameras within the fan, thus eradicating the problem of film strand correlation.

Alternative long focal length lenses are available enabling the versatility of the camera system to be extended to the medium and high altitude reconnaissance applications.

Type 690 Specification:

Format: 114 mm × 114 mm

Film: 127 mm wide double perforated. Maximum capacity 125 m thin base (.004 in)

Frame Rate: 1 to 10 frames per second in conjunction with IMC/overlap

Forward Overlap: 20%-60% remotely selected

IMC Range: 45.72 mm to 282.6 mm per second automatically set in conjunction with V/H input signal

V/H Ratio: Maximum 6
Minimum 0.6

Shutter: Focal plane type
Exposure time with standard blind:
Maximum – 0.5 m sec
Minimum – 1 m sec
Exposure time is automatically controlled by AEC

AEC: Automatic through lens photo-detector type sensing
(a) Accuracy ⅓ of 1 f stop
(b) Speed Full range 0-5 sec
Stop to stop 100 m sec
(c) Film Range NATO 4 to 8

Data: 128 bit binary data package (Ferranti) recorded adjacent to each frame
NOTE Alternative types of data can be considered

Lens: (i) 75 mm f2.8 Leitz
(ii) 150 mm f2.8 Leitz
(iii) 300 mm
(iv) 600 mm

Type 750:

Aerial panoramic photography is a method which enables a series of wide angle (180°) photographs to be recorded on one continuous length of film. Each photograph provides a coherent image of the terrain from horizon to horizon under the aircraft or, if used as a forward facing camera, a complete 180° arc forward of the aircraft. High resolution and even exposure of the subject is an important attribute of this type of camera since, by its design, only the centre portion of the lens is used, ie that closest to its optical axis. The picture quality thus achieved is greater than that provided by conventional very wide angle cameras which, in any case, will not perform satisfactorily with a field of view in excess of 100°.

Since only one camera is needed for horizon-to-horizon reconnaissance photography, (replacing the conventional three or four camera fan) ground handling of the film and subsequent photo interpretation is greatly simplified.

The design features a rotating lens optical arrangement in order to achieve high filming speeds with minimum stress on the camera mechanism. It is capable of a performance appropriate to a velocity/height ratio of 5 or 6, ie, 923 km/h (600 knots) at 60 m, and has been deliberately simplified in order to extend its life and reduce maintenance hours. It offers straightforward overhaul methods using minimal test equipment.

The Vinten 70 mm rotating lens panoramic camera is specially designed for along-track/strike recording, or cross-track/forward look reconnaissance photography. Its general construction and high framing rate make it ideal for either application. Overall dimensions and weight have been kept to the minimum. The rotating lens principle, as opposed to the rotating prism, allows the camera to operate at a constant (but variable) speed. This permits picture taking frequencies of 10 or more frames per second, with little mechanical strain on components. It helps eliminate vibration-induced resolution loss and smooths out the film transport mechanism – vital for good panoramic photography. It also ensures the best resolution that the optical system and film can provide, nominally in excess of 60 lines per millimeter.

The integral film magazine has a capacity of 85 m of film with a thickness of 0.1082 mm in daylight loading spools, enabling the camera to be loaded in situ in the aircraft. The film load provides for up to 335 pictures capacity, enough for a line search of:

14 km at 60 m at 923 km/h
21 km at 90 m at 923 km/h
28 km at 120 m at 923 km/h

The above cover is calculated on the following factors:

framing rate: 7.4 pictures per second, and 10 per cent overlap.

Type 750 Specification:

Type: Panoramic, continuous motion (non intermittent)

Lens: 75 mm focal length, f2.8 aperture

Film: (a) Width – 70 mm perforated (b) Capacity – 280 ft at .0043 thick (cassette loading)

Picture size: 235 mm × 57 mm

Rebate (space between frames): 12.2 mm

Cover angles: 180° × 42°

Frame rate (Autocycle): Up to a maximum of 10 frames per second. Related to aircraft V/H ratios 1 to 5 and ground cover overlap required

Film speed: 100 inches per second nominal

Relative shutter speed: 1/300 sec through 1/3,000 sec established by cycling rate and slit width

Shutter slit width: 3 mm and 1.5 mm preset

AEC: Open loop automatic lens aperture control f22 to f2.8. Illumination ratio 64/1 (6 stop change)

Data: (a) 32 or 64 dot Ferranti Data tablet. (b) Frame marker

Mode of Operation: (a) Strike – (Fore/Aft scan)
(b) Recce (Cross track scan)
(c) Forward – (Oblique scan)

Film speeds: NATO 3, 4, 5, 6, 7

MANUFACTURER:

W. Vinten Ltd, Western Way, Bury St. Edmunds, Suffolk, England.

VINTEN PHOTO-INTERPRETATION EQUIPMENT

DESCRIPTION:

The Vinten range of photo-interpretation tables has been evolved to offer the photo-interpreter a modern, high-speed, multi-channel film viewing system. They enable the speedy evaluation of reconnaissance film by one or two interpreters.

The powered tables employ variable thyristor-controlled high intensity lighting (1,500 ft/lamberts maximum) to suit variable density imagery and high power microscopes.

Quiet, high capacity axial fans circulate air through the tables to stabilise the light tube temperature, ensuring high light output and long life.

Each strand is driven via detachable and adjustable variable speed electric drive motors at each end and may be driven in either direction. The speed range is 0.3 m (1 ft)/min to 38 m (125 ft)/min.

The lighting and motor controls for the 652 Table are mounted on the front panel whilst duplicate controls are mounted on both sides of the 657 Table to enable two interpreters to work simultaneously.

Storage drawers and flip-up tables are provided in the Table pedestals and provision is made to mount a zoom stereoscope, microscope, TV closed-circuit camera, X/Y co-ordinatograph mensuration unit and desk calculator.

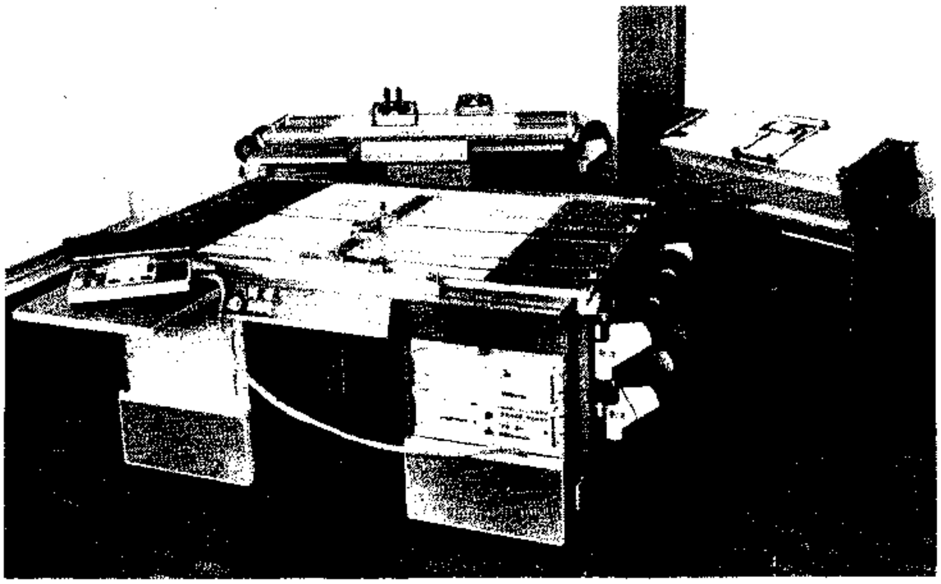
The tables are constructed around an aluminium 'I' beam frame specially designed for strength and stability; the top surfaces being fully machined to a high accuracy to accept precise measuring instruments.

To suit various requirements, two powered tables are offered, one carrying a maximum of four strands × 70 mm, three × 127 mm, or two × 241 mm, the other a maximum of seven strands × 70 mm, six at 127 mm or three × 241 mm.

The Type 666 small unit can be bench mounted and is manually operated. It is ideally suited to the needs of a smaller PR Unit where space is at a premium. It incorporates mountings for a stereoscope and magnifier for detailed examination of negatives. The light source is fully variable and is cooled by an axial fan. The table will accept two strands of 70 mm film, one of 127 mm or one of 241 mm film.

MANUFACTURER:

W. Vinten Ltd, Western Way, Bury St. Edmunds, Suffolk, England.



Vinten Photo Interpretation Table Type 652/7 allows simultaneous viewing of seven strands of film

1878.353
F126 RECONNAISSANCE CAMERA

DESCRIPTION:

The F126 camera is designed as a medium to high altitude reconnaissance camera capable of taking very high quality pictures on a 230 mm × 230 mm (9 in × 9 in) format in daylight. Image movement compensation (IMC) is provided so that sharp pictures are obtained right up to the maximum IMC of 0.3 radians/sec equivalent to an aircraft flying at 1.3 Mach at a height of 1,520 metres (5,000 ft). Variations in incident light level are fully compensated for by an automatic exposure control (AEC) system having a very fast continuous response. To minimise the effects of aircraft vibration a high speed focal plane shutter having preset slit widths giving times of 1/1,000, 1/500 and 1/250 sec is provided.

The camera consists of three main units which are the body, lens cone and cassettes. The body houses the shutter, film drive mechanism and associated electronics. The motor that drives the film at IMC speed during exposure is electronically controlled from a reference voltage proportional to the ratio of aircraft velocity/height (V/H). After the shutter fires, a quick wind (QW) mechanism advances the exposed frame so that another exposure can be made giving an overlap in ground cover of 60%.

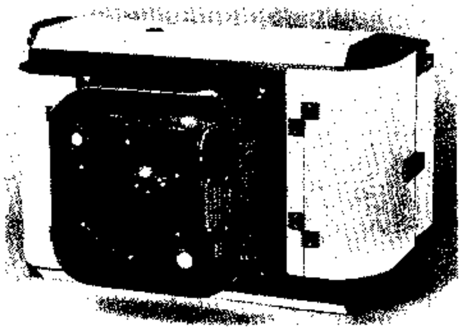
Two lens cone assemblies are currently available: a 152 mm (6 in) and 305 mm (12 in). Other focal lengths up to 915 mm (36 in) are possible. Each lens cone has its own AEC system and is pre-focused so that when it is secured to the body by the four mounting bolts, no adjustment is necessary.

The feed and take-up cassettes are identical. The cassette is loaded with live film in the dark room and then daylight loaded into the camera. A guillotine is provided so that the exposed film can be quickly removed from the camera at the end of a sortie.

The camera is designed for use in multi-camera installation where one of them is selected as a 'Master', providing a synchronising pulse to fire the shutters and QW mechanisms of the 'Slaves'.

STATUS:

In RAF service, with Nimrod, Phantom, and Harrier aircraft, and in the Jaguar reconnaissance pod.



F126 Medium/High altitude reconnaissance camera

MANUFACTURER:

Aeronautical & General Instruments Ltd, 40 Purley Way, Croydon, CR9 3BH, England.

1879.353
F135 RECONNAISSANCE CAMERA

DESCRIPTION:

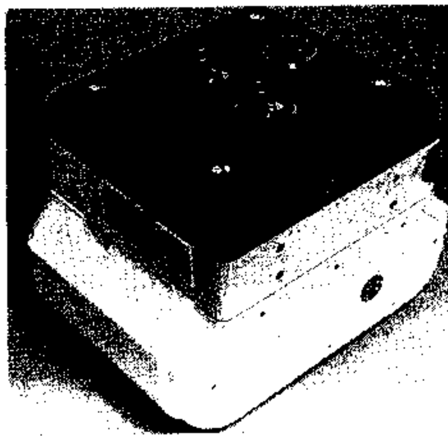
The F135 Camera is designed for use as a low level, high speed reconnaissance camera to take stereo pictures of very high quality during day or night sorties. Image movement compensation (IMC) is provided so that sharp pictures are obtained right up to the maximum IMC of 8.35 radians/sec, equivalent to an aircraft flying at Mach 1 at 40 metres. Variations in incident light level are fully compensated for by an automatic exposure control (AEC) system having a very fast continuous response. To minimise the effect of aircraft vibration a fast between lens shutter of 1/1,000 sec is used until light level falls to a level demanding the full aperture of the lens when the shutter speed is reduced steplessly to x s150 sec.

Twin lens are used to cover two formats 57 × 57 mm (2.25 × 2.25 in) side by side on 126 mm (5 in) film which greatly reduces the length of film that has to be carried. The film and drive mechanism are housed in a light tight magazine that can be daylight loaded on to the camera body, being retained by quick release catches. The motor driving the film at IMC speed is electronically controlled from a reference voltage proportional to the ratio of aircraft velocity/height (V/H). A quick wind (QW) mechanism is incorporated to increase the repetition rate so that ground cover overlap is provided.

The camera body houses the lenses, shutters and AEC together with the associated electronic control. When the shutter fires a synchronising pulse is produced to fire the electronic flash for night photography. Magazines and bodies are completely interchangeable.

Up to 4 cameras can be used in an installation. All cameras are identical but the interconnecting wiring is arranged so that one of them acts as a 'Master' to synchronise the firing of the shutters and QW on the others.

The number of controls to operate the camera has been kept to a minimum. An ON/OFF switch supplies power to the camera keeping it in a STANDBY condition with the AEC operative and



F135 Low-altitude high-speed reconnaissance camera the electronics primed but no film transported. When switched to RUN the camera takes pictures in either 'Ripple' or the '50/50' mode as selected by the mode switch. A 'frames remaining' counter indicates the number of exposures left and a warning lamp lights if the film is not transported or the end of the film is reached. The reference V/H voltage is preferably supplied by the aircraft computer but in cases where this is not available manual velocity and height controls can be fitted.

For night photography the electronic flash is switched on and is automatically synchronised from the master camera. No adjustment of the camera is necessary since the AEC automatically sets the iris to full aperture and the shutter to the 'flash' position when the incident light level is low.

OPERATING MODES:

For good stereo pictures at low altitude best results are obtained if the stereo pairs are separated by about 10% of the ground cover in the direction of flight. This is achieved in the F135 by making one lens look forward by 4 degrees and the other aft. The shutters are arranged to fire in quick succession so that an object in the centre of the format is viewed by one lens from the forward direction and by the other lens in the aft direction. When viewed with a stereo viewer these pictures give excellent stereo over the complete format. To ensure that no ground cover is lost a 10% overlap is provided by quick-winding the film between pairs of exposures. This mode of operation is known as 'Ripple'.

In the other mode of operation known as '50/50' no QW takes place and the shutters are fired alternately at time intervals to give pictures that have 50% ground cover overlap. Stereo can be obtained from these but only over half the format. This mode is intended for night photography where the repetition rate is limited by the recharge rate of the electronic flash.

STATUS:

In RAF service, with Nimrod, Phantom and Harrier aircraft.

INFRA-RED LINESCAN 201

DESCRIPTION:

The Type 201 infra-red linescan is a self contained, single unit reconnaissance system designed for installation in drones, aircraft pods or small aircraft and helicopters. Among the most notable of the features of this recently designed equipment are its small dimensions and light weight – 26.4 × 33 × 31.8 cm, and 11.6 kg. This package, which is shaped to suit drone or pod installation, contains the scanner, associated scanning and recording optics, an infra-red detector, and an electronics pack. The electronics are built in sealed cans with interconnections via sealed plugs and sockets with screened cables. Standard 70 mm film is used for recording, and this is contained in lightweight self-sealed cassettes. Individual units and sub-assemblies are interchangeable for servicing, and the equipment incorporates self-test facilities.

OPERATION:

In the linescan technique of reconnaissance, the terrain overflown is scanned in narrow strips at right-angles to the line of flight, the forward motion of the vehicle thus producing a series of consecutive strips which can be recorded side-by-side to produce a continuous picture of the radiation from the ground below. The Type 201 is responsive to the variations in infra-red radiation from the terrain scanned, and thus provides a means of passive reconnaissance by day or night. As well as producing a map of the terrain, this technique can reveal camouflaged objects and the recent presence of vehicles or aircraft from the thermal 'shadow' they leave behind.

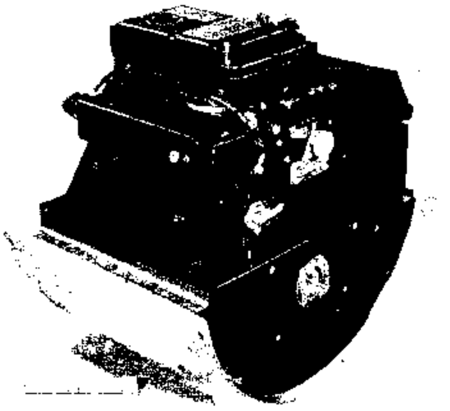
The scanner rotates at a speed of 7,500 rpm and provides a field of view of 60 degrees across track either side of vertical. This yields a coverage of just over 1 km for an aircraft flying at 300 m. Radiation collected by the scanner is focused through an optical system consisting of a pair of parabolic mirrors and a ridge mirror, onto a cadmium mercury telluride detector built into a dewar flask containing liquid air or nitrogen for cooling. Coolant capacity is sufficient to maintain the detector at a temperature of 77 degrees K for at least 30 min at normal ambient temperatures.

The detector is sensitive to radiation in the 8 to 14 micron band of the spectrum, and it reacts to changes in temperature and emissivity of the objects scanned by modulating the current passing through it. These current variations are processed electronically and used to drive a glow modulator tube, a device which produces light proportional to current. This light is used to expose the film on which the record is composed. The glow modulator tube and recorder optics are mechanically integrated with the scanner to provide accurate synchronisation between the detector signals and the recorded images.

Standard 70 mm, aerial FP 3 or equivalent film is used for recording, of which exposure is effected over only 53 mm of its width. The edge of the film may be used for the recording of navigational data, time marks, etc. Film cassettes are contained in the film transport assembly which is attached to the scanner/recorder housing by a quick-release mechanism. A standard cassette holds 5 m of film, which for a mission height of 300 m gives an along-track coverage of 64 km.

To maintain the same scale across and along track, the film is driven at different rates. The rate depends upon the ratio of the speed and altitude of the aircraft, and this is known as the Velocity/Height (V/H) ratio. A simple clutch mechanism is incorporated to keep the film tensioned down stream of the slit apertures in the scanner/recorder housing, through which the film is exposed. V/H ratios between 0.15 and 0.75 can be accommodated by the Type 201.

The built-in self test facility provides checks of scanner running, the glow modulator tube, electronic power supply, film transport mechanism, detector cooling and signal output, and electrical continuity.



Type 201 infra-red linescan sensor package as used in USD-501 reconnaissance drone

DEVELOPMENT:

The Hawker Siddeley Dynamics Type 201 infra-red linescan is the outcome of an international competition which resulted in this company being selected to develop such a system suitable for use in the Canadair AN/USD-501 reconnaissance drone. The linescan package was to be interchangeable with the standard camera pack for this drone. HSD was selected in 1968 for this task, but had in fact done an appreciable amount of design work appropriate to the project prior to this.

STATUS:

A series of flight-trials in an AN/USD-501 drone, carried out at the Royal Canadian Artillery Firing Range at Camp Shilo, Manitoba, was successfully completed early in 1970. The sensor is now in series production for the British and West German Armies.

MANUFACTURER:

Hawker Siddeley Dynamics Ltd, Electro-Optics Division, Manor Road, Hatfield, Herts. AL10 9LL, England.

1638.353

INFRA-RED LINESCAN 212

DESCRIPTION:

Derived from the Type 201, the 212 provides for reconnaissance and survey operations from aircraft and helicopters. A cooling pack is incorporated to extend system endurance, and a pilot control panel forms part of the system. Velocity/Height ratio range is 0.2 to 0.7 radian/sec. The 212 can also incorporate an Indium Antimonide detector which is sensitive in the shorter (3-5 micron) waveband. The 212 is of ruggedised design, and is intended for simple operation and minimum maintenance requirements. Normal photographic processing techniques and equipment are employed.

DEVELOPMENT:

Extensive flight trials have been conducted over varying terrain, and the environments have included conditions ranging from tropical jungle to snow-covered mountain regions. Aircraft employed for these trials have included types as diverse as the Wallis WA 117 autogyro and the Mirage III.

A maritime 212 version, with additional modular electronics for discrimination of details on vessels at sea is in development for an overseas customer. Similar applications for this version are encountered in desert or snow conditions.

STATUS:

The standard 212 is in full production and sales have been made to a number of military and civil organisations.

MANUFACTURER:

Hawker Siddeley Dynamics Ltd, Electro-Optics Division, Manor Road, Hatfield, Herts AL10 9LL, England.

1346.353

INFRA-RED LINESCAN 401

DESCRIPTION:

An equipment for near sonic reconnaissance missions at very low level. In common with other Hawker Siddeley Linescan equipments, scanner and recorder optics are mechanically integrated. This novel arrangement ensures perfect synchronisation and has the added advantage of reducing size and weight. Because of its small size and weight it is particularly suitable for installation in modest size pods.

Compatibility with high performance aircraft is met by robust construction, high pressure air for detector cooling, and a large film capacity. To cater for the high Velocity to Height ratio (V/H) a multi-channel detector and electronic system is employed. This ensures that a high resolution is maintained over the performance envelope. Pilot workload is minimised by automatic control of film and scanner speed, for V/H. Roll stabilisation is incorporated to permit high angles of bank without loss of continuity on the film. Flight navigation data is recorded on the film automatically. Standard 70 mm thin base reconnaissance film is contained in a simple large-capacity magazine. Magazines are interchangeable and easily fitted or removed from the linescan. Cockpit controls include an event marker, film footage counter, and a fault indicator lamp fed by a built-in self test facility.

DEVELOPMENT:

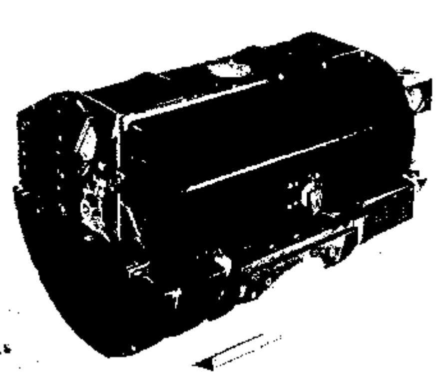
A development contract for the Type 401 was awarded to Hawker Siddeley Dynamics by the RAF in 1970 and was announced in May of that year.

STATUS:

Production against Royal Air Force contracts is in progress. Negotiations with other countries are at advanced stages and range from trials to bid submissions. A number of reconnaissance pod manufactures offer the 401 as a standard option.

MANUFACTURER:

Hawker Siddeley Dynamics Ltd, Manor Road, Hatfield, Herts AL10 9LL, England.



Hawker Siddeley Type 401 infra-red linescan unit

2422.153
IRIS INFRA-RED INTRUDER SYSTEM

IRIS is a rugged low-cost equipment designed to assist in the important task of detecting and monitoring enemy movements – especially in broken terrain or jungle.

DESCRIPTION:

The basis of the system is an infra-red beam projected between a transmitter and a sensor; interruption of the beam causes an alarm to be triggered at a remote monitoring unit. The beam is virtually impossible to detect without interrupting reception by the sensor. The effective part of the beam must be completely obscured to give an alarm, hence, any line-of-sight path between the transmitter and sensor that leaves this beam at least partly clear is usable. In particular, the transmitter and sensor, which are small in size, may be hidden in light foliage amongst or behind small twigs and branches, etc. IRIS can be used both during day and at night over ranges of 200 metres in average conditions, or 50 metres in fog, snow or tropical rain.

Each monitor unit can be associated with four separate "links" – i.e. transmitter-sensor combinations. Each channel has its own warning lamp and counter and there is a common audible warning circuit to which an operator can connect his headphones. The equipment can thus be used for direct monitoring by an operator, the affected link being indicated by the warning light, or for unattended monitoring – the counters indicating how many times each link has been broken since they were last reset to zero.

In good visibility conditions the link can be set up visually using the gun sights on the transmitter and sensor. When this is not possible a small encapsulated Audio Alignment Unit is used, with the operator's headphones, to align the links.

MANUFACTURERS:

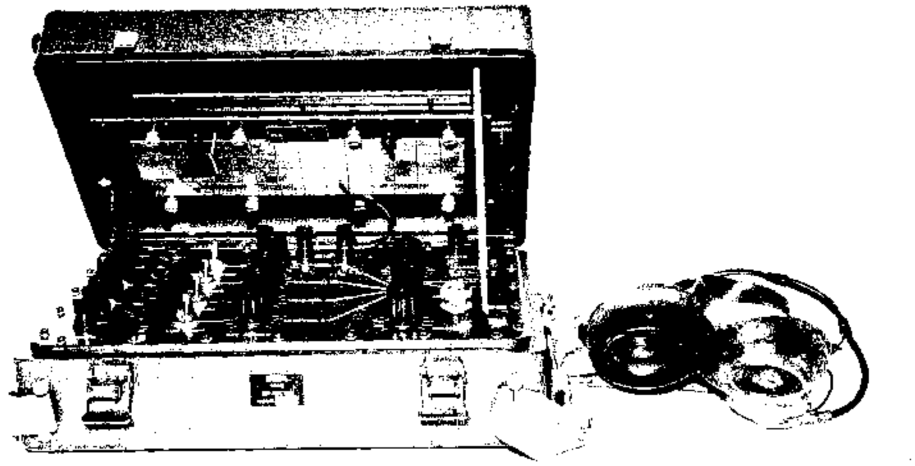
Marconi-Elliott Avionic Systems Ltd, Mobile Radar Division, Elstree Way, Borehamwood, Herts WD6 1RX, England.

2470.153
TOBIAS INTRUDER ALARM SYSTEM

This man-portable intruder alarm system, developed as a private venture by Elliott-Automation is now in use with armies and police forces in many parts of the world. It consists of a display unit having four separate signal channels to which sensors are connected by means of wire. The sensors are deployed near to likely intruder approach routes and may be many miles from the display unit. Ground vibrations set up by an intruder impinging on the sensors cause an electrical signal to be sent along the wire to the display unit. Maximum detection distances will vary with the nature of the ground and other environmental conditions. Thus a number of strategic points may be kept under surveillance by a single operator/sentry.

DESCRIPTION:

TOBIAS makes use of small, rugged low-cost, passive sensors (geophones) which, because they are buried just below ground level, are virtually undetectable. They may be sited near likely intruder approach routes or, for example, round the perimeter. Their deployment area can be many miles from the display unit. The display unit has four independent channels, to each of which up to 20 geophones may be connected. Thus, if desired, a considerable frontage or perimeter can be protected by one system. Maximum detection distance for one geophone depends largely on the nature of the ground and the amount of natural and man-made seismic activity in the area, but for a walking man it is seldom less than 50 metres radius, and 300 metres radius is not uncommon. Visual indication of movement on each channel is provided at the display unit (metres); also an aural display (headset) allows the nature of the measurement on each channel to be registered. The aural display also permits the operator to monitor activity continuously on all four channels simultaneously. Power supply (contained in lid of display unit) is eight 1½ V standard U2 (or equivalent) cells, which will provide a minimum of 72 hours continuous operation.



Tobias Intruder Alarm display unit

Tobias Specification:
Display unit C769 Mk II:
Width: 36.2 cm
Height (max): 15.25 cm
Depth: 24.5 cm
Weight (excluding batteries): 6.35 kg
Sensors:
Body height: 3.8 cm
Body width: 3.8 × 5.1 cm
Overall height including spike: 14 cm
Weight: 170 gm
Batteries: Eight U2 or HP2 cells or equivalent. USA equivalent – 'D' cells
Rated sensitivity: Less than 1 microvolt r.m.s. for a detectable signal with SET LEVEL controls fully clockwise
Radio audio output: 120 mW into 150 ohms
Rejection of induced interference: More than 65 dB
Rated battery life: Not less than 72 hours continuous operation

DEVELOPMENT:

Developed in 1966. Now in service with the British Army and 12 other countries.

MANUFACTURERS:

Marconi-Elliott Avionic Systems Ltd, Mobile Radar Division, Elstree Way, Borehamwood, Herts WD6 1RX, England.

THE UNITED STATES OF AMERICA

2766.153
PERSID-4A INTRUDER ALARM

PERSID (Personnel Seismic Intruder Detector) 4A is a 4-channel, audio-visual, military approved alarm system for use under field and combat conditions.

DESCRIPTION:

PERSID-4A is a small portable unit that is virtually impossible to detect since it uses passive geophone sensors similar to those used in oil exploration. The sensors are buried in the ground near likely intruder approach routes and are linked by wire to a control unit which can be located at considerable distances from the sensors. Each sensor detects subaudible ground vibrations of vehicles, men on foot, and animals identifiable at distances up to 100 yards for men and 300 yards for vehicles, depending on the terrain selected.

These signals are then passed to a central control unit where they are amplified, and processed to an improved audible sound possessing signature characteristics similar to those of the original sound.

Surveillance coverage can be greatly expanded by connecting as many as six geophones in parallel to each of the four input channels. By connecting additional geophones through external selector switches on each of the four input channels, even greater surveillance coverage can be achieved. High intensity sounds such as those produced by shells or hand grenades exploding near geophone sensors will not impair ability of the device to detect the movement of men or vehicles in or around the surveillance area.

Weight of the unit, complete with batteries is only about 1.6 kg. Dimensions are 200 mm × 95 mm × 152 mm. Operating temperature is from −30%C to 65%C at 95% relative humidity.

MANUFACTURER:

Defense Electronics, Division of DEI Industries, Rockville, Maryland 20854, USA.

2724.153
NIGHT OBSERVATION DEVICE – LONG-RANGE (NODLR)

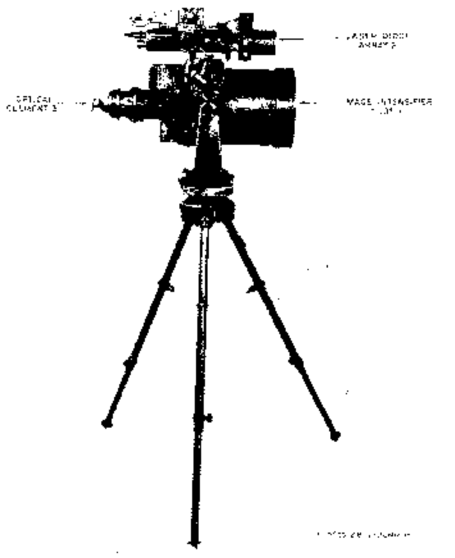
Hardly any information has been released on this device: virtually all that can be said about it is that it is designed to enhance the ability of ground forces to see in the dark. The only pointers to its method of doing this are provided by this information that the equipment incorporates an IBM laser, an RCA image tube and a Malakir cyrogenic cooler.

DEVELOPMENT:

The equipment was developed by Kollsman Instrument under a $2,168,000 US Government contract placed in 1968. 13 sets were ordered and delivery was completed early in 1970. The concerned Government agency is the Night Vision Laboratory of the US Army.

MANUFACTURER:

Main contractor: Kollsman Instrument Corporation, 575 Underhill Boulevard, Syosset, N.Y., U.S.A.



Kollsman long-range night observation equipment

1871.353
RBV CAMERA SYSTEM

DESCRIPTION:

The RCA Return-Beam Vidicon camera system described in this entry was developed for the civilian Earth Resources Technology Satellite programme, but is included here for its obvious relevance to the techniques and possibilities which exist for military reconnaissance satellites.

The 2-inch RBV Three-Camera Subsystem surveys the Earth via three co-aligned camera sensors, each viewing the identical scene but in a different spectral band. When the separate images from the three cameras are processed and superimposed in their respective colours, they provide a single full-colour image containing the radiometric and cartographic information required for the ERTS system.

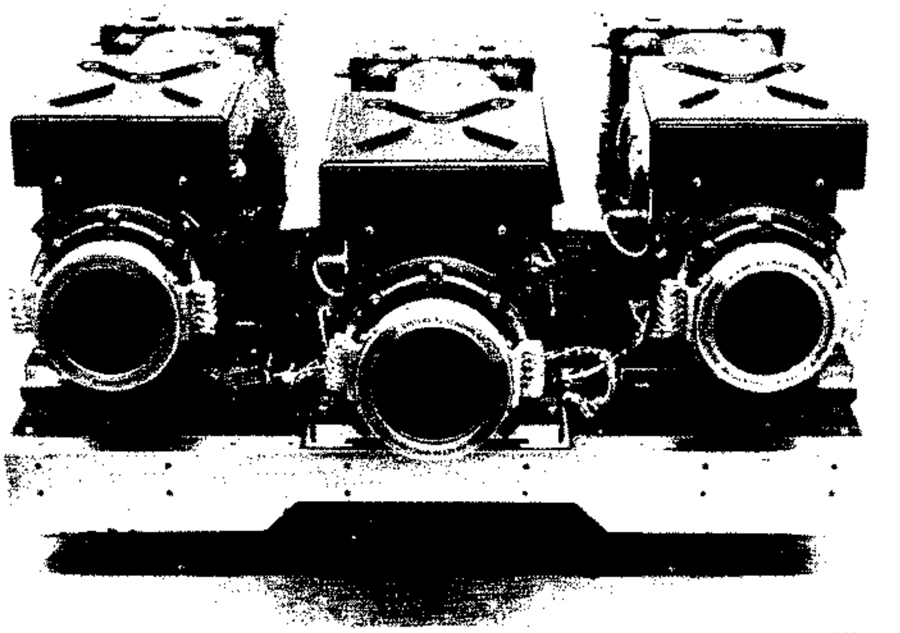
The three spectral regions covered by the three-camera subsystem are the blue-green (0.475 to 0.575 micron), red (0.580 to 0.680 micron), and near-infra-red (0.690 to 0.830 micron). The three cameras are exposed simultaneously to facilitate registration of the three separate images into the final colour composites.

Each photograph processed by the camera subsystem covers an area 100 by 100 nautical miles (185 × 185 km). These individual photographs can be arranged to provide a continuous swath along the spacecraft orbital track.

The overall three-camera subsystem comprises the following seven electronic units: three camera sensors; three camera electronics units; a common camera controller and combiner.

A baseplate unique to the subsystem serves as a precise alignment reference plane and thermal control element.

Each of the three camera sensors includes a return-beam vidicon, electron optics, electromagnetic deflection circuitry, electromechanical shutter, lens, and thermo-electric cooler. The vidicon imaging tube is a magnetically deflected, magnetically focused device with a 2 inch (5 cm) diameter face-plate. Optical filters in the lens assembly of each camera sensor determine the different spectral allocations for each. The lens assembly provides a 15.9-degree field of view across the diagonal portion of the 1-inch-square (6.45 cm^2) usable format of the vidicon face plate. A deposited reseau pattern on the faceplace establishes a geometric reference for the registration of the three separate information channels. The shutter provides for uniform exposure of the vidicon, and it can be programmed for one of three exposure times to accommodate variations in scene illumination. The thermoelectric cooler controls the thermal environment of the vidicon faceplace.



RBV 3-camera system for ERTS. This uses three specially designed Fairchild lenses, each with a different spectral range of correction; green, red, and near infra-red lenses are used

Each camera goes through four operational modes – erase mode, prepare mode, expose mode, and read mode – in taking a picture of a scene. The duration of a picture-taking sequence is 25 seconds, with the erase, prepare, and expose modes being simultaneous for the three cameras and the read mode being sequential.

An electronics unit is associated with each of the three camera sensors. This unit not only develops the various power inputs for the sensor, but it also contains the circuitry for processing the sensor video output. The unit sequences its associated camera sensor as dictated by timing inputs from the camera controller and combiner.

The electronics unit also controls the focus and sweep deflection of the camera sensor, feed-back for the thermoelectric cooler on the vidicon face-plate, and the video gain. Finally, it provides the ability to operate with or without aperture correction.

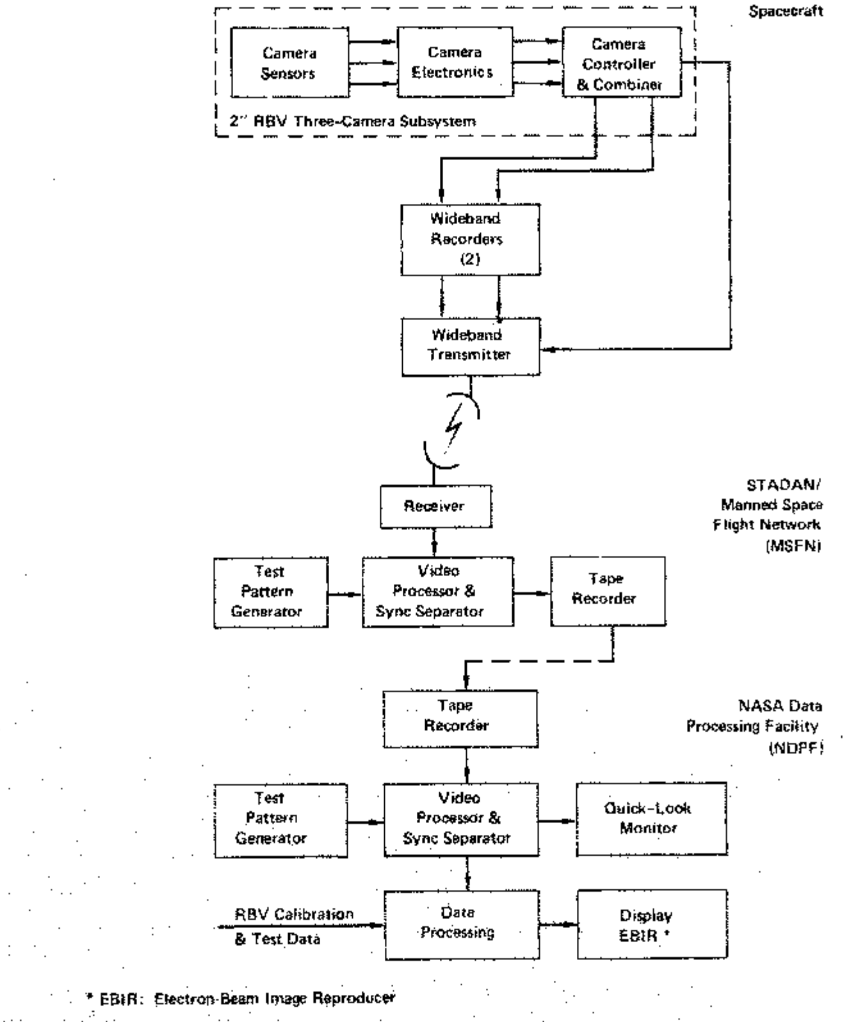
The camera controller and combiner performs two basic functions in the operation of the three-camera subsystem. First, it develops the timing for operation of the individual cameras as an integrated subsystem. Secondly, it assimilates the individual video outputs into a serial video output. It injects the required vertical and composite horizontal sync and the spacecraft time code into the data stream to generate the composite video output. In its interface with the spacecraft, the controller and combiner supplies the composite video output and receives the 1.6 MHz clock signal from the spacecraft for the timing and sequencing operations in the subsystem.

The composite video output from the controller and combiner is supplied to the spacecraft for storage on either of two wideband video tape recorders or for direct transmission via the wideband transmission link. From the spacecraft, the video output may be directly transmitted to the ground-based receiving sites or may be transmitted at a later time via readout from the tape recorders. Signals fed to the spacecraft from the controller and combiner indicate the appropriate times to operate the recorders. The recorders utilise multiple-head recording techniques and the data horizontal line rate is rephased to prevent data degradation caused by switching transients.

The transmitted signal from the satellite is received on the ground at either NASA STADAN or MSFN sites, where it is processed in a video processor and sync separator (VPASS) unit. This unit extracts information for storage in ground-based tape recorders.

The recorded tapes are then played back at NDPF into another VPASS unit, which extracts all necessary processing data. The extracted data includes both vertical and horizontal sync information, identification of the spectral channel being processed, indication of the presence of time-code information in the data stream, and signals for initiating automatic display.

During data processing, additional information (e.g., camera calibration and test data) can be entered so that an absolute measure of the radiometric and positional features of the image can be obtained.



RCA RBV 3-camera system and data processing system block diagram

Performance Characteristics:
Deflection & focus: Electromagnetic
Image size: 1 inch square (6.45 cm^2)
Lens f number: 2.8
Focal length: 126 mm
Field of view: 15.9 degrees
Resolution: 4,500 TV lines
Dynamic range: 30 to 1
Highlight brightness: Channels 1 and 2: 0.78 $\mu J/cm^2$. Channel 3: 1.2 $\mu J/cm^2$
Residual image: Less than 1%
Video bandwidth: 3.2 MHz
Exposure time: 8, 12, 16 milliseconds (selectable)
Three-camera cycle rate: 25 seconds
Frame time: 3.5 seconds
Peak signal/rms noise: 33 dB
Active horizontal scan lines: 4,125
Average subsystem power: 151 watts
Subsystem weight (excluding baseplate): 72 kg

DEVELOPMENT:

Development of the system began in the late 1960s and has been continued. RCA is known to have developed a larger (4½-inch/11.4 cm) Return Beam Vidicon camera system and a Laser Beam Image Reproducer for processing the data obtained from the improved system.

MANUFACTURER:

RCA, Government and Commercial Systems, Astro-Electronics Division, Princeton, New Jersey 08540, USA.

1869.173
RCA LASER BEAM IMAGE REPRODUCERS

DESCRIPTION:

The Laser Beam Image Reproducer (LBIR) equipment is a system which produces ultra-high quality film copies of television pictures, and as described here, has been developed over a period of more than seven years by RCA for the recording of data obtained from satellites equipped with the RCA Return-Beam Vidicon Camera System. The American ERTS (Earth Resources Technology Satellite) programme is an un-classified illustration of the kind of operations which may be undertaken with equipment of this kind and the implications for military use will be generally obvious.

Three generations of LBIR have been developed, the first having been introduced in 1969. This was capable of reproducing single-frame TV images with a resolution of 6,000 lines: the latest version is capable of more than 20,000 lines.

A pictorial diagram of the current LBIR is shown in Fig. 1. The basic imaging process consists of

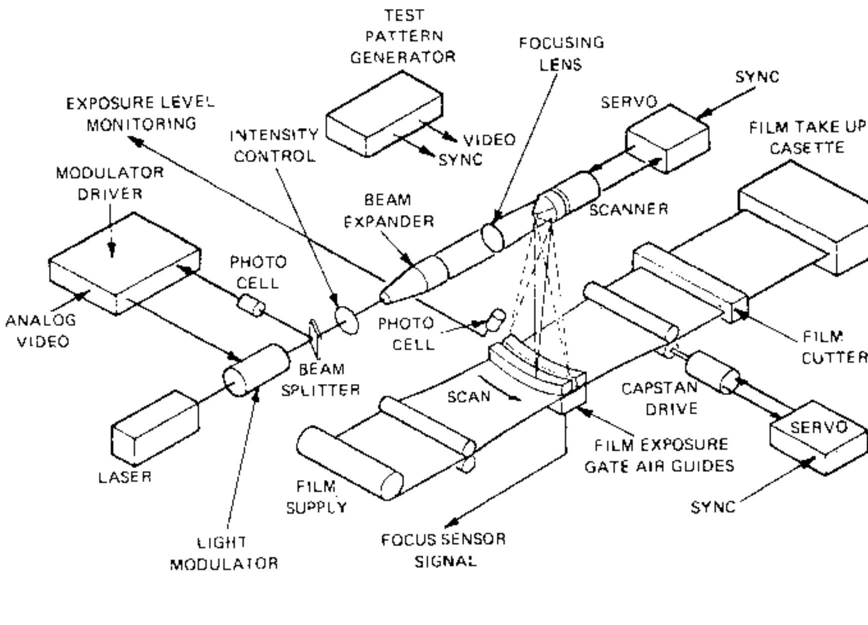


TABLE I – LBIR performance characteristics (2nd and 3rd generation comparison).

Characteristics	Previous LBIR	Present LBIR
Resolution:		
Pixels per scan	6,000	18,000
Corresponding cyles/mm	13.2	39.5
MTF (with film)	80% (Kodak RAR1496)	56% (Kodak 3414)
MTF (electro-optics only)	94%	75%
Grey scale:		
Dynamic range	100:1	250:1
Maximum film density	2.3 (Kodak RAR2496)	2.0 (Kodak 3414)
Video bandwidth	DC-5 MHz (−3 dB)	DC-10 MHz (−0.5 dB) DC-25 MHz (−3 dB)
Signal to noise ratio (electronics)	50 dB	50 dB
Horizontal blanking	10%	10%
Nominal line scan rate	1,250 lines per second	1,000 lines per second
Nominal scanner speed	18,750 r/min	15,000 r/min
Scanner sync jitter	100 ns p-p, < 10 Hz bandwidth	50 ns p-p, < 10 Hz bandwidth
Scanner	1-inch diameter, air bearings	1-inch diameter, air bearings
Number of facets	4	4
Line-to-line spacing	38 μm	12.7 μm
Line-to-line jitter	±10 μm	±0.3 μm
Transport speed range	25 to 100 mm/sec	1 to 100 mm/sec
Recording gate	Fixed curved platen	Air-guide curved platen
Film supply capacity	9½-inches wide by 125 feet (RAR 2496)	9½-inches wide by 250 feet (3414)
Laser power	12 mW *A* 632.8 nm	15 mW *A* 632.8 nm

scanning a finely focused, intensity modulated laser beam across the width of a continuous web of film. The 9½-inch (24 cm) wide film is shaped to a precise curvature by an air bearing exposure gate, and the beam is deflected across the film by a rotating four-sided pyramidal scanning mirror. The optics and scanning geometry are such that the phase-locked constant-speed scanner produces a linear scan rate, with perfect focus and uniform exposure, across the entire width of the film. Vertical scanning is accomplished by moving the film perpendicularly to the exposure scan line.

The performance characteristics of the improved (third generation) LBIR are compared to the previous design in Table I. The modifications and improvement which were implemented to achieve the higher resolution performance are described in the following paragraphs.

The major changes to the previous LBIR during the improvement programme were the substitution of a 25 MHz light modulation system in the place of the original 5 MHz system; the replacement of the scanner mirror with a new one of much higher quality; the addition of a precision air-guide film exposure gate with integral focus sensors; the modification of the film transport servo system to provide much finer line-to-line spacing control; and the use of a higher resolution film. In addition, the film transport and scanner mirror servo electronics were modified to operate at the scan rates commensurate with the higher resolution scan parameters, and the optical components were checked and critically aligned.

The major optical components in the LBIR are the beam expander, focusing lens, and scanner. These components determine the diffraction limited scanning spot size. The beam expander enlarges the modulated laser beam to completely fill the aperture of the focusing lens.

The scanner axis is coincident with the optical axis; each facet, therefore, intercepts 25% of the converging focused beam emerging from the lens, and deflects it radially (the facets are at 45° to the axis).

The rotation of the scanner causes the facet passing through the lower quadrant of the beam cross section to scan the film. All other beams are blocked so as not to expose the film. The optics are focused for diffraction limited performance, with the scanner facet being the limiting aperture.

The scanner shaft is actually the armature of the drive motor. It is supported entirely by air bearings (both journal and thrust) to provide vibration-free rotation (no ball-bearing noise). The scanner servo utilises optical tachometer feedback derived from the scanner mirror facets which are used for scanning. The scan synchronisation jitter is virtually unmeasurable on a line-to-line basis, and restricted to 50 ns peak-to-peak over a cycle period of more than a hundred scan lines.

The air-guide exposure gate provides a uniform cushion of air above and below the film as it shapes it to the precise curvature. The film is supported within the gate by the air bearing and does not touch any part of it. The depth of focus control thus achieved is at least five times better than the allowable depth of focus needed to maintain the MTF (Modulation Transfer Function) performance indicated in Table I. This is one of the most important modifications made in the LBIR for improving the high-resolution performance.

The lower half of the air-guide contains several photo diodes located in positions across its full width. A high-resolution bar target transparency is inserted in the air-guide during optical alignment, and an unmodulated beam is swept across it. Focus adjustment is made while monitoring the diode outputs. This technique results in optimum focus alignment since it is made during actual operating conditions (the scanner at nominal speed, and the air-guide shaping and supporting the film).

The film type used in the new LBIR, Kodak 3414, is a high-definition aerial film. The exposure sensitivity of 3414 is approximately ten times less than the Kodak RAR2496 originally used for the lower resolution recording. The laser power in the LBIR (15 mW at 632.8 nm) was more than adequate for the 2496 film but not sufficient to fully expose the 3414 film. This condition was corrected by eliminating the vertical aperture mask used to create merged scan lines in the lower resolution LBIR. This improved the optical efficiency enough to expose the 3414 film to densities in excess of 2.0.

DEVELOPMENT:

The LBIR was developed originally in 1967 to provide a means of recording the high-resolution imagery produced by the then newly developed RCA 2-inch RBV (Return Beam Vidicon) camera.

The objective of this original effort was to construct a machine which would reproduce the imagery in a 9 × 9 inch (23 × 23 cm) photographic transparency format with no significant degradation of image quality. The resultant prototype LBIR design provided 75% response (including film) at a resolution of 6,000 pixels per scan, had a grey scale dynamic range in excess of 100:1, and had excellent geometric fidelity.

A second-generation LBIR was developed in late 1968 to provide several basic improvements essential for field operational equipment; it provided additional image fidelity improvements as well. Several functions were automated, alignment stability was greatly improved, and a continuous film transport was added to provide operational mode versatility and rapid sequential frame capability. However, the basic image reproduction parameters, such as resolution and grey scale, were not significantly changed. This design satisfied the needs of the three-camera 2-inch RBV system being designed for the ERTS programme.

However, early in 1970, the need for a higher resolution image reproducer became evident. Sensors capable of providing up to four times the LBIR resolution (24,000 pixels per scan) were being investigated for advanced ERTS missions. As a result, RCA undertook a programme to upgrade the LBIR to a third-generation version which would be compatible with these very-high-resolution sensors.

RCA LASER RADAR RECORDER

DESCRIPTION:

This equipment is a development of the Laser Beam Image Reproducer (Entry No **1869.173**) developed by RCA principally for the reproduction of satellite pictures. The Laser Radar Recorder (LRR) is based on the same principle as the LBIR but in this case the light intensity is modulated in accordance with the returns from an airborne side looking radar instead of television camera video signals.

The LSR was developed by RCA for the UPD-5 radar reconnaissance system to record the radar data on a photographic film strip 9 inches (23 cm) wide. The recorder can be used in the aircraft or at a ground station where it can receive the radar signals in real time, telemetered from the aircraft. The former procedure is adopted when the aircraft is operating beyond practical telemetry range, and in these instances the information is stored on the film and processed on return to base.

DEVELOPMENT:

Development was started in 1972 by RCA under a $1.4 million contract awarded by Westinghouse, the prime contractor to the USAF Aeronautical Systems Division for development of the UPD-5 radar.

MANUFACTURER:

RCA, Government and Commercial Systems, Moorestown, New Jersey, USA.

1880.353

FAIRCHILD PANORAMIC CAMERAS

DESCRIPTION:

The Fairchild Camera and Instrument Corporation produces a wide range of cameras for civil and military applications. The principal airborne panoramic reconnaissance models are described in the following paragraphs.

KA-60 PANORAMIC CAMERA

High performance 70 mm panoramic camera primarily used in high performance aircraft for low altitude reconnaissance photography.

Takes overlapping pictures covering the line of flight from horizon to horizon.

Provision is made in the camera for installation of a cathode ray tube or a solid state display which is used with a data annotation system to record pertinent information on each photographic frame.

Specifications:

Type: Reconnaissance, panoramic, rotary prism, vertical or forward oblique, low altitude

Lens: 3 inch (76 mm) f/2.8

Format: 30 cm with data block

Coverage: 40° longitudinal by 180° lateral scan
Film Capacity: 70 mm by 500 feet (152 m), thin base, or 70 mm by 250 feet (76 m), thick base, perforated Aerecon Plus X-EK 3401 or EK 8401
Cycle rate: Auto cycle: 1 to 12 cycles per second. Pulse: 1 second per cycle to 15 seconds per cycle (automatically switched from autocycle at 1 cps)
Overlap: 60 per cent maximum
Performance: (1) Maximum dynamic resolution: 60 lines/mm, high-contrast EK 8401 film. (2) Typical dynamic resolution: 40 lines/mm, high-contrast EK 8401 film
Weight: 19.5 kg

KA-82 PANORAMIC CAMERA

Intended for high quality photographic imagery over a wide range of tactical reconnaissance mission requirements.

Combines high resolution capability of stationary film type of panoramic camera with high reliability of continuously rotating elements.

Features automatic exposure control, forward motion compensation, data recording, manual focus adjustment, 12 or 56 per cent overlap.

Specifications:
Lens: 12 inch (304 mm) f/3.8
Format: 114 × 733 mm
Coverage: 21 degrees longitudinal by 140 degrees lateral scan
Film Capacity: 5 inches by 2,000 feet (12.7 cm × 609 m), thin base, perforated
Cycle Rate: 10.0 seconds per cycle to 1.17 cycles per second (56 per cent overlap); 20.0 to 1.71 seconds per cycle (12 per cent overlap)
Mode of Operation: Autocycle
Exposure Time: 1/30 to 1/12,000 second
Dynamic Resolution: 85 lines/mm to 115 lines/mm, high contrast, EK 3400 film
Weight (with film): 98 kg

KB-18 PANORAMIC STRIKE CAMERA

Provides a light-weight, compact aerial strike capability with low altitude panoramic photography. Fore-to-aft coverage of 180° along the line of flight, and a field angle of 41° throughout the scan.

Specifications:
Format: 9.40 × 2.25 inches (238 × 56 mm)
Mode of Operation Autocycle: 1, 2 or 4 cycles per second
Lens: 3 inch (76 mm), f/2.8
Relative Shutter Speeds: Approximately 1/100 sec to 1/4,000 sec within limits established by cycling rate and AEC
Dynamic Resolution: 60 lines/mm to 70 lines/mm, high contrast (EK 2401 film)
Film Capacity: 70 mm by 250 feet (76 m) (about 300 exposures)
Operating Altitude: 0 to 50,000 feet
Weight (with film): 17 kg

KA-77 PANORAMIC CAMERA

Provides a light-weight, compact, reconnaissance capability for low altitude panoramic photography. Operation in the forward oblique position provides 70 per cent overlap, normally without forward motion compensation. Operation in the vertical position provides horizon-to-horizon coverage with 60 per cent overlap (with forward motion compensation). Automatically records flight data.

Specifications:
Scan Angle: 180° lateral; 40° field view angle
Format: 114 × 462 mm
Mode of Operation:
Autocycle: 1 to 6 cycles per second
Pulse: 2 seconds per cycle minimum pulse
Exposure Control: Automatic shutter speed and lens aperture, AE120, 64, 80
Lens: 6 inch (152 mm), f/3.8
Dynamic Resolution: 40 lines/mm to 50 lines/mm, high contrast (8401 film)
Film Capacity: 5 inches by 500 feet (12.7 cm × 152 m) (standard base). 5 inches by 1,000 feet (12.7 cm × 305 m) (Estar thin base)
Weight (with film): 51 kg

F-415Y STILL PICTURE PANORAMIC CAMERA

Horizon to horizon daylight reconnaissance capability specifically for high-speed, low-flying aircraft.

Moving-film panoramic type, using a 3-inch (76 mm) f/2.8 lens with Automatic Exposure Control.

Supply spool stores up to 1,800 feet of film, providing a capability of over 2,000 exposures.

Specifications:
Scan Angle: 40° longitudinal by 180° lateral
Mode of Operation: Autocycle, 0.63 through 3.1 frames per second, continuous
Relative Shutter Speed: 1/120 through 1/6,000 second
Forward Motion Compensation: 0.189 through 0.93 radians per second
Film Format: 2.25 by 9.4 inches (56 × 238 mm)
Weight, Body and Magazine (with film): 24 kg

MANUFACTURER:

Fairchild Space and Defence Systems, 300 Robbins Lane, Syosett, Long Island, New York 11791, USA.

1881.353

F-639 MEDIUM/HIGH ALTITUDE MAPPING CAMERA

DESCRIPTION:

High-precision frame camera designed to provide highly accurate metric characteristics over the vehicle flight path.

System incorporates a cartographic camera with a 6-inch (152 mm) focal length f/5.6 Geocon I lens and a Fairchild Rapidyne shutter.

Data recording capabilities consist of a resettable exposure counter, 24-hour calendar clock and card for hand-written data, and fixed data consisting of lens, calibrated focal length, camera serial number, lens serial number. Recording of platen and lens cone temperature is provided by means of a binary data readout.

Four primary fiducials locate the principal point of the lens. Two secondary fiducials are recorded on the film at the first pinpoint of light and serve as a reference point for measuring film movement during exposure.

Specifications:
Lens: 6 inches (152 mm) f/5.6 Geocon I
Format: 228 × 228 mm
Film Capacity: 9½ inches × 700 feet (241 mm × 213 m) of thin base film
Mode of Operation: Autocycle, with 55 per cent or 10 per cent forward overlap
Resolution: 35 lines/mm AWAR on EK Type 3400 film, low contrast (2:1), 53 lines/mm high contrast
Distortion: Radial and tangential – 10 microns maximum
Platen Flatness: Within ±0.0001 inches
Weight (with film): Camera, magazine, film

MANUFACTURER:

Fairchild Space and Defence Systems, 300 Robbins Lane, Syosset, Long Island, New York 11791, USA.

1882.353

MINIPAN CAMERA AND MOUNT

DESCRIPTION:

The Minipan camera installation has been developed by Perkin-Elmer to provide target acquisition and strike data regardless of the roll attitude or manoeuvres of the aircraft following a strike. Essentially, the equipment consists of a 35 mm panoramic camera which is provided with a roll-stabilised mount and incorporated in a pod or other housing appropriate to the particular application.

STATUS:

About 200 Minipan cameras are being used on A-4 and Mirage aircraft of various air forces. The Royal Australian Navy has procured the equipment for identification of ships at sea. In this application, the Minipan is mounted in the aft engine door of an A-4 Skyhawk aircraft, and the camera scan – transverse to the line of flight – permits ship identification. The equipment is in use in the Netherlands for bomb trajectory evaluation and the US Army has acquired a small number for use in RPVs.

MANUFACTURER:

Perkin-Elmer Aerospace Division, 2855 Metropolitan Place, Pomona, California 91767, USA.

1883.353

PAVE SPIKE VIDEO FILM RECORDERS

DESCRIPTION:

This specially developed camera system produced by Perkin-Elmer can photograph either the televised video display or the radar image viewed by the observer in the rear cockpit of a Pave Spike-equipped F-4 Phantom aircraft. Operated manually or automatically, both modes synchronise the camera frame rate to the video or radar display, and a fully loaded magazine provides for slightly more than eight minutes of mission recording. The Pave Spike air-to-ground weapon delivery system is described in Entry No. **1533.311** in Section One of this edition.

The specifications included the following design requirements: (1) the optical design must allow direct film recording of the video display without obstructing the operator's view, (2) the unit must not interfere with the pilot's ejection envelope, be easy to install, and allow the film magazine to be loaded and unloaded without camera removal, and (3) the electronic design must synchronise camera operation to the 60 Hz field synchronisation signal available from the video display equipment and the automatic recorder during laser firing.

OPERATION:

The instrument can photograph the video display viewed by the observer in the aircraft and can record either manually or automatically. If the automatic mode is selected, the recorder operates at 10 frames per second whenever the Pave Spike System is performing the lasing function. In the manual mode, recording runs at 10 frames per second, independent of the lasing function. Both modes synchronise the camera frame rate with the video display field synchronisation, thus ensuring that a full frame is photographed under all circumstances. This eliminates the "rolling bar" effect present on systems not synchronised with the field synchronisation signal.

Approximately half the light rays from the video display (Figure 1) are reflected by a high efficiency

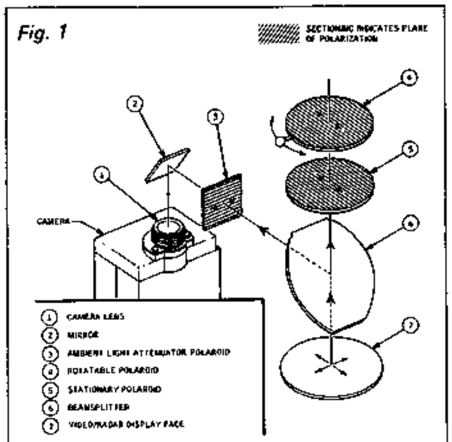

Fig. 1 Pave Spike Optical System

beamsplitter, transmitted through a polaroid filter, and then reflected off a mirror into the camera. The remaining half of the light rays pass through the beamsplitter and are then transmitted through two polaroid elements to the operator.

The amount of light reaching the operator is determined by the angle of polarization between the stationary polaroid element and the rotational polaroid element. This permits the operator to adjust the brightness of the display without affecting the exposure level on the film. The ambient light attenuator polaroid filter between the beamsplitter and the mirror prevents ambient light from reaching the film. The angle of polarisation of this filter is controlled by the stationary polaroid filter.

DEVELOPMENT:

In September of 1972, the US Air Force initiated an RFP (request for proposal) for an instrument to photograph the video display in reconnaissance equipment (Pave Spike System) installed in F4 aircraft.

The Aerospace Division of Perkin-Elmer was awarded a contract to design and build an engineering evaluation and test unit. The instrument was designed, fabricated, tested, and installed in the aircraft within 30 days after go-ahead.

MANUFACTURER:

Perkin-Elmer Aerospace Division, 2855 Metropolitan Place, Pomona, California 91767, USA.

SONAR AND UNDERWATER DETECTION EQUIPMENT

AUSTRALIA

1790.453
MULLOKA SONAR

DESCRIPTION:

Mulloka is the name given to a joint programme by the Royal Australian Navy and the Federal Department of Supply to develop a new sonar, needed because of performance limitations of American and British equipments in Australian waters, it is claimed. A pilot model has been developed and built by the Weapons Research Establishment at Salisbury, South Australia and this has been tested at sea by the RAN. The design of the new sonar has as a particular objective high performance in the detection of targets in the regions of the sea around Australia, and to this end studies have been made of the sound propagation properties of tropical and sub-tropical waters. The latest high-speed signal processing and computing techniques are applied in the new system, other advances being in the adoption of high-efficiency amplifiers, and a new (unspecified) method of driving the transducers.

DEVELOPMENT:

Both Australian and foreign companies participated in the production of the pilot model sonar, but it is planned that production engineering will be undertaken in Australia. This programme has links with the general increase in emphasis on ASW by the Australian Government, a related project being the Barra submarine detection system.

1791.453
PROJECT BARRA

DESCRIPTION

Under the title Project Barra, Australian industry and Australian Government Agencies are collaborating in the study and development of a new system of sonobuoys and the complementary airborne data processing system for the detection of submarines from both land-based and carrier-based maritime aircraft. It is anticipated that the system will be used by both the RAAF and the RAN. The Barra project is one result of several years of successful work under Project Nangana, which is a continuing research programme by the Department of Supply Weapons Research Establishment, Salisbury, South Australia. The latter programme is being pursued in close collaboration with the RAAF and RAN and is concerned with the development of improved methods of submarine detection. The UK MoD expressed an interest in Project Barra and there is some collaboration between the two countries.

In August 1973 the Australian Department of Supply let a $A200,000 contract to Amalgamated Wireless (Australasia) Ltd to act as prime contractor for engineering studies of the new system, this being the first involvement in the development phase on the part of Australian industry. In January 1974 AWA was awarded a second contract, worth $A2-million for project definition and initial development in Phase 2, this to be undertaken in co-operation with Commonwealth Aircraft Corporation, Plessey Communications Pty, and Cablemakers and Electronic Systems. The UK MoD also has given Marconic-Elliott Avionic Systems Ltd a contract for project definition and initial development of airborne system elements to complement the Australian activities.

CANADA

2038.453
AN/SQS-507 (HELEN) SONAR

DESCRIPTION:

The AN/SQS-507 Sonar is a variable depth sonar for detection, tracking and attack. It was designed for the Canadian ASW Hydrofoil Programme, but can be readily adapted to either a conventional speed variable depth sonar or a hull-mounted sonar. The hydrofoil was intended for an anti-submarine role in the open ocean using homing torpedoes with the AN/SQS-507 as the primary sensor. The weapons systems and sensor systems, including the AN/SQS-507 have the capability of being coupled into a central Action Data System.

The variable depth body is launched and recovered while the hydrofoil is hull-borne. For high-speed towing the body is left in the water while the ship is brought to foilborne speeds.

DEVELOPMENT:

Development of the system began in 1965 and the equipment after successfully passing its tests was handed over to the Canadian Forces in 1968. The design and manufacture was carried out by Westinghouse Canada Limited as a part of the systems contract for the Hydrofoil Fighting Equipment Package.

MANUFACTURERS:

Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario Canada, L8N 3K2.

1792.453
AN/SQS-505 SONAR

DESCRIPTION.

The AN/SQS-505 is a medium size search and attack sonar which is presently in service with the Canadian Maritime Forces and will soon go into service with the Royal Netherlands Navy and the Belgian Navy. For ease of description the system can be examined in five basic groups:

(1) Transducer Subsystems
(2) Transmitter
(3) Receiver
(4) Control and Indicator Group, and
(5) Options

The basic electronics, items 2, 3 and 4, consist of nine cabinets, weighing 6200 lbs. and occupying 260 cu. ft. Average power requirements are 13 kW. The AN/SQS-505 features:

(1) Active omni-surveillance
(2) Independent Omni-passive Search
(3) Non-Interfering Surveillance Modes
(4) Off-tube Storage Displays
(5) Frequency Diversity
(6) Three Classification Techniques Modes
- Display of Target Doppler
- Separate Steerable Audio Channel
- Acoustic short pulse echo classification techniques (ASPECT)
(7) Computer Compatibility
(8) Two-way Computer Communication
(9) Computer aided tracking
(10) Single Sonar Operator
(11) Integrated Test Equipment
(12) On Line Monitoring of the Sonar Transmitter
(13) Overall Receiver Quick Test
(14) Solid-state Electronics
(15) Self-contained Cooling

Transducer Subsystem

The transducer assembly, weighing about 2270 kgs, consists of a cylindrical array of 36 staves, each containing ten single element transducers. It is mounted in one of the following four configurations:

(1) Hull-mounted with fixed dome
(2) Hull-mounted with retractable dome
(3) Hull-mounted with fixed dome and retractable transducer mechanism
(4) Variable Depth Towed Sonar (VDS)

The double walled stainless steel sonar dome, which is about 4.1 m long, 1.4 m wide, extends 1.7 m below the keel, and weighs with the transducer 3,266 kgs, is common to all hull-mounted configurations.

Two types of retracting mechanisms are available for the AN/SQS-505 sonar system. The one lifts the sonar dome vertically, whereas the other rotates the sonar dome up into the sea chest presenting a hard surface which is conformal to the ship's hull, thus reducing drag. A further advantage of the rotating type is that the actuating machinery is outside the sea chest and therefore isolated from the corrosive action of sea water. All sonar dome configurations have space available for an underwater telephone transducer.

The Variable Depth Towed Transducer subsystem consists of three main elements:

(1) The towed body which contains the transducer and the body heading reference
(2) The AN/SQA-502 hoist consisting of the winch, saddle, launch/recovery gear, operator's compartment and associated hydraulics
(3) Armoured tow cable with electrical conductors and fairings.

The towed body is a body of revolution approximately 5.5 m (18 ft) long and 1.8 m (6 ft) in diameter. All-up weight in air including transducer is 6,350 kg (14,000 lbs). The body has low hydrodynamic drag and is ballasted for deep towing of the transducer. A gyro compass mounted in the body provides body heading reference to the sonar equipment for display stabilization.

While towing, the bobbing action of the boom reduces the strain placed on the cable by the vertical motions of the ship in rough seas. A cable winder mechanism which is fitted to the winch removes the necessity for slip-rings and permits straight through connections of the electrical conductors. The tow cable is about 2.5 cm (1 inch) in diameter including a double layer of armour over the nearly one hundred conductors. Steel nosed fairings are fitted to the tow cable for drag reduction. For normal towing and body depth changes only one operator is required. Two are required during launch and recovery.

Transmitter

The transmitter cabinet contains 36 transmitter modules, one for each of the 36 transducer staves. Each module consists of a silicon controlled rectifier in a patented series/resonant circuit.

The operator can select three different modes of transmission:

(1) Omni-directional Transmission (ODT)
(2) Triple Rotational Directional Transmission (TRDT)
(3) Directional Transmission (DT)

Also selectable are the transmission frequency, transmitted pulse length and transmitted power. Built-in test equipment provides on-line monitoring of the transmitter output and permits semiautomatic fault location down to the level of the replaceable module.

Power Supply

A separate cabinet contains a transformer rectifier type of power supply which converts the ship's prime power to DC for operation of the sonar transmitter.

Matching and Tuning Unit

The matching and tuning unit provides matching of the transmitter and receiver systems into the transducer subsystems, either Hull-Mounted or VDS.

Receiver

Three cabinets house the receiver group's solid state electronics. Receiver coverage is 360° in azimuth, omni-directional out to a range of 2,930 km (32,000 yards). The receiver consists of seven subsystems:

(1) Preamplifiers/Beam Forming
(2) Fine Tracking Receiver
(3) Passive System
(4) Signal Conditioning
(5) Signal Processing
(6) Signal Combining
(7) Searchlight Audio

The Preamplifier/Beam Forming subsystem produces 36 pairs of split beams which are then conected to give thirty-six 10° beams covering the 360° azimuth.

Search Receiver

Omni-directional search is obtained by 36 channels each connected to one of the preformed beam outputs. After processing through subsystems 4, 5 and 6 these channels provide the inputs to the PPI, Range, and Doppler displays. During this processing an input is provided for the ship's log information to be fed into the ODN (Own Doppler Nullification) circuits. ODN compensation is +40 knots. Coverage for ∓40 knots of target doppler is provided in the signal processing by a bank of 16 matched filters per channel. After detection in the signal processing there are now 576 (16 × 36) channel outputs which must be presented in a form which can be monitored by a single operator. This is done in subsystem No. 6 by the use of OR-gates providing inputs for Range and Doppler, and PPI Displays

At target range the search receiver produces a 10° arc on the PPI corresponding to the 10° beam in which the target lies which gives the approximate target bearing. An experienced operator can further narrow the bearing to within 2° to 3° by examining and correlating the adjacent 10° sectors for a weak echo coming on the skirts of these beams. For fire control purposes the bearing must be further refined. This refinement is obtained from the Fine Tracking Receiver which is a searchlight channel which can be steered by electronic switches to the sector of interest. It connects the half-beam points of a particular beam from the Beam Forming Subsystem and uses the difference in time-of-arrival of the echo wave between these points to obtain an interpolation of bearing angle within the 10-degree beam. A threshold is preset for the amplitude of the echo above background noise to maintain a bearing accuracy of 1° rms. When used with a digital computer (Command and Control System) the Fine Tracking Receiver can be steered by the computer to provide accurate bearing information on as many as six targets at the same time with a single operator.

A steerable searchlight audio subsystem is connected by an electronic switch after the ODN stage enabling any channel to be selected by means of the cursor bearing control.

Two passive channels are provided, a Scanned Passive channel giving 360° surveillance, and a Steered Passive channel directed by means of the cursor bearing control to any of the thirty-six 10° beams.

All receiver systems operate simultaneously without mutual interference or loss of displayed information except when the 'ASPECT' mode is used.

Built-in test equipment is provided to measure Sonar self-noise level in individual receiver beams, to check performance semi-automatically of all receiver systems, and to permit fault location down to the replaceable printed circuit board or module.

Control and Indicator Group

The control and Indicator Group is made up of three sections.

The Generator Indicator, which forms the left-hand wing of the operator's console, contains timing function generation circuits for the sonar, the waveform generation circuits for the displays and the passive sonar display.

The Sonar Primary Indicator is located in the centre of the console, and contains the PPI Display and the 'A' Scan Range and Doppler Display. When a computer is used it provides the sonar/computer link. The ball tab and computer or target entry buttons allow the operator to insert information into the computer or fire control systems, while at the same time the digital PPI permits data from the computer to be superimposed on the raw sonar video. The cursor is multiplexed with the video and can therefore be present on the display at any time without interfering with the presentation of the sonar or computer produced information.

The right-hand wing of the console contains the Sonar Transmission Control. This unit generates the waveforms which drive the transmitter, and contains the controls necessary for selection of the various modes of operation.

Features of the Control and Indicator Group are:

(1) Stabilised PPI display, relative to North, with stern marker to aid in orientation.
(2) Choice of ship centered or offset PPI display to facilitate surveillance of a particular sector.
(3) Separate CRT for display of range and doppler information.
(4) Five-ping history A-Scan Range display. The use of an off-tube storage facility provides a continuous and unflickering display of the returns from the latest five consecutive transmissions, which then permits effective correlation for target detection and verification.
(5) Cursor controlled doppler display. Continuously updated omni-directional doppler information from the receiver is stored in an off-tube memory, but only the doppler information −230 to +230 metres on each side of the range cursors is displayed, thus automatically correlating the doppler information with the target being tracked by the operator.
(6) ASPECT display. The CRT normally used for the A-Scan Range and Doppler display is used to display ASPECT returns as an aid in classification and to provide more accurate target doppler information.
(7) Continuous Memory Passive Display. By the use of an off-tube storage facility, a continual presentation is given on a separate CRT of the latest 7.5 minutes of receiver output. This facilitates the detection of any persistent underwater noise source.
(8) Active/Steered Audio. An audio channel output may be steered in parallel with the range and bearing cursor to aid in target classification. Outputs are provided for loud speakers and head sets.
(9) Passive Audio. A passive audio output scans the 36 preformed beams once every four seconds. Outputs are provided for loud speakers and head sets.
(10) Digital Readouts for Range and Bearing. The cursor range and bearing settings are continuously displayed in digital form, aiding the operator with a quick visual reference.
(11) Display of Ship's Course and Speed. A continual digital readout is provided for own ship's course, and a dial indicator shows ship's speed.

Optional Equipment

Additional electronic systems components are available for training purposes and for ships equipped with computer aided command and control systems.

(1) A Sonar Remote Indicator, which can be installed in the operations room of the ship, displays sonar and other related tactical information which is received from the sonar primary indicator and the computer.
(2) A Sonar Auxiliary Unit, which normally is located in the sonar control room, houses the following units in its single cabinet:
  (a) A Sonar Signal Injector provides simulated active and passive target signals for training purposes.
  (b) An Analogue Data Recorder Reproducer allows signals entering the Control and Indicator Group to be recorded and reproduced later for test or training purposes. It can also provide background noise and reverberation for combination with simulated target signals from the Sonar Signal Injector.
  (c) A Digital Level Converter provides the interface between the computer and the sonar equipment.
  (d) An Electronic Marker Generator provides the symbols required for presentation on the Sonar Primary Indicator and Sonar Remote Indicator displays.

STATUS:

In service with the Canadian Maritime Forces. Scheduled for service in Royal Netherlands Navy and Belgian Navy.

MANUFACTURER:

Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario, Canada, L8N 3K2.

1636.453

HS-1000 SERIES SONAR

DESCRIPTION:

The HS-1000 Series Sonar is a family of lightweight omni-directional anti-submarine sonars which have been designed and developed to give small naval vessels a modern lightweight sonar system having a significant search and attack capability.

The HS-1000 Series Sonar includes:

(1) HS-1001: Variable Depth Sonar (VDS) for ASW vessels down to 250 tons.
(2) HS-1002: Hull-Mounted (HM) sonar for ASW vessels down to 100 tons.
(3) HS-1001/2: VDS/HM Sonar with single electronics and transfer switch for ASW vessels down to 250 tons.
(4) HS 1003: VDS Sonar for ASW vessels down to 100 tons.
(5) HS-1002/3: HM/VDS Sonar with single electronics and transfer switch for ASW vessels down to 100 tons.
(6) HS-1007: Medium-sized VDS or HM Sonar of the HS-1000 Series which features higher power for ASW vessels down to 250 tons.
(7) HS-1007/7: VDS/HM Sonar with single electronics and transfer switch for ASW vessels down to 250 tons.

Note: The size of vessels quoted herein specifies the ASW role. However, the physical parameters of this family of sonars make them well suited for naval vessels which are multi-purpose or have ASW as a secondary role.

They provide a digital display of target range and bearing information for use with an anti-submarine weapon e.g. torpedo, missile, projectile, rocket, helicopter, etc. Where a computer or data system is also fitted, this target information may be entered in a digital or analogue form by depressing the target entry button.

Systems are available with either a hull mounted (HM) or variable depth towed (VDS) transducer subsystem. The hull mounted transducer subsystem can be supplied with either a fixed or retractable sonar dome. A single set of electronics can be installed on a ship fitted with both a hull mounted and VDS transducer subsystem. By the use of a transfer switch, the sonar operator can employ either of the transducer subsystems.

Hull Mounted (HM) Transducer Subsystem:

The sonar dome supplied with the HS-1000 series sonar uses an acoustic window of double-walled stainless steel construction. This is matched to the transmission frequency and is acoustically isolated from the ship. The HS-1000 series sonar system offers either a fixed sonar dome or for larger ships a retractable sonar dome. Either a vertical retracting mechanism or a rotating type of mechanism is available.

The rotating type of retracting mechanism has the advantage that in the retracted position it presents a surface which conforms to the ship's hull, thereby significantly reducing drag. Also, all actuators on the rotating type of retracting mechanism are inboard of the sea chest, thus eliminating the severe corrosion problem presented by contact with sea water.

Variable Depth Transducer (VDS) Subsystem:

The towed body used with the HS-1000 series sonar is a body of a new type. The acoustic window is fabricated from stretch formed stainless steel. The body contains both heading and depth sensor, and the transducer is easily removed for servicing.

The towing cable is approximately 2 cm in diameter and has 61 electrical conductors. Gapless type fairing reduces the overall drag on the ship to approximately 2,700 kg at a speed of 30 knots with 100 metres of cable out. The towing system, including the towed body, faired cable (330 ft or 100 m), winch, and launching gear is approximately 10,000 lbs (4,500 kg) and it occupies approximately 108 sq ft (10 sq metres) of deck space. The system bolts flush to the ship's deck and transom, and does not require any "cut-out" in the vessel's stern section. Normal launch and recovery speeds are eight to twelve knots in a sea state three. The maximum towing speed is about 36 knots.

Display:

The display which is digitally generated is presented on a 12 inch (30 cm) PPI. The range scales are selectable, and sound velocity correction is provided in 10 m per second steps from 1,400 metres per second to 1,550 metres per second. The display stabilisation can be selected to be either relative to true North or relative to ship's head. Digital range and bearing readouts are provided. The cursor is electronic, and is multiplexed with the video. This provides a cursor that is present at all times and can be moved at any time without disturbing the video presentation. Cursor control is effected by means of an R.O ball-tracker Target data outputs can be provided, if required, for interfacing with a fire control system. A target entry button is provided to make the data transfer.

Electronics Cabinet:

The electronics cabinet contains all the circuitry associated with sonar operation. The upper two drawers contain the receiver circuits. The centre drawer contains the display, operator's controls and transmitter control circuitry. Immediately below the display is the drawer containing the transmitter power output modules. The bottom drawer contains the power supplies for the electronics, and the energy storage system for the transmitter.

In the accompanying picture the Integrated Test Equipment (ITE) is shown mounted on top of the main electronics cabinet. The ITE unit is removable for locating it in the most convenient position in the sonar room. The ITE provides monitoring of the electronics power supplies, continuous check of the transmitter outputs, semi-automatic test of receivers and display, and the ITE self-check. The ITE permits the sonar equipment to be checked for performance and a fault to be detected and readily located to a replaceable module or printed circuit board with a minimum of skill and training for the operator. Also available to the operator is an overall quick check of the receivers and display. When the O/A Test switch on the control console is depressed signals are injected into the front end of the receivers at the preformed beams and if the receivers and display are functioning properly the appropriate pattern will appear on the PPI.

The Interface and Transfer unit houses the transfer switch used with the VDS/HM configuration. It also contains the tuning circuits to match the sonar electronics to the various cable lengths and transducers. Other circuits in this unit interface the sonar electronics to inputs such as ship's heading and ship's log and outputs such as fire control data. This arrangement not only offers flexibility in interfacing with various ship's systems but also isolates the sonar system from the ship.

Dimensions:

Main Cabinet: Width 25 in (63 cm). Depth 41 in (104 cm). Height 67 in (170 cm). Weight 905 lbs (411 kg).

Integrated Test Equipment: Width 25 in (63 cm). Depth 30 in (76 cm). Height 13 in (33 cm). Weight 89 lbs (40 kg).

Interface and Transfer Unit: Width 24 in (61 cm). Depth 10 in (VLT CM). Height 24 in (61 cm). Weight 69 lbs (31 kg).

HS-1007 Sonar:

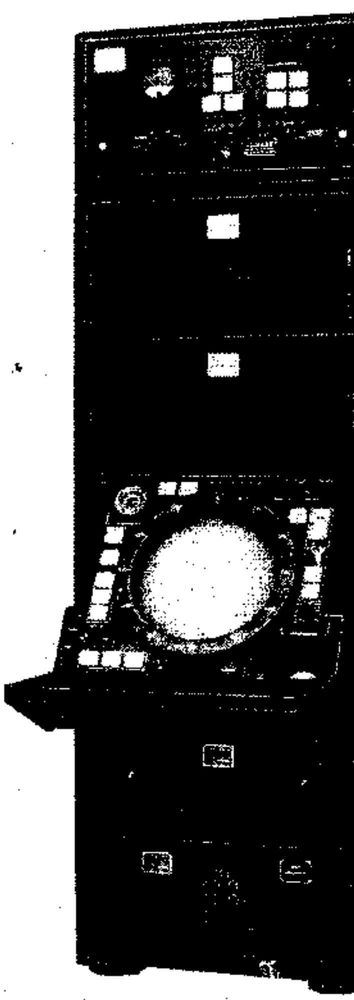
The HS-1007 is a medium sized sonar which utilizes the receivers, display, transducer, HM subsystem, and VDS subsystem of the HS-1000 Series. The transmitter and transmitter power supply are replaced with more powerful units so that four times (omnimode) and twenty times (TRDT mode) more sonar energy is transmitted into the medium. The electronics of the HS-1007 consists of three main cabinets, the receiver/display and control cabinet, the transmitter cabinet, and the transmitter power supply cabinet. The first cabinet has the same dimensions as previously but now weighs 700 lbs (318 kg). Dimensions of the later two cabinets are:

Transmitter: Width 25 in (63 cm). Depth 25 in (63 cm). Height 68 in (173 cm). Weight 850 lbs (386 kg).

Transmitter Power Supply: Width 25 in (63 cm). Depth 25 in (63 cm). Height 68 in (173 cm) Weight 1100 lbs (500 kg).

HS-1003 Sonar:

The HS-1003 Sonar has been introduced to provide small ships down to 100 tons with a VDS capability. The HS-1003 towing and handling equipment, including towed body and faired cable (200 m) weighs 5000 lbs (2270 kg) and occupies approximately 38 sq ft (3.5 sq metres) of deck area. The HS-1003 uses a 12 channel version of the HS-1000 Series electronics.



HS-1001/2 Display/Control console and electronics cabinet, with ITE at top

DEVELOPMENT:

Development of the HS-1000 series sonar commenced in June of 1970 as a jointly sponsored programme with contributions being made both by the company and the Canadian Government. The first prototype unit was completed in December of 1971. Sea trials of this first system were completed in the Autumn of 1972.

STATUS:

The HS-1000 series sonar is in current production and is on order for the West German Navy and one other, believed to be that of a Scandinavian nation. Deliveries had commenced in early 1972. Production is expected to continue into the 1980s. Both HS-1001/2 combined HM/VDS and HS-1001 VDS systems have been ordered.

MANUFACTURER:

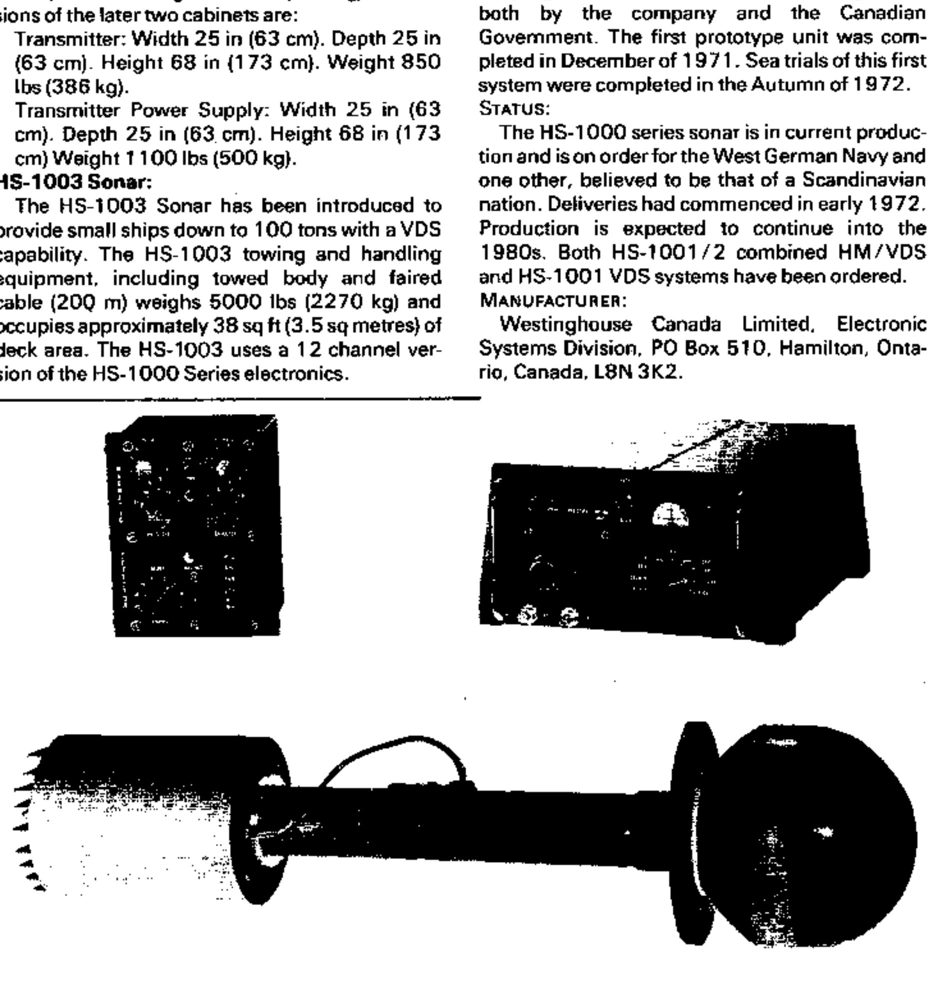
Westinghouse Canada Limited, Electronic Systems Division, PO Box 510, Hamilton, Ontario, Canada, L8N 3K2.

1386.353
ASQ-501 MAGNETIC ANOMALY DETECTOR

DESCRIPTION:

The AN/ASQ-501 Magnetic Anomaly Detector (MAD) is a sensitive magnetometer system developed for airborne submarine detection roles. A basic sensitivity of 0.01 gamma is claimed for this equipment, which has a total system weight of 15.88 kg.

In place of the multiple cell detection method more generally adopted, the ASQ-501 employs a single oriented caesium cell as the principal element. It is an optically pumped system, but the unwanted rotational or heading error effects which are normally minimised by the multi-cell technique, are counteracted in the ASQ-501 by orienting the single caesium cell on a mechanical



CAE electronics AN/ASQ-501 magnetic anomaly detector equipment

gimbal system. This, combined with an inherently stable self-oscillator caesium sensor loop and a low-noise, infinite dynamic range, frequency-to voltage converter, is claimed to yield the most sensitive airborne magnetometer available.
Sensitivity: 0.01 gamma (10.7 Oersteds)
Detecting Head Figure of Merit: 0.24 gamma
Detector: Single oriented caesium cell, optically-pumped self oscillator
Operating Range: 0.20 to 0.70 Oersteds
Larmour Output (Total Field): 27.984 Hz/gamma
Analogue Output No. 1 (Minimally Filtered): 105 mV/gamma
Analogue Output No. 2: 15.0V p-p fsd
FSD Sensitivities: 40, 20, 10, 4, 2, 1, 0, 0.4, 0.2 gamma
HP Filter: 0.04, 0.06, 0.1, 0.15, 0.3 Hz
LP Filter: 0.4, 0.8, 1.2, 1.6 Hz
Military Specifications Compliance: Satisfies MIL-E-5400
Operating Temperature Range: −54°C to +71°C
Storage Temperature Range: −62°C to +85°C
Power requirements: 115 Vac 400 Hz, 3 ph, 120 VA 28 V(ac or dc), 10 VA for Panel Lamps only
Specified reliability: MTBF 1000 Hours

DEVELOPMENT:
The oriented single-cell technique was developed by the Canadian National Aeronautical Establishment. Early models were first flown in 1968, and in 1970 a development model began operational evaluation tests in a Canadian Forces' CHSS 2 helicopter.

STATUS:
Service Test models have been delivered and successfully evaluated by the Royal Navy for use on the RN WG-13, Lynx helicopter. Successful evaluation has also been completed by the RAF on the Nimrod, and by the Canadian Forces on the National Aeronautical Establishment MAD aircraft, with a view to application on the projected Canadian Long Range Patrol Aircraft.

MANUFACTURER:
CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal, 379 PQ, Canada.

1388.393
ASA-65 9-TERM COMPENSATOR

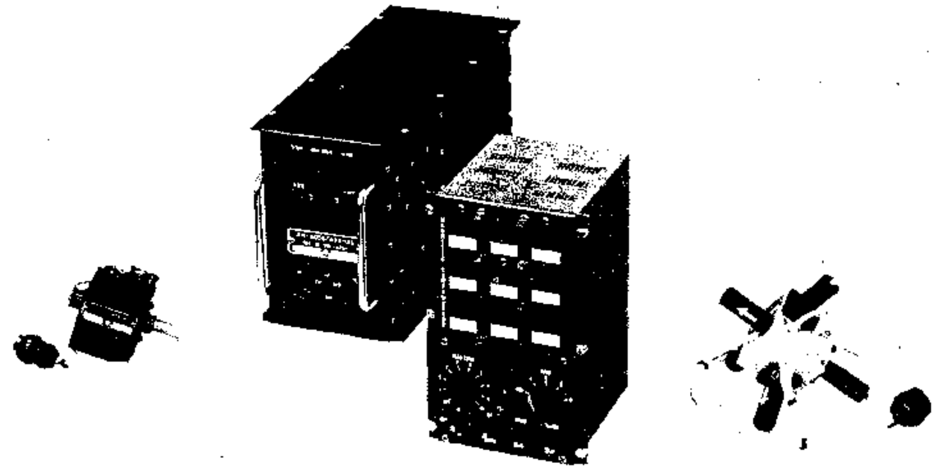
DESCRIPTION
The ASA-65 is an advanced compensator which was developed to eliminate interference from all permanent, induced and eddy-current field sources.

Before the development of the ASA-65, induced and eddy-current fields were compensated for by the design of fixed permalloy strip configurations mounted near the MAD detector, and by fixed coils also installed close to the detector. The strips and coils were designed to create equal and opposite induced and eddy-current fields to those generated by the aircraft. These fixed compensators require custom design for each aircraft type, involving lengthy experimental flying, and do not cater for changes in induced and eddy-current sources during the life of the aircraft. Also they require close tolerance hardware to be installed close to the MAD detector, normally in the non-magnetic MAD boom. Furthermore, fixed compensation systems are not capable of providing adequate compensation levels for new, more sensitive, MAD systems. The ASA-65 has the following advantages:

The CAE 9 Term Compensator (AN/ASA-65) provides automatic compensation for aircraft-generated manoeuvre interference signals.

By minimizing unwanted interference signals, it substantially improves MAD detection range, especially during tactical and turbulent flight conditions.

This equipment compensates all significant permanent, induced and eddy-current interference fields in approximately 30 to 45 minutes. Permanent terms can be trimmed up on each flight in about five minutes, compared to close to one hour for manual compensation systems.



ASA-65 9-Term Compensator for MAD equipment

The automatic nature of the ASA-65 together with simple operating procedures, eliminates the requirements for specialized operator training. Comprehensive tests have shown that experience is not a necessity in achieving satisfactory compensation levels.

The ASA-65 is compatible with all existing magnetometer systems in present use. Accommodation for the varying compensation requirements of different aircraft type is conveniently accomplished by means of internal patch connectors.

The equipment is designed to satisfy the requirements of applicable military specifications, and using state-of-the-art techniques has a demonstrated M.T.B.F. of more than 1,000 hours. The use of completely solid-state circuitry has resulted in a total system weight of less than 13.6 kg.

The compensation figure of merit is stated to be consistently less than one gamma, and the equipment is capable of accommodating maximum compensation fields of 50 gamma on each of the aircraft axes.

STATUS:
Production quantities have been manufactured and delivered to the RAF for the HS.801 Nimrod maritime aircraft, and the ASA-65 is also being delivered for USN P-3C Orion aircraft and S-3A Viking.

MANUFACTURER:
CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal 379, PQ, Canada.

PAP 104 MINE DISPOSAL WEAPON

DESCRIPTION:
The PAP 104 system has been developed as a means of remotely placing a mine disposal charge alongside a mine which has previously been located by means of a mine-hunting sonar. It consists basically of four main parts, a wire-guided submersible vehicle which carries the destruction charge and is equipped with a TV camera, a control console, TV monitor and remote control box, the last three items being located on the carrier vessel. Overall dimensions of the submersible are: length 2.7 m, width 1.2 m, height 1.3 m, and weight 700 kg (inclusive of explosive charge). Operating range is 500 metres at depths of 300 m or less, and battery life is two hours at 3 knots. The maximum speed is 5.5 knots.

DEVELOPMENT:
Development of the PAP system was carried out by Direction Technique des Constructions Navales, Groupe d'Etudes Sous-Marines de l'Atlantique in collaboration with Société Eca.

STATUS:
In service with the French Navy. The Navies of Belgium, Britain, West Germany and the Netherlands have decided to equip their mine sweepers and contracts have been placed by Belgium and Holland, with the other two nations expected to conclude negotiations soon.

MANUFACTURER:
ECA, Société Etudes et Constructions Aeronautiques, 17 Avenue du Chateau, BP 16, 92190-Meudon, France.

1159.253
DUBV-23D SURFACE VESSEL SONAR

DESCRIPTION:
The DUBV-23D is a bow-mounted, low-frequency, panoramic sonar for anti-submarine operations. The 48-column transducer array is housed in a bulb at the forepart of the ship, the bulb being of streamlined design to reduce parasitic noises to permit listening at high speeds. The panoramic sonar is intended for both search and attack roles.

In addition to the transducer array, the equipment includes the transmitter/receiver unit, a computer section for the processing of data being fed to weapons, and control and display consoles at the anti-submarine attack station.

The DUBV-23 is of identical design to the towed sonar, DUBV-43, described in Entry No. **1334.253**, and in French vessels the two sonars are used together for anti-submarine warfare.

OPERATION:
Operating modes provide for: panoramic surveillance, sector surveillance, step surveillance, passive surveillance at sonar frequency, panoramic attack transmission, or 'search-light' attack transmission. In addition to the system's own display devices, the DUBV 23D provides for target data outputs to other ship's systems and repeater PPIs.

The following notes refer to combined use of the DUBV-23 and DUBV-43 sonars. Advantages claimed for this method are:

(1) The attack and target data processing section of the DUBV-23 can be connected to the towed sonar by remote control, which provides for control of weapons by the sonar giving best results.

(2) The simultaneous use of a hull transducer and a towed transducer, whose depth can be selected within the limits of 10 to about 200 metres, considerably increases the sound volume and correspondingly limits the chances of attack

by conventional submarines.

(3) The use of a towed transducer array offers a significant measure of protection against performance degradation due to sea-state effects.

(4) It is possible to attack a target whilst continuing surveillance.

(5) Deep submersion of the DUBV-43 sonar permits a doubling of transmitter power, with an appropriate increase in detection range.

Four modes of operation are possible:

INDEPENDENT: The two sonars are completely independent except for reciprocal connections for audio and video sensitivity control during transmission. This mode is normally employed only when one sonar is defective.

23SYN: In this mode the transmissions of the two sonars are synchronised, using the same or different frequencies, with the DUBV-23 as the master. The hull sonar is for attack, and the towed sonar for surveillance.

43 SYN: This mode is identical to the preceding mode, but with the towed sonar as master.

43 ATT: This mode is divided into two phases: The first, Delayed 43 ATT, is a preparatory stage for effecting certain remote switching operations, and the second, Standby 43 ATT, permits processing of data from the towed sonar and its transmission to the weapons via the Attack section of the DUBV-23 sonar. In this mode the attack section of the DUBV-23 and the DUBV-43 must use the same frequency. However, the surveillance section of the DUBV-23 can, if necessary, be operated on a frequency different from that assigned to the DUBV-43.

CHARACTERISTICS:

Transmitter:

Frequencies: 4 operating frequencies in the neighbourhood of 5kHz, of which two are operational

Power: 96 kW (2 × 8 kW)

Type: FF (fixed frequency), FM (linear frequency modulation with non-coherent data processing at reception)

Duration: 4, 30, 150 or 700 ms

Scatter echo: With or without rejection

Doppler effect correction: On all 48 channels

Cadence: Adjustable step by step from 1,500 to 48,000 yards

Receiver: Panoramic, directional, passive listening in sonar band

STATUS:

Quantity production. The equipment is in service with the French Forces.

MANUFACTURER:

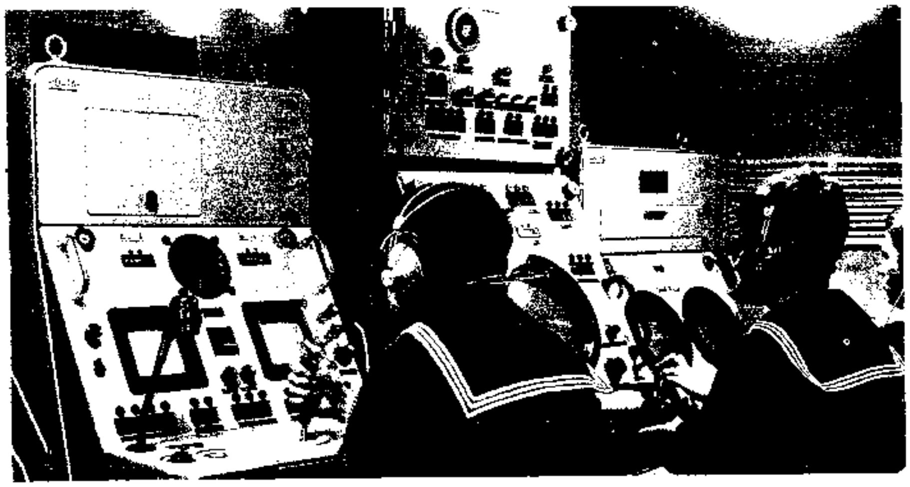
CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1334.453
DUBV-43B VARIABLE DEPTH SONAR

DESCRIPTION:

The DUBV-43B variable depth sonar consists of a streamlined towed body called the 'fish', containing the sonar transducer array. This is towed from the rear of the parent vessel at distances of up to 250 metres and can be set to run at depths between 10 and 200 metres. It is equipped with stabilisers providing for control in roll, pitch and depth. An attack version of the system is also provided with a gyro-compass. Dimensions of the 'fish' are: length 550 cms, width 170 cms, and submerged weight 7.75 tonnes. The towing cable also incorporates 48 pairs of signal conductors. The range of towing speeds is 4 to 24 knots, and detection ranges of up to 25 km are quoted. The DUBV-43B is identical to the DUBV-24C sonar (Entry No. **1217.253**) except for the transducer array, which in the DUBV-24C is in a hull-mounted sonar dome, while the DUBV-43B array is towed. The increased operating depth of the latter permits an increase in radiated power to 96 kW.

The transducer array is 1 metre in diameter and 1.2 metres high. It consists of 24 vertical 'staves' of 8 transducers to give a total of 192 elements.



The DUBV-43 Sonar Control Console

STATUS:

The DUBV-43 is in service with six recently converted anti-submarine escorts (Types T47 and T56) of the French Navy and is to be fitted to the Type C67A series of corvettes.

MANUFACTURERS:

Direction Technique des Constructions Navales, 2 rue Royale, Paris 8, France.

CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1162.453
DUUX-2 A/B/C PASSIVE SONAR

DESCRIPTION:

The DUUX-2 is a passive listening device for submarine noises. It enables a submerged submarine to determine, on the basis of signals received by either base (port and starboard) the bearing and range of a submerged noise source (Surface vessel or other submarine) while maintaining complete secrecy.

There are three versions, details of which appeared in the 1970-71 Jane's Weapon Systems.

STATUS:

Version A: Quantity production.

Version B and C: Preliminary production. Version A is in service with the French Forces. Version B is to be adopted by French Forces, and Version C is to be adopted by German Forces.

MANUFACTURER:

CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1356.453
THOMSON-CSF PASSIVE SONAR

DESCRIPTION:

This is a recent development by the Thomson-CSF company and no official designation and few details have so far been obtained. It is intended for use in submarines of most sizes to provide for the detection and location of surface anti-submarine vessels. It may also be used in conjunction with an active sonar, or a microphone array, and there is provision for integration in an action information and torpedo fire control system. Digital techniques are employed. No further details can yet be revealed.

MANUFACTURER:

Thomson-CSF, France.

1217.253
SONAR DUBV-24C

DESCRIPTION.

The DUBV-24C is a low frequency, preformed channel panoramic sonar designed for search and attack. According to the ASW weapons systems carried on board, the DUBV-24C sonar can be used either alone or in combination with a searchlight attack sonar, or with a passive sonar. It can operate on four different frequencies.

A novel feature of the DUBV-24C is its use of "preformed beams". In conventional sonar systems, the hydrophones are scanned at a rate prohibiting complete echo signal reception, the receiver input being collected by sampling from each transducer by a continuously rotating switch. This sampling process greatly reduces the recognition differential which is proportional to echo length. In the DUBV-24C sonar, the signals originating from the staves of the transducer are electronically formed in beams, and these channels are then processed for maximum improvement of the signal-to-noise ratio. For the same purpose, switching takes place after detection.

To give a simple analogy, this technique is equivalent to providing an all-round watch by using a large number of observers, each watching a sector, instead of having a single observer slowly scanning the complete horizon. The "preformed beams" technology gives the DUBV 24C sonar a very high figure of merit, as compared with other types of sonar systems. The data displayed on the cathode ray tubes and checked by the operator are fed to a computer which transmits processed co-ordinates to the ASW fire control system.

The DUBV-24C SONAR includes:

An ultrasonic transducer protected by a dome which is attached under the hull by hinges parallel to the roll axis of the ship; the transducer drum has 24 vertical staves, with 8 elements in each stave.

A transmitter-receiver which handles the elaborate signal processing of the sonar. this equipment is contained in several cabinets due to its multiple functions and to the large number of channels processed, it is normally located below decks, close to the sonar dome. Signal processing circuits are fully transistorised. This assembly includes a special-purpose computer to provide processed data for the ASW fire control equipment.

Display and control units located in the ASW control room and on the bridge.

Test and training facilities.

The DUBV-24C sonar allows several modes of operation for search or attack, according to bathythermal and tactical conditions.

There are 4 search and 2 attack procedures

1. **Omnidirectional transmission / reception (search).**
   Used particularly in limited range bathythermal conditions. Audio-reception in six sectors
2. **Triple beam (three-ping) transmission/ re-**

ception (search).
Used in long range bathythermal conditions.
Transmission with a triple rotating beam (three searchlight beams).
Omnidirectional reception.
Audio-reception also possible.

3. **Stopped triple-beam transmission/reception (search).**
Similar to the three-ping mode, but with automatic beam stepping.
Audio-reception also possible.

4. **Searchlight attack transmission/reception (attack).**
Simultaneous transmission on three beams at 120° interval.
Bearing controlled by operator.
Accurate bearing and range read on a Target Area bearing deviation Indicator Approximate doppler on an Analyser Indicator scope.

5. **Omnidirectional attack transmission/reception (attack)**
This operating mode allows accurate determination of a rapidly moving target, particularly at close range.
Transmission similar to that used in the omnidirectional t/r mode.
Reception as in directional attack t/r (bearing deviation indicator).
Audio-reception and plotting on a range recorder fed with the audio-signal.

6. **Passive listening (search)**
No transmitting.
All-round reception with automatic sensitivity adjustment according to the average noise in all directions.

DUBV-24C Characteristics:

Transmitter:
Frequencies: 4 operating frequencies in the neighbourhood of 5 kHz, of which two are operational
Power: 48 kW (2 × 24 kW)
Type: FF (fixed frequency) and FM (linear frequency modulation with non-coherent data processing at reception)
Duration: 5, 30, 150, 94 700 ms
Cadence: Adjustable without detection from 3,000 to 48,000 yards (9 scales)
Scatter echo: With or without rejection
Doppler effect correction: On all 24 channels
Receiver: Panoramic, Directional, Passive monitoring in sonar band

MANUFACTURER:
CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1633.253
PASCAL SONAR

DESCRIPTION:
The Pascal Sonar is intended for use on small and medium-tonnage vessels for both surveillance and tracking functions. There are two versions, a hull-mounted type, and a combined hull/towed model. There are three components to the system: a panoramic transducer array of 24 columns, transmitter console, and receiver display console.
Visual presentation of data provisions include a PPI scanning display, a range-plotting interval display on an enlarged screen, and estimated target vector display by 'hodograph' tube. Acoustic data presentation arrangements allow for either headphone or loudspeaker listening. Target data outputs are available for transmission to other ships systems.
Operational modes include (1) passive surveillance on a plotted channel in a ± 500 Hz band in the region of a display frequency between 2.5 and 15 kHz; (2) panoramic preformed channel data processing with doppler, filtering, and detection, integrated on all 24 channels; and (3) coherent data processing in FM mode on plotted channel. There is also a training mode.

Pascal Characteristics:
Transmitter:
Operating frequencies: 10 and 11.5 kHz
Power 5 kW, duration: 25 and 100 ms
Transmission mode: TFF and TFF in FF and TFF in FM
Repeat cadence: 4-8-16 or 32 s

Receiver:
Pass band: ± 200 Hz in the neighbourhood of 10 or 11.5 kHz after Doppler correction
Range scale: 3, 6, 12, 24 km
Channel or column noise measurement accuracy: ± 1 db. measurement of radical component by automatic extraction to ± 2 N.
Determination of oscillation in range and azimuth.
Automatic testing by injection of calibrated echoes

STATUS:
At prototype stage in mid-1972.

MANUFACTURER:
CIT-ALCATEL Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1634.453
DUUA-2A SONAR

DESCRIPTION:
The DUUA-2A sonar is fitted to modernised Daphne class submarines and a number of "1200-tonnes" submarines, and provides for simultaneous surveillance and attack. It can be used,
(1) for active detection in single, (FP) or frequency modulation (FM) modes,
(2) for passive detection,
(3) as an interceptor, ie location of a sonar source.
The DUUA-2A may also be used for ultrasonic communications purposes and for depth sounding in very deep water.

DUUA-2A Characteristics:
Transmitter: Frequency 8.4 kHz
Power: 30 kW in normal operation, and in 1.5 kW in reduced operation, SGF and IC;
Each emission is manually triggered;
Emission duration 30 ms in SFG; 300 ms in FP; 500 ms in FM
Receiver:
Pass band: ± 170 Hz in FP, ± 350 Hz in FM in the neighbourhood of 8.4 kHz, and ± 500 Hz in EBM in the neighbourhood of a selected frequency between 2.5 and 15 kHz
Range scale in active mode: 3, 6, 12 and 24 km
Transducer: Directional, made of 8 88T 8.5 elements, driven by servo mechanism MSS 5 directivity or site and bearing $2\ \theta_3 = 10°$ at 8.5 kHz. Manual orientation by crank on azimuth or automatic orientation at 4 or 8°/s from −175 to +175° on bearing. Reset between stops at 60°/s. Site positioning from +15° to −30°

STATUS
In production.

MANUFACTURERS:
The transducer assembly is provided by the French Navy.
The transmitter console is produced by Thomson C.S.F.
The remainder of the system is produced by CIT-ALCATEL.

1631.353
HS-71/DUAV-4 HELICOPTER SONAR

DESCRIPTION:
The HS-71 is an active/passive sonar designed for submarine surveillance and location (azimuth, distance and radial speed). It is specially designed for use on board light, versatile, ship-based helicopters of which the WG13 Lynx is a typical example.
The HS-71 differs from conventional sonar in its signal processing system which is designed to give improved detection, especially in severe reverberation conditions such as shallow waters. The sonar can be operated in either the active or passive mode, true bearing, range and radial speed are measured in the former mode, true bearing only in the passive mode.
A combined display unit permits surveillance display (initial detection) or plotting display (precise azimuth determination). Total weight (including electronic rack, winch, cable and dome) −250 kg.

STATUS:
The HS-71 is used by the French Navy under the designation DUAV-4. In series production.

MANUFACTURER:
CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Céder 15, France.

1067.453
SONOBUOYS TYPES DSTA3 AND DSTV 2K

DESCRIPTION:
Two types of sonar buoys, DSTA 3 and DSTV 2K, which are dropped from aircraft and used for anti-submarine warfare.
This transistorized equipment has successfully undergone all tests required by the specifications of the French Navy. It is also used by the French Navy Air Force.
The DSTA 3 is an "active" type buoy, which uses a miniaturized active sonar unit for the detection and pinpointing of submarine targets. The position is determined with respect to the buoy. Doppler effect is also exploited to determine the approximate speed of the target. The system also includes:
(1) A UHF telecontrol receiver with several channels, which makes it possible to position the sonar transmitter to "On" or "Off" from the drop aircraft.
(2) A sonar transmitter that sends electric pulses to the hydrophone.
(3) A VHF transmitter which relays the data to the aircraft.
The electric unit is supplied by two cells activated by sea water.
A brake parachute slows the fall and stabilizes the buoy. Impact with the water begins a sequence which quickly sets the buoy into operational condition.
Dimensions: height 1.50 m, diameter 15 cm; weight 25 kg.
The DSTV 2K is a "passive" buoy. It detects submarine noises which it then transmits via radio to the aircraft or to any listening stations equipped with a suitable receiver. It is made up of the following:
(1) A low frequency amplifier that amplifies the signals received by the hydrophone.
(2) A VHF frequency modulation transmitter for transmitting the signals to the aircraft.
(3) A supply system comprising cells that can be started by sea water.
For greater efficiency, the DSTA 3 can be used with the airborne signal processing equipment, DSAA-4 (Entry **1632.253**, below).

MANUFACTURER:
CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1632.253
ACTIVE BUOY SYSTEM TYPE DSAA-4

DESCRIPTION:

The DSAA-4 system provides for accurate location of a submarine and determination of target components (course speed), and is used in connection with DSTA 3 active buoys and DSTV 2 satellite buoys. The use of coherent signal processing is intended to improve performance in terms of action radius and accuracy of detection, particularly in a reverberant medium (shallow waters). The system permits simultaneous processing of 2 buoys. Sonar signals, displayed on an oscilloscope, are copied and processed by a special calculator feeding the data to a tactical plotter board or display console. The use of DSTV 2 satellite buoys (passive) in combination with DSTA 3 master buoys (active) substantially reduces the cost-efficiency ratio, while providing the system with optimum tactical flexibility during tracking.

The DSAA-4 is intended for ASW patrol-boats and helicopters, and two versions are available for light helicopters:

A) Radio relay buoy-carrying light helicopter: Signal and data processing equipment on board the destroyer.
B) Independent helicopter with integrated data processing. The system is supplemented by a calculator which facilitates the work of the operator and which (a) ensures the initial collection of sonar data to start automatic tracking, and (b) ensures operation of synthetic plotting and attack command. For this purpose, the operator is provided with a single combined plot/sonar console.

STATUS:

In series production.

MANUFACTURER:

CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1719.263
SONAR COVERAGE COMPUTER

DESCRIPTION:

This sonar coverage computer produced by CIT-ALCATEL displays on a CRT the sound beam transmitted by one or two acoustic sources into a medium of given sound velocity profile and bottom depth. The beam pattern which is provided makes it possible to estimate the sonar coverage as a function of the sources' characteristics (depth and beam-width). The sound velocity profile is introduced by manual setting of velocity/depth data that are selected from the available BTs. The equipment includes in two units: (1) a specialized digital computer, and (2) a display (CRT) and control unit.

The electronic computers consist of TTL integrated circuits that ensure high reliability, and avoid the need for adjustment.

The sonar coverage computer is used to aid the solution of various detection, location and classification problems.

On board surface ships it provides information for optimum use of hull-mounted and variable depth sonars, and on board submarines it gives quick visualization of the shadow zones and sonar radiated areas.

In ASW aircraft it can be used to determine the optimum positioning (depth and range) of the available acoustic detection equipments such as sonars or sonobuoys.

The sonar coverage computer may also be of great help in ASW training centres and in laboratories dealing with the design of equipments that exploit or have to face the various problems related to the propagation of sound in the sea.

OPERATION:

Sound Velocity profile:

The profile is approximately a sequence of constant gradients layers, i.e. a sequence of linear segments. The introduced data are the sound speed and depth values at each selected angular point at the junction of two consecutive segments. The data setting is extremely flexible: the values can be changed at any moment and in any order, there are no fixed, predetermined values of sound speed or gradient, and the number of points chosen to determine the profile may take any value between 2 and 12. The only limitation to the data setting is that values leading to gradients greater than 5 m/s/m, in absolute value, should be avoided. In fact, such values are not encountered in the sea.

The sea bottom is considered by the equipment as an horizontal plane whose depth may be chosen at any value up to 8,000 m. The rays reflected by the bottom can be retained, restricted or ignored, according to the position of a switch. A particularly interesting feature is that the sound speed need not be calculated at the bottom depth. The latter is set independently, and the computer calculates the corresponding sound speed from a linear extrapolation of the last two data points above the bottom. The last profile layer is thus extended down to the sea bed, whose depth may then be changed according to the exact location in the working area, without having each time to recalculate the corresponding sound velocity.

Transducer Characteristics:

Variable source:

(a) Depth: set at any value between 0 and 8,000 m with a qualification of 1 m. (b) Beamwidth: set by the switch and direction in degree $\pm$ 1 radian max.

Pre-selected source:

Depth is stable and pre-cabled at 5 metres in order to simulate a hull sonar, and width is the same as that of the variable source.

The sea surface is considered as an horizontal plane. The reflections from the top can be retained or restricted according to the same switch controlling the reflections from the bottom.

Display of the Sound Field:

The cathode ray tube is fitted with a remanent layer type P7. The overall range of the sound field visualized on the CRT can set at: 10-20-40-80 and 160 ky. This setting also determines the extreme range that is considered in the computation. The height of water from the surface visualized on the CRT can be set at 1-2-4 and 8km (independently of the water depth). In addition, a depth magnifier makes it possible to insert a further vertical enlargement of $\times$ 10 so that the sound field displayed on the scope corresponds to the first 100, 200, 400 or 800 m from the surface. The sound field is represented by the ray traces for number of rays inside the beamwidth

The angular interval between rays can be chosen by the operator between the 3 values of 1, 0.5 and 0.1 degrees. This would correspond, for the maximum beam width of 2 radians, to between 114, 228 or 1,140 rays. The 0.1 deg interval setting is specially useful for a visual estimation of the energy distribution inside the sound field.

The sonar computer is fitted with analogue outputs, that can be used for presentation on external equipments. Computation of each ray is fast and depends on the ray curvature and maximum range. As an example, the average duration for the calculation and display of one ray up to 50km is of the order of 5 ms, so that a 30-ray sound field is presented in a nearly continuous manner.

A switch allows selection of the visualization of the field emitted, by either one of the sources, or by both sources.

Graduated scales electronically generated are manually set, and the graduations are: 1 kmand 10kmin range, and 10 m and 100 m, or 100 and 1 km, in depth according to the selected scales. The bathygraph curve can be displayed instead of sound field in order to simplify display and control by the operator.

Technical characteristics:

Manual settings:

Bathy sound speed range: 1400-1600 m/s – quantification 0.1 m/s

Bathy layer interfaces range: 0-8000 – quantification: 1 m

Variable depth source range: 0-8000 m – quantification: 1 m

Bottom depth range: 0-8000 m – quantification: 1 m

Limiting angles range: $\pm$ 1 radian – quantification: 1°

Sonar coverage:

Visualized range: 10-20-40-80-160 ky

Visualized depth: 100-200-400-800 m – 1-2-4-8 km

Ray angular interval: —1, —0.5 and 0.1 degree

MANUFACTURER:

CIT-ALCATEL, Division Marine, 33 rue Emériau, 75725 Paris Cédex 15, France.

1724.253
TSM 2400 SONAR

DESCRIPTION:

The TSM 2400 is a new surface-ship active sonar in development for fitting in 'Aviso' class ships and other similar anti-submarine vessels. Few details have been revealed beyond the fact that it is an 'all-round', active sonar for submarine surveillance and attack operations.

MANUFACTURER:

Thomson-CSF, Division Activités Sous-Marine, 06-Cagnes-sur-Mer, France.

1725.253
DIODON SONAR

DESCRIPTION:

The Diodon is a new sonar for fitting in anti-submarine ships of small or medium tonnage. It is an active all-round system employing digital techniques. The main functions are submarine detection and attack. No other details have been obtained.

MANUFACTURER:

Thomson-CSF, Division Activités Sous-Marine, 06-Cagnes-sur-Mer, France.

1726.453
PIRANHA SONAR: DUBM 41A

DESCRIPTION:

The DUBM 41A system is a high-resolution side-looking sonar system designed for the location and classification of objects, such as mines, lying on the sea-bed. The system consists of three towed sonár vehicles, two consoles, and the necessary cables and shipboards hoists and handling gear. In normal operation two of the three sonar bodies are used, with the third kept as a ready spare. A permanent record of the sonar data gathered is made on a facsimile type recorder. The information also is presented simultaneously on two CRT storage tubes, these console-mounted displays providing an image of the sea-bed. The system is designed for use by low tonnage vessels, and in waters of depths of 60 metres or less. The towed sonars operate at about 5 to 9 metres above the sea-bed at speeds of between 3 and 7 knots. The tow cables are provided with deflector vanes which ensure that the sonar bodies are towed at a distance to left and right of the ship's track, and marker floats are provided to indicate the line of travel for each sonar.

The sonar body is a streamlined vehicle fitted with the side-looking sonars, plus an additional sonar array for determining height above sea-bed and for obstacle detection. Servo-controlled fins are provided for depth control and roll stabilisation is incorporated by means of a separate set of four fins. Dimensions of each sonar vehicle are: length 3.725 m, diameter 36 cm, in-air weight 340 kg. Each body has two side looking sonar arrays for the sea-bed scanning, and a group of three directional sensors in the nose. The latter are pointed horizontally, vertically, and at an oblique downward angle ahead. The first of these is for obstacle detection, while the other two provide data for servo control of the depth of the body. The body also contains a case of ten NUPR 1A acoustic markers which can be released by remote control to designate an object or selected position. A separate marker is installed as an aid to recovery should the sonar body break its tow. Manual controls are provided at the operating console to permit manual piloting, either to override automatic control or as a standby mode.

Each of the two sonar bodies operates on its own frequency, the two being separated by 50 kHz, with the area of sea-bed between the two bodies being scanned by both sonars. A typical scanned area covered by the two bodies amounts to a total width of about 200 metres, with maximum sonar range selected. This is 75 m, and there are two other range settings, 50 m and 25 m. At the latter setting, resolution is stated to be better than 10 cm in both the lateral (scan) direction and in the line of travel.

DEVELOPMENT:
Development of the DUBM-41A was conducted in collaboration by the Guerre des Mines de la Marine Francaise (GESMA) and Thomson-CSF.

MANUFACTURER:
Thomson CSF, Division Activités Sous-Marine, 06 Cagnes-sur-Mer, France.

1357.253
DUBM 20A MINE HUNTING SONAR

DESCRIPTION:
The DUBM 20A is a mine detection and classification sonar, and consists of an array providing a 70 degree search sector for the detection of mines and a restricted sector for precise location and identification. The acoustic array is housed in a retractable dome and is stabilised in pitch and roll.

MANUFACTURER:
Thomson-CSF, France.

1358.253
DUBM 40 MINE HUNTING SONAR

DESCRIPTION:
The DUBM 40 is a lightweight mine detection sonar intended for use on launches or hydrofoil craft. It is operated in the active mode for the detection and classification of mines on the sea-bed, and in the passive mode for the location of ultrasonic navigational buoys. A single control console provides for operation of the acoustic head which is towed by a special cable system, and is provided with two CRT displays.

MANUFACTURER:
Thomson-CSF, France.

2092.453
HARBOUR PROTECTION EQUIPMENT

The purpose of this equipment is to detect the passage of submarines or other vessels through a harbour entrance or similarly confined sea passage.

The equipment comprises a series of magnetic detection devices, placed in line on the sea bed across the entrance through which the vessels of interest must pass, each connected to a fluxmeter recorder (CDC type FESD 11). The basic detection device consists of two rectangular coils placed, as nearly as possible, horizontally on the sea bed and connected in opposition so as to cancel the effect of disturbances of the earth's magnetic field. The coils are arranged so that the vessel will pass over them in sequence and each pair is connected to a conveniently located fluxmeter that may be up to 10 km away.

Any ferromagnetic hull passing over the coils will give rise to a deflection of the stylus of the recording fluxmeter. This instrument has two recording paper speeds; and when on watch it runs at the lower speed. When a flux variation that exceeds a preset theshold value is detected, the instrument switches to high paper speed and an alarm circuit is engaged. To avoid overload there is provision within the fluxmeter for automatic sensitivity adjustment.

As a refinement, the magnetic deflection system may be supplemented by an acoustic system, an array of hydrophones also being placed across the protected passage and connected to amplifier, speakers and recorders co-located with the fluxmetric recorder.

MANUFACTURER:
Thomson-CSF, Division Activités Sous-Marine, 06-Cagnes-sur-Mer, France.

1389.353
DHAX-1 MAGNETIC ANOMALY DETECTOR

DESCRIPTION:
The type DHAX-1 MAD is designed for use in aircraft for the detection of submerged submarines by detection of the disturbance to the local natural magnetic field caused by their large ferrous bulk. The system comprises three units: a probe containing two caesium vapour paramagnetic resonance cells (this is usually tail-mounted on the aircraft, and weighs 15 kg), an electronics unit weighing 18 kg, and a control unit (3 kg).

The last of these units incorporates a manual test facility for checking correct operation and calibration of the system in flight. Data from the MAD is fed to the aircraft's ASW tactical data system. No performance details, other than a sensitivity of less than one gamma, have been revealed.

STATUS:
The DHAX-1 is fitted in French Atlantic ASW aircraft, and in those of a number of other nations.

MANUFACTURER:
Thomson-CSF, Division Equipements Avioniques et Spatiaux, 178 Boulevard Gabriel Peri, 92-Malakoff, France.

1390.353
DHAX-3 MAGNETIC ANOMALY DETECTOR

DESCRIPTION:
The DHAX-3 is an improved and more modern version of the DHAX-1 MAD equipment (Entry No. **1389.353**), and primarily designed for deployment at the end of a cable from ASW helicopters. In place of the 4-cell detector unit used in the DHAX-1, the DHAX-3 employs six caesium vapour paramagnetic cells, and is stated to have a very low susceptibility to rotational and heading effect.

Weights of the three units which comprise the equipment are: probe – 6.2 kg, electronics unit – 7.5 kg, and control unit 0.8 kg. These figures suggest that the use of solid-state electronics has permitted a system weight of less than half that of the DHAX-1 to be achieved. No performance details have been released.

STATUS:
In service with French Forces.

MANUFACTURER:
Thomson-CSF, Division Equipements Avioniques et Spatiaux, 178 Boulevarde Gabriel Peri, 92-Malakoff, France.

ITALY

1720.453
IP64-MD64 SONARS

DESCRIPTION:
The USEA IP64 sonar set is designed for installation aboard small or medium-size submarines, and it combines a passive sonar equipment and an active echo-ranging sonar. It is also designed for integration with the MD64 sonar set for range measurement of noise sources by passive means. The receiving transducer elements, which are common to the passive and active mode, are arranged in the bow of the vessel in a long conformal array to enhance the directional capabilities. The transmitting transducer elements are arranged in a circular array located on deck.

Search and detection are carried out primarily by means of the passive listening set, which incorporates advanced correlation techniques and records the received signals on a graph plotter. After target detection, a single transmission pulse in the direction of the target by the echo-ranging sonar is sufficient to provide range and relative speed target data.

The MD64 equipment measures the range of a detected noise source by passive means only. The range of a noise source is determined by the measurement of the relative time delay of sound waves detected by three hydrophones. Two groups of three hydrophones each are provided, for port and starboard measurements. Each hydrophone uses a number of elements phased in the horizontal plane to produce a reception beam, directed toward the source. Operation is automatic and after acquisition of the noise source, the equipment locks on and continuous bearing data is produced. Range is measured continuously and is recorded graphically.

MANUFACTURER:
USEA – Via G. Matteotti 63, 19030 Pugliola di Lerici, La Spezia, Italy.

1721.453
B168 SONOBUOY

DESCRIPTION:
The USEA B168 sonobuoy is designed to meet all the operational requirements of Julie/Jezebel ASW tactics. Principal dimensions are length 1,220 mm, diameter 91 mm, weight 8 kg. Other features are long communication range by means of high power and optimisation of the vertical radiation pattern. Operation is possible on twice the number of radio frequency channels normally employed in the band 162.25 to 173.50 MHz. The B168 can be in operation within 15 seconds of release and having reached a maximum depth of 60 metres.

MANUFACTURER:
USEA - Via G. Matteotti 63, 19030 Pugliola di Lerici, La Spezia, Italy.

1722.353
FALCO SUBMARINE LOCATING SYSTEM

DESCRIPTION:

The FALCO system is an airborne equipment designed to increase the capability for helicopters and fixed-wing aircraft to detect, classify and locate submarines. The system operates on the low frequency noise radiated by targets and gathered by directional low frequency passive sonobuoys.

Noise spectral analysis, target data processing and display are performed by a real time digital computer. It is claimed that the FALCO system is able to determine target position, with an accuracy sufficient to carry out an attack with automatic homing torpedoes, and with errors due to sonobuoys drifting automatically cancelled out. The equipment is produced in several versions

MANUFACTURER:

SELENIA Industrie Elettroniche Associate SpA., Via Tiburtina Km 12.400, 00131 Roma, Italy.

1723.453
SERVOMECCANISMI SONOBUOY EQUIPMENT

DESCRIPTION:

The Servomeccanismi organisation produces three types of passive sonobuoy:

BIT-3: This is an A-size omnidirectional passive sonobuoy for use at depths between 20 and 100 metres, with a selectable life of 1 to 3 hours, and transmitting data over a 31-channel, IW link.

BIT 8: This is similar to the BIT-3 but has different frequency/sensitivity characteristics.

BIR: This is a miniature (500 mm long × 100 mm diameter, 3 kg) sonobuoy for use with helicopters. It is omnidirectional and can be deployed at depths to 20 m. Life is one hour.

Receivers for use with these sonobuoys are the REA-16 and REA-31, having 16 and 31 reception channels, respectively.

MANUFACTURER:

Servomeccanismi Ing. E. Olivetti, Via Mediana Km 29.3, 00040 Pomezia, Italy.

THE NETHERLANDS

1525.263
SP1-03 SOUND RAY PATH ANALYSER

DESCRIPTION:

The SP1-03 is a small special-purpose computer-based equipment providing instantaneous prediction of sound ray paths calculated directly from sound velocity over long, medium and short ranges. The equipment comprises two units, indicator and power supply, with a combined weight of 110 kg. An 8-inch (20.3 cm) diameter CRT display is provided, and sound ray paths are displayed with a spacing of 0.5, the number depending upon beam selection, resulting in a maximum calculation time of 74 milliseconds. The SP1-03 is suitable for both anti-submarine operations and oceanography applications.

Converging rays form a region of low propagation loss which is effective for target detection and location. Convergence zones can be easily predicted from the screen intensity of the display. A Bottom Reflections On/Off switch enables the effects of bottom-bounced sound rays to be studied. A variable depth transducer facility is provided, under control of the operator, and this enables the depth of the sonar to be adjusted to permit looking into shadow zones. The equipment caters for either fixed or variable transducer depth. 15 feet (4.57 m) in the first case and 10 to 10,000 ft (3 to 3,000 m) for the latter. Initial velocity and transducer depth is calculated automatically.

The bottom depth setting is adjustable to a maximum of 20,000 ft (6,000 m), and the reflection attenuation is adjustable from 0 to 20 dB. Sound velocity is variable between 4,700 and 5,100 ft/sec (1,433 and 1,554 m/sec), with a gradient maximum in the layers plus 2 to minus 2 seconds. Five ranges are provided. A high pulse repetition rate is used in the interests of stability. The equipment is fully solid-state and integrated circuits are used in construction.

Operational applications include: on surface ships with hull-mounted variable depth sonars for instant and variable prediction of sound ray paths; on submarines for the determination of optimum listening and escape depths, and defence against helicopters and sonar buoys, for mine-hunting in shallow waters, oceanography and hydrography.

DEVELOPMENT:

Development was undertaken by Van der Heem N.V. in The Netherlands.

STATUS:

The SP1-03 is in operational service with a number of navies.

MANUFACTURER:

Van der Heem Electronics Nv, Den Haag, The Netherlands.

THE UNITED KINGDOM

7002.253
MS26 and MS27 SMALL SHIP SONARS

DESCRIPTION:

Hull mounted ship sonars designed for single operator control in both the surveillance and attack roles. Also used as a 'dunking' sonar in certain helicopters, under the designation Type 195.

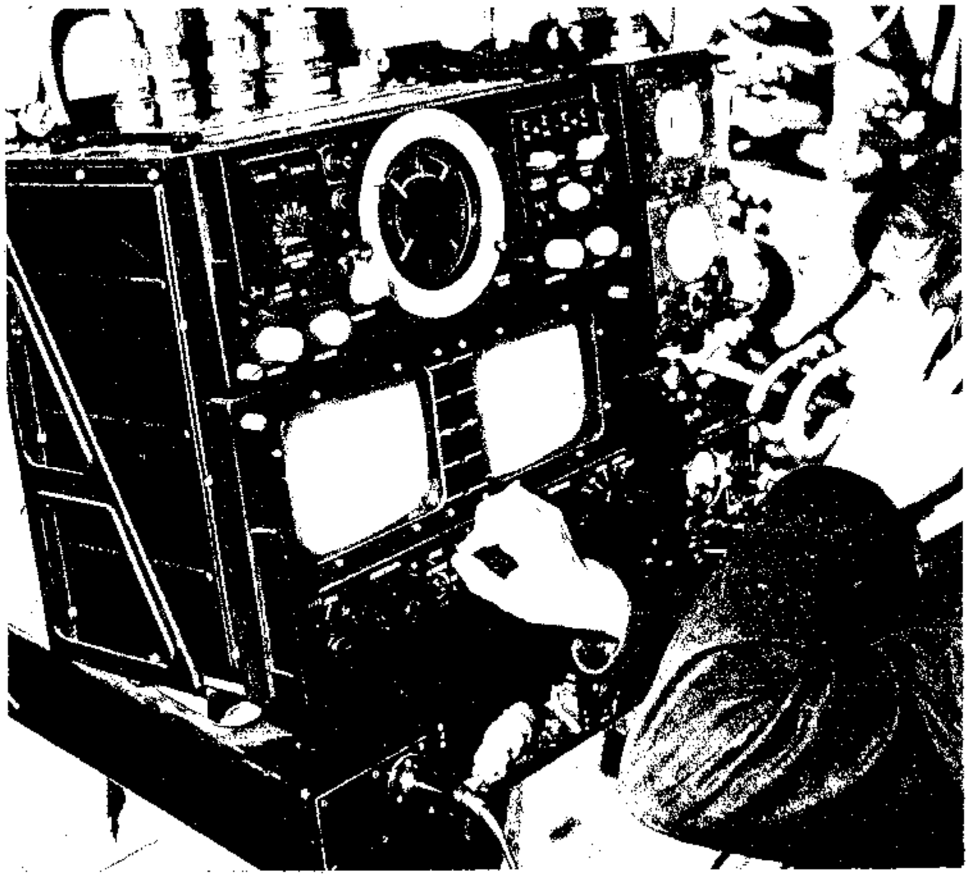
OPERATION:

The MS26 is a self-contained system for ships and patrol craft down to 150 tons. It provides full 360 degrees coverage in four steps of 90 degrees and may be manually controlled to cover a particular sector, or set to carry out automatic search procedure. It incorporates a 'maintenance of close contact' facility for tracking close or deep targets. The single operator controls the sonar through a special console. He is provided with three sources of sonar information – audio, visual doppler and visual sector.

The doppler facility provides increased initial detection range and improved classification capabilities compared with conventional small ship sonars. The MS26 transducer array is mounted within a hull outfit with a glass-reinforced plastic dome.

The MS27 differs from the MS26 only in its associated hull outfit. The MS27 transducer array is mounted in a Royal Navy hull outfit 19 or similar, which makes the equipment suitable for installation in small escorts down to about 650 tons displacement. The MS27 can be used as a surveillance sonar in association with a separate fire control sonar within the same hull outfit. This enables the ship to continue surveillance for new threats whilst engaging a target already detected.

Both equipments use fully transistorised circuits to ensure high reliability, while modular construction techniques permit rapid maintenance and minimise loss of operational time. They also offer a means of economically providing secondary sonar capability in multi role vessels. Under slow speed operation, when the back-



Operator's console of MS26/27 sonar system ground noise is that caused by breaking and pounding of waves, equivalent to, say sea state 4, the theoretical initial detection range can be calculated about 7,000 metres. A practical working range of detection under most conditions is approximately 4,500 metres.

The equipment is sub-divided into small units which may be sited in convenient areas not necessarily adjacent to the control console.

MS26 and MS27 Unit Dimensions:

Operator's console: 53 cm wide, 43 cm high, 30 cm deep, 26.5 kg

Doppler receiver: 40 cm wide, 29.2 cm high, 52 cm deep, 20.7 kg

Sector receiver: 40 cm wide, 29.2 cm high, 38 cm deep, 10.8 kg

Transmitter: 29.2 cm wide, 19 cm high, 52 cm deep, 13.7 kg

Auxiliaries unit: 40 cm wide, 29.2 cm high, 51 cm deep, 27.1 kg

Sonar power supply: 43.2 cm wide, 38 cm high, 50 cm deep, 73 kg

Transducer assembly: 44.5 cm wide, 99.6 cm high, 53 cm deep, 100 kg

MS26 hull outfit: 80 cm wide, 137.3 cm high, 140 cm deep, 1,015 kg

MS26 Sonar Dome: 48.3 cm wide, 72.5 cm high, 132 cm deep, 1,015 kg

STATUS:

Now in quantity production. The MS26 has been adopted by four foreign navies, two of these being NATO member countries.

MANUFACTURER:

Plessey Marine, The Plessey Company Ltd, Ilford, Essex, England.

ADDITIONAL EQUIPMENT:

Various other ancillary units are available which will measure transmitter output power and receiver sensitivity; indicate figure of merit under prevailing noise conditions; provide at points remote to the control console tactical information on target movement; provide in situ system checking which locates any system fault or performance deterioriation; and provide a controlled simulated display for training purposes.

1024.353
TYPE 195 HELICOPTER SONAR

DESCRIPTION:

This is a helicopter-mounted 'dunking' version of the Plessey MS26/27 range of small vessel sonars. The principal difference between the Type 195 and these equipments is the use of a winch-controlled transducer for the detection and location in place of the hull-mounted units employed in the MS26/27. Other essential details are the same and will be found in the entry for the MS26/27 sonars.

STATUS:

The Type 195 sonar is an item of the equipment forming the Westland Sea King ASW helicopter system.

MANUFACTURER:

Plessey Marine, The Plessey Co Ltd, Ilford, Essex, England.

Type 195 dunking sonar in use by Royal Navy Sea King helicopter

1221.253
MS32 SONAR

DESCRIPTION:

The MS32 sonar is an active, panoramic, hull-mounted sonar equipment suitable for fitting in all classes of anti-submarine escort ships. Solid-state electronics are used in construction, these being housed in six cabinets of total weight 2,000 kg, each cabinet measuring 68.5 × 61 × 173 cm. The transducer and directing gear also weighs about 2,000 kg.

The system provides initial detection and classification of targets, and fire control facilities for anti-submarine weapons. Torpedo warning facilities are also available.

Comprehensive signal processing and data display facilities are provided by a sonar room display console measuring 107 × 91 × 173 cm, and weighing 330 kg.

The only indications of performance are those which can be indirectly surmised from the power supply requirements.

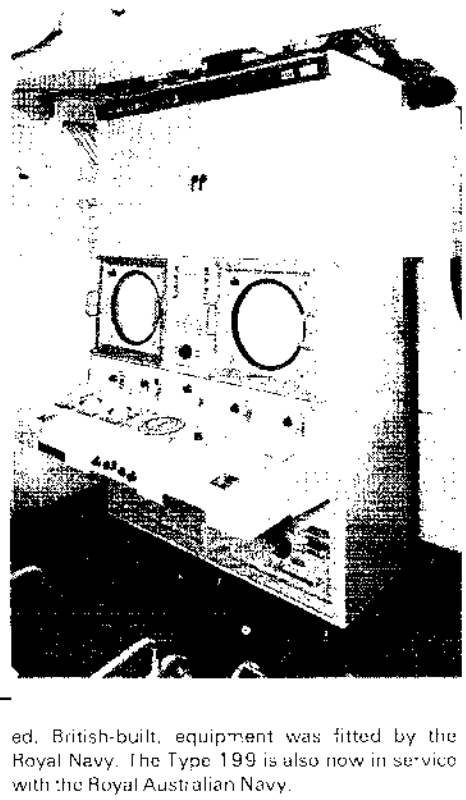
110 or 240 V AC	50/60 Hz, single phase, about 5 kW average peak power.
115 V AC	400 Hz, three phase, 1 kW maximum.
440 V AC	60 Hz, three phase, 100 KVA (pulse).

STATUS:

Development began in mid-1967 and was completed in 1972.

MANUFACTURER:

Plessey Marine, The Plessey Co Ltd, Ilford, Essex, England.



Plessey MS32 sonar display system

2447.253
SONAR TYPE 199

Type 199 is a variable-depth submarine detector. Its principal feature is the towing of the transducer in deep water behind the ship; the purpose of this being to enable the detecting device to operate at various levels and therefore overcome the effects of refraction between different water areas. A further advantage is a considerable reduction in the amount of ship's noise picked up by the transducer.

DEVELOPMENT:

Development started with a contract placed by the Canadian Government with EMI Electronics (Canada) Ltd and the equipment went into service with the Royal Canadian Navy in 1962. In the following year Canadian-built equipment went into service with the Royal Navy. In 1968 an improved, British-built, equipment was fitted by the Royal Navy. The Type 199 is also now in service with the Royal Australian Navy.

TEST AND TRAINING EQUIPMENT:

EMI Electronics provide a base test equipment for checking the towed vehicle.

MANUFACTURER:

EMI Electronics Ltd, Blyth Road, Hayes, Middlesex.

1755.453
TYPE 162M SIDEWAYS-LOOKING SONAR

DESCRIPTION:

Sonar Type 162M detects and classifies both midwater and seabed targets. It displays port and starboard recordings simultaneously on a single straight line recorder, which has a maximum range scale of 1200 yards. Operation is simplified by entirely automatic gain control. Reliability is enhanced with solid state technology and maintenance is facilitated by ease of access and comprehensive built-in testing and monitoring features.

The three transducers are all similar and employ 49.8 kHz barium titanate elements. Their beam pattern is fan-shaped, about 3° wide and 40° vertical angle; the side-looking elements have their axes 25° below the horizontal.

The recorder design uses a double helix (left and right hand) so that there are two points of contact with the moist electrosensitive paper. As the helix rotates, the two points of contact move outwards from the centre. Port and starboard signals are fed respectively to the left and right-hand points of contact so that they are recorded simultaneously. There are two zero lines near the middle of the paper, and the 18 mm gap between them is used for time marks every 5 minutes. The paper width is 286 mm, and each trace occupies 133 mm.

An electronic oscillator provides a controlled frequency supply for the driving motor and interval marks. Motor speed changes, for the three range scales, are made by frequency division so as to avoid the use of a change speed gear box, and a stroboscopic arrangement is included so that the helix speed may be easily checked.

A loud-speaker, and a socket for headphones, enable signals to be monitored aurally if required.

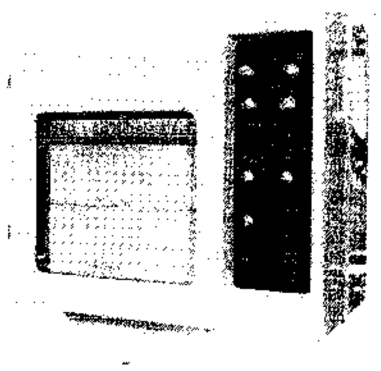
The three range scales are 0-300, 0-600 and 0-1200 yards, and accuracy is better than 2 per cent assuming a sound velocity of 4,920 ft/sec. The paper speed changes automatically when the range scale is selected, and the speeds are 6, 3 and 1.5 in/min respectively. At a ship speed of 10.8 knots the display scales are the same across the paper and vertically. A take-up spool is fitted but its use is optional. A fix marker draws a line across the width of the paper when a button is pressed, and it can be operated in conjunction with a Type 778 echo sounder or other equipment.

The Receiver/Transmitter contains:

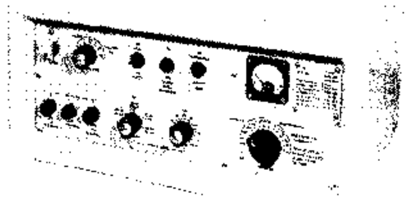
(a) the transmission system in which a crystal oscillator supplies the correct energising frequency, which is gated to form pulses of 0.75 ms duration at intervals commanded by the recorder; the pulses are amplified to deliver 80W to each of the wideways looking transducers and 40W to the centre (downward looking) transducer. There is a switch to cut out either the port or starboard transducer when not required, and the centre transducer is automatically disconnected on the longest range scale.

(b) the reception system, which includes signal amplifiers, mixers, transmit/receive switches, initial reverberation suppression and automatic gain control. By careful selection of time constants, it has been found possible to preserve a sufficient level of sea bed reverberation to display target shadows, and yet to permit weak echoes from distant targets to be seen in the presence of the reverberation. This system is so effective that the operator has no need of a manual gain control.

(c) the monitoring and test facilities, which enable all supply voltages and the functioning of the transmitter and receiver to be checked and test signals to be injected.



Type 162M sonar transmitter-receiver unit



Type 162M sonar recorder

STATUS:

Prototypes underwent sea trials during 1973, and production equipment installations began in 1974.

MANUFACTURER:

Kelvin Hughes, New North Road, Hainault, Ilford, Essex, England, IG6 2UR.

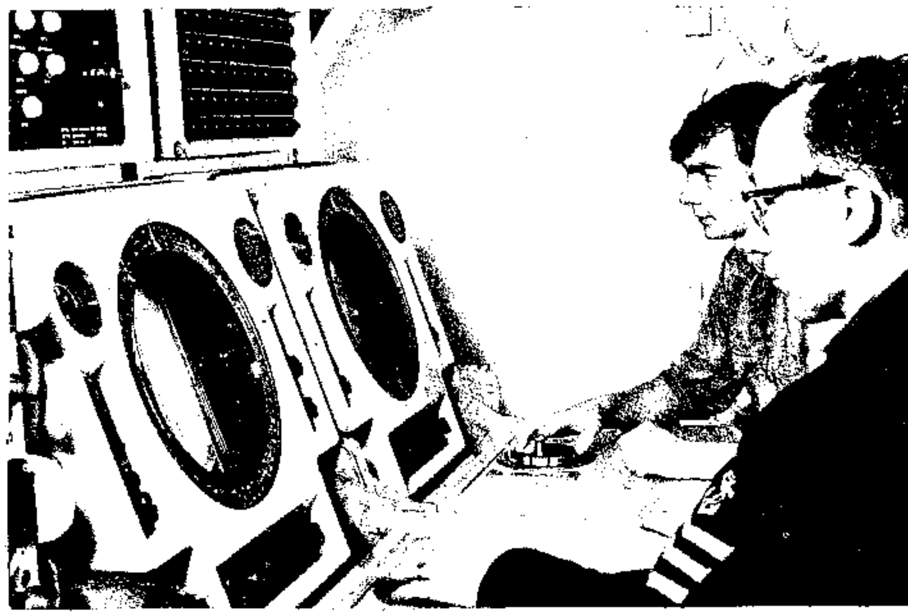
RN MINE HUNTING SYSTEM (ACOUSTIC) Mk 1

DESCRIPTION:

This system is based on the RN Type 193 sonar for the detection, classification and neutralising of ground mines, and moored mines which are not capable of being swept. The complete system comprises additional elements such as an accurate navigation sub-system, pilotage radar, and mine destruction equipment. It is also used in the Decca Minehunting System and operates in the Vosper 45 metre glass-fibre minehunter. It is also suitable for use with the Sperry CAT mine disposal weapon or the French PAP 104 system (**1786.453**). All other details of this system remain classified.

MANUFACTURER:

Plessey Marine, The Plessey Company Ltd, Ilford, Essex, England.



Operator's console of the RN Mine Hunting sonar system

1787.453
Mk 1C ACTIVE SONOBUOY T17164

DESCRIPTION:

As the result of an extensive research and development programme, Plessey Marine has made design changes and repackaged the existing Mk 1C active sonobuoy into a unit of "A" size dimensions. The use of solid-state electronics coupled with a complete reassessment of mechanical design has resulted in a unit weighing only 8.85 kg, which compares with typical weights of about 39 kg for conventional sonobuoys. Volume of the Mk 1C T17164 is 0.011 cubic metre, which compares with 0.11 cubic metre for conventional units.

The sonobuoy is constructed in two main sections. The top section contains the rotochute, RF transmitter, and batteries, whilst the lower section contains the compass unit, transducer and rotation mechanism. The sections are connected together with a part complaint cable.

The sonobuoy can be released from the aircraft either through the bomb bay or the sonobuoy shute and its rate of fall is limited to 18.3 m/s (60 ft per sec). When it strikes the water an interior rod disengages the rotochute assembly which is jettisoned and thus enables the folded dipole antenna to erect. The two sections of the sonobuoy automatically separate on striking the water and the complaint cable contained in the upper section is paid out whilst the lower section sinks to a predetermined depth. When this section has reached its selected depth, the paddles are deployed allowing the transducer array to open to its operational position. The motor drive to the paddles engages and the lower unit rotates against the reaction of the paddles. The unit rotates in steps, pausing at each point to carry out the transmit/receive sequence, which includes compass interrogation to provide bearing information. The output frequencies are fed via the cable to modulate the RF transmitter. Operation continues for over 60 minutes until RF shut down and final scuttle.

MANUFACTURER:

The Plessey Company Ltd, Plessey Marine, Ilford, Essex, IG2 6BB, England.

Sonobuoy T17164 with bomb-bay adaptor

1374.253

MINE HUNTING SONAR 193M

DESCRIPTION:

The 193M is a redesign by Plessey of the Type 193 minehunting sonar, the adoption of solid-state electronics and other advances in technology have resulted in a reduction in installed weight to about 860 kg, which compares with a figure of some 2100 kg for the older Type 193. Among the operational improvements are extensive use of digital displays and direct insertion of range data to the PPI.

Two frequencies are employed by the 193M sonar, the lower for search and the higher for classification. The transducers for these signals are carried beneath the ship on a stabilised, steerable mounting, the whole assembly contained within an inflated fabric dome. The returned echoes are presented to the operators on separate CRTs at the control console. One of these displays range and bearing of targets within the sector being scanned by the search transducer, while the other is used for the presentation of the classification channel data. The controls for adjusting the transducer position, signal parameters such as frequency and pulse length and for co-operating with the rest of the mine-hunting and destruction team, are also provided at the console. Type 193M data can also be fed into other ship's systems.

DEVELOPMENT:

Development of the Type 193M was undertaken by Plessey, based on proposals made to the company in 1968.

STATUS:

In service with the Royal Navy. It is also used in the Decca Minehunting System and operates in the Vosper 45 metre glass-fibre reinforced minehunter vessel. It is suitable for use with the Sperry Cat mine disposal weapon or the French PAP 104 system (**1786.453**)

MANUFACTURER:

The Plessey Company Ltd, Plessey Marine, Ilford, Essex, IG2 6BB, England.

1223.263

PLESSEY ACOUSTIC RAY TRACE INDICATOR

DESCRIPTION:

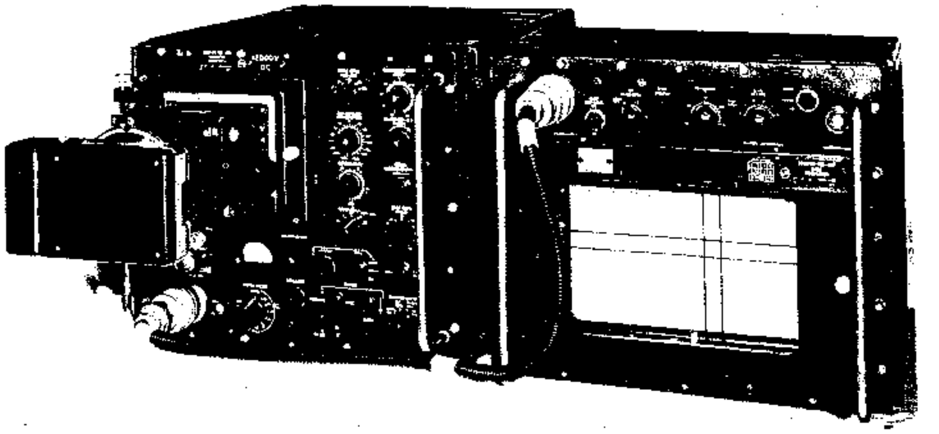
The acoustic ray trace indicator (ARTI) is a data processing system developed to permit the rapid application of corrections for variation in the ocean environment to sonar systems, enabling more accurate predictions of transmission paths and sonar coverage.

The equipment consists of three portable units, each housed in a separate instrument case:

Data converter. This unit contains the devices for data input setting from each of the possible sources, the input data store and the first stages of the computation. The overall case size is 441 × 356 × 251 mm.

Sonar ray computer. This contains the major part of the computer, with the output display. Overall size is 441 × 356 × 480 mm.

Accessory outfit. The third unit provides storage space for the polaroid camera and all connecting cables and accessories.



Plessey Acoustic Ray Trace Indicator equipment

The ARTI equipment can accept input data from any temperature or velocity-profile source, but has been specifically designed to accept plots automatically from either the RN sound velocity recorder, or from the XBT expendable bathythermograph (which see). It incorporates an analogue computer which integrates the sonar plot with the temperature/depth or velocity/depth data and predicts ray paths at one degree intervals within the sonar beam. It is designed so that the specific parameters of any sonar equipment can be manually preset.

OPERATION:

Problems relating to the nature of the environment, as much as intrinsic sonar performance, are limiting factors in the conduct of underwater detection and tracking operations. Sonar energy, instead of travelling in straight lines, is refracted due to salinity, pressure and temperature gradients within the medium. Predictions of sonar range and the volume surveyed by a given equipment are thus predicated by the accuracy with which transmission paths can be forecast.

Bathythermograph plots enable predictions of ray-bending of varying accuracy to be made, accuracy generally depending upon the extent of the computational facilities available. Accurate transmission path data normally demands extensive and laborious calculation, which does not comply with the modern requirement for rapidly available data.

The ARTI equipment has been designed to provide the necessary computational capacity on an automatic basis, coupled with a suitable means of presenting the resultant information.

The data converter unit of the system enables the operator to transfer five salient points from the bathythermograph trace into an electronic store, in a matter of seconds. The computer will then produce immediately the resulting sonar beam patterns on its CRT display, calculated for any desired sonar transducer depth, angle and beamwidth. The display shows reflections from the sea surface, and if required, from the bottom which is adjustable in depth and slope. A further useful facility is the provision of markers along the sonar beam, enabling sonar transmission range to be correlated with actual horizontal range. Five alternative horizontal ranges and five depth ranges can be selected to produce a display suited to short ranged sonars, or right out of the limit of the longest range sonars, and for shallow water or the greatest ocean depths. A record of any display can be obtained very quickly using the Polaroid camera supplied as part of the equipment.

STATUS:

The ARTI equipment had reached prototype stage early in 1970 and entered quantity production for the Royal Navy in 1971. A number of foreign navies are reported to be interested.

MANUFACTURER:

Plessey Marine, The Plessey Co. Ltd, Ilford, Essex, England.

1788.453

PLESSEY UNDERWATER PROGRAMMES

DESCRIPTION:

The following paragraphs list major underwater projects in which Plessey is known to be engaged but about which detailed information has not been released.

PMS 35

This is a small frigate digital sonar which is now in development.

Nuclear Submarine Sonar

This is a long-range detection equipment for the latest British nuclear submarines. It is not known what stage has been reached in this programme.

Intruder Detection System

SADE – Sensitive Acoustic Detection Equipment. This is for the defence of strategic shore installations against undersea intruders in miniature submarines, underwater demolition swimmers, etc.

Noise Aanlysis System

This programme is related to acoustic ranges for noise analysis of ships and submarines.

Project 15 Sonar

Under the designation Project 15, a new advanced fleet escort sonar for the Royal Navy is under development.

Mark 44 Mod 1 Torpedo

This is a short-range homing torpedo for use against submarines and intended for launch from ships or helicopters.

STWS-1

The STWS-1 is a self-contained anti-submarine weapon system for surface escorts incorporating a triple tube for launching Mk 44 and Mk 46 torpedoes.

MANUFACTURER:

The Plessey Company Ltd, Plessey Marine, Ilford, Essex, IG2 6BB, England.

2536.253

AN/SQS-26 SONAR

Claimed to be the most advanced surface ship sonar operational in the US Navy, the AN/SQS-26 is a large and complex system comprising 576 transducer elements, formed in a cylindrical array, and 37 cabinets of signal processing, transmitting and display equipment. The cylindrical array of transducer elements is located in a large bulb dome below the waterline of the ship's bow. The system may be operated in either an active or passive mode to detect, identify and track multiple targets.

AN/SQS-26, which has been re-designated AN/SQS-53, has been specified for the 30 "Spruance" class (DD-963) destroyers being built for the US Navy by Litton Industries, and the sonars are being built by General Electric on a sub-contract from Litton.

They will form part of a total ASW system that includes advanced fire control equipment and an array of weapons including ASROC, conventional torpedoes and depth charges. The long effective range and deep penetration of the AN/SQS-53 will give the destroyer a valuable ASW capability; the DD-963 will also be the first major combatant ship of the US Navy to have sonar linked directly to a digital computer for target data processing.

MANUFACTURER:

General Electric Company, Heavy Military Systems, Syracuse, New York, USA.

Bow housing of SQS-26 sonar

2534.253

AN/SQS-36 AND AN/SQS-38 MEDIUM-RANGE HULL-MOUNTED SCANNING SONARS

These equipments have been designed for the medium-range detection of submarines in deep and shallow water. The AN/SQS-38 is the more modern of the two; the AN/SQS-36 has been in service with the US Navy since 1964.

Associated with these equipments, and using the same electronics, are the AN/SQS-35/36 and AN/SQS-35V Hull/Variable Depth Sonars which use one set of electronics to work with either a hull-mounted or a VDS transducer – selection being made by a push-button on the operator's console.

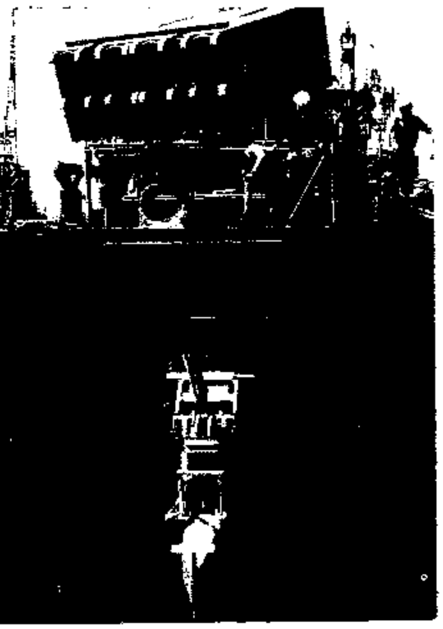
All four equipments are single console systems. The AN/SQS-36 and the AN/SQS-35/36 are primarily miniaturised vacuum-tube equipments; the AN/SQS-38 and the AN/SQS-35V are completely solid-state equipments.

DEVELOPMENT:

Development of the earlier versions was begun in 1959 for the US Navy, prototypes were made in 1962 and the equipment went into service with the US Navy in 1964. Since then the Italian and Norwegian Navies have adopted the system and other navies may yet do so Weapons associated with the system are the Mark 44 Torpedo and ASROC (USA), Terne (Norway) and Lanciabas (Italy). Seventy-five equipments have so far been delivered.

MANUFACTURER:

Edo Corporation, International Division, 14-04 111 Street, College Point, N.Y., USA.



AN/SQS-35(V) variable depth sonar seen aboard the escort ship USS Francis Hammond

1789.453

AN/SQQ-14 SONAR

DESCRIPTION:

The AN/SQQ-14 system is essentially a variable-depth, dual-frequency sonar for detecting and classifying bottom mines in shallow water. It utilises a towed body in the shape of an elongated sphere towed through a centre well on a US Navy minesweeper.

A unique aspect of the AN/SQQ-14 design is the towing cable. This consists of discrete, 18-inch sections of articulated struts with universal joints at each section, permitting the cable to flex in any vertical plane, but restraining it from torsional motion. This configuration imparts a constant heading to the towed body, thereby eliminating the need for a gyroscopic heading reference system.

STATUS:

Operational.

MANUFACTURER:

General Electric Company, Heavy Military Electronic Systems, Syracuse, New York, USA.

1807.453

AN/SQS-56 SONAR

DESCRIPTION:

AN/SQS-56 is the designation given to the new sonar being developed for the latest US Navy PF (Patrol Frigate) Class of ships. Few details have been released apart from the fact that the SQS-56 is a digital, computer-controlled system of lightweight and small dimensions. Despite this, performance is reported to be high in terms of both acoustic power and display capabilities. It can be manned by a single operator who can carry out search, detection and tracking of targets in either active or passive mode operation. The integral general-purpose digital computer provides the means for interfacing the sonar with shipboard weapons or data automation system.

STATUS:

The prototype model had been delivered to the USN by May 1974 for installation on a test ship. Technical evaluation by the Naval Undersea Centre will be followed by Operational Test and Evaluation conducted by the Commander, Operational Test and Evaluation Force. Upon completion of these tests the prototype will be accepted by the USN and designated AN/SQS-56(XN-1). Under current plans this model will be returned to Raytheon for production engineering and subsequent delivery to the first PF. SQS-56 sonars will be procured for another 49 PF ships, plus a number of sets for use at training establishments.

MANUFACTURER:

Raytheon Company, Submarine Signal Division, Portsmouth, Rhode Island, USA.

1635.453
BATHY THERMOGRAPH DATA RECORDER RO-308/SSQ-36

DESCRIPTION:

The BT Recorder is an integral part of US Navy/Lockheed P3C Orion aircraft ASW system. The equipment converts sea water temperature information provided by the AN/SSQ-36 Bathythermograph Buoy-Transmitter set and AN/AAR-72 Radio Receiving set to two output forms:

(1) A permanent record of the vertical temperature profile (temperature vs. depth) on a paper strip chart.

(2) A parallel mode, 8-bit, binary coded data word for delivery to the AN/AYA-8 Data Processing System.

The BT Buoy is dropped from an aircraft in the target area. Sea water is utilised as the activating agent and after an initial, predictable delay, the Buoy releases a temperature sensing probe (TS probe). The TS probe is the variable element in a frequency generation circuit. A radio frequency signal, transmitted by the BT Buoy is modulated at a frequency correlated to the temperature of the water. On board the aircraft the ARR-72 Radio is tuned to the BT Buoy carrier frequency. Water temperature information is converted to an audio frequency signal and delivered to the BT Recorder.

MANUFACTURER:

Western Components Division, Archbald, Pennsylvania 18403, USA.

2580.253
EDO MODEL 610 LONG-RANGE HULL-MOUNTED SCANNING SONAR

Designed for the long-range detection of submarines in deep and shallow water, the Edo Model 610 Scanning Sonar has two active consoles – and can thus perform an effective search while-track-function. Facilities offered include a search capability in three 120° sectors, passive correlation and reverberation processing. The transmitter and receiver beams are preformed. Output is available for fire control system. All mode changes and range scale changes are controlled by console push-buttons, and displays include a doppler display on each of the active consoles and a passive sonar bearing-time recorder display.

DEVELOPMENT:

Model 610 was developed by the Edo Corporation as a private venture starting in 1965. The first prototype was completed in 1966 and the first production model completed its sea trials in 1969. At least twelve equipments have so far been ordered for use in the Royal Netherlands Navy and the Italian Navy and other sales are pending. Associated weapon systems include the Mark 44 Torpedo (US) 375 Rocket Launcher (Sweden) Lanciabas (Italy) and Ikara (Australia).

MANUFACTURER:

Edo Corporation, International Division, 14-04 111 Street, College Point, N.Y., USA.

1637.353
AQS-13 HELICOPTER SONAR

DESCRIPTION:

The AQS-13 is a helicopter 'dunking' sonar system providing all-round active search facilities, and probably also possessing a passive operating mode. No detailed information is available.

STATUS:

The AQS-13 is widely used by American forces and has been supplied or ordered for naval helicopters of Italy, Iran, and unspecified South American countries. A second major contract for the AQS-13 for use by Italian Navy AB-204 and AB-212 helicopters was placed in March 1974.

MANUFACTURER:

The Bendix Corporation, Electrodynamics Division, 11600 Sherman Way, North Hollywood, California 91605, USA.

2581.253
EDO MODEL 700 SERIES SONARS

Basic equipment of this range of single operator sonars is the Model 700 Medium-Range Hull-mounted Sonar. Major variants are the Model 700/701 VDS and the Model 700/701 Hull-mounted/VDS.

The basic equipment has a 254 mm panoramic display and a doppler display. All mode and range-scale changes are made by push-button controls on the operator's console.

DEVELOPMENT:

Like the Model 610 (**2580.253**) the model 700 series has been developed by the Edo Corporation as a private venture for sale on the International Market. Development started in 1966 and the first prototype was completed in 1968. Sea trials of the first production model were completed in the following year. At least twenty of these equipments have so far been ordered, customers including the Royal Netherlands and Japanese Navies, and other sales are pending. Associated weapon systems include the Mark 44 Torpedo (US), the Bofors 375 Launcher (Sweden), Lanciabas (Italy) and Ikara (Australia).

MANUFACTURER:

Edo Corporation, International Division, 14-04 111 Street, College Point, N.Y., USA.

DATA PROCESSING EQUIPMENT

SWEDEN

2345.163
FIELD ARTILLERY COMPUTER EQUIPMENT – SAAB ACE-380

DESCRIPTION:

ACE-380 is a mobile (two-man-portable) field artillery computer equipment which can be operated by one man to compute, store and retrieve data on both fixed and moving targets. It is easy to operate, incorporates built-in error detection facilities and computes firing data within one second. Main capabilities are:

Target data storage for 500 targets.
Firing data for up to 40 ballistics inclusive of corrections and daily adjustments.
Storing of complete target data with corrected firing information for 20 targets.
Automatic or semi-automatic input from forward observer radio link data receiver.
Automatic output of firing data to gun data link.
Automatic input from transmitter of muzzle velocity data.
Prognosis of air for 30 levels above ground.
All data stored within the equipment displayed immediately on request and easily updated.

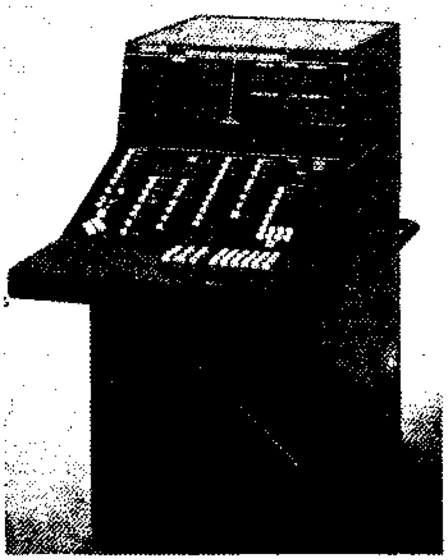
These facilities are provided by a multi-purpose digital computer with a ferrite core memory and a real-time programming system.

Keyboard and display panels are designed with separate functional fields for each group of input parameters. Operation is simple and can readily be learnt by a soldier with some artillery experience. Input data is inserted into the computer either manually or automatically from fire control apparatus. Data on any target can be called up and displayed by pressing the appropriate key: it can then be checked, and manually adjusted if necessary, and returned to store. When the input data are complete the computer is commanded to "compute" and the computer output can then be transmitted verbally or automatically to the firing positions.

The computer, developed by Saab-Scania, has a memory capacity of 16,000 words – extendable to 64,000. Other types of modern multi-purpose computer can be used, however, provided they meet the appropriate operational and environmental specifications.

MECHANICAL AND ENVIRONMENTAL CHARACTERISTICS:

Width: 545 mm
Depth: 1,100 mm
Height: 1,085 mm
Weight: 50 kg
Power: 22-28V d.c. 150 W
Operating temperature range: –30°C to +45°C
Storage temperature range: –50°C to + 70°C
Moisture: 0 – 100% RH



ACE-380 Field Artillery Computer Equipment

MTBF: 1,500 hrs on active service

MANUFACTURER:

Saab-Scania, Missile and Electronics Section, S-581 88 Linköping, Sweden.

2344.163
FIELD ARTILLERY FIRE CONTROL EQUIPMENT 9FA 101

DESCRIPTION:

This is a digital system for the control of field artillery. In its simplest form it consists of a d.c. powered combined input keyboard, computer and output display; but for most practical purposes it may be assumed that the system will be augmented by the inclusion of display repeaters at the gun emplacements. A further possible extension is the addition of a radio data link (called HADAR) between forward observers and the 9FA 101 computer station.

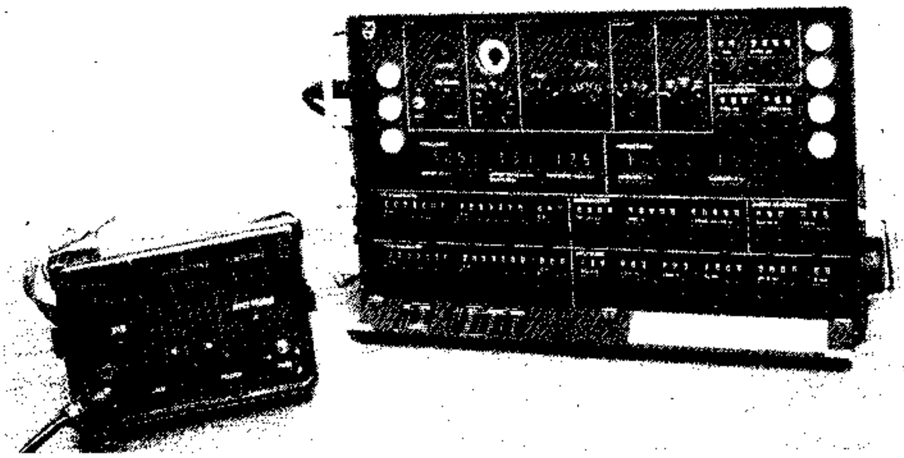
Data are supplied to the computer by keying the appropriate co-ordinates, etc., and in some instances by setting multi-position switches. When data on any target are complete the computer is caused to calculate the train, elevation and fuse information required for any designated gun. These calculations are displayed on the main control instrument but they can also be displayed on small repeaters (gun indicators) mounted on the guns. These repeaters incorporate lights and buzzers to give firing commands, or indicate that new target data have been computed, and incorporate a speech channel for communication.

A further sophistication of the system can be achieved by adding gun direction equipment consisting of a gun indicator with an optical telescopic sight with an automatic input.

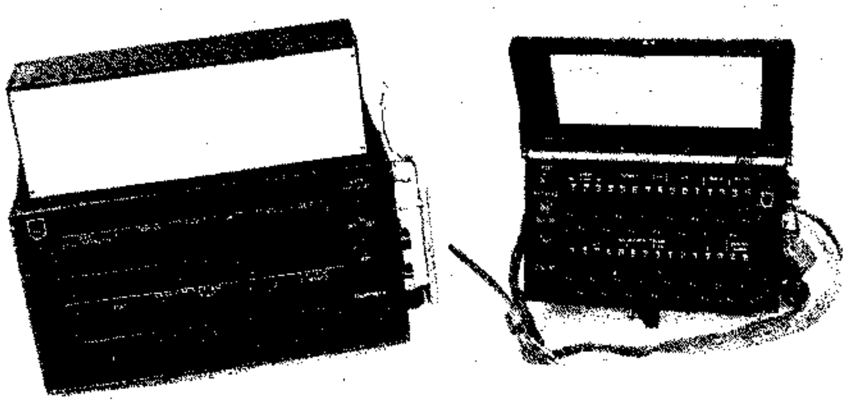
Main tactical functions performed by the system are:

Calculation of firing data on the basis of manually set or automatically fed input values.
Tactical switching between a maximum of 28 selectable ballistics.
Input of fire observation data in accordance with the line-of-collimation principle.
Computation of co-efficients for utilisation of the experimental fire correction.
Input of altitude observation data for fuse setting.
Input of speed and course of moving targets.

As already noted, there is also available a data transmission equipment called HADAR which is compatible with the 9FA 101 and enables a forward observation post to communicate conveniently and unambiguously with the command post.



Ballistic computer and gun indicator of 9FA 101 Field Artillery Fire Control Equipment



HADAR data reporting equipment

CHARACTERISTICS:

Type of computer: Special purpose, fixed programme and constant memory
Word length: 17 bits
Number representation: Serial binary, negative numbers in 2-complement
Time of computation for firing data: Approximately 1 sec
Build up: Integrated circuits
Power: 24 V d.c. approx. 75 W for the ballistic computer. 14 V d.c. approx. 15 W for the gun indicator

Size and weight: Ballistic computer: width 605 mm, height 366 mm, depth 223 mm. Weight 31.5 kg

Gun Indicator: width 267 mm, height 180 mm, depth 134 mm, weight 3.7 kg

Environmental: The equipment is built for use under the severest military conditions. It has been designed to meet the requirements for environmental endurance laid down by the Swedish Army for portable equipment corresponding to DEF 133, class 13, in applicable parts. The fixed memory ensures no programme loss after power failure and other disturbance.

STATUS:

The 9FA 101 system has been tested for two years by the Swedish Army and has been ordered for series production.

MANUFACTURER:

Philips Teleindustri AB, Fack, S-175 20, Järfalla 1, Sweden.

2346.163
TANK FIRE CONTROL EQUIPMENT – BOFORS TYPES S & C

DESCRIPTION:

Bofors make two basic types of tank fire control equipment. Type S for turretless tanks such as the STRV 103 (also made by Bofors – see entry number **5003.102**) and Type C for tanks with turrets.

Basis of both systems is the computation of lead angle by reference to the target range and the rate of change of target bearing (and taking into account ballistic data and wind speed and direction). The computation is simplified by using the measured range to define an integration time corresponding to the time of flight of the shell and then measuring the target angular displacement in that integration period. This measured displacement is then used to displace the line of sight so that when the operator is 'on target' the line of fire is appropriately displaced from the line of sight.

In their most complete form the fire control systems use a laser rangefinder for the critical range measurement; but simpler systems with provision for the insertion of range data obtained by other means can be provided.

Having initially lined up his sight with the target and having measured the target range, by means of the laser rangefinder or otherwise, the operator presses a button which initiates the integration process. While this process continues the operator must keep the target in his sight – which will be easier with sight and weapon stabilisation but is not impossible without. When the integration is complete the appropriate lead angle is injected into the sighting system and once the operator is 'on target' after the lead angle has been injected the gun may be fired with a high probability of success.

The main difference between the S and C systems is that the latter does not incorporate provision for computation of elevation lead angle. This facility is necessary in the S system because of the restriction of elevation movement for the gun of the STRV 103. Whereas in a turret tank the appropriate gun tangent elevation can be set independently of the nature of the terrain, the STRV 103 gun must be caused to fire (computer controlled) as the gun moves through the optimum elevation angle.

MANUFACTURER:

AB Bofors, S 690 20 Bofors, Sweden.

THE UNITED KINGDOM

2400.163
AMETS – ARTILLERY METEOROLOGICAL SYSTEM

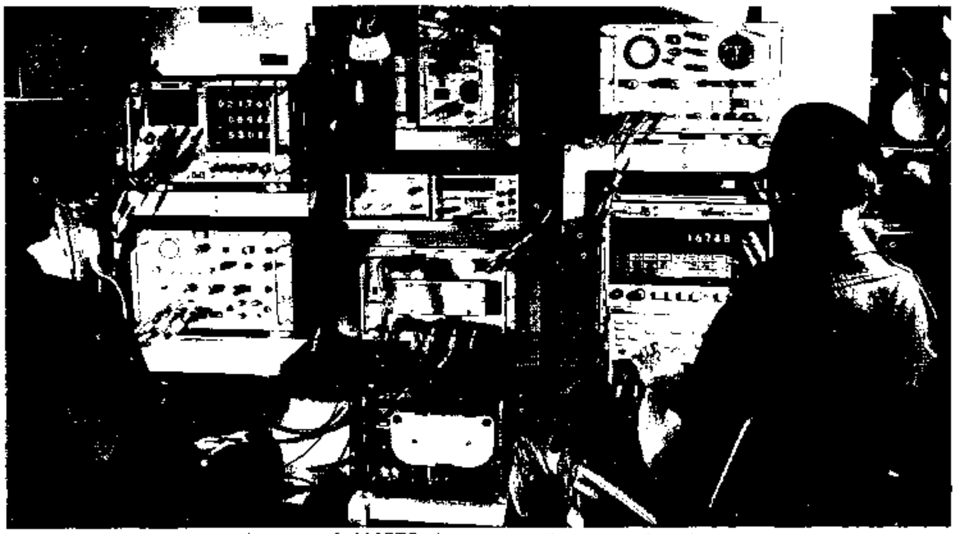
AMETS is the name given to a self-contained, computer-based, mobile meteorological system developed for the British Army by Marconi Space & Defence Systems Ltd. and Plessey Radar, for obtaining and processing information on atmospheric conditions automatically. It is capable of processing data from a wind-finding radar and radio sonde complex to an altitude of 20 kilometres every hour, and incorporates a facility to output partial messages within 5 minutes of the radio sonde passing through the relevant height band. A single AMETS will normally provide all meteorological data needed in the area of one Army Division.

AMETS uses a normal radio sonde but with a temperature sensor only. The outputs from radio sonde and radar are fed into a computer which can then calculate the required meteorological information. Measurement of surface pressure, and the average humidity figures which can be provided for the particular zone of operation are stored in the computer memory. The loss of accuracy resulting from this considerable simplification of radio sonde is negligible for artillery purposes, yet it offers appreciable gains in terms of operational simplicity, cost and reliability in military field conditions.

CONSTRUCTION:

The data processing part of the system is based on the 920B computer, produced by Marconi-Elliott Computer Systems, and already in use in a wide variety of military applications including FACE. The Plessey WF3M radar is built to full military standards, and is derived from the Plessey WF3 windfinding radar used for civil meteorology.

AMETS is mounted in a single instrumentation vehicle with a small trailer carrying the radar. In addition there will normally be a command post vehicle, and reconnaissance and stores vehicles to carry hydrogen and other troop stores. The instrumentation vehicle will carry all the data processing equipment, the radar and radio sonde monitoring and display units and a full range of diagnostic test equipment.



Interior of AMETS data processing control and display cabin

STATUS:

In service

The Plessey Company Ltd., Addlestone, Weybridge, Surrey.

2415.163
FACE – FIELD ARTILLERY COMPUTER EQUIPMENT

DESCRIPTION:

FACE is a field gunnery computer system specifically designed to perform quickly and accurately the lengthy calculations which are involved in producing artillery firing data. Traditionally, these calculations have been performed using range tables and simple analogue instrumentation. The first design studies for FACE began in 1963, initiated by the Ministry of Defence, and with the Royal Artillery and the Royal Armament Research and Development Establishment in collaboration. The first service models were issued to the British Army in 1969.

FACE undertakes two specific roles. Firstly, as an artillery survey computer it carries out all the calculations necessary in this task. Secondly, and more important, as a gun data computer it processes all the information required to place a shell accurately on the target and displays this information on a console. A single FACE system can handle the information relating to three batteries of eight guns each.

For each calibre of weapon in the gun data role and for the artillery survey role there is a programme tape stored in a sealed cassette, and the data on this tape can be read into the computer by the programme loading unit; this covers ballistic and other fixed data besides the computer operating programme.

Other data which, while not fixed, does not vary over appreciable periods of time, such as gun muzzle velocities and battery position, is entered manually by the operator, and once entered can be easily up-dated. An important feature is the ability of the system to accept meteorological data in the form of a punched paper tape, which can be prepared on the teleprinter which forms part of the system, and then read into the computer with a break in computation of firing data of less than a minute. This also enables new meteorological data to be accepted more frequently, which leads to more accurate shooting.

The basis of FACE is the Marconi-Elliott 920B digital computer, and the memory capability of the computer has been employed to remember drill sequences for the operator, and so make the system less complex to use.

OPERATION:

While the guns are deploying for action the console operator in the battery command-post vehicle begins to receive setting-up data. This is added to the information already in the computer's store which includes a latitude function allowing for earth rotational effects and the muzzle velocity for each gun for each charge. The first input is the geographical reference of the centre of the battery position – the "battery grid"; next, the position of each gun in relation to the battery centre, and the temperature of the ammunition charges. Then meteorological information is received by radio and is also entered into the computer. The equipment is now ready to receive data for shooting, in the form of target position and height, the type of ammunition to be used, etc. Once all the relevant information has been fed into the computer, it produces answers which are passed to the guns; the orders to fire can then be given.

The forward observer, noting the fall of shot, radios corrections relative to his line of sight back to the command-post. The console operator feeds these straight into FACE which computes updated gun data for relay to the guns.

Frequently, gunners are required to deliver fire in support of a pre-arranged battle plan. In practice, battle conditions often call for changes to this fire plan: because FACE has great speed and flexibility, these changes can be easily accommodated.

The new 105 mm, 155 mm and 175 mm guns have been in service for some time. They are all multi-charge weapons, having both high- and low-angle fire capability, and each employs many projectile types to give a wide choice of performance. Their versatility could not be fully exploited without the assistance of FACE. It is, however, equally applicable to rockets and guns of any other calibre.

FACE installed in a Landrover

STATUS:
In service with the Australian and British Armies.

TACFIRE – TACTICAL FIRE DIRECTION SYSTEM

DESCRIPTION:

TACFIRE is an automated system of great complexity for the direction of artillery fire. Essentially devised for US Army operation in war situations where artillery formations are of battalion size or larger, and deployed over an area which can be covered by man-portable communications equipment, it embodies concepts which are of more general applicability – as also is some of the peripheral hardware.

Conceptually, the successor to the FADAC system (**1125.163**), TACFIRE's principal purpose is the achievement of a high degree of efficiency in the use of artillery fire. In the simplest possible terms it comprises a central powerful computer, which stores all the data that may be relevant to any likely tactical situation, a number of peripheral input devices, a central situation display system linked to a number of satellite systems equipped with input devices and situation displays and, finally, a large number of gunners who ultimately receive instructions to fire.

An artillery battalion – the smallest formation to which the complete TACFIRE system could be relevant – comprises three six-gun batteries and may have up to ten forward observers. Each of these observers has a device called a Fixed Format Entry Device (FFMED) which he can use to call for artillery fire. The message that he sends is digital and in a 1.3 second burst over land line or radio link to the central computer. If his request for fire is granted he can also use his FFMED to transmit corrections after the preliminary ranging round and call for Fire For Effect (FFE) when no further adjustment is required. Subsequently he will use his FFMED to confirm destruction of the target or otherwise update the computer.

The computer is located at a Fire Direction Centre (FDC); and when a request is received there it is checked and acknowledged to the forward observer and then entered into the computer. It is then processed, taking into account all the relevant data in the computer store and the situation, together with a suggested action, is presented to the Fire Direction Officer (FDO) by means of a Digital Plotter Map (DPM), possibly supplemented by an Electronic Tactical Display (ETD) – though this is usually found only at Divisional level – and an Electronic Line Printer (ELP). The FDO is equipped with an Artillery Control Console (ACC) which he can use to query the computer and which he also uses, when he has decided on the action to be taken, to route a message to the selected battery or batteries via the FDC.

At each battery there is a Battery Display Unit (BDU) comprising a Data Terminal Unit (DTU) and an ELP. Messages received are checked and acknowledged to the FDC and printed out for the battery commander. When a round is fired, the commander reports it to the FDO who instructs the forward observer to report the fall of shot. The battery command post can also be equipped with a transmit/receive Variable Format Message Entry Device (VFMED) which can be used to communicate ammunition or gun status to the FDC.

At the present time there is no provision for extending the system to provide data at the individual guns (cf **2344.163**) but this facility may be added later.

The foregoing is a simplified description of a very complex system; some further details of system components are given below.

Units normally associated with a Division Artillery Fire Direction Centre (FDC):

(1) Computer Centre Equipment (at FDC)
Computer (L-3050M)
Data Terminal Unit (DTU)
Artillery Control Console (ACC)
Digital Plotter Map (DPM)
Electronic Tactical Display (ETD)
Electronic Line Printer (ELP)
Removable Media Memory Units (RMMUs)
Random Access Memory (RAM)

(2) Remote Equipment:
Fixed Format Message Entry Devices (FFMEDs) with Air Observers (AOs) and other acquisition agencies
Variable Format Message Entry Device (VFMEDs) with Survey Teams and at Missile Battalions

Units normally associated with a Battalion Fire Direction Centre:

(1) Computer Centre Equipment (at FDC) Computer (L-3050M)
Data Terminal Unit (DTU)
Memory Loading Unit (MLU)
Artillery Control Console (ACC)
Digital Plotter Map (DPM)
Electronic Line Printer (ELP)

(2) Remote Equipment:
Battery Display Units (BDUs) at Batteries
FFM-EDs with Forward Observers and at other locations

Computer:

The L-3050M computer is the heart of the TACFIRE System. It is a general-purpose, microelectronic computer specifically designed for tactical use. It has commands added to the normal general-purpose computer commands to facilitate solution of the real-time command and control system problems required in TACFIRE.

The DivArty and Battalion computers are identical, except for an auxiliary operation kit for DivArty. The auxiliary operation kit contains a central Processing Unit (CPU) identical to that employed in the main computer to provide backup for full operation without degradation in case of main computer CPU failure.

Artillery Control Console (ACC):

The ACC is the primary man-machine interface at the FDC. It provides a true, real-time, general-purpose entry/query capability for a large data base and permits requests for calculations via messages composed in user language. It has two separate Display/Editor Assemblies with CRT screens for alphanumeric information display; one for receipt of incoming messages and the other for message composition and editing.

The keyboard consists of a standard ASCII alphanumeric keyboard plus editor controls. The switch panel has special action switches and a designator matrix for 64 of the most frequently used designators. The panel can be changed in the field to accommodate the specific needs of the user by composing a new matrix on the editor and requesting a computer printout on the Electronic Line Printer (ELP). The print-out fits under the plastic plate in place of the old designators.

Digital Plotter Map (DPM):

The DPM is a large-scale, automated display device that allows FDC personnel to plan operations, monitor activities, and retain an overview of the tactical situation. The DPM used at DivArty also meets Battalion requirements. It features:

4- by 4-foot (122 × 122 cm) plotting surface
Plots on overlay of standard Army field maps, or on map itself
Plot lines, boundaries, site symbols, and other required data
Computer driven (direct) or manually operable
Accuracy to +1/32 inch (0.8 mm)

Electronic Tactical Display (ETD):

This augments the DivArty DPM to provide an electronic tactical map capability. It permits almost instantaneous composition of different tactical displays for situation assessment using offset, expanded and selected site symbol categories. Other features include:

17-inch (432 mm) CRT display
Light pen selection of displayed data
Computer driven-display map lines and 250 site symbols
Easy orientation of DPM display

Electronic Line Printer (ELP):

The ELP is a nonimpact printer using a CRT and thermo-electric process to print on direct-write paper. It features high-speed printing (600 characters per second) and direct drive by the computer.

Production of permanent (archival) records.

Removable Media Memory Unit (RMMU):

Bulk memory storage required for the DivArty FDC is provided by the RMMU and the Random Access Memory (RAM). The RMMU provides memory storage of 300,000 words for additional DivArty data and programs.

Memory Loading Unit (MLU):

Operating in conjunction with the computer is the Memory Loading Unit, an auxiliary tape memory unit providing storage capacity of 300,000 words for additional quantities of data and program and providing the initial loading capability for the main computer memory.

Random Access Memory (RAM):

The RAM provides additional bulk memory storage for increased DivArty data and programs. It has a memory capacity of 10 million bits (400,000 words).

the Memory Loading Unit, an auxiliary tape memory unit providing storage capacity of 300,000 words for additional quantities of data and program and providing the initial loading capability for the main computer memory.

Random Access Memory (RAM):

The RAM provides additional bulk memory storage for increased DivArty data and programs. It has a memory capacity of 10 million bits (400,00 words).

Data Terminal:

This unit is used at all DivArty and Battalion FDCs and in remotely used BDUs and VFMEDs. It operates in the half-duplex mode over standard Artillery communication nets shared by many subscribers and shared with voice communication.

Battery Display Unit (BDU):

The BDU, located at the firing batteries, displays and provides hard copy printout of fire orders and other messages sent to the batteries. It provides alarms and certain discrete illuminated indications. The BDU works on existing Artillery communication nets (radio or wire) in conjunction with voice.

Message Entry Devices:

The fixed Format Entry Device (FFMED) is a small rugged, lightweight, hand-held device used by FOs (and other field personnel) for entering digital messages into the FDCs. Messages are sent digitally via the setting of 25 front-panel switches. The unit works over existing Artillery communication nets using radio or wire line in conjunction with voice transmissions.

The Variable Format Message Entry Device (VFMED) provides two-way digital communication from remote units such as Survey Parties and Missile Battalions to DivArty FDCs.

STATUS:

In development for the US Army.

UNI-COMP SIGNAL ANALYSIS SYSTEMS

DESCRIPTION:

The Uni-Comp Incorporated signal analysis systems comprise a number of hardware options for use with the company's Comp-16 and Comp-18 miniature digital computers. Typical applications are in radar, sonar, and acoustic data reduction and analysis, and intelligence and monitoring operations. The range of hardware includes:

Super Fast Fourier Transform (SFFT) – 030
Vector Complex Multiplier (VCM) – 031
Matrix Complex Multiplier (MCM) – 033
Vector Complex Co-ordinate Converter (VCCC) – 032
Multiply/Divide/Square Root (MDSR) – 002

The above optional hardware modules are used to increase the computational speed of signal analysis systems versus a software approach. They are low priced accessories and enhance the opportunities for real-time analysis and processing.

The system is a flexible approach to the acquisition, and analysis of analogue signals created by various types of transducers. Designed around UniComp's 16 or 18 bit mini-computers, it can perform the following basic operations:

(1) Time sampling of one or more input analogue signals.
(2) Analysis of the acquired data using Fast Fourier Transforms, correlation analysis, convolution, power spectrum analysis, Hanning weighting, and combinations of these.
(3) Recording the raw and processed data on magnetic tape for later analysis or processing.
(4) Displaying the raw and analysed data in real-time for operator examination.

Alternatively, the system can create analogue signals containing specified frequency characteristics. Also, signals received can be modified according to desired criteria and re-created in different forms. An example is the selective shift of frequencies, phases, and amplitudes.

The 'Super-fast Fourier Transform' hardware option adapts the COMP-16 or COMP-18 general purpose computers to on-line real-time systems where simultaneous time and frequency domain analysis is required. The hardware is flexible and adaptable to a variety of systems configurations. The hardware consists of an indexing unit and complex arithmetic unit which together perform Fourier transforms on blocks of data in memory. The size of data blocks is controlled from the computer, and must be a power of 2, hence the buffer is usually 128, 256, up to 8,192 samples but other sizes can be accommodated.

The power of 2, to be used in the analysis is sent from the computer to the hardware indexing unit. A start command is then given which starts either the forward or reverse Fourier transform process. Data is moved from the computer's memory, operated on and put back in memory. The data is operated on in the complex arithmetic unit. This unit incorporates a new algorithm for complex multiplication which performs the following operation:

$$X = (REAL \cdot \cos(THTA) - IMAG \cdot \sin(THTA)/2$$
$$Y = (REAL \cdot \sin(THTA) + IMAG \cdot \cos(THTA)/2$$

Where REAL and IMAG are data supplied from memory and THTA is an angle supplied by the hardware indexing unit.

New algorithms have been incorporated in the hardware which reduce the basic FFT computation cycle by a factor of four over other methods. Control is provided for selecting either the one or two word complex format. With the two word format, up to 16 or 18 bit accuracy is preserved; however, twice as much memory is used for the same number of samples. If one word format is selected both real and imaginary samples reside in one computer word. This forces the sample size to be less than 8 (or 9 for COMP-18) bits. However, the Fourier transform is completed in ¾ of the time required for two word format.

The following estimated times are provided for the Fourier transform task for a block at N real samples complex or N/2 samples:

Time = 1·5·(N-1)·(2N) microseconds

Complex points	Real points	Time for F.F.T.*
256	512	6 milliseconds
512	1024	14 milliseconds
1024	2048	30 milliseconds
2048	4096	68 milliseconds
4096	8192	148 milliseconds

*Time assumes all data blocks are core resident.

1125.163

FADAC SYSTEM

DESCRIPTION:

The Field Artillery Digital Automatic Computer (FADAC) System is comprised of the Computer, Gun Direction, M18 (FADAC); Test Set, Computer Logic Unit, AN/GSM-70 (FALT); and Reproducer, Signal Data, AM/GSQ-64 (MLU). The Teletypewriter Set, TT-537/TG is used by the US Army for FADAC Artillery Survey, LANCE, Engineering Survey, and Met Data Reduction applications as the means to produce typed information as an output from the FADAC. A 3 kW Generator is used to provide the necessary electrical power.

FADAC is an electronic, general purpose, digital computer designed primarily for the automatic computation and display of firing data for tubed artillery, free flight rockets, and various types of missiles. In the role of fire control, the computer is capable of storing data for five batteries of any two calibres of cannon artillery. Data can be provided for each of these batteries by simple operator selector of the battery solution desired. For example, the computer can have ballistic data for both the 105 mm and 155 mm howitzer stored in its memory at one time. By insertion of new programmed information into the FADAC memory (by means of the MLU) and changing the input matrix panel, the operator can make program changes to permit solution of rocket, missile or other artillery problems such as survey counter-battery counter-mortar fire, fire planning, flash and sound ranging, reduction of meteorological data and master control for programmed automatic check-out equipment.

FALT is a test set used with the MLU to locate malfunctions in the FADAC. With proper test tapes, the FALT also has the capability of self-testing itself or can be used to test other FALTS.

The MLU is a photo-electric tape reader and is used to load the memory of FADAC. It is also used with the FALT to perform diagnostic test (trouble-shooting or check-out) of the FADAC.

GERMANY (FEDERAL REPUBLIC)

1619.163
FLER-H TANK FIRE CONTROL COMPUTER

DESCRIPTION:

The FLER-H is a hybrid computer of modular construction, principally designed and developed for use in tank fire control systems, but capable of other military applications such as anti-aircraft and artillery systems. The main elements of the computer are the computer core store and the computer control unit, plus a number of peripheral units. These include a vertical sensor for trunnion cant and terrain slope; an air data sensor; and a powder temperature measurement unit. The store is mainly comprised of integrated circuits, and, the processing of non-linear data such as elevation angle and correction data is effected by hybrid multipliers and using polynomial approximation. Modular ballistic units provide for the known parameters of the various types of ammunition used. Other input data apart from that previously mentioned consists of range, target tracking in azimuth and elevation, crosswind component, gun tube wear, departure error and parallax. Outputs of the FLER-H cover the correction angles in the form of AC electrical signals to control the sights and the weapon.

DEVELOPMENT:

Development has been carried out jointly by AEG-Telefunken and Philips Teleindustri AB.

1626.163
FALKE AND MARDER COMPUTERS

DESCRIPTION:

Falke and Marder are similar versions of AEG-Telefunken TR-84M digital computers, the main differences being in the mechanical packaging and input/output arrangements. The TR-84M is one of several military processors developed from the civil TR-8 range of machines, and others in the military range are the TR-84F, TR-86M, and TR-88M.

The Falke and Marder versions were developed for the West German Defence Ministry Falke artillery computing system, and the Marder programme, respectively. In the complete Falke system, five TR-84M computers are employed for the following functions:

(1) For sound ranging data reduction to locate enemy guns.
(2) For flash spotting data reduction with the same objectives as (1).
(3) Processing radiosonde data and compiling meteorological messages.
(4) Artillery and ballistics computations at gun positions.
(5) Fire control and battery co-ordination.

The basic specification of the TR-84M, which is housed in a NATO Type II case, comprises a core store of 4096, 18-bit words expandable up to 16,384 words; 10 MHz clock frequency; a command store capable of accommodating 30 commands; 2 microsecs cycle time; 4 microsecs add time; 8 microsecs multiplication time. There is a comprehensive library of software for artillery applications.

Other members of the series have been configured for other military applications. The TR-84F is for airborne roles, the TR-86M for communications and control and fire control applications, and the TR-88M for other military control systems. For some functions 'back-to-back' working of two computers is provided for. The TR-86M is believed to be employed in some installations of the Hollandse Signaalapparaten M-20 Series naval fire control system.

STATUS:

Development was carried out by AEG-Telefunken in the late 1960s and quantity deliveries had commenced by 1969.

CANADA

1483.363
SENSOR DATA PROCESSING SYSTEM

DESCRIPTION:

The Canadian Armed Forces Maritime Command is using a sophisticated airborne Anti-Submarine Warfare (ASW) sensor system which has been developed over a number of years since 1969 at a total cost of nearly $10,000,000. This was awarded to Computing Devices of Canada for development of both hardware and software based on the ALPHA computer, originally developed by Computing Devices' parent company in the US, Control Data Corporation.

The Computer Sensor Processing system accepts raw signal information from sensors such as airborne sonar and converts the analogue signals into digital information. This is processed by the ALPHA computer and its associated peripheral equipments. The computer is programmed for detection and pattern recognition. In the event of a pattern being recognised indicating the presence of a submarine (in the case of the ASW) the computer uses the input data to provide bearings and sound an alert, with an indication of the type of target detected.

The ASW system currently in use with the Canadian Maritime Command has been in operational use since 1965, and comprises the following modules: ALPHA central processor, 16k core memory, interface to Canadian Armed Forces equipment, independent input/output processor, two Dynatape magnetic tape mass storage systems, magnetic tape unit controller, cooling system and the power distribution box.

Recent system enhancements indicate that this system may become the advanced OMNI and directional Sensor Data Processing system suitable for application in the new ASW patrol aircraft under consideration by Canada. Latest system addition is the Fast Fourier Transform (FFT) analyser which will enable the combined signal and data processing system to handle a wider range of sensors without the necessity of any costly aircraft re-equipping.

The FFT peripheral equipment is a general purpose, high speed signal processing unit intended for military applications requiring compactness, and high performance coupled to low power consumption. The FFT – which makes extensive use of medium scale integrated circuits and MOS technology – has been specifically designed as a peripheral to the ALPHA-based system, hence obviating the need for interfacing hardware.

As well as use with sonar devices, the system is suitable for on-line processing in conjunction with electronic warfare devices, communications equipment, infra-red systems, seismic devices and radar.

SABCA TANK FIRE CONTROL SYSTEM
DESCRIPTION:

The SABCA Tank Fire Control System (TFCS) is in full production for the Leopard tanks of the Belgian Army. Delivery will start at the end of 1975. A pre-production run of four equipments was ordered at the end of 1971 and these are undergoing trials by the Belgian Army.

SABCA is prime contractor for the system with two main sub-contractors: OIP (Société Belge d'Optique de Précision – Gent) for the sight and CBL (Compagnie Belge des Lasers – Gent) for the laser (CGE licence). The specific responsibility of SABCA is for the computer, sensors, mirror drive, system integration and installation kit.

The SABCA TFCS uses high accuracy analog computation technique in the ballistic computer and non-standard condition sensor normalisation circuits. The high performance laser uses logic circuits for range computation.

A combined laser/optical sight makes use of a ruggedized two-degree of freedom gimballed mirror drive, in order to keep the reticle always centered in the field of view regardless of the lead angle value. The mirror drive approach also automatically keeps the laser and optical axes exactly aligned at all times.

System built-in test, both continuous and triggered, gives a high confidence level in the system operation, and automatically designates the faulty unit in case of failure. The whole is designed for simple and easy maintenance and maximum accessibility.

A Firing Simulator for combat tanks called TALAFIT is also produced by SABCA and a prototype has been delivered to the Belgian Army. Full production will begin in 1974. TALAFIT consists of a simulator unit and a control panel for the instructor. It is installed on the gun turret in front of the gunsight window. The gunner is presented with a fixed battle scene with standing and moving targets, which he has to detect, identify and to engage.

The instructor is able to observe aiming and operating errors and to check the gunner's reaction time. It is also possible to interconnect several trainers for gunnery competitions, each trainee being installed in his own tank.

MANUFACTURER:

SABCA Chaussée de Haecht 1470, 1130 Bruxelles, Belgium.

DENMARK

1576.153
DR 513 BALLISTIC RADAR
DESCRIPTION:

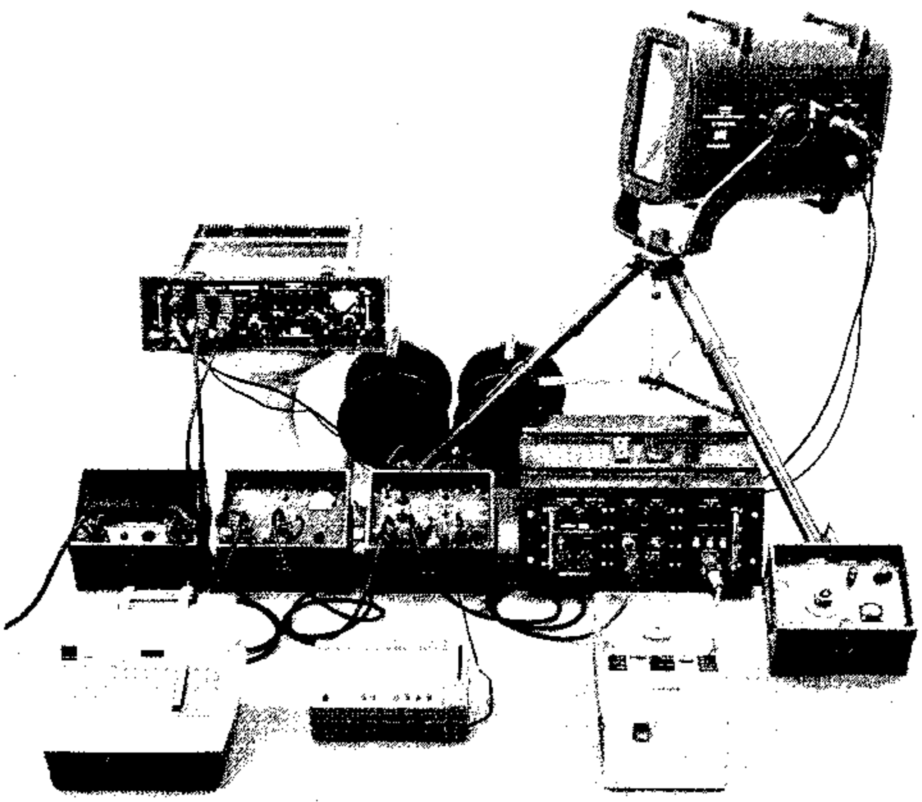
The doppler radar DR 513 is a ballistic measuring instrument designed for muzzle velocity measurements on various kinds and sizes of projectiles. The equipment is equally well suited for use in the field and on shooting ranges. The basic doppler equipment consists of the Antenna Unit, Data Unit, and Test Unit.

The antenna unit contains a horn antenna with a dielectric lens and the receiver-transmitter assemblies. The mechanical as well as the electrical construction of the antenna unit is designed to withstand a very high degree of shock and vibration, making it possible to place the unit next to or even on top of the firing equipment. By this means the geometrical error is minimised, and thus the accuracy of the equipment is increased.

The doppler signal from the antenna unit is transferred to the data unit by means of a coaxial cable. The doppler signal is led through filters to an assembly where the "velocity" is measured at two points of the trajectory. The result is displayed on the front panel. By means of the test equipment it is possible to simulate a moving target, making it easy to check the whole radar equipment.

To extend the possibilities of the basic radar equipment a number of additional units are available. Through use of the entire system, and the collected information, it is possible to make advanced trajectory analyses such as digital and analogue measurements throughout the trajectory.

By means of punched paper tape, the results and additional information can be transferred to a computer for further processing.



DR 513 Muzzle velocity doppler radar system

CHARACTERISTICS:

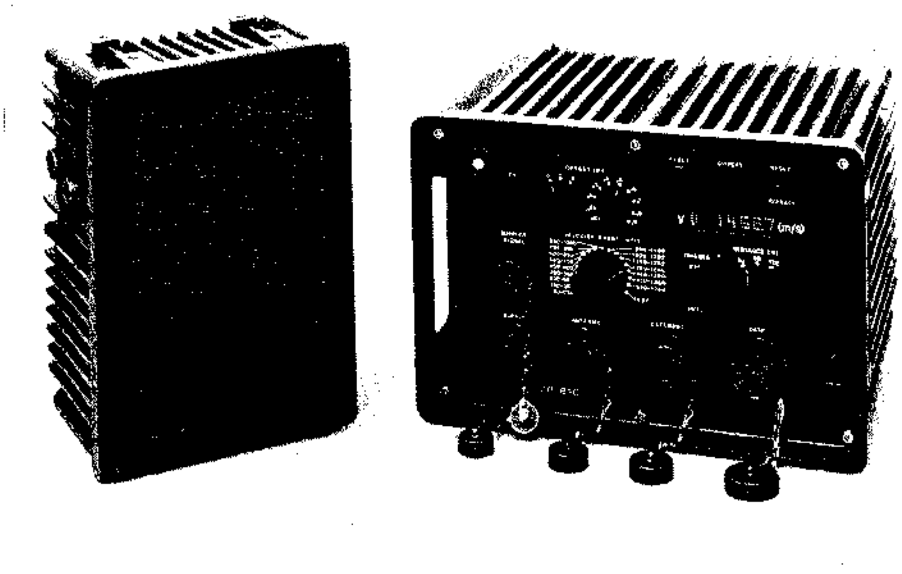
Technical Specifications (basic equipment):
Antenna unit: Horn antenna with dielectric lens
Beamwidth, Horizontal: 14 degrees
Beamwidth, Vertical: 6 degrees
Polarisation: Horizontal

Transmitter:
Frequency: 10493 MHz (standard)
Power output: 300 mW (minimum)

Receiver:
Duplex: Ferrite circulator
Noise figure: 13 dB

Velocity range: 50 2000 m/sec
Data display: Nixie tubes
Power supply: 24 V d.c. + 10 per cent
Dimensions and weights:
Antenna Unit: 620 × 400 × 270 mm
47 kg
Data Unit: 500 × 200 × 330 mm
24 kg
Measuring points: 30 and 40 m (standard)
Measuring base: 2 m (standard)
STATUS:
The equipment was developed by Terma Elektronisk Industri A/S, Arhus N, Denmark, and has so far been delivered to forces and weapon manufacturers in Denmark, Norway, Sweden, Finland, West Germany, Holland, Switzerland, Italy, Yugoslavia, Great Britain, Mexico, Singapore, Malaysia and Pakistan.
MANUFACTURERS:
Radartronic A/S, Helsingforsgade 14, 8200 Arhus N Denmark.

2286.153
DR 810 BALLISTIC RADAR
DESCRIPTION:
DR 810 (Doppler Radar 810) is designed to measure muzzle velocities (MV) under field-service conditions. The equipment consists of an Antenna Unit and a Data Unit and is constructed so that it requires a minimum of operation. The measurement procedure is fully automatic and the measurement result is presented in metres/sec. immediately after firing.
This is obtained by placing the Antenna Unit on the elevating non-recoiling parts of the gun so that the radar beam always covers the projectile's trajectory. The velocity is measured in several points of the trajectory and the muzzle velocity is found by extrapolation back to the muzzle.
CHARACTERISTICS:
a) The muzzle velocity is displayed in metres/sec. immediately after firing with an accuracy of 0.1%.
b) Average muzzle velocity of the last 2-8 shots can also be displayed automatically after each shot.
c) Velocity range 50-1750m/s.
d) Programmable Data Unit for optimal accuracy on different kinds of measurement problems.
e) Built-in interface capability for external data handling equipment (e.g. fire control computers).
f) The short processing time gives the ability of measuring the muzzle velocity of automatic weapons.
g) The Antenna Unit can be placed on the elevating non-recoiling parts of the gun or on a tripod next to the gun.
h) Automatic indication of measurement errors.



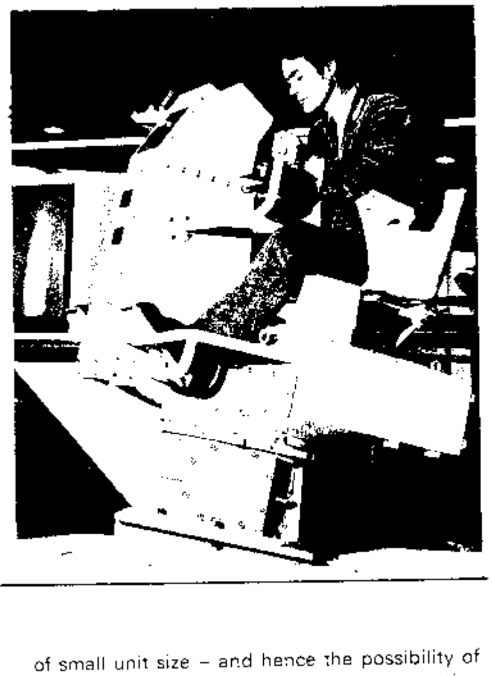
Units of DR 810 radar

i) The first measurement point can be selected 30, 60, 120 m from the muzzle in order to avoid muzzle flash disturbances.
j) Automatic correction of the parallaxe between the projectile trajectory and the Antenna line of sight.
k) 24 V DC and 220 V AC operation.
l) Crystal controlled transmitter frequency.
Antenna Unit:
Size (H × W × D): 305 × 217 × 163 mm
Weight: 13 kg
Data Unit:
Size (H × W × D): 250 × 367 × 316 mm
Weight: 22 kg
DR 810 is tested after IEC – 68 – 2

MANUFACTURER:
Radartronic A/S, Helsingforsgade 14a, 8200 Arhus N, Denmark.

FRANCE

2162.283
OPTICAL FIRE CONTROL AND TARGET DESIGNATION EQUIPMENT
DESCRIPTION:
This optical fire control and target designation set is a complex, lightweight one-piece unit which is easy to operate, and suitable for use on all kinds of surface vessels. It could also be installed in appropriate types of land vehicle.
Three operating modes are available: gun fire or missile-launching control; air and surface firing observation; operation with line-of-sight controlled by an external equipment. The set incorporates the equipment necessary for aiming and stabilising the optical line of sight (servo-control system and rate-gyro unit) and defining fire control co-ordinates and transmitting them to a weapon. If desired, the set may be associated with a cine camera, a low-light or normal TV camera and/or a laser range-finder. Adaptation to a particular weapon or system is achieved by changing modules.
CHARACTERISTICS:
Elevation: $-25°$ to $+65°$
Traverse: unlimited
Maximum angular velocity: elevation or traverse, 2 rad/sec
Weight: 330 kg approx
Clearance radius: 0.75 m
STATUS:
In series production for the French Navy and others.
MANUFACTURER:
CSEE – Compagnie de Signaux et d'Entreprises Electriques, 2-9 rue Caroline, Paris cédex 17, France.



CSSE Optical fire Control and Target Designation Equipment

ITALY

2234.283
GUN REMOTE CONTROL EQUIPMENT
DESCRIPTION:
This equipment has been designed to provide accurate and rapid control of the movement of guns and similar heavy devices on training and elevation mountings. The initial application will be to 3-inch and 5-inch guns but rocket launchers and radar antennas are other suitable applications.
The basic idea is that of taking advantage of the low inertia of a small DC electric motor and multiplying the mechanical output of such a motor by a factor consistent with the mechanical power required by coupling a series of motors in parallel by mechanical means. In this way the total inertia of the mechanical array is maintained at a lower level for a given power output than that of an equivalent single motor. The motors – which are, of course, low inertia types – are driven by an electrical system which uses silicon controlled rectifiers.
Primarily aimed at providing a means for rapid slewing in training and elevation with low angular error, the equipment offers the added advantages of small unit size – and hence the possibility of compact installation – low power consumption and ease of repair and maintenance.
DEVELOPMENT:
Development was started as a private venture in 1968, the first prototype was completed in May 1969 and service entry was planned for October 1969. Twenty-six installations have been ordered for use with gun mountings in the Italian, German and Canadian Navies.
MANUFACTURER:
OTO Melara, Via Valdilocchi, La Spezia, Italy.

2247.293

ALBATROS MISSILE LAUNCHER

This equipment is intended for use in the Albatros weapon system (**1551.281**) employing the Sparrow RIM-7H or the Aspide 1A missile. It is an 8-compartment launcher designed for installation on warships ranging in size from corvettes upwards. The launcher consists of a training mounting on which the group of eight launching cells is mounted and can be elevated or depressed.

Each cell contains a missile with folded wings, hanging from a launching rail. The cells are airtight and provided with an autonomous climatization system.

The forward hatch will open automatically an instant before firing and the light rear cover will be broken during firing by the exhaust pressure. Should an accidental ignition occur, the missile will remain hooked on the rail, the adjacent cells will not suffer, and the gases will escape through the rear blast cover.

DEVELOPMENT:

Development started in 1968 on an Italian government contract and firing tests were successfully concluded in 1971 at the Sardinia missile range. Technical and operational evaluation was carried out by the Italian Navy in 1972/73 with a prototype of the launcher installed on an operational ship.

CHARACTERISTICS:

Training:
Arc: +165°
Speed: 45 deg/sec
Acceleration: 30 deg/sec/sec
Resetting time for 120 deg: 5 sec
Static error: +1 deg

Elevation:
Arc: −5 +65 deg
Speed: 25 deg/sec
Acceleration: 30 deg/sec/sec
Resetting time for 60 deg: 4 sec
Static error: +1 deg

Electric supply requirements:
115 V 400 Hz three phase
440 V 60 Hz three phase
28 V DC

Total rated power: 30 kVA

Environmental conditions:
Operating temperatures:
min: −10°C
max: +38°C plus solar radiation of 1,000 W per sq metre
Storage temperatures:
min: −10°C
max: +75°C

Weight less missiles: 7 tons

Applicable specifications are the MIL Standard and Italian Navy specs.

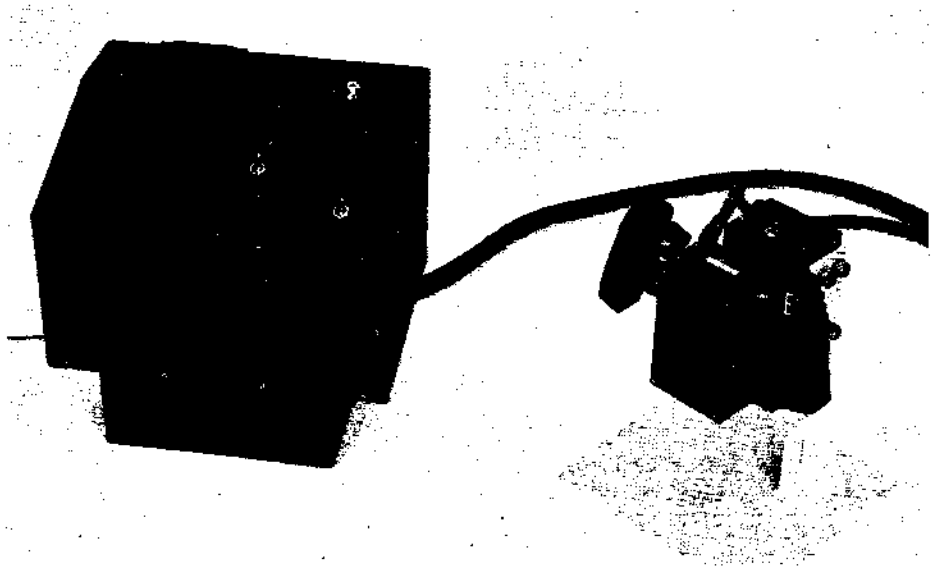
TANK FIRE CONTROL SYSTEM

DESCRIPTION:

This is a computer-controlled fire control system designed for use in the Swedish IKv91 light tank (**5063.102**) but capable of further development to meet the requirements of other tanks and of more sophisticated gun-laying.

Heart of the system is a ballistics computer which accepts any or all of the following preset or continuous inputs.

Range from a laser range finder or manually set
Ammunition characteristics of up to three different types
Muzzle velocity and powder temperature for each type of ammunition
Air Pressure
Air Temperature
Cross wind
Angular velocity of target in azimuth and elevation as measured by the gunlaying system
Deviation angles in azimuth and elevation (according to type of ammunition)
Trunnion tilt
Parallax correction gunsight to barrel



AGA Tank Fire Control System with computer box cover closed

The computer is an all-electronic device using dc voltages to form control analogues but with digital control of logic and switching functions. Using the input data listed above, it calculates the lead angle and superelevation needed to hit the target whether the latter be stationary or moving. The trunnion tilt is measured by a single pendulum with its axis, parallel to the gun axis; and since the gunner's line of sight is also parallel with the gun axis, the tilt is measured in the weapon-gunsight coordinate system and is thus independent of any inclination of the chassis in other directions. This tilt correction is optional, however, and can be switched off if required.

Gun-laying can be performed either by the gunner or by the tank commander. Rate-aided control is used in both azimuth and elevation, giving high maximum laying velocities. The exact relation between the desired angular velocity demanded by the layer and the real velocity produced by the servos is controlled by accurate tachometers mounted on the servos.

The laying handle is operated by both hands and embodies a switch to introduce or remove lead angle computation according to the nature of the target, another to select laser range finder or manual range and, of course, the firing switch. It also includes a "dead man's grip" which switches off the servos when the handle is released. The servos are also switched off when hatches which can interfere with the gun are open. A further safety precaution is afforded by control of the permissible gun elevation which varies with direction relative to the chassis. An important feature is the quite independent line of sight which allows the operator to leave the lead angle switch on at any target manoeuvre aspect.

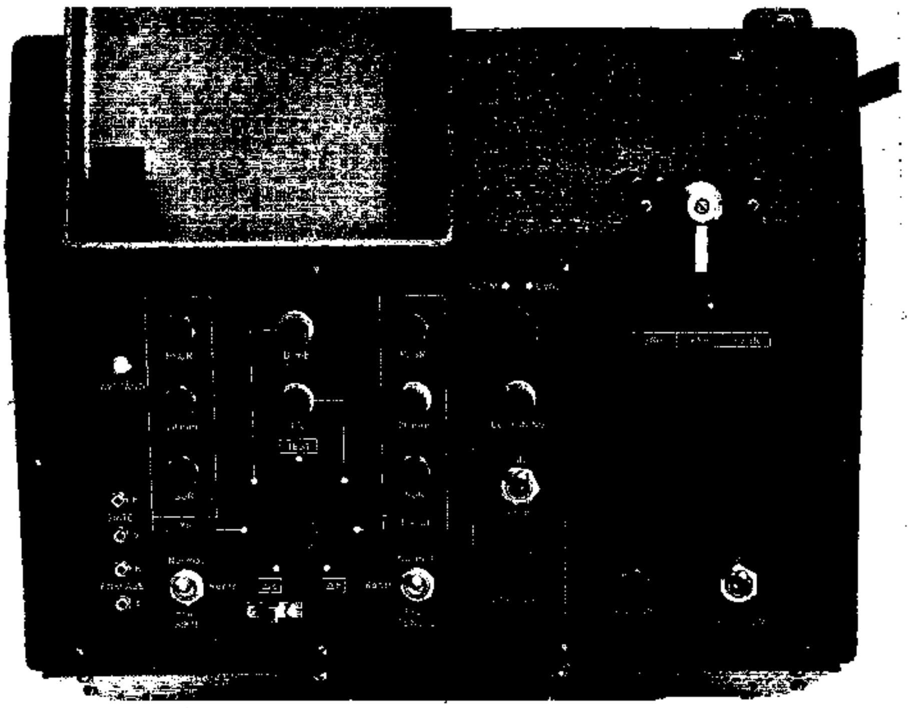
The computer is housed in a single box on the front panel of which are mounted all necessary controls. Most of these are covered by a hinged lid in operational conditions, the controls available in such conditions being the ballistics selector – a large 3-position switch – and the manual range and crosswind setting controls. A display panel in the centre of this part of the front panel normally presents the manual range selected but can also be used to set crosswind. When the hinged lid is raised, this same display is used to present the set values of the ballistics and other controls as selected by a selector switch; it can also be used as a voltmeter for troubleshooting.

EXTENSION POSSIBILITIES:

As designed for the IKv91 the fire control system is used to engage targets when the tank is at rest. AGA, however, have also designed a system which can be used for fire control from a moving tank. A vertical reference gyro (also made by Aga) replaces the simple pendulum device and additional control circuits are used to establish a completely independent line of sight also in this system. Advantages of this approach to the problem (ie an independent line of sight in both systems) are said to be the possibility of obtaining high dynamic gunlaying accuracy without the need for powerful and costly gun and turret servos; and, resulting from this, the possibility of low-cost retrofits in older tanks.

CHARACTERISTICS:

Range: 200-2,000 m
Elevation: $-10°$ to $+15°$
Tracking speed: azimuth: 80 mils/sec; elevation: 40 mils/sec
Slewing speed: azimuth: 400 mils/sec; elevation: 200 mils/sec
Minimum speed: 0.1 mil/sec
MV: nominal + 50 m/sec
Powder temperature: $-45°$ to $+55°C$
Air temperature: $-45°$ to $+55°C$
Air pressure: 900 to 1,100 mb
Tilt: $+15°$
Jump: +3 mils



Computer box with cover open

STATUS:

After a development lasting less than a year, highly successful operational trials were carried out by the Swedish Army in the Summer of 1972.

The IKv91 installation is now in series production.

AGA 181 20 Lidingö 1, Sweden.

2324.153
ANTI-AIRCRAFT FIRE CONTROL SYSTEMS

DESCRIPTION:

Several mobile anti-aircraft fire-control systems designed and supplied for use with 40 mm or 57 mm Bofors anti-aircraft guns by L.M. Ericsson but no longer in production are still in service with the Swedish Army. Available information relating to three such systems is set out below.

1. Ericsson / Arenco Radar System

This comprises an Ericsson PE-48/T X-band radar (**2325.153**) and an Arenco Electronics computer mounted together with operator's equipment on a substantial platform which is levelled by hydraulic jacks. The radar tracks in range and angle and supplies data for processing by the computer which in turn provides fire control signals for two 40 mm or 57 mm guns.

2. Ericsson / Contraves Radar / Optical System

This comprises an Ericsson PE-452/T X-band radar (**2327.153**) mounted on a Contraves optical-tracking fire control unit which also contains a Contraves fire control computer. The radar measures range only; and radar range and optical angular data from the inputs to the computer which in turn provides fire control signals for two 40 mm guns. The chassis on which the system is mounted can be manhandled over short distances and is levelled by screwjacks.

3. Ericsson / Contraves Radar System

This comprises an Ericsson PE-453/T X-band radar (**2328.153**) mounted on a chassis which incorporates a Contraves fire control computer. The radar tracks in range and angle and the computer controls two 40 mm guns. The chassis is levelled by screw jacks.

A fourth Ericsson radar, the S-band PS-171/R (**2326.153**), is used as an early warning/putter-on. It is contained in a cabin on a four-wheeled trailer with the aerial on the roof.

STATUS:

All the above systems are believed still to be in service with the Swedish Army; but production has ceased and final deliveries were made in 1967.

MANUFACTURERS:

Systems and radars: Telefonaktiebolaget L.M. Ericsson, MI Division, S-43120 Mölndal, Sweden.

Computers: Arenco Electronics and Contraves AG.

Guns: AB Bofors.

2604.153
ISIDOR MUZZLE VELOCITY METER

DESCRIPTION:

Jointly developed by L.M. Ericsson and SATT Elektronik the Isidor muzzle velocity meter is intended for use with artillery under active service conditions.

The equipment consists of a light (4 kg) rectangular microwave antenna unit, which can be mounted on any convenient part of the gun structure so that the radiation axis is parallel to the barrel, and a calculator unit. If the gun does not provide a convenient attachment point for the antenna unit there is provision in the calculation process for the insertion of a parallax correction.

The antenna unit contains a solid state transmitter which energises the antenna through a circulator and supplies a reference signal to a balanced mixer in the receiver chain. The output from this mixer forms the input to a pre-amplifier and high-pass filter from which signals are taken by cable to the calculator unit. At this unit the doppler frequencies are measured and the corresponding velocities displayed – after corrections for parallax and retardation have been applied – as the difference between preset nominal and measured velocity for single rounds or as the average of a number of rounds.

Range capability of the equipment is more than 2,000 times the calibre of the shell – the purpose of this not inconsiderable range being to permit measurements to be made with high velocity guns around whose muzzles a cloud of ionised gas forms after every shot, making it difficult if not impossible for a radar device to 'see' the shell as it leaves the barrel.

Measurement accuracy of the equipment is said to be 0.5% and measurements can be made within the range 175 m/sec to 1,100 m/sec. The whole equipment meets Swedish Army environmental requirements.

MANUFACTURER:

Telefonaktiebolaget L.M. Ericsson, MI Division, S-43120 Mölndal, Sweden.

THE UNITED KINGDOM

1038.183
CHIEFTAIN TANK GUN CONTROL EQUIPMENT

DESCRIPTION:

Gyroscopic control is applied to the gun traverse and elevation axes through a servo loop. This stabilises the gun so that it is unaffected by any movement of the hull of the vehicle occasioned by rapid manoeuvre or movement over rough terrain. The system is used in the Chieftain tank and is largely responsible for the high in-motion performance achieved with its 120 mm high velocity gun. The basic principles of the servo system are similar to those employed on the Centurion. The mechanical considerations involved, however, differ considerably. There are three modes of operation.

OPERATION:

Non-Stabilised Mode: When the vehicle is stationary and the equipment is used in the unstabilised mode, the gunner is part of a fast response servo system controlling traverse and elevation while observing the target through a telescopic sight of high magnification. Separate controllers are available for traverse and elevation, or a 'duplex' controller for one-hand operation may be provided. The gunner can rapidly traverse and elevate in a few seconds and track a moving target to within about one minute of arc whilst awaiting the order to fire from the Commander.

Stabilised Mode: With the vehicle in motion, particularly over rough country, accurate laying would normally be impossible. In the stabilisation mode a pair of rate gyros mounted on the gun cradle produce electrical signals proportional to the angular velocity in space of the gun in traverse or elevation. These signals are combined with the output from the tachometer-generators to form a 're-set' signal injected into the appropriate servo channel. The effect is to keep the muzzle of the gun pointed at the same point in space.

Thus, in a Chieftain moving at speed across rough country, if the gunner now makes only the normal tracking corrections, the gun will continue to point at the target irrespective of the attitude of the hull of the vehicle.

Emergency Mode: The turret can be traversed at fixed speeds to right and left and the stopping position selected. In addition, a purely manual mode is provided in which the speed of traverse and elevation is limited by the ability of the gunner to rotate the heavy turret.

DEVELOPMENT:

Joint programme, GEC Electronics and the Fighting Vehicles Research and Development Establishment.

MANUFACTURER:

Marconi Radar Systems Ltd, Control Engineering Department, New Parks, Leicester, England.

2596.183
GUN CONTROL AND STABILISATION SYSTEMS GCE576 AND GCE581

DESCRIPTION:

These modernised gun control and stabilisation equipments have been designed primarily for installation in the Centurion tank. The purpose of the development is to enable countries who wish to retain their Centurion tanks in active or reserve service for several years to come to replace the obsolete thermionic Gun Control Equipment FV/GCE No 1 with a modern system. The reason for offering two versions of the equipment is that some Services wish to retain the original servo motors and metadynes mounted in the vehicles, and the GCE581 equipment is designed to operate with these machines. Using the original electrical machines means that the peak turret and gun speeds and accelerations are as for the original FV/GCE No 1 thermionic equipment; however, many of the advantages stated below are common to both versions of the equipment, and because better gyroscopes and higher amplifier loop gains are used, the stabilisation accuracy of the GCE581 system is much better than the FV/GCE No 1 equipment.

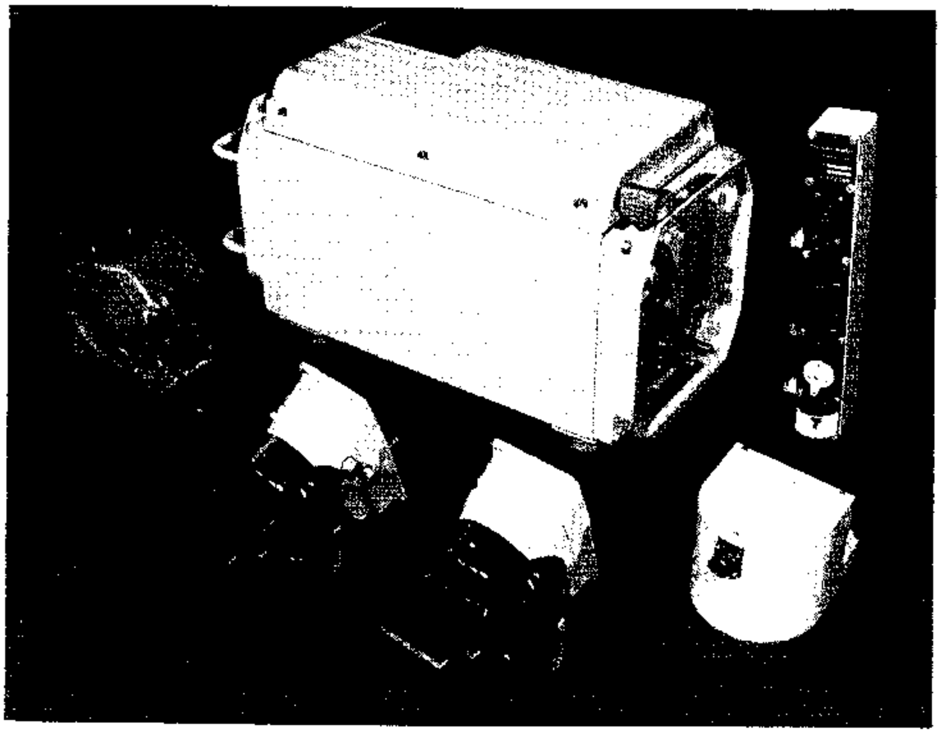
If a better performance as regards turret and gun speed is required, then it is necessary to change the metadyne and servo motors used with FV/GCE No 1 for more powerful machines, and Marconi equipment GCE576 uses such machines in conjunction with a new control cubicle.

The control cubicle itself uses modern components throughout, and improved testing and monitoring facilities are included so that faults can be rapidly traced and diagnosed, and the equipment set up quickly.

All units in the cubicle can be changed on a plug-in replacement basis, allowing repairs to be carried out rapidly by relatively unskilled staff. The size and weight of the cubicle has been reduced. All connectors are NATO-approved quick-release types.

The separate elevation and traverse gyros are replaced by a single modern 2-axis low drift gyroscope unit. A two-handed duplex gunner's controller replaces the original separate controllers, and allows more accurate and easier gun laying. The 400 Hz supply for the gyroscope spin motors is generated by a solid-state inverter mounted in the control cubicle, which replaces the motor-alternator set used with the FV/GCE No 1 system. The run-up time for the equipment is less than one minute, and in fact the system can be used after only twenty seconds, which considerably reduces the time required for the tank to achieve action-readiness. The power taken from the vehicle supply in the standby conditions (with the control equipment switched ON but the metadyne OFF) is reduced to less than 4 amps from 20 amps.

Relative performances of the two systems are:



New items of Marconi GCE576 and GCE581 systems showing the Control Cubicle with (left to right) the single 2-axis gyro unit, gunner's controller, commander's controller, elevation tachogenerator and switch unit

	GCE576	GCE581
ELEVATION motion of gun		
Max Controlled speed mil/sec (°/sec)	100 (5.7)	100 (5.7)
Maximum Acceleration mil/sec² (°/sec²)	240 (13.5)	440 (25)
Traverse motion of turret and gun		
Max Controlled Speed mil/sec (°/sec)	100 (5.7)	100 (5.7)
Max (slew) speed mil/sec (°/sec)	311 (17.5)	417 (23.5)
Maximum Acceleration mil/sec² (°/sec²)	550 (31)	666 (37.5)

It is seen that the GCE576 system allows an increase in traverse speed of 35%, and an increase in acceleration of 22% in traverse.

The stabilisation performance of the GCE576 system is such that a 2 mil diameter target is held for 56% of the total time when the vehicle is traversing a rough-country course at 10 mph.

Since the GCE581 system is not able to produce the same peak accelerations as can the GCE576, it will hold a 2 mil diameter target for 50% of the time.

It should be stated that these figures include all sections of the test course and that during severe hull manoeuvres or disturbances the gunner would not attempt to fire, giving effectively a better average stabilisation figure. For GCE576 the standard deviation from point of aim is 1.3 mils.

The mechanical condition of the vehicle must be reasonable but does not need to be first class in order to obtain a good performance when the Marconi gun control equipment is fitted.

MANUFACTURER:

Marconi Radar Systems Ltd, Control Systems Department, New Parks, Leicester, England.

2597.183
POWER TRAVERSE SYSTEMS FOR LIGHT FIGHTING VEHICLES

DESCRIPTION:

A power traverse system has been developed to meet the requirement for a power traverse facility in several AFV's, such as the Scorpion light tank and Fox armoured car.

The system can be fitted onto other AFV's which mount turrets having approximately the same weight and dimensions as the two vehicles referred to above, and by carrying out some modifications to the traverse gearbox a similar arrangement can be retro-fitted into Saladin armoured cars.

The manual traverse gearbox is replaced by a power traverse gearbox which fits directly in place of the present gearbox.

A control amplifier allows the motor speed to be varied from low speeds up to slew.

The gunner has a robust hand wheel which can be used to traverse the turret manually. When the handle is lifted against a light spring pressure, the power control mode is selected, and the handle is held in this position by a catch on the gunner's handle to prevent the gunner tiring. When the catch is released the handle falls back to the neutral position.

In order to engage the traverse hand drive, the gunner pulls down the handle, again against a light spring pressure, and engages the hand-drive gearing.

This allows the turret to be turned by hand, and thus operates as an emergency mode should any fault occur on the power system.

Some gunners also like to carry out the final laying of the gun by hand, and the arrangement described allows this to be done.

When the gunner selects the power traverse mode, zero turret speed is always demanded until he turns the handle in the direction in which he wishes to traverse the turret. Slew is achieved by moving the handle 30 degrees left or right, and the characteristic of the control is shaped so that accurate control of the turret at low traversing rates can be achieved easily.

The amplifier assembly is designed to be mounted at the base of the commander's sight, and the commander has a controller at his position which allows him to override the gunner and to turn the turret and gun onto any target which he selects.

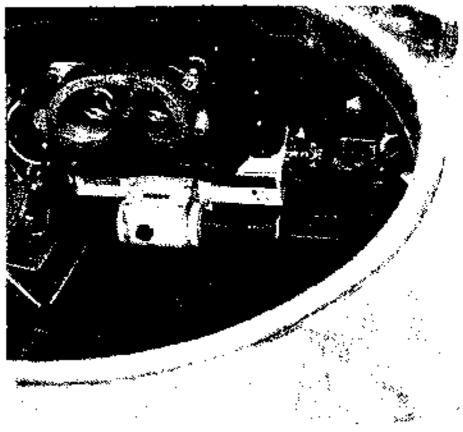
Full control of the turret over the complete speed range can be achieved by either the gunner or commander.

The existing manual traverse indicator can be mounted onto the Marconi power traverse gearbox, or a digital pickoff can be mounted which is used with a Marconi electronic traverse indicator, with digital readout of turret position in mils.

Special emphasis has been placed on ease of operation of the system. The gunner can control the turret from "creep" speeds, up to 427 mils/second under power without removing his hand from the manual traverse handle.

The commander can take control of the turret at all times when the system is in the power mode.

The control amplifier uses solid-state electronic components throughout, and is ready for immediate operation at switch-on. The amplifier output stage uses switching techniques which results in minimum power being dissipated in the amplifier assembly itself, and increases the electrical efficiency of the system. Electronic circuits limit the peak output current during a motor acceleration phase to 25 amps.



The commander's controller installed in Scorpion

The totally enclosed motor has an integral brake fitted, which is lifted when the gunner or commander demands power traverse, and therefore gives a fail-safe system. A pre-set slipping clutch mounted in the gearbox prevents damage should the gun strike an obstacle, but this clutch exerts sufficient torque to prevent slip occurring when the vehicle hull manoeuvres rapidly. An anti back-drive mechanism prevents the gunner's handle being turned when the gun hits an obstruction, or when the vehicle jinks. The equipment conforms with UK MoD (Army) standards, including MVEE specification 2051, and the operating temperature range is −40°C to +70°C.

For use in the Fox vehicle, the same amplifier assembly is offered in conjunction with a traverse gearbox designed for fitting the restricted space of the Fox turret.

As an alternative solution, a modification kit can be supplied which allows the existing design of hand traverse gearbox in the Fox vehicle to be modified for power operation, this being used in conjunction with the standard amplifier assembly.

The gunner's controller installed in Scorpion

It is a relatively simple matter to modify the output circuit of the power amplifier so that higher output currents may be supplied (up to 75 amps) should a requirement arise to control a more powerful motor driving a larger turret on a new design of vehicle.

CHARACTERISTICS:

Additional Weight (approximate):
Power Amplifier and Commander's Controller: 4.9 kg
Motor 2.0 kg
Relay Box and Cable Harness 5.0 kg

Maximum designed turret slew speed: 427 mils per second (24°/sec) on slopes up to 20°

Supply Voltage: 28 volts dc

Peak Current: 25 amps when slewing

Normal operating current: 10 amps

MANUFACTURER:

Marconi Radar Systems Ltd, Control Systems Department, New Parks, Leicester, England.

2435.153
PROJECTILE VELOCITY MEASURING RADAR

DESCRIPTION:

An integrated range of velocity measuring equipment is manufactured by Ferranti Ltd. Included in the range is PACER, which is intended for battlefield use and provides a direct read-out of muzzle velocity, and PVME (Projectile Velocity Measuring Equipment) which is a flexible and precise instrument, for use at proof-ranges and research and development establishments.

PACER:

PACER utilises a small rugged radar head with a solid-state transmitter which is activated only during measurement. The display unit incorporates simple operating controls and a nixie read out which indicates true muzzle velocity in metres per second. The mean error on MV measurement is ±0.3 metres/second over a velocity range from 200 to 1,600 metres/second. Measurements down to 100 metres/second can be made at reduced accuracy. PACER can be operated from 24 volt dc (5A typical) or from ac mains. It is rugged, weatherproof and designed for field use. It can be deployed from a vehicle and brought into operation by one man. Internal test and validity check features are provided.

PVME:

The equipment is configured to meet the needs of proof ranges and R & D establishments for an accurate and flexible doppler system. Accuracies in velocity measurement of 1 part in 10^4 can be achieved over a series of velocity measurements at precisely timed intervals along the trajectory.

The measuring path-length, the delay which defines the start of the first measurement and the interval between successive measurements are under the control of the operator and all measurements are duplicated using doppler receivers of differing bandwidth.

Three methods of read-out are provided:

1. An oscilloscope provides an analogue display of velocity against time as an indication that the physical measuring conditions are satisfactory.
2. The processor unit can store (for subsequent display) the timings of the projectile (to 1 microsecond) through the first three measuring intervals.
3. An optional 'accessory module' enables these timings and those for successive measuring intervals to be punched onto paper tape for subsequent print-out or computation.

Combined Systems:

The PACER display unit can be used with a PVME system to provide immediate read-out of muzzle velocity. The PACER radar head can be used in conjunction with the PVME processor and accessory module where small size and enhanced blast-resistance are of more importance than extreme radar range.

MANUFACTURER:

Ferranti Ltd, Military Systems Dept, Simonsway, Wythenshawe, Manchester M22 5IA, England.

2468.183
POWER TRAVERSE SYSTEM FOR LIGHT FIGHTING VEHICLES

DESCRIPTION:

Developed to meet a demand for power traverse facilities on various AFVs, including the Fox armoured car (**5064.102**) and the Scorpion/Scimitar family of light fighting vehicles (**5040.102**), this system is appropriate to AFVs carrying turrets of the same general dimensions as these vehicles.

The manual traverse gearbox has been modified to provide variable speed powered traverse, yet maintain its interchangeability with the manual gearboxes already fitted. An override and speed control facility for the vehicle commander is provided. This is normally mounted beneath the commander's sight but its location can be varied.

The traverse handle is normally retained in the lower (or manual traverse) position by light spring pressure. Power slew is engaged when the handle is brought to a set position and pressed upwards to overcome the spring pressure. Movement of the gunner's handle through approximately 40° in the direction in which slew is required causes the turret to slew at a single speed. Rotation continues until the handle is returned to the set position. The control handle is spring biased to the centre and downwards and prevents accidental operation of the motor. The gunner is provided with power slew only, fine laying being achieved with the manual traverse. The commander's override facility is operable only with power slew engaged by the gunner and gives full variable speed, fine lay being provided so that the commander may lay the gunner on the correct line in azimuth.

CHARACTERISTICS:

Additional weight for power modification: approx 5 kg

Maximum designed turret slewing speed: 427 mils/sec

Minimum turret tracking speed: 0.9 mil/sec

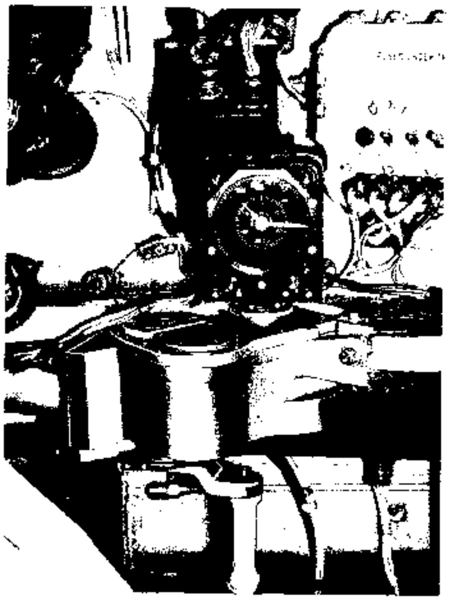
Maximum gradient of operation: 20°

Supply voltage: 28 V DC

Normal operating current: 10 A

MANUFACTURER:

Dunlop Ltd, Aviation Division, Holbrook Lane, Foleshill, Coventry, CV6 4AA, England.



Commander's control in a Scorpion tank

WEAPON STABILISATION SYSTEM

DESCRIPTION

The weapon stabilisation system made by the National Waterlift Company in the USA and described in entry **2740.183** is also made under licence from NWL in the United Kingdom.

No information is available concerning differences between the US and UK versions of the equipment. All performance and operational data appear to be the same for both installations; but it is assumed that the British-made equipment uses at least some British made components and that there has therefore been some redesign to accommodate such changes.

MANUFACTURER:

Dunlop Ltd, Aviation Division, Holbrook Lane, Foleshill, Coventry CV6 4AA, England.

THE UNITED STATES OF AMERICA

2829.183
ADD-ON WEAPON STABILISATION SYSTEM

DESCRIPTION:

This is an electro-hydraulic add-on stabilisation system developed as a private venture by Cadillac Gage and adopted by the American, Belgian and Federal German authorities for retrospective fitting.

The stabilisation system is basically a feedback positioning system utilising conventional rate gyros with electronic integrators as reference elements. Position information obtained is processed and applied to the electro-hydraulic servo valves in each axis. These valves, in turn, supply the required hydraulic fluid to the elevation and traverse mechanisms to correct the attitude of the gun. Additional system state variables are measured, processed, and added to the position loop to provide damping, permitting extremely high system gains.

To enable the operator to superimpose corrections upon the system, electrical transducer outputs are added to those from the gyros in such a manner that handle position commands a system velocity similar to that commanded by the control valves in the power control system.

Widely varying vehicle battery voltages are converted by the system power supply into the closely regulated AC and DC voltages necessary to operate the stabilization system. Regulation of this unit is such that voltage variations caused by other electrical systems in the vehicle do not affect the performance of the stabilization system.

MANUFACTURER:

Cadillac Gage Company, P.O. Box 1027, Warren, Michigan 48090, USA.

2549.183
HYDROMECHANICAL TRANSMISSION

DESCRIPTION:

Designed for use with SP guns and other tracked and wheeled vehicles, this system provides an infinitely variable ratio for the propulsion and steering transmission of tracklaying vehicles and hydromechanical transmission for wheeled vehicles at optimum engine fuel consumption.

A closed-loop control, combined with the infinitely variable ratio characteristic of a split hydraulic/mechanical power path transmission continuously matches the operator's vehicle speed command and road load requirement to the optimum engine conditions, by automatically adjusting the transmission ratio.

STATUS:

Development started as a joint company/government venture in 1960. Prototype installations for wheeled and tracked vehicles were completed in 1963 and 1965 respectively. Vehicles in which the system has been demonstrated include: the XM 104 SP 105 mm Howitzer, the M 113, the XM 729 armoured vehicle, the XM 759 Marginal Terrain Vehicle, the XM 701 MICV 65 and the XM 723, MICV 70. Under a contract to FMC Corporation, GE has manufactured eight 500 hp XM 2 transmissions. In a recent endurance demonstration an XM 2 completed a 10,000 mile run at the GE Pittsfield, Mass. course. Current user of the system is the United States Army.

MANUFACTURERS:

Electronic Systems Division (Ordnance Systems), General Electric Company, 100 Plastics Avenue, Pittsfield, Mass. 01201, USA.

MICV in which the GE XM2 transmission completed a 10,000 mile endurance run

2548.183
ALL-ELECTRIC STABILIZED GUN DRIVES

DESCRIPTION:

These gun drives, developed as a private venture by the Electronic Systems Division (Ordnance Systems) of the General Electric Company, are designed to enable an AFV to fire accurately while on the move, even over rough terrain.

A typical layout of the components of the system is shown in the accompanying diagram, and it will be seen that the installation uses references and rate gyroscope as primary sensors. Outputs from these are processed at low level and the results used as inputs to the power electronics unit, which uses transistors in a switching mode of operation to control the turret and cupola elevation and traverse drive motors. As can be seen, the manual elevation and traverse facilities are retained. The system incorporates circuitry for built-in test equipment (BITE).

STATUS:

Development was started as a private venture in January 1965 and the first prototype completed in September 1966. Demonstration installations were made in the M60 (**5024.102**) and M60A2 (**5025.102**) tanks and in the XM 701 (MICV 65) and XM 800 (**5070.102**) Armoured Reconnaissance Scout Vehicle. Under a development contract with the FMC Corporation, San Jose, California, GE has delivered four prototype equipments and spare parts for stabilisation and drives on the turret of a tracked version of the ARSV being developed for the US Army.

MANUFACTURERS:

Electronic Systems Division (Ordnance Systems), General Electric Company, 100 Plastics Avenue, Pittsfield, Mass 01201, USA.

2545.293
MISSILE LAUNCHER/CANISTER

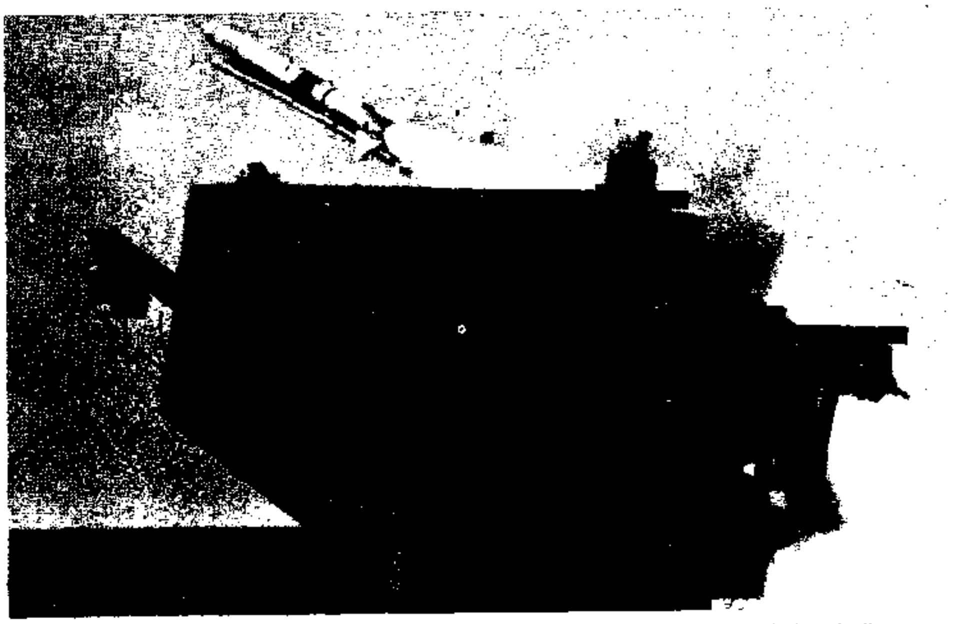
DESCRIPTION:

Sponsored by US Naval Ordnance Systems Command and developed by the Naval Ordnance Station, Louisville, Kentucky, an inexpensive launcher/container for shipborne missiles has been successfully tested in a series of static and mobile firings at White Sands Missile Range and from the USS *Norton Sound*.

The launcher/canister is simpler and smaller than a conventional track-guide box launcher and provides reliability, maintenance, and reloading features which are attractive. Using the new device, a missile can be loaded at shore ammunition depot, shipped as a sealed unit to the firing ship, loaded on a launcher mount, plugged in to electrical connections and fired directly from the canister – all without having to be touched after initial loading. This increases missile reliability and decreases maintenance requirements.

The novel feature of the launcher/canister is its launcher guide method. The missile rests on a launch pad made of inexpensive plastic foam, rather than being hung from a track as in conventional launchers. The foam pad is launched from the canister with the missile, but soon falls away due to aerodynamic drag.

The tests of the launcher/canister have been conducted using Sea Sparrow missiles with folding wings. Other possible missile applications are Harpoon, Standard, ASROC, Chaparral and Agile.



Missile launch from the new canister. Note the foam supporting pad beneath the missile

RESPONSIBLE AUTHORITIES:

Naval Ordnance Systems Command (ORD-5531), Washington DC.

Naval Ordnance Station, Louisville, Kentucky, USA.

2713.293
MISSILE LAUNCHER R-202

DESCRIPTION:

This missile launcher has been designed primarily for use in naval conversions from gun to missile armament. Suitable for launching Sparrow or similar missiles (see, for example, entry number **2770.231**) the design of the launcher permits the deck house and missile loading system to be worked out by the shipyard to meet the operational requirements of the user.

In one possible arrangement the missile would be stored in the deck house on rack with launch rails pre installed in them. Two missiles would be stored on the loaders with wings and fins in place and ready for ramming to the firing positions.

All loading functions are performed from the local control panel, except that wings and fins are manually installed on the missile. The missile loader is provided with a vertical lift actuator which provides means for removing the missiles from the overhead track and also provides for engaging the missile with the launcher. There are two distinctly separate missile loaders which may be rammed simultaneously or independently as dictated by the exact missile status at the time of loading. Each loading position has an individual door to minimise weight, size, and servo drive requirement.

SUGGESTED CHARACTERISTICS:

Weights: Launcher (above deck) 725 kg. Loader (below deck) 1,680 kg. Launch rails (each) 25 kg. Solid state electronics 900 kg
Power: 16 kW peak; 9 kW average
Traverse: 360°
Elevation: −15° to +85°

MANUFACTURER:

Raytheon Company, Bedford, Massachusetts 01730, USA.

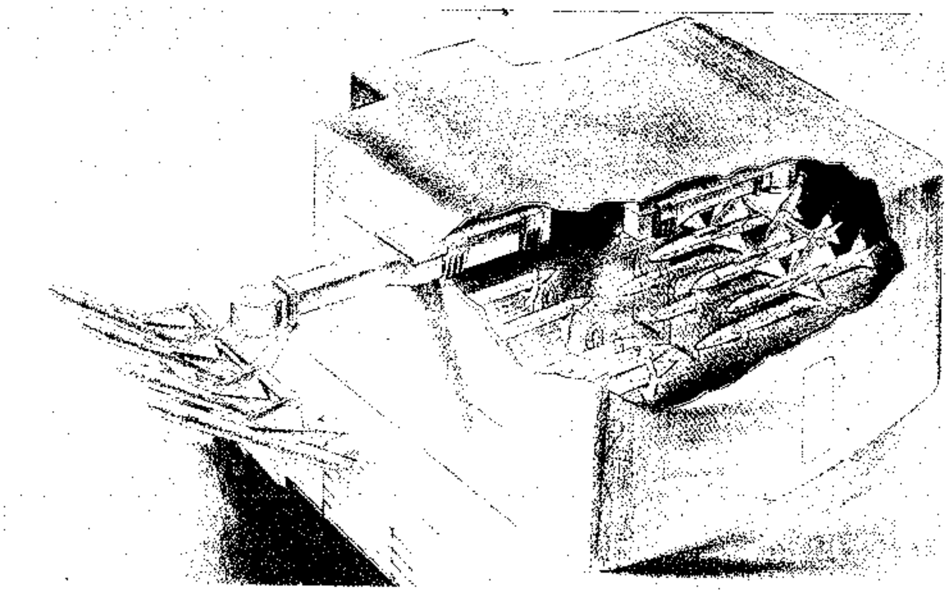
2714.293
MISSILE LAUNCHER R-204

DESCRIPTION:

Designed for naval use, the R-204 missile launcher is capable of firing four Sparrow III missiles either singly or in rapid succession to combat an enemy air attack. The R-204 is of simple construction consisting of an extendable boom and a missile support assembly. This assembly contains a pillbox pivot, a pylon mounting bar, and four pylons together with their associated launch rails. It also contains the necessary electronic circuits for readying the Sparrow III for launch. This two-axis launcher has limits of 360 degrees in train and −15 to +65 degrees in elevation.

During attack, the launcher boom is extended by its power drive. The missile support assembly is slaved in its two axes to commands from the fire control system. Simultaneously, signals are injected into the missile to command its actions after launch.

When the missile is free of the launcher, it can effect the manoeuvres necessary to fly towards the target intercept point. These features – the missile support assembly's ability to rotate about its two axes and the Sparrow III's degree of manoeuvrability – combine to provide a large defended zone.



R-204 missile launcher

In a typical ship's installation, the centre of rotation of the missile support assembly in train is beyond the edge of the ship, thereby permitting missiles to be launched from 000 to 160 degrees on both sides of the ship. The defended zone is larger than 180 degrees because of the missile's ability to turn after launch.

Because the extendable boom is above deck level and can be completely withdrawn into a missile handling room, deck space is conserved.

MANUFACTURER:

Raytheon Company, Bedford, Massachusetts 01730, USA.

2740.283
N W L WEAPON STABILISATION SYSTEM

The National Waterlift Company has developed a compact and accurate weapon stabilisation system which is particularly well suited to fitting into gun carrying armoured personnel carriers or light combat vehicles which have a two man turret and a medium calibre weapon. However, the basic concept is equally adaptable to vehicles weighing up to 50 tons and carrying normal tank armament.

This NWL "Second Generation" Weapon Stabilisation System, by the use of high-quality components in a system of low overall complexity, has the following important characteristics:

High dynamic accuracy during angular vehicle excursions.

No loss of weapon static accuracy when firing from a standing position under stabilisation.

Smooth and controllable tracking at very low rates.

Very high system slew rates.

Ability to lay rapidly and accurately on point targets.

Man-machine relationship designed for maximum use of gunner's abilities.

Ruggedness, consistent with roughest field use.

Modular construction, with many modules common to both elevation and traverse controls.

System designed for various levels of battle damage.

NWL Stabilisation System	Traverse	Elevation
Manual Characteristics		
Displacement	52 mils/revolution	64 mils/revolution
Maximum slew rate	100 mils/second	140 mils/second
Sensitivity	.037 inch/0.1 mil	028 inch/0.1 mil
Power Characteristics		
Minimum Tracking Rate	.10 mils/sec	.10 mils/sec
Maximum Slew Rate	54°/sec	72°/sec
Handle Travel	+80°	+40°
Maximum Handle Backlash	1½°	1½°
Sensitivity	1½ mil/sec/degree	1½ mil/sec/degree
Stabilised Characteristics		
Maximum Tracking Rate	.15 mils/sec	.15 mils/sec
Maximum Slew Rate	54°/sec	72°/sec
Maximum Drift Stationary	.1 mil/minute	.1 mil/minute
Maximum Error	2 mils/30°/sec	2 mils/50°/sec
Average Error	.5 mils/15 mph zig-zag	.5 mils/15 mph

DESCRIPTION:

The NWL system is composed of the following major components:

Inertial Sensors – the gyroscopic devices used in the system have low null uncertainty and wide dynamic range, and the ruggedness and long operating life required for use in the combat vehicle environment.

Electronic Power Supply and Servo Amplifier – the electronic power supply accepts the unregulated vehicle battery voltage and changes it to the various regulated voltages both AC and DC, that are required by the servo amplifiers and the system sensors.

The servo amplifier consists of two highly similar channels of signal processing circuitry. Each channel accepts various sensor signals, processes them, and as a result supplies current to the electrohydraulic servo valve to cause the weapon to perform as desired.

Both the power supply and the amplifier have been designed for low power drain and use solid state components exclusively. They have built-in EMI suppression and are both short and open circuit protected.

Gunner and Commander Controls – the gunner and commander controls are designed to provide an optimum man-machine relationship. They provide the means of slewing the weapon system rapidly, tracking smoothly and controllably at very low rates; and laying the weapon rapidly and accurately on point targets.

Traverse and Elevation Servoactuators – specifically designed to meet the stringent requirements of stabilising weapon-carrying land vehicles. They utilise a new electrohydraulic servo valve designed by NWL.

Hydraulic Power Supply – an efficient, quiet, reliable hydraulic power supply is provided to convert the vehicle's unregulated DC electrical energy to regulated hydraulic energy. This energy is used on demand to operate the system in both the hydraulic power mode and electrohydraulic stabilised mode of operation. The power supply allows a fully operational system to remain on silent watch for long periods with pump operation.

System Test Package – in addition to the basic system components a system test package has been designed which enables relatively unskilled personnel to troubleshoot the entire stabilisation system.

Wherever possible components are interchangeable between axes for simplification of manufacture and maintenance.

OPERATION:

Manual: In the manual mode, the gun movement is entirely by a hand driven mechanical gearing. It is therefore simple, reliable, and silent.

Power: The power mode provides complete hydraulic actuation of traverse and elevation when a DC supply is connected to the hydraulic pump. It is a simple, demand-type system, giving excellent sensitivity.

Stabilised: In the stabilised mode all components of the system are employed, but failure of any part will revert the system to the power mode.

The system has been tested under quasi-battle conditions at speeds up to 25 mph in a 20 ton tracked vehicle, and has shown itself to be both accurate and reliable. One advantage which is claimed for it is the ability of the system to be mounted in the vehicle in its separate component parts, linked by cables or hydraulic pipes. This eases the difficulty of stowage inside a small turret.

STABILISED GUN CONTROL SYSTEM

DESCRIPTION:

This is an electro-hydraulic system that provides the control means for positioning the turret, gun, and cupola, in the M60A1E2 Tank. The hydraulic power system can be controlled by directing hydraulic oil through gunner's or commander's control assemblies directly or by electronic signals from rate-sensing devices in the hull, turret and cupola to hold either or both weapons in position for stabilised operation.

The system operates either in a power or stabilised mode and is put into operation by applying 24 V DC to the electric motor in the hydraulic power supply and electronic power supplies which in turn generate voltages necessary to operate the electronic system of the turret. The motor-pump combination operates to generate, store, and supply hydraulic oil at 2,000 psi pressure to the turret and the cupola. This pressurised oil is used to operate hydraulic actuators which elevate or depress the main gun or cupola weapon, and to drive hydraulic motors which traverse the turret or cupola through gearbox and ring gear systems.

In the power mode, only the hydro-mechanical components are used. The gunner in the turret and the commander in the cupola each have a set of control handles that are used to direct the pressurised hydraulic fluid to the hydro-mechanical components to control the positioning of their weapons. In addition, the handles contain triggers for firing the weapons, pal, switches for releasing the traverse mechanism brake and two thumb switches for insertion or removal of target lead information.

When the system is in the stabilisation mode of operation, both hydro-mechanical and electronic components are used. The hydraulic components are controlled by electrical signals from gyros and handle linear variable differential transformers. These signals are processed by the electronic components to maintain the two weapons in the position determined by the gunner and commander.

The hydraulic power system also can be used operated in the Emergency Mode. In the Emergency Power Mode all electronic components are switched out of the system and electrical power is used only to operate the motor pump, power valves, deck clearance switches, trigger circuits, and electrical traverse brakes. When no electrical power is available, the turret can be operated manually in azimuth by means of a hand crank located on the traverse gear box, and in elevation by means of a rotary hand pump. The hydraulic power system to the cupola can be operated in the manual mode by manually actuating the cupola power valve and supplying pressurised oil to the cupola from a hydraulic hand pump located in the turret.

Four stabilisation options are provided, Stabilization Stationary, Stabilization Travel, Main Gun, and Target Designate. Stabilization Stationary is used when the vehicle is not moving, and Stabilization Travel is used when it is. The main difference is in the system's turret response to movement of the operator's control handles which is slower when the vehicle is stationary than when it is moving. This provides finer gun-laying capability when the vehicle is stationary.

In normal stabilised operation, the main gun and cupola weapon are stabilised independently, with the gunner or commander maintaining control over the main gun or cupola respectively. When the Main Gun Mode is put into operation, the cupola weapon becomes synchronised with the main gun and the gunner's handles control both systems. The commander can take control of both systems by pressing the over-ride palm switches on the control handles.

In the Target Designate mode, the main gun lines up with the cupola weapon. After the main gun establishes line-of-sight with the cupola weapon (approximately 1 second duration) both stations revert back to normal stabilized operation and the commander can move the cupola away from the main gun position to observe other targets.

RANGEFINDING AND SIGHTING EQUIPMENT

FRANCE

7030.393
APX-BEZU M260 GYRO-STABILISED SIGHT

DESCRIPTION:

The APX-BEZU M260 Gyro-stabilised sight has been designed for survey of land, target detection and acquisition, and for guiding missiles in manual remote control with a hit probability of 90 per cent.

OPERATION:

The sight has a periscopic view and is composed of a binocular sight and double lens with two magnifications – 2.5 and 10 – and a panoramic sight containing the gyroscopic unit. Stability of images is obtained by a 45° mirror slaved to a gyroscope, together with a shock absorbing device.

The mirror can scan land in elevation and azimuth at a velocity ranging from 20°/s (0.1 mrd/s) to 10°s (180 mrd/s). The field of sight is 5° 30' (100 mrd) with magnification 10 and 22° (400 mrd) with magnification 2.5. The complete scanning field is 136° in azimuth and 82° in elevation. On the wide field, a luminous circle represents the small field. The angular difference between the optical axis and the axis of the vehicle is indicated. Controls are centralised on the two handles, and the body of the sight is telescopic, which permits variations of height of the sight. In the high position, the operator, with no magnification has a complete field observation. A fire simulator, as well as a television or film camera can be fitted to the equipment.

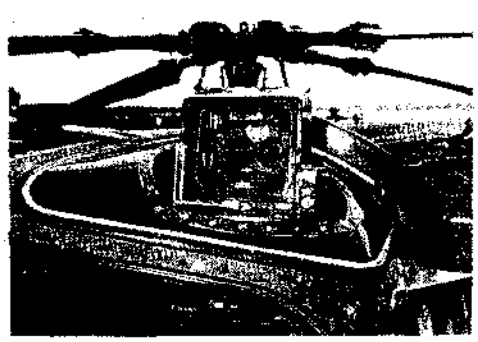
STATUS:

The APX-BEZU M260 sight was mounted and tested on many helicopters, including Alouette II and Alouette III in France; Scout, Wasp and Wessex in Great Britain; and Bell Agusta in Italy. It is part of the equipment of Alouette III and Wasp helicopters. This sight has also been used on fast patrol boats by several countries.

MANUFACTURERS:

Designed by DTAT, Ateliers de Construction de Puteaux and the SERE Company. Produced by SFIM, 13 Avenue Ramolfo-Garnier, F9130-Massy, France.

Licenced manufacture is in progress in the UK by BAC's Guided Weapons Division at Stevenage, Herts.



APX-BEZU M260 sight as installed in Westland Wasp helicopter

1642.393
THOMSON-CSF LOW LIGHT TELEVISION

DESCRIPTION:

The Thomson-CSF company has produced, in response to a French military requirement, a helicopter borne night vision system based on a low light level television equipment. The system comprises three main units: a remotely controlled camera and its associated stabilised mounting; display unit; and a remote control unit. Another version has been developed for fitting to the AMX-10 tank.

The camera uses a 'Super Nocticon' tube with a silicon target, and an automatic shutter is provided for protection against bright light. The optics include variable focus between 50 and 240 mm, variable aperture, and the zoom facility provides for an angle of view variable between 30 degrees for search and 6 degrees for identification of target. The stabilised mounting was developed by SERE-Bezu, and is engineered for location in a cut-out in the underside of a helicopter. The camera axis is fixed relative to the aircraft, and the line-of-sight is maintained against attitude changes by means of a gyro-stabilised mirror between the viewing aperture and the camera optics.

The display unit has a rectangular CRT screen of 11 cm diagonals, and there are provisions for mixing the TV picture with symbols produced by a nav/attack system. The control box provides for remote operation of the camera and direction of the mirror to give pan and tilt movements of the sight line.

DEVELOPMENT:

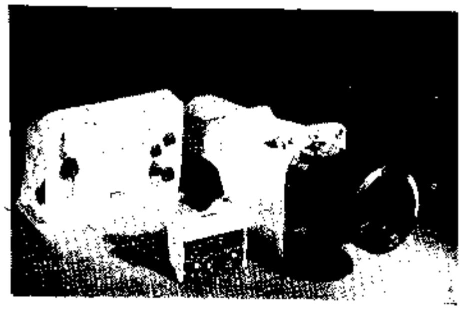
The system was developed under French Government contract.

STATUS:

Flight trials of two equipments started in 1972 on a French Army helicopter and a maritime aircraft. The tank version is said to be in production.

MANUFACTURER:

Thomson-CSF, France.



Low light-level TV system designed for AMX 10 tank

7032.393
APX M334 GYRO-STABILISED SIGHT

DESCRIPTION:

The APX M334 sight has been designed to survey land, detection and acquisition of targets, and guidance of missiles in manual remote control.

OPERATION:

This periscopic viewing equipment is composed of a monocular angularly positioned and single-lens sight, a body made of a prism correcting the image slanting and Galilee's system ensuring two manifications – 2.5 and 10 – and a panoramic head including a gyroscope similar to the one of the APX-BEZU M260 sight.

Mirror scanning of land in elevation and azimuth, and hoods of panoramic head are slaved in azimuth to the mirror. Scanning speed is adjustable from 3' 30"/s to 5° 40'/s at magnification 2.5; from 5' 1"/s to 1° 25"/s at magnification 10; and 28°/s for target acquisition.

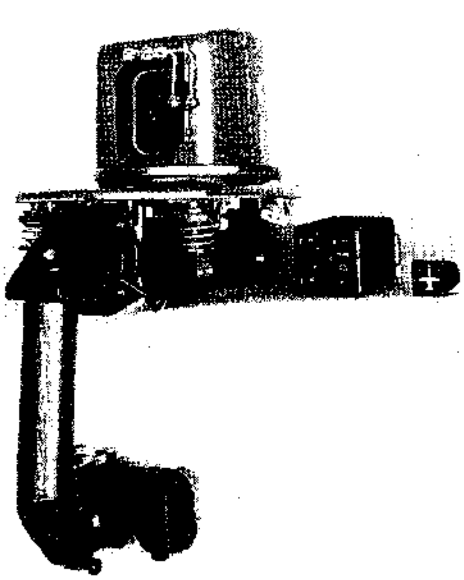
The field of sight is 5° 30' at magnification 10, and 22° at magnification 2.5. Total scanning field is 262° in azimuth and 82° in elevation. On the wide field a luminous circle represents the small field, and angular differences between line of sight and the axis of the vehicle can be indicated. The eyepiece is retractable when the equipment is not in use, enabling the operator to have complete eye vision. To render observation more comfortable, a pseudo-binocular version of the sight has been developed.

STATUS:

In production.

MANUFACTURER:

SFIM, 13 Avenue Ramolfo-Garnier, F91301-Massy, France.



APX M334 Gyro-stabilised sight and control box

2059.193
RANGEFINDER M208 FOR AMX30 TANK

DESCRIPTION:

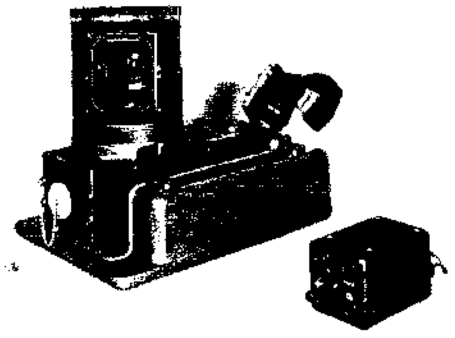
This rangefinder is for use by the tank commander to determine both the range of a target and the elevation setting for different types of 105 mm ammunition. It can be used either as a superimposition rangefinder or as an aiming telescope. By means of a linkage the eyepiece remains in a fixed position while the rangefinder follows the elevation and depression of the gun cradle.

CHARACTERISTICS:

Rangefinder:
Base: 2 m
Magnification: × 12
Field: 50 mils
Measuring distance: 600-3,500 m
Telescope:

Magnification: × 6
Field: 100 mils
Range: 600-3,500 m
Combined weight: 81 kg
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

1737.193
APX M396 STABILISED SIGHT
DESCRIPTION:
The APX M396 has been derived from the APX M334 (Entry No. **7032.393**), and is also referred to as the 'Cabin Version' of that sight. It is intended for observation, target detection and acquisition, and missile guidance applications in vehicles liable to high amplitude motion over a wide frequency range, such as fast patrol boats and helicopters. Stabilisation is by means of gyros, supplemented by elastic suspensions and damping. Detection and acquisition can be effected at ranges up to 10 km. Magnifications of 2.5 and 10 are provided, the respective fields being 400 milliradians and 100 milliradians. Magnification change is accomplished in 0.15 sec.
STATUS:
Development has been completed and production had been started by early 1973. Evaluation has been carried out in an Atlantic aircraft of the Marine Francaise.
MANUFACTURER:
SFIM, (Société de Fabrication d'Instruments de Mesure), 13 Avenue Ramolfo-Garnier, F91301-Massy, France.



APX M396 stabilised sight and control box

2079.193
RANGEFINDER M292
DESCRIPTION:
A small monocular rangefinder designed for use with the ACL-STRIM light anti-tank weapon (**2055.103**). The device comprises a sighting telescope and a coincidence rangefinder and is preadjusted for measuring two selected distances bracketing the intended firing range.
CHARACTERISTICS:
Telescope: Magnification × 4, Field 150 mils
Rangefinder: Periscope height 140 m, Magnification × 12, Vertical field 16.6 mils, Horizontal field 33.3 mils, Selected measured distances 300-450 m, Accuracy 10 m
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2107.193
AIMING TELESCOPE M262
DESCRIPTION:
This equipment is designed for use with the 90 mm gun on the AML-90. The telescope is made in two parts which can move relative to each other: the part with the objective moves with the gun cradle while the eyepiece remains in a constant position within the turret.
Two variants of the telescope are available: one has a movable graticule suitable for use with both HE and hollow charge ammunition and the other has a fixed graticule that can be selected for one type of ammunition only.
CHARACTERISTICS:
Magnification: × 6
Field: 190 mils
Eyepiece: Adjustable
Elevation: −8° to +32°
Weight: 5.5 kg
Micrometer: Illuminated for night firing
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2103.193
BINOCULAR TELESCOPE M267 and PRISM HEAD M270
DESCRIPTION:
The M267 binocular telescope is a tank commander's instrument for use with the secondary armament of the AMX-30 tank (see **2094.193** for infra-red equivalent). It is used in conjunction with the M27 prism head.
Theis prism head consists of a prism that can be rotated in the elevation plane to reflect light towards the M267 scope or towards the OB-23-A infra-red telescope, the objective lenses being fitted in the base of the head. The prism is mounted behind thick protective glass and the whole is enclosed in a steel armour-plate housing. Projecting from the side of the M270 is a swivelling arm on which the LMG (and its infra-red searchlight if fitted) is mounted. The weapon elevation aiming and the corresponding −10° to +45° swivel of the prism are controlled simultaneously by a handwheel in the roof of the turret.
The M270 head may also be used to aim the 20 mm cannon, in which case the prism head is electrically servo-controlled by the movement of the cannon.
CHARACTERISTICS:
Binocular telescope: Magnification: × 10. Field: 100 mils
Overall specification: Weight: 8 kg, Operating temperature range: −40° to +55°
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2108.193
INFRA-RED AIMING TELESCOPE (M262 MODIFIED)
DESCRIPTION:
This instrument is a modification of the M262 telescope (**2107.13**) for operation with the 90 mm gun of the AML-90 in infra-red light. Illumination is provided by a PH-2-A searchlight fastened to the gun. A linkage similar to that in the M262 keeps the eyepiece in a substantially constant position when the gun is elevated or depressed. The telescope has a fixed graticule with variable illumination.
CHARACTERISTICS:
Magnification: × 5.4
Field: 7°
Elevation: −8° to +20°
Graticule adjustment: × 25 mils vertically and laterally
Focus: Adjusted to 1,000 m
Range: 1,000 m with PH-8-B searchlight
Duration of use: 40 hours
Operating temperature range: −40° to +55°
Periscope Height: 418 mm
Weight: 28 kg
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2093.193
INFRA-RED AIMING TELESCOPE OB-17-A
DESCRIPTION:
This equipment is designed for use with the 105 mm gun on the AMX-30 tank in conjunction with the PH-8 B IR searchlight.
Alignment of the optical and gun axes is preadjusted and fixed. Correct elevation is automatically engaged when the telescope is slipped into its housing. A built-in collimator and lamp produces an illuminated reticle in the centre of the field of view which gives the line of sight. The illumination of this reticle can be adjusted.
CHARACTERISTICS:
Magnification: × 5.4
Field: 7°
Elevation: −8° to + 20°
Graticule adjustment: + 25 mils vertically and laterally
Focus: Adjusted to 1,000 m
Range: 1,000 m with PH-8-B searchlight
Duration of use: 40 hours
Operating temperature range: −40°to + 55°C
Periscope Height: 418 mm
Weight: 28 kg
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2094.193
INFRA-RED BINOCULAR AIMING TELESCOPE (OB-23-A)
DESCRIPTION:
This equipment is designed for use by the AMX-30 tank commander with the tank's secondary armament. It is used in association with the M270 prism head (see **2103.193**) when the turret LMG is being fired or with the servo-controlled prism head for the 20 mm cannon. Illumination is either by a PH-9-A searchlight fitted on the LMG or by the PH-8-B searchlight on the 105 mm gun (see **2093.193**) for the 20 mm cannon.
The telescope contains two IR channels in a single light alloy housing. Aiming is aided by a variable graticule displayed on the visual field.
CHARACTERISTICS:
Magnification: × 4
Field: 9°
Elevation: −10° to +45°
Duration of use: 25 hours
Operating temperature range: −40° to +55°
Weight: 8 kg
MANUFACTURER
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret.

2109.193
INFRA-RED DAY/NIGHT DRIVING PERISCOPE OB-16-A
DESCRIPTION.
This periscope is mounted in the driving turrets of AMX-30 tanks and similar vehicles. It is provided with a binocular infra-red system for night driving and a monocular system for daylight use. Both infra-red and visible light channels are in the same light alloy housing.
CHARACTERISTICS.
Infra-red System: Magnification: × 1, Field: 35°, Focus: 40 m
Daylight System: Magnification: × 1. Field: 24°
Duration of use: 40 hours
Operating temperature range: −40° to +55°C
Weight: 6.5 kg
MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92 Levallois-Perret.

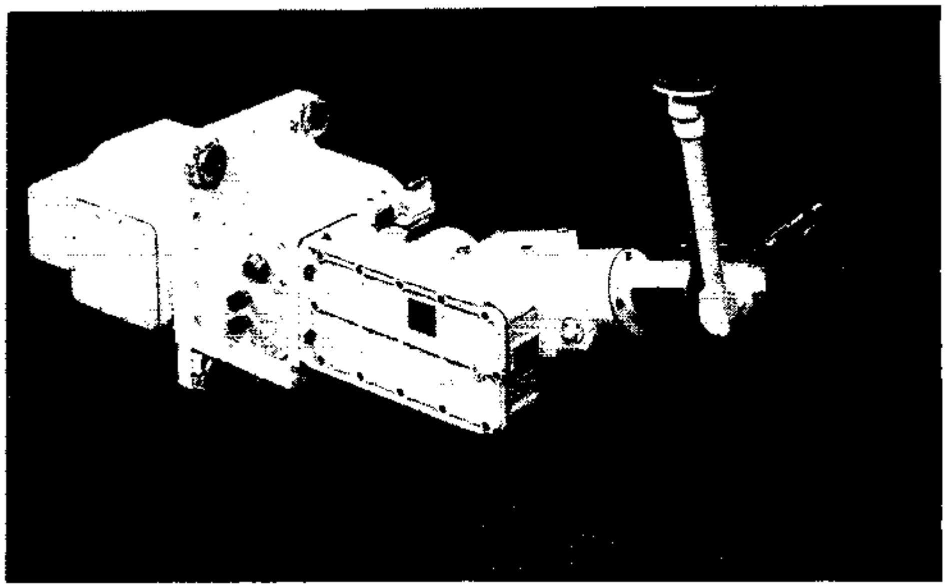
2099.193
INFRA-RED PERISCOPE OB-11-A
DESCRIPTION:
This periscope is designed for use with the AMX-13 main armament and in conjunction with the PH-2-A searchlight mounted on the moving part of the turret.
A luminous collimator is brought into operation when the operator leans on the periscope fore-head rest: the brightness of this can be adjusted. Optical adjustment is by two knurled knobs giving ±10 mils in elevation and ±20 mils in azimuth. Sighting index marks on the graticule show distances in hectometres up to 20 hectometres for the AP shell.
CHARACTERISTICS:
Magnification: × 5
Field: 7°
Focus: Adjusted to 700 m
Range: 800-1,000 m
Duration of use: 40 hours
Operating temperature range: −40° to +55°C
Weight: 7.6 kg

MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret, France.

2105.193
TELESCOPE-PERISCOPE M112
DESCRIPTION:
This combined monocular telescope and binocular periscope is designed for use with the AML-60 light armoured car. By changing the micrometers, however, it can be adapted for use with the twin 30 mm cannon of the AMX13T tank.
Elevation aiming control is linked to the weapon but provision is made for manual scanning. The micrometers can be illuminated for night firing.
CHARACTERISTICS:
Telescope: Magnification: × 5. Field: 230 mils
Periscope: Magnification: × 1. Static field 570 mils. Field including eye motion 1,140 mils
Elevation aiming: −22° to +47°
Weight: 6 kg

MANUFACTURER:
SOPELEM, 102 rue Chaptal, 92-Levallois-Perret, France.

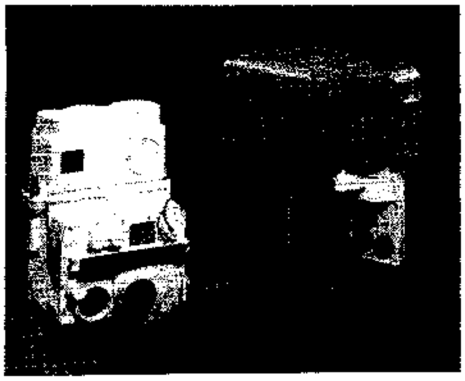
1796.193
APX M401 OPTICAL SIGHT AND RANGE-FINDER
DESCRIPTION:
The APX M401 equipment consisting of a laser rangefinder, an aiming optical system and an optical deflection device, is part of the automatic firing control system intended for the AMX-10C tank.
In addition to its observation and aiming functions, it provides automatically information on the distance of the target to the firing control system.
Its accuracy is ±5 metres regardless of the distance of the target within the limits of the range.
The maximum measurable distance depends on the visibility and can reach 10 km. The unit comprises a pilot light indicating the possible presence of two echoes, a unit memorising the two echoes and a switch allowing a manual selection of the echo to be displayed.
CHARACTERISTICS:
Emitter:
Laser material: neodymium glass
Wavelength: 1.06 um
Pulse duration: 25×10^{-9} s
Energy: 100 mJ
Peak power: 4 MW
Divergence: 0.5 mrad
Repetition rate: 1 measurement every 2 seconds
Receiver:
Detector: Avalanche photodiode



APX M401 Optical sight and laser rangefinder

Field angle: 0.5 mrad
Rangefinder: 265 × 180 × 120 mm. 4 kg
Supply unit: 440 × 160 × 160 mm. 11 kg
STATUS:
The APX M401 was designed under DTAT contract and had reached prototype stage by early 1974.
MANUFACTURERS:
CGE-Laboratoires de Marcoussis, Route de Nozay, 91460-Marcoussis, France.
SOPELEM, 102 rue Chaptal, 92306-Levallois-Perret, France.

1797.193
APX M409 OPTICAL SIGHT AND RANGE-FINDER
DESCRIPTION:
The APX M409, consisting of a laser rangefinder, a daylight sight, a night-time sight and a prism head, is intended for the AMX-30 tank.
In addition to its observation and aiming functions, it provides directly to the tank commander information on target range.
Its accuracy is ±5 metres regardless of the distance of the target within the limits of the range. The maximum measurable distance depends on the visibility and can reach 10 km. When distances relating to two targets are measured simultaneously, the two readings are displayed at the same time one above the other.
Through a blanking device, it is possible to eliminate any echoes from less than a predetermined surface.
CHARACTERISTICS:
Emitter:
Laser material: Neodymium glass
Wavelength: 1.06 micron
Pulse duration: 25×10^{-9} s
Energy: 100 mJ
Peak power: 4 MW
Divergence: 0.5 mrad
Repetition rate: 1 measurement every 2 seconds
Optical sight and rangefinder: 350 × 200 × 150 mm. 10 kg
Supply unit: 320 × 200 × 160 mm. 25 kg
STATUS:
The APX M409 was designed and developed under DTAT contract. It is now in series production for AMX 30 tanks ordered by a foreign army.
MANUFACTURERS:
CGE-Laboratoires de Marcoussis, Route de Nozay, 91460-Marcoussis, France.
SOPELEM, 102 rue Chaptal, 92306-Levallois-Perret, France.



APX M409 Optical sight and laser rangefinder

1798.193
IPY 43 PORTABLE LASER TARGET MARKER
DESCRIPTION:
The IPY 43 is a one-man portable laser target illuminator/designator for battlefield use. The size and configuration of the equipment can be seen in the accompanying illustration. An optical telescopic sight is incorporated to assist in acquiring the target and to ensure its accurate marking for the co-operating attack aircraft or other weapon.
CHARACTERISTICS:
Laser material: Neodymium doped YAG
Wavelength: 1.06 micron
Pulse duration: 20×10^{-9} s
Energy: 60 mJ
Peak power: 3.5 MW
Divergence: 0.3 mrad
Repetition rate: Adjustable from 1 to 10 pulses per second
STATUS:

Developed under OTAT contract, the IPY 43 had reached the pre-production stage by early 1974.

IPY 43 Laser illuminator

MANUFACTURER
CGE-Laboratoires de Marcoussis, Route de Nozay, 91460-Marcoussis, France.

1317.393
THOMSON-CSF SERIES 120-190 ATTACK SIGHTS

DESCRIPTION:
These displays comprise three units: a collimating head, projecting a coloured display; an electronic unit, for signal processing; a pilot's control unit (not required if the HUD (Head-Up Display) is operated through the control unit of the NAV/Attack system).

Collimating Unit: The coloured display required for an operating mode is obtained with servoed reticules, controlled by signals from the electronic unit. Up to four different sets of reticules may be used. After optical mixing of reticules' images, collimation is effected by a large 120 mm lens.

Electronic units: This fulfils the following functions: interface with the Nav/Attack system associated to the HUD elaboration of the display control signals delivered to the collimating head, according to the operating mode; permanent auto-test of the HUD; power supply.

OPERATION:
The following modes are available:
(1) **Air-to-air** (operation with a fire control radar, such as the Cyrano).
(a) **All weather interception** with display of flight information (horizon, altitude, airspeed), and target information (elevation/azimuth, range, closing speed).
(b) **Missile launching**: Missiles of all types can be launched, and the HUD may accommodate any type of approach; snap-up or down, head-on etc.
(c) **Gunfire**: The HUD is designed to permit automatic gunfire at optimum radar range, in all-weather conditions, with no limitation (such as altitude, speed etc).
(2) **Air-to-ground**
(a) **Conventional armament** (gun-rocket-bombs): The HUD provides the following display for air-ground attacks: target position, for all-weather approach and ranging (laser or radar, with subsequent display of range to target); bomb impact line roll stabilised, drift corrected, enabling accurate automatic release of low drag and high drag bombs; and altitude levels.
(b) **Special weapons**: The HUD is designed to enable operation of a large variety of special weapons e.g. missiles of all types, A.S.30, Martel, cluster bombs etc, etc.
(3) **Navigation and landing**
(a) **Navigation** (cruise, terrain following, target approach): The following data can be displayed: horizon; heading and heading commands to keep a selected track; altitude and altitude commands; airspeed (or Mach number) and airspeed commands; flight director.
(b) **All weather approach:** This provides for the additional display of the axis of an instrument landing system.

Thomson-CSF 120 Series attsck sight collimating head

(c) **STOL landing:** This is a special display which enables a precise control of flight path angle and airspeed, resulting in an accurate impact on the runway threshold (within +30 metres), with the proper air-speed.

STATUS:
Systems of this type are in production for the Jaguar version for the French Air Force and for the Mirage FI.

MANUFACTURER:
Thomson-CSF, Division Equipments Avionique et Spatiaux, 178 Boulevard Gabriel Péri, 92-Malakoff, Paris, France.

THOMSON-CSF R SERIES GUNSIGHTS

DESCRIPTION.
The series R gunsights produced by Thomson-CSF range from the simplest sight appropriate to basic training aircraft, to systems where the gunsight is performing many of the functions of a head-up display, accepting flight director information from a comprehensive navigation and attack system.

Three main types of R series gunsights are manufactured

Type R20 – Single moving reticle.
Type R30 – Two reticles, one fixed, one moving.
Type R300 – Two reticles. 1 fixed, two crosses used as a reference, a heading and rangine moving scale; 1 fixed. Stadimetric ranging with aircraft span set in. Optional roll indication.

Matching the progressive sophistication of the three R series sights listed above, various equipment combinations provide a corresponding increase in the range of operational facilities provided.

The basic R20 single sighting head provides for infra-red missile launch, and visual gunfire with gyroscopic sighting for two preset ranges in the air-to-air mode. In the air-to-ground mode the modes are, gun and rocket fire with fixed depression angle manually set in flight, and low and high-drag bombing with fixed depression manually set in flight.

Thomson-CSF R Series gunsight equipment

The R30 consists of sighting head, control box and electronic unit. Additional facilities provided in the air-to-air mode (over those of the R20) are radar or manual ranging and altitude correction; and in the air to-ground mode, roll stabilisation, corrections for ballistic deflection by drift insert, and the possibility of operation with a bombing computer.

The R300 consists of the sighting head, control box, electronics unit, and bomb release system, and provides additional facilities in the air-to-ground mode. These include: computed depression values based on weapon ballistics and aircraft parameters; automatic or manual release; roll stabilisation; windage and angle of attack corrections for rocket attack.

All three versions are intended for operation in conjunction with altitude and airspeed sensors, vertical gyro platform, angle of attack sensor, radio altimeter, doppler.

STATUS:

In production.

AGAT AIR-TO-SURFACE WEAPON AIMING SYSTEM

DESCRIPTION:

The AGAT weapon aiming system for tactical aircraft has been developed by Thomson-CSF for Mirage and F1 aircraft, and includes the Gunsight type 121 of the series referred to in Entry **1317.393** above.

The AGAT system provides facilities for the delivery of all types of airborne ordnance including guided missiles. The system can be readily integrated with other navigation and attack system components, or it can be used as a self-contained navigation and attack system in its own right. It requires inputs from the aircraft air data computer and from other equipment.

AGAT consists of the following major components:

Gunsight type 121
Attack computer type 32
Laser rangefinder type TAV-38
Navigation map display type LC 102

The bombing computer type 32 is digital in operation, and can be used for automatic or manually initiated bombing with or without visual corrections from the pilot using the attack sight. Visual attacks are more accurate but may be impossible in bad weather. The system generates aiming data for free fall or retarded bombs as well as for gun and rocket fire in the visual mode. Attacks can be made without the pilot being required to fly a rigidly prescribed course, and he is free to carry out evasive action during the attack phase.

In operation the computer calculates the ballistic range of the bomb using pre-set data and sensor information when available. It also continuously calculates the aircraft range to the target using navigation data and laser information during the attack phase. Targets may be attacked using off-set aiming points.

Bomb release is signalled in the automatic mode when target range and bomb ballistic ranges are equal. In the visual mode the computer output controls the attack sight aiming mark, and the pilot releases the bomb when the aiming mark and target are coincident.

For en-route navigation and to indicate blind attacks the pilot uses the LC 102 centralised navigation indicator which is a form of moving map display.

TAV-38 LASER RANGEFINDER

DESCRIPTION:

The TAV-38 Laser Rangefinder is designed to provide air-to-ground ranging facilities up to ranges of 10 km in clear-sky conditions. The equipment comprises two units – Laser Head and Power Unit. The latter unit weighs 12 kg and has no moving parts. It provides the high energy DC voltage to the flash exciter tube and the auxiliary supplies to the system. The laser head weighs 8.5 kg, and houses the laser cavity, with its neodymium rod, flash exciter and triggering device. It also contains the receiver circuitry which incorporates an avalanche photo-diode, the digital range counter and transmission/reception optics.

Among the design features contributing to light weight and modest dimensions is an original type of exciter yielding more power to the neodymium rod, thus reducing the heat that needs to be carried away. The laser/internal cooling arrangements make the unit suitable for use under a wide range of ambient temperature conditions.

OPERATION:

Ranging is effected by measuring the time interval between the emission of an energy pulse and the return of reflected energy. Measurement is by means of a digital counter, with a clock frequency of 29.98 MHz, which corresponds to a distance increment of 5 metres. The digital output is converted into serial binary format for output. The wavelength of the emission is 1.06 micron.

The deflector system developed by Thomson-CSF enables the direction of the beam emitted by the laser rangefinder to be referenced to the boresight provided for the pilot by a collimator. The angle of deviation thus obtained is plus or minus 10 degrees in both elevation and azimuth.

DEVELOPMENT:

The type TAV-38 is the result of collaboration between Thomson-CSF and Marcoussis Laboratories CGE Research Centre, the former being responsible for the beam deflector system and the latter for the TAV-34 laser rangefinder.

STATUS:

The system has been ordered for a number of Mirage F-1 aircraft for export.

MANUFACTURERS:

TA 101 and TAY 18 AIRBORNE LASER RANGEFINDERS

DESCRIPTION:

Mechanically, these two airborne laser rangefinders are essentially identical, the principal difference between them being in the laser source employed in each version, and the corresponding differences in performance characteristics.

In the case of the TA 101, a neodymium-doped glass laser is used, and in the TAY 18 a neodymium-doped YAG laser. The equipment is comprised of two units, laser head and electronics unit. The latter weighs 10.5 kg for each model, and weights of the TA 101 and TAY 18 heads are 10.5 kg and 11 kg, respectively. Maximum range of the TA 101 is 10 km, and that of the TAY 18 is 8 km; minimum range in both cases is 320 metres, and ranging accuracy +5 m.

Other characteristics of the two models are as follows:

	TA 101	TAY 18
Wavelength	1.06	1.08 micron
Pulse duration	30.1-9-9	20.1-9 sec
Energy	0.2-0.3	0.06 Joule
Min pulse spacing	2 secs	0.1 sec
Pulse rate	10/min	100/min

The laser head incorporates a mirror in the optical system that is provided with servo controls operating in azimuth and elevation, permitting alignment of the laser boresight with an operator's line of sight.

DEVELOPMENT:

The equipment has been developed for the French Jaguar aircraft programme.

STATUS:

The pre-production stage had been reached at June 1971.

TAV 19 HELICOPTER LASER RANGEFINDER

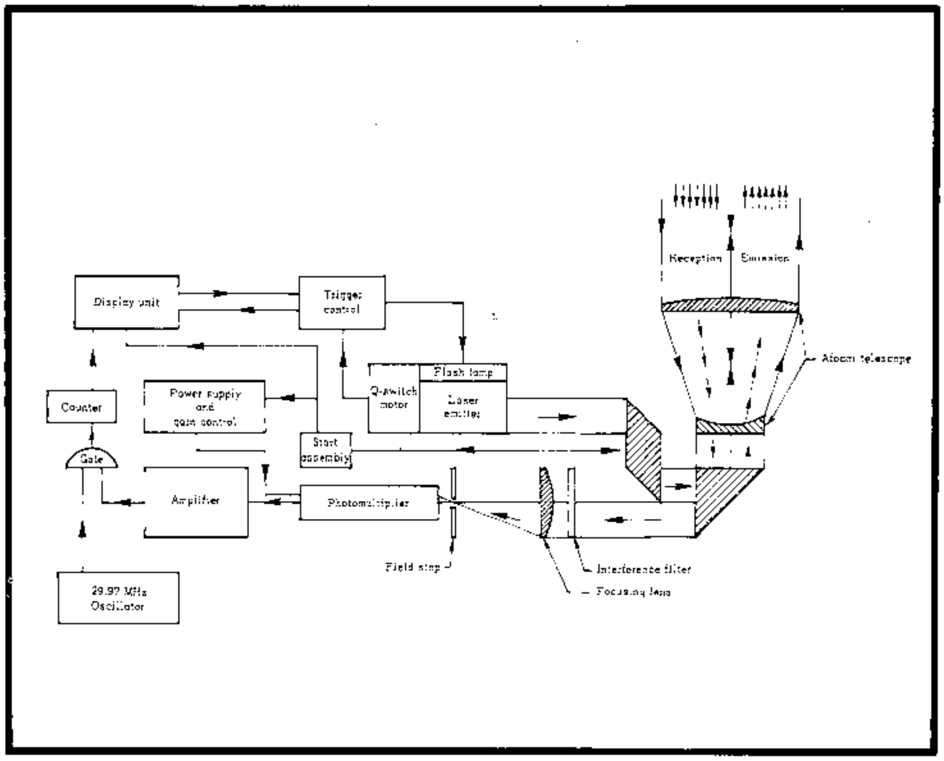
DESCRIPTION:

Designed for helicopter based rangefinding, the laser rangefinder TAV 19 was conceived for use with the Model M260 gyrostabilised view-finder of the Alteiers de Constructions de Puteaux (APX). It allows the measurement of the distance to a target identified previously in the view-finder.

Its accuracy is ± 5 metres, at any distance within the useful range. The maximum range depends on visibility and may reach 10 kilometres. The minimum range is 320 metres.

The TAV 19 rangefinder emits a very short laser pulse which is scattered by the target and picked up by a receiver placed near the transmitter. The distance is proportional to the time interval between the emission of the pulse and the reception

TAV 19 helciopter laser rangefinder



TAV 19 Schematic diagram

of the echo This interval is measured by an electronic counter with the help of a reference clock.

The TAV 19 rangefinder includes two separate subunits: the rangefinder head and a power supply unit. The component parts of the rangefinder head (laser transmitter and receiver) are fixed on a plate which is mounted directly below the APX view-finder. After the cover is secured, the entire unit is maintained sealed by the use of two o-rings. The rangefinder is equipped with a firing switch. After identification of the target, the operator presses a button in order to initiate the laser pulse. The range is displayed numerically in the right eyepiece of the view-finder.

The light pulse is emitted by a neodymium-doped glass laser. The beam is sent through an afocal telescope designed so as to reduce the beam divergence. A small fraction of the emitted energy is picked out and sent onto the light-sensitive layer of a photomultiplier tube, through an interference filter and a field stop. The resulting pulse, after shaping and amplification, gives the start signal to the electronic counter. The echo received from the target follows the same optical path and produces the stop signal for the counter.

CHARACTERISTICS:
Laser Emitter
W.AVELENGTH: 1.06 micron
Pulse duration: 30.10 ^{9} second
Nominal energy: 1 Joule
Peak power: 30 megawatts
Beam divergence at the output of the optical system: 1.5 milliradian
Repetition rate: 3 pulses per minute
Reception System:
Field angle: 1.5 milliradian
Bandwidth: 30 MHz
Minimum detectable power: 4.10 ^{7} watt
Weights:
Rangefinder head: 7 kg
Power supply: 15 kg
Dimensions:
Rangefinder head: 380 mm × 240 mm × 150 mm
Power supply: 290 mm × 265 mm × 200 mm

STATUS:

TMV 26 NAVAL LASER RANGEFINDER

DESCRIPTION:
The TMV 26 naval laser rangefinder is designed to be integrated with the director system of 100 mm naval gun turrets to provide fire control ranging facilities on sea and shore targets against which radar ranging facilities may be inadequate. Accuracy is ±5 metres irrespective of target range, within the operating limits of the system. The maximum attainable range is dependent upon atmospheric conditions but can extend to 16 km.

CHARACTERISTICS:
Emitter:
Laser material: Neodymium glass
Wavelength: 1.06 micron
Pulse duration: 20.10^{-9} sec
Energy: 100 m Joule
Peak power: 4 MW
Transmission field: 1 mrad
Receiver:
Detector: Avalanche diode
Reception field: 1 mrad

STATUS:
The prototype stage had been reached by early 1974.

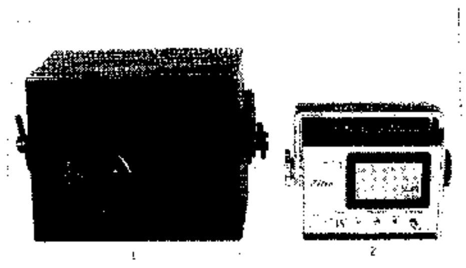
RZ 502 THERMAL IMAGING EQUIPMENT

DESCRIPTION:
The thermal imaging unit type RZ 502 due to its 50-element detector array provides a high-resolution thermal image which is displayed on the monitor at a rate of 60 half-pictures/sec, which appears as a real image to the human eye. This high-resolution thermal imaging unit serves for observation or reconnaissance. It can be installed in vehicles or helicopters. Independent of night or day conditions, the unit detects differential thermal radiation of man made or natural bodies. Haze, slight fog and dust have little or no effect on the image quality, even when the object to be detected is invisible to the naked eye. This also applies for objects (possible targets) in undergrowth which normally represent excellent camouflage. In conditions of this sort, the thermal imager will often reveal the target through its camouflage.

CHARACTERISTICS:
Optics:
Objective: SiGe achromate
Focal length: 100 mm
Aperture: 1.67



RZ 502 thermal imaging camera and display unit

Dia. of entrance pupil: 60 mm
Field of view: 6° × 10°
Detector:
Detector material: InSb
Type of detector: array, 50 elements
Size of elements: 100 micron × 50 micron
Geometric resolution: 1 mrad × 0.5 mrad
Spectral range: 3 micron to 5.5 micron
Cooling temperature: 77°K
Cooler: Joule-Thomson
Coolant: nitrogen gas
Coolant pressure: 400 to 120 atm.
Monitor
No. of lines: 100
Frame rate: 60 half-pictures/sec
Image diagonal: 90 mm
Electrical Data:
Nominal voltage: 24 V DC
Operating voltage: 18 to 30 V DC
Max. power consumption: 45 W approx

STATUS:
In production.

MANUFACTURER:
Eltro GmbH, 6900 Heidelberg 1, Postfach 520, West Germany.

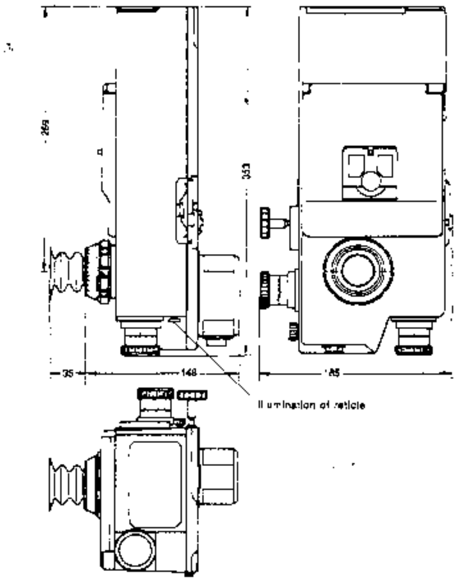
2186.153
IR GUN SIGHT TYPE BM 8001

DESCRIPTION:

This infra-red gunsight has been designed for use on the M47 and M48 battle tanks, on the Marder APC and on other armoured fighting vehicles. In a suitable mounting the gunsight can be interchanged with a daylight periscope, and it can be lined up to match the alignment of the daylight instrument with very little adjustment.

Reflected radiation from targets illuminated with infra-red from an associated IR searchlight or other source is reflected on to an image converter tube by means of a fixed mirror; and the converted image is viewed through an eyepiece. The instrument has a wide field of view (200 m in 1,000 m distance) and is rugged and easy to operate.

MANUFACTURER:
Elektro Spezial GmbH, 28 Bremen 44, Hans-Bredow-Strasse, Germany.



Three views of the BM 8001 gunsight showing dimensions in mm

2187.153
IR PERISCOPE TYPE BM 8004

DESCRIPTION:

This infra-red periscope has been designed for use on the Hotchkiss and HS 30 armoured vehicles. Radiation reflected from a scene illuminated by an IR searchlight mounted in the vehicle, or by some other light source, enters the periscope and is reflected on to an image converter tube by a mirror that can be adjusted to alter the periscope's field of view in elevation. The image converter is then viewed through an eyepiece, and the relatively wide field of view (130 m at 1,000 m) makes it possible to pick out targets quickly.

The periscope is of robust construction and is completely self-contained – power being supplied by a nickel-cadmium battery. The equipment is sealed and can withstand immersion in fresh or salt water for up to 2 hours without deterioration in performance. To keep the internal circuits and mechanisms dry a silica gel cartridge is mounted in the side of the instrument.

All controls are easily accessible and the battery, image converter tube and silica gel capsule can readily be changed.

MANUFACTURER:
Elektro Spezial GmbH, 28 Bremen 44, Hans-Breddow-Strasse, Germany.

1727.153
DRIVER'S PERISCOPE TYPE BM 8005

DESCRIPTION:

The BM 8005 has been designed for the Marder personnel carrier, Leopard Main Battle Tank, and other armoured vehicles having a standard vision port of 65 × 130 mm, or the M113 and other vehicles with an adaptor.

The passive driver's periscope is a binocular night vision device (one optical path for each eye), operated on the principle of image intensification and particularly developed for armoured vehicles provided with the standard vision block port of 65 mm by 130 mm.

The periscope serves mainly as a driver's vision device enabling night driving, without the assistance of any artificial light sources, down to a minimum illumination level of about 5.10^{-5} ft-c.

In addition the periscope can advantageously be utilised for surveillance purposes. As a particular advantage the periscope is also sensitive to near infra-red radiation. In respect to mechanical loads and temperature resistance, the periscope meets the relevant military specification requirements.

MANUFACTURER:
Elektro Spezial GmbH, 28 Bremen 44, Hans-Bredow-Strasse, Germany.

UAL 11201 TANK LASER/UAL 11501 ARTILLERY LASER

L. M. ERICCSON, Sweden, and ISKRA ZZA, Yugoslavia, co-operate in the production of laser rangefinders for tank and artillery applications. The Tank Laser, UAL 11201, and the Artillery Laser, UAL 11501, use the same kind of laser transmitter, where the laser medium is a Ne-doped glass rod.

UAL 11201 is a laser rangefinder intended for tank weapon fire control and having a maximum range of about 7 km. The Tank Laser consists of one unit which is powered from the electrical system of the tank.

Two target ranges in the same line of sight can be registered and the operator decides which value is to be displayed. The Tank Laser is also equipped with an echo counter which indicates the total number of targets within the laser beam. Range information, number of target echoes and "Laser Ready" are presented in the image. Range information can be fed to a fire control computer via the range data output connector.

UAL 11501 is intended for rangefinding over comparatively long ranges (up to 15 km) for field artillery fire control. Built-in electronic angular pick-offs deliver information about azimuth and elevation directions to the target.

The Artillery Laser system consists of a transceiver unit, a power unit and a tripod. Two target ranges in the same line of sight can be registered and the operator decides which value is to be displayed. This laser is also equipped with an echo counter which indicates the total number of echoes within the laser beam. Range and angular information, number of target echoes and "Laser Ready" are presented on separate displays on the operator's panel. Range and angular information can also be fed to a fire control computer via the data output connector.

TYPE HV7 X 200 AT NIGHT SIGHT

DESCRIPTION:

This is a night observation and aiming device consisting of an image intensifier system for medium range forward edge of battle surveillance or in a supplementary role as an aiming sight on crew-served weapons. No artificial illumination of any sort is needed. Special ballistic graticules can be incorporated to suit specific weapons. For general surveillance, the system is either tripod or vehicle-mounted. The spectral sensitivity characteristics of the tubes employed permits detection of the presence of enemy near-infra-red emitters.

Entirely self-contained, the unit comprises a high-speed mirror objective, a 3-stage fibre-coupled image intensifier assembly with power supply, eyepiece system, and graticule projector with adjustable illumination. Monocular or binocular eyepieces are available. There is an automatic brightness control, and a manual gain control. The typical detection ranges are up to 1000 metres for infantry and 3000 metres for tanks, depending upon factors such as ambient light level and contrast. A typical system weight is 12.8 kg.

MANUFACTURER:

N.V. Optische Industrie "De Oude Delft," PO Box 72, Delft, The Netherlands.

1801.193

TYPE TP1MS NIGHT PERISCOPE

DESCRIPTION:

The TP1MS is a passive night periscope for combat vehicles. It is a small, binocular, wide-angle, passive night vision image intensifier system for direct visual observation by the driver of the road and terrain in front of the vehicle under ambient night illumination conditions. The system will enable movement of combat vehicles at a speed of approx 40 km/hour under starlight conditions without the aid of artificial illumination, and with a maximum security from detection.

The viewer consists of an entrance prism, two objective lens systems, two image intensifier tubes, two oculars, and an incorporated high tension unit. The required 20-30V DC is drawn from the vehicle's power supply. An adjustable diaphragm is incorporated to suppress any disturbing effects of the night sky illumination. The field of view of 56° in the horizontal plane gives the driver a clear view of the roadside.

The high-tension power pack is stabilised and will automatically protect the tube against high photocathode illumination, automatically restoring to normal use again afterwards.

CHARACTERISTICS:

Total magnification: × 0.9

Field of View: Horizontal 56°; Vertical 45°

Centre resolution: under starlight conditions – 1 m lux, 1.0 mrad

Range: up to 200 m

Weight: 6.5 kg

Number of tubes: 2

Tube type: special diode, photocathode S25, phosphor screen P20

Cathode sensitivity: 250 Au/1 m

Power supply: 20-30 V DC

Entrance optics: Focal length 45 mm relative aperture 1:1.1. Fixed focus 15 m to infinity

Ocular system: Binocular and adjustable between +5 and −3 dpt

Operating temperature: Between −40°C and +50°

Storage temperature: Between −45° and +60°

MANUFACTURER:

N.V. Optische Industrie, "De Oude Delft", PO Box 72, Delft, The Netherlands.

1732.153

TYPE LAR LASER RANGEFINDER

DESCRIPTION:

The laser rangefinder, type LAR is an instrument specially developed for direct fire control support. It combines a rangefinder, with 5 metres' range accuracy independent of the distance, with instant electronic measurement of azimuth and elevation bearings. Combined in one box, it will fit easily in an armoured observation vehicle or on a jeep. Basically designed for mobile use, the LAR may also be used as man-portable unit operating from a tripod. An external powerpack will supply sufficient energy for at least 150 measurements. The LAR forms a modest two men load.

Basically the LAR is designed to measure ranges up to 10 kilometres for normal artillery purposes. If an operational specification calls for a maximum range of 20 kilometres, this requirement can be fulfilled as well. The system is readily adaptable to naval or coast artillery applications.

The laser rangefinder system LAR consists of a rugged ranging unit with built-in observation/aiming telescope and electro-optical azimuth and elevation encoders, a tripod for fieldwork and a re-chargeable 24 V NiCd battery in carrying case or in beltform. The ranging unit operates by sending out a short duration pulse of laser light, emitted by a Q-switched Neodymium glass laser transmitter. The operational wavelength is 1.06 microns and therefore invisible to the human eye. The reflected light from the target is processed in the receiver and converted into an electrical signal. An electronic counter is controlled by the outgoing and incoming signal(s) and connected with the display panel to provide distances reading accurate to ±5 metres.

The encoders provide continuous information of both the azimuth and elevation of the target. After a range measurement is performed, range as well as azimuth and elevation information is stored in the memories. An outlet is provided for transmission of these data to a computer of an integrated artillery fire control system. Angle measurements are also possible without previous range measurements. The system has a multiple target discrimination capability, with two memories. This makes it possible to measure the range of two targets within the beamwidth of the receiver detector field.

The average pulse repetition frequency is 6 per minute, and intermittent operation of 15 per minute is possible for a short time. The data stored in the memories is available for one minute, after which the unit will switch itself off into the "STANDBY" position in order to save battery power.

Type LAR Specification:

Ranging unit:

Laser type: Neodymium glass

Q-switch: rotating prism

Wavelength: 1.06 microns

Output beamwidth: 1 mrad

Output energy: approx 300 mjoule

Pulse repetition rate: 6/min average 15/min intermittent

Performance: min: 400 metres; max: 10,000 metres (20,000 metres if required)

Range accuracy: ±5 metres

Resolution detector field: 1 mrad (0.5 and 0.3 mrad also possible with reduced range)

Depth discrimination: ±30 metres

Azimuth encoder:

angle: 0-6,400 mils

accuracy: 1 mil

Elevation encoder:

angle: +450 mils

accuracy: 1 mil

Telescope: 7° (120 mils)
Magnification: × 7
Eyepiece adjustment: +5 dptr
Reticle: vertical and horizontal scales of 5 mils with aiming circle of 1 mil, adjustable illumination
Safety filter: built-in KG3 filter for eye protection
General data:
Computer output: BCD code (1-2-4-8) TTL logic
Power supply: 24 VDC nominal
Operational temperature limits: −40°C to +55°
Battery: NiCd, 24 Volts, 4Ah, rechargeable
Capacity: 150 measurements at +15°
Weights:
Ranging unit, (including telescope and angle measuring system): 25 kg
Tripod: 7 kg
Battery: 2 kg

Manufacturer:
N.V. Optische Industrie "De Oude Delft", PO Box 72, Delft, The Netherlands.

1733.153
TYPE LAT TANK LASER RANGEFINDER
Description:
The universal laser rangefinder type LAT has been designed to measure the distance from a tank to a potential target at a range between 400 and 6,000 metres, with an accuracy of +5 metres. A maximum range of 10,000 metres is possible under good weather conditions. The target is observed and tracked through the aiming sight of the tank. The system consists of a ranging unit and two control boxes, interconnected through cables.

The system can be mounted on many types of tanks, where, due to the fact that the space inside the turret might be very limited, the most economic solution is to attach the ranging unit to the gunshield or turret. Modular construction of the ranging unit makes the system easy to adapt to user requirements. This implies that arrangements are possible to incorporate the laser rangefinder modules into an optical sight or periscope.

The universal tank laser rangefinder, type LAT, consists of a rugged ranging unit and two control boxes. They are interconnected through heavy cables. The ranging unit operates by sending out a short duration pulse of laser light, emitted by a Q-Neodymium laser transmitter, an optical receiver, operating wave length of 1.06 microns. This light is invisible to the human eye. The reflected laser light from the target is processed in the receiver and converted into an electrical signal. An electronic counter is controlled by the outgoing and incoming signals and connected with the display panels on the control boxes. Distance readings are accurate to +5 metres. After a range measurement is performed, range data are stored in the memories, where they remain until the next measurement is performed.

An outlet is provided for transmission of these data to a computer of an integrated fire control system. The digital information is available in BCD code (1-2-4-8) for TTL interface. The system has a multiple target discrimination capability with two memories. This makes it possible to measure the range of two different targets within the beamwidth of the receiver detector field. Undesired target reflections can be eliminated by use of the minimum range gate. The average pulse repetition frequency is 6 per minute. Intermittent operation of 15 per minute is possible for a short time.

Type LAT Specification:
Ranging unit:
Laser type: neodymium glass
Q-switch: rotating prism
Wavelength: 1.06 microns
Output beamwidth: 0.5 mRad
Output energy: approx 300 mJoule
Pulse width: approx 30 nSec
Pulse repetition rate: 6 per minute average/15 per minute intermittent
Performance: 400-6,000 metres
Range accuracy: +5 metres
Resolution detector field: 0.5 mRad (0.3 mRad is also possible with reduced range)
Depth discrimination: 30 metres
Calibration telescope:
Field of view: 2° (34 mils)
Magnification: × 7
Control boxes:
Range display: decimal; 400-9,995 metres, the range of two targets can be displayed successively
Multiple target indication: signal light to indicate more than 1 echo received
Minimum range: continuous min range setting through control knob
General data:
Computer output: BCD code (1-2-4-8) TTL interface
Power supply: 19-29 VDC
Operational temperature: −40°C to +55°C
Weight: 18 kg

Manufacturer:
N.V. Optische Industrie "De Oude Delft", PO Box 72, Delft, The Netherlands.

NORWAY

1804.193
LP3 LASER RANGEFINDER
Description:
The Simrad LP3 laser rangefinder is a man-portable, tripod-mounted combined sight and laser rangefinder. It enables range, bearing and elevation data for targets to be rapidly acquired and used directly by weapons or fed into computerised artillery fire control systems. A quick-aiming sight is provided to permit rapid orientation against targets appearing only briefly, such as shell bursts or gun flashes. A Q-switched Neodymium-doped glass laser is used, providing a peak power of 1.5 MW. With a pulse length of 30 nanoseconds this amounts to an equivalent radiated energy of about 45 mJoules. A pulse rate of 12 per minute can be sustained during continuous operation, or 30 per minute for intermittent operation. A photodiode optimised for 1.06 micron is employed as a detector in the receiver. The maximum and minimum ranges are 20,000 metres and 200 metres, with the minimum-range setting continuously variable between 200 and 6,000 m.

Range presentation is by LED numeric indicators, with a measured resolution of 5 metres and range discrimination of 30 metres. The associated optical sight has a field of view of seven degrees and a × 7 magnification. Total weight of the equipment, with tripod, is 11 kg.

Development:
The Simrad LP3 laser rangefinder was developed for the Norwegian Army under Government contract. The programme was supported by the Norwegian Defence Research Establishment.

Status:
In production for the Norwegian Army and the forces of unspecified foreign countries.

Manufacturer:
Simrad A/S, PO Box 6114, Etterstad, Oslo 6, Norway.

UAL 11105 LASER RANGEFINDER
Description:
UAL 11105 is a medium range (less than 15 km) portable laser rangefinder intended for such field applications as target observation from close-by position in co-operation with artillery fire control systems.

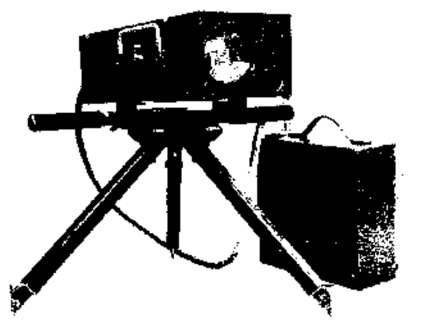
Target observation includes range measurement and determination of azimuth and elevation angles of the target related to a well defined terrain point. The L. M. Ericsson laser, when fully equipped, is a combined instrument capable of performing all these tasks. Range and angular information can also automatically be fed to a fire control computer via a data transmitter.

The periscope form of construction enables the operator to work from behind cover.

Description:
The rangefinder consists of the periscope laser, the tripod and the battery case.

The periscope laser consists of a Q-switched neodymium laser transmitter, an optical receiver, two digital counters, numerical displays, an optical sight for aiming the laser, control logic and voltage converter.

The laser is a sealed unit and is provided with a desiccator. The top cover can be removed for easy service and maintenance.

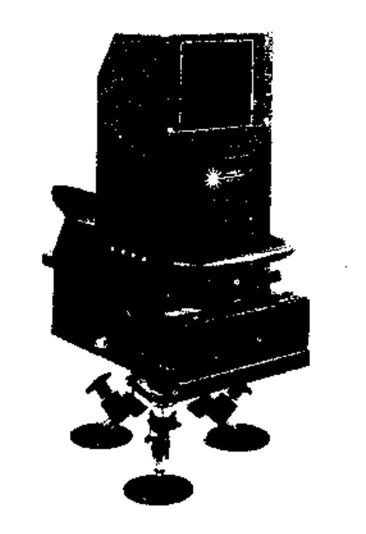


The L M Ericsson portable laser range-finder in basic form

The battery case contains 12 NiCd cells with a capacity of 3.5 Ah. This means about 250 measurements without recharging.

The portable laser rangefinder is also produced in a basic configuration, without the periscope.

Manufacturer:
Telefonaktiebolaget L. M. Ericsson, MI Division, S-431 20 Mölndal, Sweden.



Periscope version of L M Ericsson UAL 11105 laser range-finder

2347.193

TANK LASER RANGE–FINDER

DESCRIPTION:

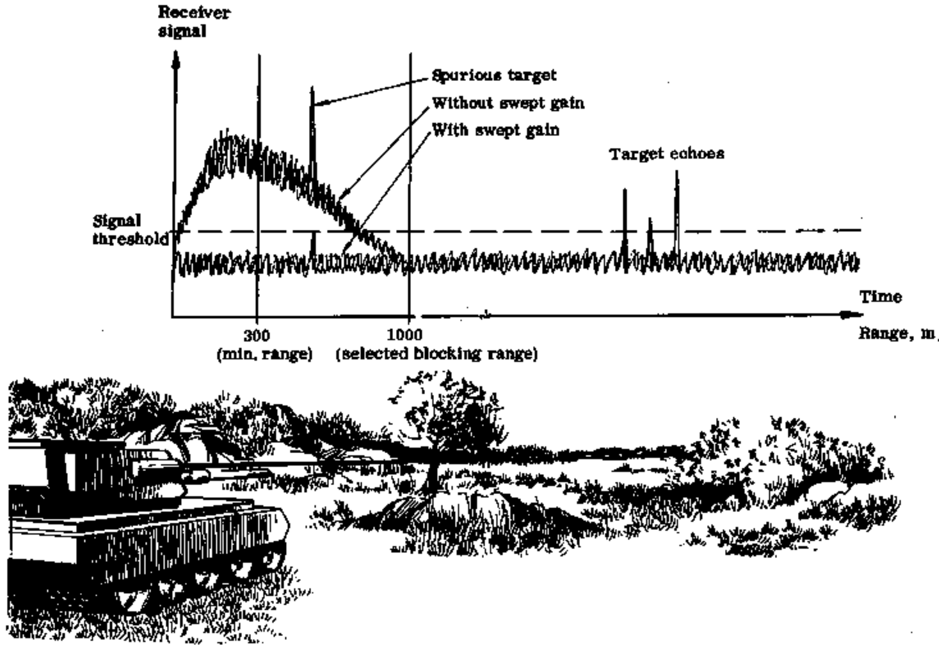
The Ericsson medium-range Tank Laser range-finder is intended for mounting on a tank, armoured vehicle or truck. It is divided into three units – the transceiver unit, the control unit, and the power unit.

The Tank Laser is capable of measuring two different target ranges at the same time, provided the targets are in the line of the laser beam. The different target ranges are displayed simultaneously. The operator selects which range data are to be fed to the co-operating equipment.

The transceiver unit is mounted outside or inside the turret. In the former case some additional armoured shielding is necessary. The transceiver optics are arranged to use the optical sight of the tank when the unit is mounted inside the turret.

The control unit, which is mounted inside the tank, contains three range counters, three range displays, control logics and low voltage supplies for the electronics. The displays are located behind a window on the front panel on which also are mounted the controls and signal lamps. On the rear there are three connectors, one for the transceiver unit, one for input power and one for the interface with the co-operating external equipment.

To eliminate the influence of undesirable echoes caused by atmosphere backscattering, spurious targets (flies, smoke, etc.) and echoes at short ranges, the Tank Laser is provided with swept gain and a blocking circuit.



Tank laser range-finder – principle of operation

Echoes from targets at short ranges are removed by a blocking range that can be set to two different fixed positions by the operator. Other selectable blocking ranges can be provided. An AGC circuit controls the receiver noise level.

MANUFACTURER:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-431 20 Mölndal, Sweden

1213.253

UAL 1012 MARINE LASER RANGE-FINDER

DESCRIPTION:

Range-finder for marine ranging functions, point of impact observation for fire control purposes and similar applications. The UAL 10102 uses a ruby laser giving an output power of 5 MW to provide a range of 30 km. Range accuracy is quoted as plus or minus 10 m. Two pulse rates are available, 15 or 30 pulses per minute. The higher rate can be sustained for 20 seconds after which there is a delay of 20 seconds before the next firing takes place.

There are three principal units to the equipment: transceiver (13 kg), power pack (16 kg), and indicator (10 kg). It may be used separately or in combination with aligning devices such as TV or light amplifiers. When used with a TV camera, the UAL 10102 can be remotely controlled. An optical device in the laser is used for alignment.

The indicator unit has two numerical displays, the main one of which shows the latest measured range. The other, a memory chart, shows the last four measurements preceding the one shown on the main readout. When operating at the high pulse rate, the chart indicator shows instead the difference between the last value before the change-over to high pulsing and the measurement after changeover.

The transceiver unit contains separate tubes for the transmitting and receiving sections. The former houses the ruby laser and transmitting optics, while the latter tube contains receiver and associated optics, photo-detector, and receiver electronics. A fan provides cooling for the ruby rod and flash tube.

The indicator houses electronics for control and ranging logic on 13 circuit boards, and its front panel carries controls and the two displays. The main display consists of a five-digit indicator (Nixie tubes), and the memory display has four rows of four digits each.

OPERATION:

Operation of the transceiver unit is described in conjunction with Figure I. In the laser transmitter power is fed to the ruby (1) from a flash tube (2). The latter is lighted by a starting device (3) which

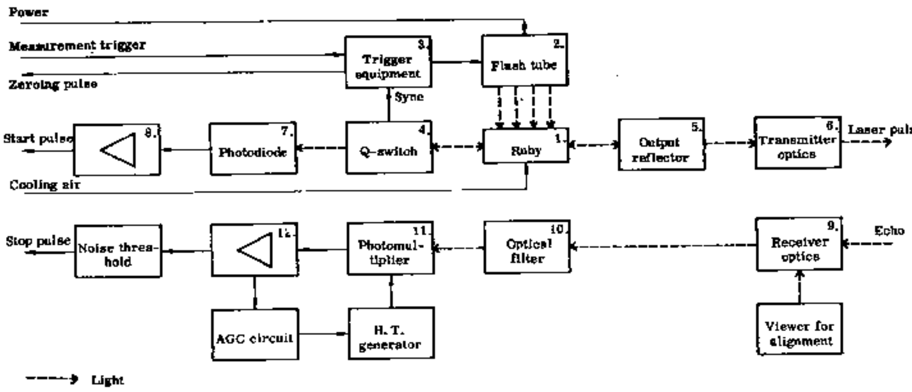


Fig. 1. Transceiver unit

is synchronised with a rotating prism Q-switch (4). When the ruby has stored maximum energy, the prism of the Q-switch is turned to the position which gives maximum feed-back of axial radiation in the ruby. The laser pulse is now built up and passed through the partially transparent reflector (5) and the transmitting optical system (6).

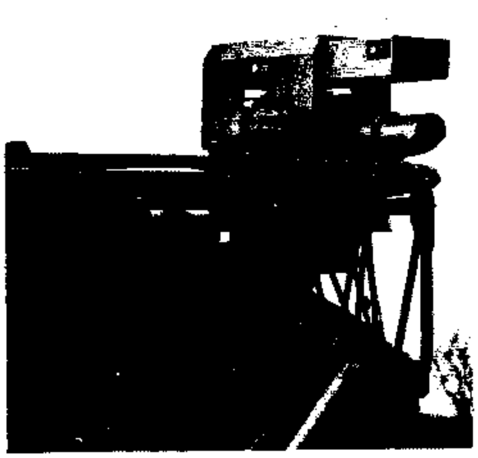
Part of the outgoing laser pulse is detected by a photo-diode (7) which through a driving stage (8) provides a starting triger to the timing counter of the indicator unit.

Reflected laser energy from the target is collected by the receiver optical system (9), passes through an optical pass-band filter (10) and finally strikes a photo-multiplier (11), where a signal is received and fed to a signal amplifier (12), which in turn sends a stop pulse to the counting circuits in the indicator unit.

The indicator unit measures the time elapsed from transmission of a pulse and reception of its reflection from the target, this being converted into an indication of range.

DEVELOPMENT:

L M Ericsson produced its first portable laser range-finder in 1965. The UAL 10102 is the result of continuation of this line of development and is one of a number of equipments of this type produced by the company.



The UAL 10102 marine laser range-finder in a land-based application

STATUS:

The UAL 10102 has been delivered in quantity to the Swedish Naval forces and other Scandinavian countries.

MANUFACTURER:

Telefonaktiebolaget L. M. Ericsson, MI Division, S-431 20 Mölndal 1, Sweden.

1376.393
LME AIRBORNE LASER RANGE-FINDER

DESCRIPTION:

The L M Ericsson airborne laser range-finder is produced in two versions, one pod-mounted and one for internal fitting in the parent aircraft, and is intended for range finding for air to ground attacks with bombs or rockets. The former version has a fixed 'sight-line' relative to the aircraft, whereas the latter has a servo positioned laser head.

The pod-mounted equipment consists of a transmitter/receiver and an electronics unit, both contained within the pod. The latter unit contains a digital range counter, control logic, and low-voltage power supplies. The measured range information is fed to the aircraft fire control computer.

In the other version, the laser transmitter/receiver unit can be positioned in azimuth by signals from the fire control computer, the necessary servo electronics being contained in the electronics unit.

The laser transmitter element is a neodymium-doped rod with a spinning prism, and the rod is excited by a xenon flash-tube. The Q-switch (spinning prism) is driven by a motor which is started just before a range measurement. The laser system is essentially the same as is used in other LME range-finders.

To eliminate unwanted echoes caused by back-scatter from the atmosphere, a preset blocking range facility is incorporated. This facility, in conjunction with an electronic counter which cancels all but the last detectable echo, ensures ranging on the designated target. Receiver noise level is controlled by an AGC system.

Range performance for both versions is 6 km in good visibility conditions, with a minimum range of 600 metres. Accuracy in range is ±10 m and range resolution 10 m.

MANUFACTURER:

Telefonaktiebolaget L M Ericsson, MI Division, S-431 20 Mölndal, Sweden.

1730.393
RGS 2 AIRCRAFT SIGHT

DESCRIPTION:

The Saab-Scania RGS 2 is a lead computing optical sight developed for use with any type of fighter or attack aircraft. Important design objectives were accuracy, small dimensions and weight, and low price. Its operational function is to display to the pilot a movable aiming point projected to infinity. The deflection of the aiming point is controlled in accordance with the characteristics of the preselected weapon, and with certain parameters of the prevailing flight conditions. In one simple configuration, only pitch, roll, and yaw rates are measured and all other parameters, such as speed, altitude and range, are set in manually by the pilot. In more sophisticated configurations, one or more signals are fed to the system from external sources. This flexibility enables the RGS 2 to be applied to a variety of aircraft types with minimum additional design effort.

The system has provisions for the following attack modes: guns, rockets and missiles for air-to-air; guns, rockets and bombs in the air-to-ground role. Stadiametric range (by wing-span setting) measurement is used in the air-to-air gun mode. When bombing, a suitable aiming mark depression (max 170 mils) is preset on the control unit. The dynamic range of the aiming mark deflection is plus or minus 120 mils in both pitch and yaw.

The RGS 2 system is comprised of three units: Optical Sighting Head, Gyro Unit, and Control Unit. Principal dimensions of these items are as follows:

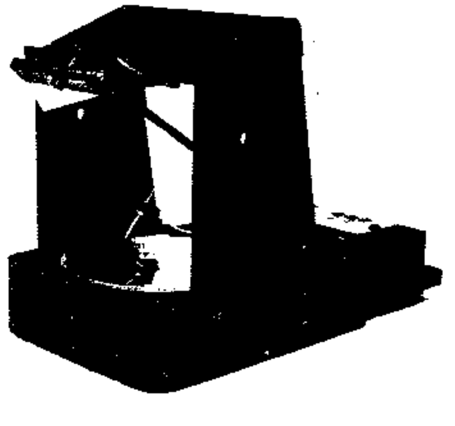
Sight Head: 164 × 134 × 238 mm

Computer and Gyro Unit: 100 × 160 × 250 mm

Control Unit: Size dependent upon system facilities

The sole purpose of the sight head is to generate a moving aiming mark of controllable width. Deflection of the aiming mark is accomplished by a spherical mirror, suspended in gimbals and controlled by a servo system comprising torque motors, feed-back pick-offs, and servo amplifiers. The width of the aiming mark is controlled by a similar servo system acting on a variable reticle placed in the focal plane of the spherical mirror. The whole optical assembly, with the exception of a fixed plane mirror and an ordinary inclined combining glass, is housed in the base of the sight head.

The computer and gyro unit contains three rate gyros and several circuit boards bearing the computing circuits, signal converters, three identical servo amplifiers and power supply circuits. All the pilot's operating controls are on the panel of the control unit.



Saab RGS-2 aircraft sight head

Saab-Scania, Datasaab Division, S-55002 Jönköping, Sweden.

1629.393
BT9R BOMBING SYSTEM

DESCRIPTION:

The BT9R system consists of the following units: Ballistics Computer, Control Unit, Laser Transceiver Unit, Distance Display Unit (optional), and Release Circuits (optional).

The *Ballistics Computer* is a hybrid electronic computer using both digital and analogue techniques to perform the calculations required to determine the release conditions. It comprises a rack of printed circuit boards mounted in a single light alloy box. Extensive use is made of integrated circuits such as shift registers, analogue multipliers, operational amplifiers and drivers.

The *Laser Transceiver Unit* houses a laser transmitter and a laser receiver with their accompanying optic systems. The laser beams can be deflected +10 degrees by a servo controlled optical device.

The servo is slaved to the drift angle from the Doppler Radar. If no Doppler is used the deflecting device can be omitted.

The *Control Unit* is provided with knobs for manual setting of target altitude, QNH and bomb ballistics factor. If the aircraft is equipped with a Doppler Radar, the Control Unit can be omitted.

The *Distance Display Unit* is an optional unit placed in the cockpit. It gives a visual digital presentation of the measured distance. The Display Unit also contains two indicating lamps and a switch for initiating the built-in test cycle. If the DDU is omitted, the lamps and switches are placed elsewhere in the cockpit.

The *Laser Range Finder* is also available in a pod version.

OPERATION:

System operation involves the following phases:

(1) Determining the aircraft's initial position in relation to the target. Slant range is accurately measured by firing the Laser Range Finder at the pickle point. The corresponding elevation angle is obtained from the aircraft Vertical Reference.

(2) Calculation and storage of the horizontal and vertical distances from the pickle point to the target. Continuous updating of these quantities using horizontal and vertical components of ground speed from the doppler radar or true air speed and angle of attack from the Air Data Computer.

(3) Continuous calculation of the release condition with respect to the aircraft's present position, the magnitude and direction of its velocity vector and the ballistic properties of the particular bomb. If doppler radar signals are available, wind effects are automatically compensated for.

(4) Continuous comparison of the calculated release angle with actual attitude angle. Automatic release signal to the bomb racks when the above quantities balance.

The BT9R is designed to be used at distances up to 6 km, dive angles up to 60° and within the velocity range 500 to 1,100 km/h. The impact accuracy is to a great extent dependent on the accuracy of the input signals, i.e. those represent ing pitch angle, speed, altitude and angle of attack. Other contributing error sources outside the BT9R are the pilot's aiming error, the bomb lock delay and the natural dispersion of the bombs themselves.

MANUFACTURER:

Saab Scania, Datasaab Division, Jönkoping, Sweden.

SAAB TVT-300 AUTOMATIC TV-TRACKER

DESCRIPTION:

The TVT-300 is a system for automatic tracking of objects, in which the optical contrasts of the object against its background as seen by a television camera are utilised. The basic system consists of a TV camera on a gyro-stabilised platform, monitor, and an electronics unit containing video processing and servo control circuits. The equipment can be engineered and assembled to serve either fire control or missile guidance applications. Daylight or low light-level TV cameras are used, depending upon operational requirements.

OPERATION:

With the target within the view of the TV camera the operator places an electronic "window" on the target by means of a joy-stick. The "window", the position of which is indicated by an electronic cross-pointer, has an extension of a few per cent of the camera field of view. The operator then initiates automatic tracking whereby the servo control circuits keep the "window" centred on the target contrast and also align the target to the centre of the camera field of view.

Signals corresponding to the deviation of the "window" from the optical axis of the camera are used to control the platform servo motors which – trigged by the deviation signals – train the platform to keep the camera continuously directed towards the selected target. Tracking can be performed on dark or bright contrasts, or on very slight contrast levels. When used in a fire control system the platform angular positions in bearing and elevation are fed – directly or through a computer – for automatic tracking of the guns.

For missile guidance, the TV tracker is placed within the missile. Before launching, the TV picture is visible on a monitor screen in the aircraft, and this is used by the operator to identify the target. This done, tracking is initiated, and after checking that lock-on has been achieved, the missile is fired. The deviation signals from the tracker are applied to the missile guidance controls, to maintain the velocity vector in alignment with the camera's line of sight to the target until impact. As soon as the missile has been released from the aircraft, the pilot is free to take evasive action.

DEVELOPMENT:

This system has been the subject of active development work by Saab-Scania for five years, and it is understood that the Swedish authorities have a missile application under study. The system was operational on a Swedish fast patrol boat in 1972. A more advanced TV/laser fire control system for naval and army applications is currently under development.

STATUS:

The Swedish Defence Materiel Administration (FMV) recently awarded Saab-Scania a production order for delivery of Saab TVT-300/11 Fire Director Systems for installation on board torpedo boats and mine-sweepers of the Swedish Navy. The order, amounting to about Skr 6 millions, was preceded by operational tests and evaluation by the Swedish Navy in competition with similar fire directing systems.

The principal component of the system is the Automatic TV Tracker TVT-300. In the Saab TVT-300/11 the TV camera bearing and elevation values are used to directly control the aiming of AA guns which are slaved to the camera. The system

Saab TVT-300s 11 director

replaces the conventional fire direction and correction devices. Target acquisition and corrections are quickly and accurately made from a close-up view of the target view on the TV monitor.

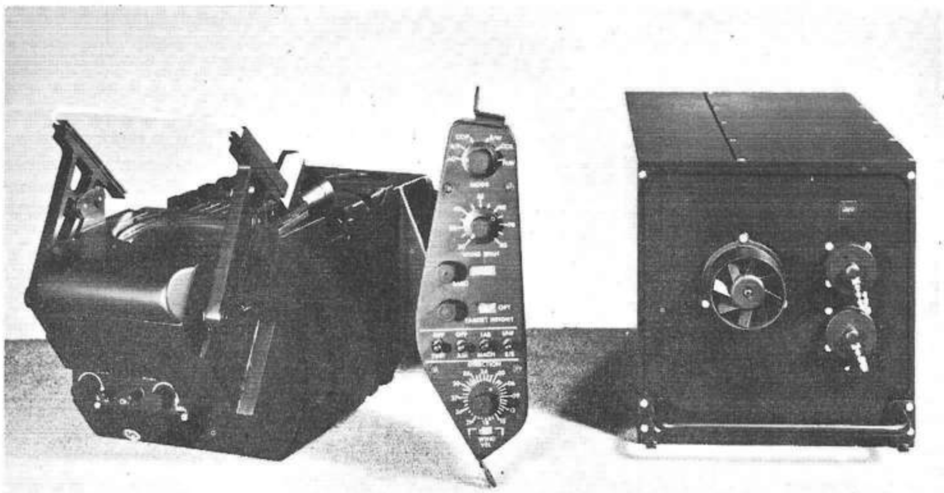
TYPE 664 HUD-WAS

DESCRIPTION:

The Type 664 Head Up Display-Weapon Aiming System, is derived from the Elliott ILAAS equipment, developed in 1967 to meet a US Navy requirement for a comprehensive head-up display system. This was followed by the Corsair, A-7 HUD, and over 1500 such systems had been manufactured by the end of 1973. By utilising the spare capacity in the A-7 Electronic Unit digital computer to carry out the weapon aiming computations, a self-contained HUD-WAS was developed to meet the requirement of the A-4 aircraft. The Type 664 is the logical successor of the A-4 equipment, providing an advanced three-box system with a 4096-word digital computer electronic unit which is capable of providing a comprehensive repertoire of air-to-air and air-to-ground aiming modes, and leaving spare capacity available for dealing with other possible tasks.

The Electronic Unit accepts digital and analogue inputs from various sensors (the precise number and type of sensors will vary with aircraft types and missions, but examples are attitude and heading reference, air data computer, angle of attack sensor, radar, radio altimeter, doppler, etc), together with mode and weapon selection data from the pilot's control unit and weapon control panel. These, in conjunction with the ballistic data stored in the system, provide symbology outputs to the pilot's Display Unit which, viewed with the normal flight instrument symbology, provide the pilot with a highly versatile weapon aiming display. This enables attacks to be carried without the constraints of set dive angles, speeds and precise release heights that are applicable to some weapon delivery systems.

The Pilot's Display Unit houses a 4-inch (10 cm) lens system, with an integral standby sight and an electrostatically focussed CRT, designed to give a 25-degree field of view. The mounting in the aircraft is by means of a harmonisation mounting tray. Other facilities include a servoed combiner mechanism, integral EHT supply and integral



HUD-WAS Type 664, showing (l to r) pilot's display, side control panel and electronics unit

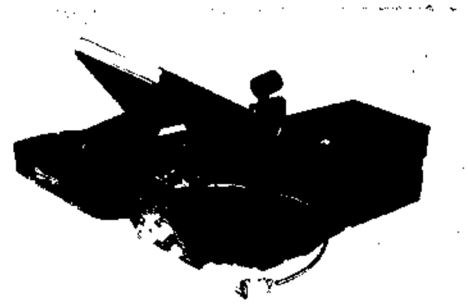
standby sight power supply. There is also provision for a side-mounted camera.

Any symbology format made up from straight lines and segments of circles can be displayed, the precise amount of information available and the symbology presented to the pilot at any one time will vary with customer requirements and operating mode. A declutter switch is provided to remove non-essential information from the display when desired. The Type 664 system can be extended to include the display of a night sensor (Forward Looking Infra-Red or Low-Light Level TV) scene in a raster form, overlaid with normal symbology, thus providing a day and night capability. This is effected by the addition of a video combiner unit.

The Pilots Control Unit enables the selection of weapon aiming, navigation or test modes, together with wind data and target height information if doppler and radar sensors are not available. Weapon aiming modes available include:

Type 666 display unit, showing controls

Air-to-Air – CCIL (snapshoot), Missiles
Air-to-Ground – Rockets, Guns, CCIP, CCRP.
MANUFACTURER:
Marconi-Elliott Avionic Systems Ltd, Airborne Display Division, Airport Works, Rochester, Kent, England.



Type 666 pilot's display unit forming part of HUD-WAS for General Dynamics YF16 light-weight fighter

1805.393
MRCA HEAD-UP DISPLAY

DESCRIPTION:
The Head-Up Display (HUD) being supplied by Smiths Industries for the MRCA has not been described in detail, and the following paragraphs must be regarded as unofficial. They are however indicative of some of the most recent HUD technology and are representative of current practice within the SI organisation.

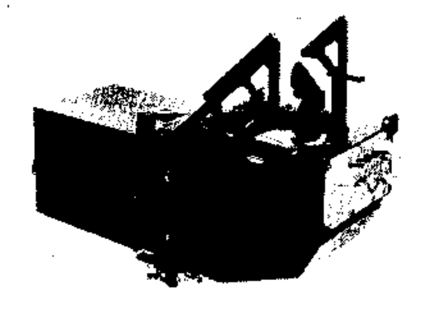
It has been stated that the MRCA HUD system is based on the broad philosophy of that supplied by Smiths Industries for the RAF Jaguar and which was described in some detail in Jane's Weapon Systems 1970-71 (Entries Nos 1127.373 and 1312.383). From the Jaguar system the company has developed a more advanced version and it is assumed that the MRCA equipment will embody many of the features of that system.

In both the Jaguar and the Harrier (which also employs a Smiths HUD) the HUD display computer was designed to interface with a separate weapon-aiming computer. Subsequent work was directed toward providing a weapon-aiming computing capability within an electronic HUD, and this resulted in a single digital computer unit with the necessary capacity for both HUD character generation and control, and weapon-aiming calculations. (Smiths Industries Ltd was named as the sub-contractor to Litef – Litton Technische Werke – for the manufacture of the Spirit 3 central airborne computer for MRCA in February 1972.)

The HUD display computer has four main functional sections: (1) input interface, (2) central processor, (3) output interface, and (4) power supply unit. The first of these sections performs analogue-to-digital conversions where appropriate and provides the essential link between the aircraft systems and sensors, control inputs, and the rest of the HUD system. The central processor carries out all the digital computation. The main programme is contained in a read-only memory which can be reprogrammed, if required, to accommodate changes in display format or other aspect of either system or operation. The ROM has a capacity of 4500 words, which is more than is required for a typical HUD, thus providing spare capacity for growth. A read/write memory of 256 words is used for temporary storage during normal digital computing functions.

The output interface includes a symbol function generator with a 1000-word symbol store containing the information which defines the symbol shapes. Instructions from the central processor feed this information out to X and Y integrators to provide analogue outputs for the pilot's display unit. Digital resolving techniques are used to stabilise certain symbols in roll.

The pilot's display unit converts the electrical signals from the display computer into the display which the pilot sees superimposed on his view of the outside world. The model for the MRCA is a fully line-replaceable unit featuring a 5-inch (127 mm) lens and built-in EHT unit, pilot's control panel and deflection amplifiers. The combining glass is fitted to a movable carriage to increase the field of view in elevation without the need for head movement on the part of the pilot. The servo drive for the carriage is automatically controlled by the display computer.



MRCA pilot's Head-up Display Unit

Smiths Industries Limited, Aviation Division, Bishops Cleeve, Cheltenham, GL52 4SF, England.

1012.393
ISIS WEAPON AIMING SYSTEM

DESCRIPTION:
The ISIS (Integrated Strike and Interception Systems) series of equipment comprises a range of aircraft sighting systems based on the use of gyro-controlled, lead computing optical techniques. Different versions are available to fulfil air-to-air and air-to-ground missions with varying degrees of complexity, according to operational requirements.

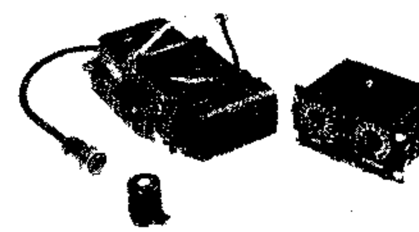
Common to all versions of the ISIS family of weapon aiming sights is the use of a 2-axis rate gyro, the movement of which is controlled by variations in the magnetic restraint imposed upon it in accordance with the requirements of the aiming process. The gyro is located in the sighting head, and has two principal parts, concerned with display and control, respectively. The display portion consists of a circular mirror centred on the rotational axis of the gyro. The aiming pattern is reflected from this into the pilot's forward view so that any deflection of the gyro relative to its housing results in a corresponding deflection of the aiming pattern relative to the centre of the field of view. The control portion of the gyro rotates in a controllable magnetic field, the strength of which determines the amount of deflection produced by a given aircraft rate of turn. The control field may also be intentionally unbalanced to produce required deflections of the gyro, and thus the aiming pattern.

OPERATION:
Air-to-Air: Control of the magnetic restraint on the gyro is particularly applicable to this mode. The constant of proportionality between gyro deflection and aircraft rate of turn is defined as the sensitivity of the sight, which for a given weapon is required to vary with range. This is achieved by coupling the ranging sensor (radar or optical) to a potentiometer which thereby adjusts the field strength operating on the gyro range. The gyro deflection, and hence the lead angle, is then correct throughout the attack path. Fixed range sensitivity operation is possible at a cost in reduced overall accuracy. The effect of gravity upon the projectile is compensated by arranging for a small depression of the sight-line, and the amount of depression is controlled by a similar arrangement for that used to adjust sensistivity, so that the allowance for gravity drop is correct throughout the attack path.

Air-to-Surface: In this mode, where variations in size of probable targets and other considerations may rule out the use of stadiametric ranging, and the gravity drop effect assumes greater importance, a depressed sight-line method of approach is used. The magnetic field controlling the gyro is unbalanced to cause a downward deflection of the aiming pattern, the amount of deflection being dependent upon the aircraft dive angle and speed. In some versions of ISIS switching is arranged to provide the correct sight-line depression for one fixed speed and one range of dive angles. If continuous speed and pitch angle inputs are available, however, these can be used to provide for continuous variation of sight-line depression.

Manual adjustment of sight-line depression can also be provided. A fixed sensitivity datum is used for each type of weapon in the ground attack mode.

Roll stabilisation of the aiming mark has become a standard feature of many of the ISIS variants where a vertical reference gyro is already installed in the aircraft. This feature reduces the tracking time of the target to a matter of 2 to 3 seconds thus limiting the "exposure time" of the pilot to ground fire.



ISIS F-195R

Additional Facilities: Provision can be made for the ISIS system to accept inputs from other sources such as doppler drift, laser or radar ranging.

DEVELOPMENT:
Design and development was initiated by Ferranti in 1960, and the first aircraft to be fitted with an ISIS system was the Fiat G91Y, under a development programme for the West German Air Force. The ISIS concept is a development of the gyroscopic gunsight (GGS) of which over 50,000 have been manufactured by Ferranti Limited since 1943. The GGS was basically an air to air system and the developed ISIS gyro unit became necessary to operate the system in the more rugged air to ground environment yet retaining the air to air capability.

The basic concept of the ISIS has been developed with the object of enabling the requirements of different users to be met from a range of standard systems – several of which are capable of subsequent extension. Details are given in the adjacent panels.

STATUS:

The ISIS system first entered operational service in 1968 and current users include the Canadian Defence Forces, Italian Air Force, Austrian Air Force, Royal Australian Air Force, Argentine Navy, Singapore Defence Forces, Royal Norwegian Air Force, Indian Air Force, US Marine Corps, Royal Air Force and Venezuelan Air Force.

ISIS equipment has been fitted to the SAAB 105, (ISIS F-105), Fiat G91Y (ISIS B), Aeromacchi MB 326 (ISIS F-126), McDonnell Douglas A-4S (ISIS D-101), Northrop CF5A (ISIS N), Northrop NF5A, HSA Hawk and HAL Gnat 1A (ISIS F-195R) and HAL HF24 (ISIS F-124).

The ISIS D-01 has been delivered to the US Navy for use by the US Marine Corps, in conjunction with a USN laser target designator system.

MANUFACTURER:

Ferranti Ltd, Electronic Systems Dept., Ferry Road, Edinburgh EH5 2XS, Scotland.

1009.393

TYPE AF120 GYRO-STABILISED SIGHT

DESCRIPTION:

A gyro-stabilised optical sighting system developed for weapon sighting and observation purposes from platforms subject to high levels of vibration, such as helicopters, patrol boats, fighting vehicles and hovercraft.

OPERATION:

The AF120 sight takes the form of a periscope, the upper mirror of which is capable of movement in the pitch and azimuth planes under the control of a directly coupled two-axis datum gyro. Controlled motion can be imparted to the field of view in both azimuth and pitch without requiring head movement by the operator. This is effected by controls incorporated in the horizontal handgrip/controller at the lower end of the unit. Azimuth movement is controlled by a thumb-wheel in the handgrip and pitch demands are made by rotating the handgrip itself in the direction in which it is desired to rotate the line of sight. The signals from these controls are fed to torque motors on the pitch and azimuth gimbals which precess the gyro in the required direction at a rate which is proportional to the angle through which the controller has been rotated.

The gyro is housed in an hermetically sealed casing, fitted with a sight-line window, together with the upper mirror. This casing is in turn housed in a more robust casing designed to withstand an external environment, and provided with a window equipped with an electric wiper for rain removal and mechanical washer. When the gyro is precessed in azimuth, a servo link between the gyro and inner head drives the latter into the null position with respect to the gyro.

The outer head is connected by flexible link to the inner head and thus the two sight line windows are maintained in line and in correct position in relation to the upper mirror. When the upper mirror is rotated relative to the lower mirror in azimuth, the corresponding rotation of the viewed image which would normally be present, is eliminated by the inclusion in the optical system of an image tilt compensating prism. This is servo linked to the inner head in such a way as to maintain the viewed image erect.

Two powers of magnification are provided, × 2.5 and × 10 selection being from a control on the handgrip/controller.

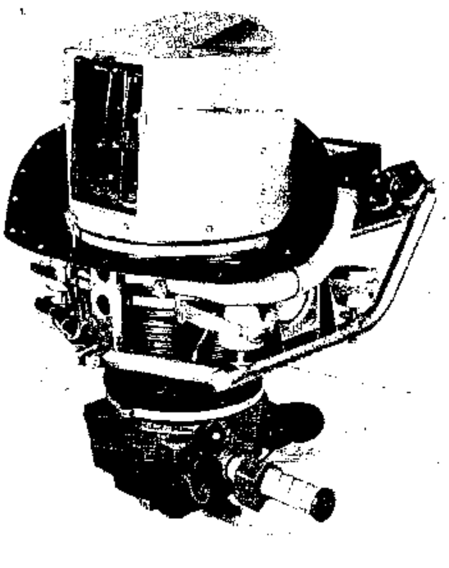
Sight line relative to the vehicle's fore-and-aft axis is displayed in two ways – (1) servo-driven graticules display sight line azimuth for the operator, and (2) a small indicator displays the same information for other crew members.

DEVELOPMENT:

Development was commenced in February 1967 as a private venture by Ferranti and Avimo Ltd, and the first prototype was completed in September 1968. The basic design has been engineered to permit continuing development and a second generation, light weight, modular constructed version of this sight has evolved suitable for fitting to all types of light helicopter.

STATUS:

British Army evaluation trials of the AF120 sight took place in Westland Scout helicopters at the Army Aviation Centre, Middle Wallop, Hants, in 1968, some of these tests being in conjunction with evaluation of the Nord SS. 11 wire-guided missile. Comparative trials were also made of the French APX 260 Bezu sight. A contract was placed in 1970 covering the supply of AF 120 sights for use in British Army Scout helicopters.



Type AF120 stabilised sight

MANUFACTURERS:

The optical sub-system of this equipment is manufactured by Avimo Ltd, Taunton, Somerset, England.

Electronics and gyro sub-systems are the responsibility of Ferranti Ltd, Instrumentation Division, Aircraft Equipment Department, Moston, Manchester M10 0BE, England.

1794.393

TYPE AF530 GYRO-STABILISED SIGHT

DESCRIPTION:

The AF530 sight may be used for observation, target acquisition/recognition/identification and missile guidance. Modular construction, light weight and ruggedness permit its use in a wide variety of helicopter types, land vehicles and light patrol boats. It has been developed for the BAC Hawkswing missile system.

The sight is a gyro stabilised monocular, periscope telescope which provides a stable, magnified image of the selected field of view irrespective of the normal pitch, yaw and vibrational disturbances to which it might be subjected. In addition, the sight incorporates facilities for missile simulator injection and TV camera attachment.

In the helicopter application, the sight is normally installed in the cabin roof with its longitudinal axis fixed to align with the helicopter's fore-and-aft datum. A rotating viewing head protrudes through the canopy and allows the operator to scan the landscape through the monocular which is mounted on a stowable down tube.

Movement of the field of view in azimuth and elevation is achieved by horizontal and vertical orientation of a gyro stabilised mirror mounted within the rotating head. The stabilised position of the mirror can be varied by a thumb-stick controller which also contains a press switch for changing viewing magnification from × 2.5 (low magnification with large field of view) to × 10 (high magnification with narrower field of view) or vice-versa.

OPERATION:

Light from the field of view enters the sight via a window in the rotating head and is reflected into the optical assembly by the mirror, which is suitably inclined to the vertical plane. After reflection, the light passes through magnification change lenses, a Pechan prism (to maintain an erect image) and a relay lens system in the down tube, to the monocular where it is focussed to give an erect magnified image of the landscape within the field of view.

The mirror is mounted in a system of gimbals which move about mutually perpendicular axes, under the action of a gyro, so as to orientate the mirror and maintain a stable image of the selected view.

The desired sight line is maintained by the adjustment of the thumbstick controller which transmits command signals to the gyro's elevation and azimuth torque motors to drive the mirror to the desired position. Azimuth movement of the gyro is limited, therefore to maintain a satisfactory viewing range it is necessary to rotate the complete head enclosing the gyro and mirror. This is achieved by the incorporation of an azimuth sensor in the gyro which produces signals proportional to the gyro's azimuth movement.

Magnification power of the sight can be rapidly interchanged by the operation of a push switch on the tracking controller. This action causes a lens system to be inserted into, or withdrawn from, the light path between mirror and optical assembly.

The relay lens system in the down tube enables the sight to be used in a wide variety of installations where the down tube requirement may differ. An adjustable eye point is also possible with this design.

FERRANTI LASER RANGER AND MARKED TARGET SEEKER

DESCRIPTION:

An aircraft ranging and direction equipment designed primarily for air to surface attacks when it is used, either as a self contained laser ranger or, when operating in conjunction with a Laser Target Marker (Designator), as a simultaneous rangefinder and target seeker. It is specifically intended for use with weapon systems optimised for low level first pass attack when target tracking time is necessarily short and grazing angles are very low. This latter feature, coupled with high accuracy, gives this laser system a distinct advantage over radar ranging equipments.

OPERATION:

The laser ranger operates by directing a pulse of infra-red energy from a YAG laser at the target. Range is then derived by measuring the time interval between transmitting the pulse and receiving the scattered energy returned to the ranger from the target. The laser beam is stabilised against vibration and angular movement to ensure accurate alignment with the target. A high PRF allows continuous range information to be obtained when this is required.

When used in conjunction with a laser target marking system, a Forward Air Controller aims a pulsed laser marker at the designated target and uses a radio link to direct the pilot of the attacking aircraft. As the aircraft approaches the target, the Target Marker is switched on. The target seeker in the aircraft automatically acquires and tracks the scattered laser energy from the target. The tracking operation generates signals which are translated into director information for presentation to the pilot on a head-up display.

Advantages arising from the latter mode of operation include positive identification of the target by someone who normally has relatively more time available than the pilot; pilot work load is reduced by elimination of the task of searching for the target over a wide field of view; an attack can still be made even though the pilot may not see his target due to poor light or because of camouflage.

The laser beam is fully stabilised against aircraft movements and is steerable to plus 3 degrees and minus 20 degrees elevation, plus or minus 12 degrees in azimuth, and plus or minus 90 degrees in roll. Range is quoted as being greater than pilot's visual range up to 9 km.

The Stabilised Laser Unit weighs 19.5 kg and is 57.5 cm long by 26.5 cm wide. The height is 30.4 cm. An Electronics Unit containing ranging and power circuits is also provided, measuring 43.2 cm long by 33.0 cm wide by 12.7 cm high and weighs 13.6 kg.

DEVELOPMENT:

Development was started in late 1968 under UK Government contract and the first prototype was completed by mid 1970. A laser ranger and target marker ground equipment to work in conjunction with the airborne equipment is also under development.

STATUS:

The equipment is destined for service with the Harrier and Jaguar strike aircraft of the Royal Air Force during the mid 1970s. It is now the subject of a production order for both aircraft types. A variant is being developed for the Multi- Role-Combat- Aircraft (MRCA) in collaboration with German and Italian industry.

SHORTS TARGET DESIGNATION SIGHT

DESCRIPTION:

The target designation sight is used for visual acquisition and tracking of surface and air targets. The sight consists of a binocular mounted on a sight head, fitted to a pedestal which is bolted to the deck. The binocular platform is fitted with handgrips with which the binocular may be rotated and the sight head may be raised or lowered on an elevating shaft to provide height adjustment.

OPERATION:

On acquiring the target in the binocular field of view and centring it on the cross-marking, the operator presses the designated alarm switch on his right hand grip. The target bearing and elevation information is transmitted automatically to the control centre by two synchro elements, one in the pedestal for bearing, the other in the sight head for elevation.

DEVELOPMENT:

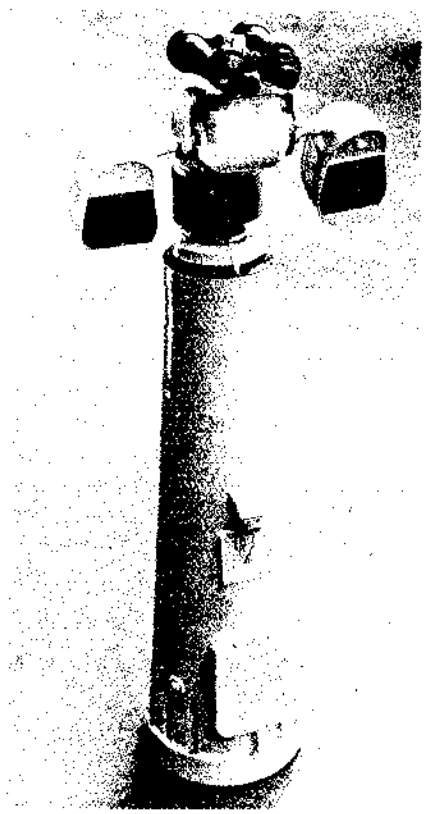
This equipment has been evolved from an element of the Seacat missile system (which see), and is a modification of the pedestal-mounted visual director used with that system.

STATUS:

Orders have been placed for substantial numbers of these sights for use by the Royal Australian and Royal Canadian Navies. The former Service will fit them on frigates and destroyers, and the destroyer-escorts Mackenzie, Saskatchewan, Yukon and Qu'Appelle, and helicopter-destroyers Annapolis and Nipigon of the RCN will be fitted.

MANUFACTURER:

Short Brothers and Harland Ltd, PO Box 241, Airport Road, Belfast BT3 9DZ, Northern Ireland.



Shorts Target Designation Sight

1742.193

FERRANTI LASER TARGET MARKER AND RANGER

DESCRIPTION:

The Ferranti Laser Target Marker and Ranger has been designed to enable Forward Air Controllers to designate ground targets for either co-operating laser seeker equipped strike aircraft or for precision SMART weapons. Aircraft using the airborne laser seeker counterpart are able to carry out single pass attacks without the requirement for the pilot to be visual with his target.

The equipment also has built-in ranging for artillery or other purposes. When integrated with the Pilkington (PE) Ltd. Night Observation Device (NOD), a night operational capability is provided.

The system comprises a Main Unit, Precision Angulation Support System (PASS) manufactured by Marconi Elliott Avionic Systems Limited and a Nickel Cadmium Battery. PASS provides a highly stable support as well as azimuth and elevation control and measurement. The equipment will range on demand and has an endurance to permit target marking for at least 20 minutes (within a specified duty cycle) before battery recharge is necessary. Lightweight, compactness, ruggedness and reliability are key design features.

OPERATION:

The Target Marker is the ground element of the newly evolved system of close air support.

The FAC aims the pulsed laser at the chosen target and uses the radio link to call the strike aircraft. When the aircraft approaches the target area, the Marker is switched on and the airborne Marked Target Seeker acquires and tracks the scattered energy, driving the pilot's head-up display to indicate target position. The pilot may then carry out an attack without ever seeing the target. In the case of SMART weapons, the seeker is built into the missile or bomb.

DEVELOPMENT:

The laser Target Marker and Ranger is being developed in conjunction with the Ferranti Airborne Laser Ranger and Marked Target Seeker for the Jaguar, Harrier and similar strike aircraft.

Late development model of Ferranti Laser Target Marker and Ranger for use by the British Army

STATUS:

The equipment is understood to be in the late stage of development.

MANUFACTURER:

Electronic Systems Department, Ferranti Ltd, Ferry Road, Edinburgh EH5 2XS, Scotland.

1340.293
LOOK OUT AIMING SIGHT Mk 1

DESCRIPTION:

The look-out Aiming Sight Mk 1 is a stabilised visual target search and tracking system intended to provide visual look-out facilities to assist a ship's AIO (Action Information Organisation), and to supplement target data derived from radar or other sources. It is primarily intended for the acquisition of surface or low-flying aerial targets, especially at low angles of target elevation where radar performance may be subject to natural limitations.

The equipment comprises three principal elements: Look-out Aiming Sight, Sight Below-Decks Assembly, and Relay Panel. A fourth unit, the Emergency Fire Control Box, may be included, depending upon system requirements.

The Look-out Aiming Sight is generally of cast aluminium construction, and is power operated and stabilised, the sight line being controlled by the operator by means of a conventional joystick to precess a gyro, from which the resultant signals are fed to the elevation and training (azimuth) servo systems. The operator can pre-select the scope of the joystick control to suit operational requirements. Sighting is by means of binoculars Type G.388. Provision is made for mounting either a cine or television camera for tracking or missile gathering purposes.

Hand elevation and training facilities are provided for servicing.

The sight below-decks assembly is a watertight cabinet housing all the ancillary electrical and electronic equipment associated with the sight, comprising the elevation and training torque motor amplifiers, power supply units, contractors and switchgear. Test and monitoring facilities are also included.

The Relay Panel contains the requisite relays and switching equipment to provide an interface between the Look-out Aiming Sight and the ship's weapon/AIO system. Where an Emergency Fire Control Box is included in the system, the Relay Panel also performs the necessary change-over switching functions to transfer control.

The Emergency Fire Control Box provides all the controls necessary for the direct emergency operation of the gun in association with the sight or other external tracking source, and includes the mechanism necessary for the computation and transmission of gun data appropriate to the target engaged.

OPERATION:

Two basic modes of operation are possible, Control and Follow. In the former mode there are three main operational roles:

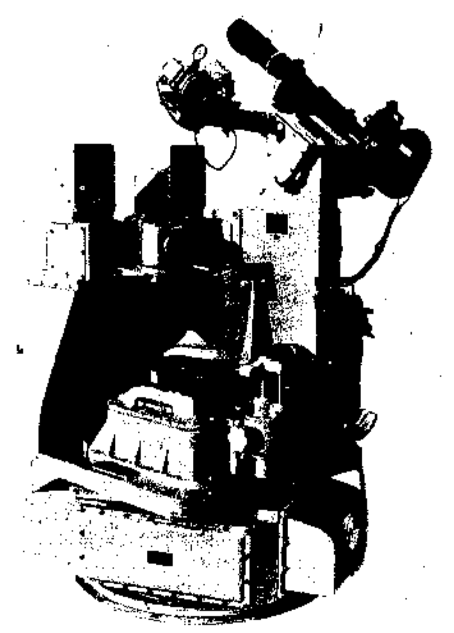
1. To provide visual look-out facilities in support of the ship's AIO, and to supplement target data derived from radar and other sources.
2. To provide means of directly conning a main weapon tracking system onto a visually acquired target.
3. To operate as an emergency gun control system in the event of failure of the main control system.

In the Follow mode the sight can be remotely conned from the AIO, or other command stations, or to a given bearing and elevation for visual investigation and identification of a designated target.

Joystick control response can be varied by the operator to suit operational requirements in various control mode roles as follows:

	Elevation	*Training*
Slewing	5°/sec	45°/sec
AA Control	5°/sec	10°/sec
Surface Control	2°/sec	2°/sec

Limits of travel in elevation are 30 degrees depression to 55 degrees elevation, and training is unlimited. Four sets of elevation and training data are available for transmission to other ship's systems.



Vickers Mk 1 look-out and aiming sight used with the Mk 8 gun mounting. This combines the separate functions of an air look-out sight and an aiming sight in a single fully-stabilised unit

STATUS:

Vickers Ltd, Armament Division, Crayford Works, Crayford, Kent, England.

2432.193
LF2 LASER RANGEFINDER FOR CHIEFTAIN TANK

DESCRIPTION:

The LF2 uses a ruby laser giving 1 MW 0.04usec output pulses. Ranges can be taken from 500 to 10,000 metres with an accuracy of ±10 metres for more than 90% of shots. It was developed initially for the Chieftain tank (**5006.102**) but can be adapted to suit other AFVs where space permits.

The equipment consists of two units – a Head Unit (17 kg) containing the laser rangefinder, and a Power Unit (12 kg) to provide the special electrical supplies. The Head Unit is mounted in Chieftain to look through the gunner's sight aperture and it combines the function of gunner's periscopic sight. This means that the sight, which is boresighted to the 120 mm gun by a mechanical linkage, is also rigidly boresighted to the laser transmitter/receiver under all environmental conditions.

OPERATION:

The gunner elevates and traverses to aim on a target seen with his right eye in the X8 magnification sight. He presses the 'Flash' button and reads the range, given in a separate eyepiece, using his left eye. He then refers back to the telescopic sight where there is ballistic data for the ammunition in use and lays the gun accordingly. The operation is quick and simple to perform and at no time is the gunner's concentration on the target distracted.

The most significant error affecting the engagement of targets at medium and long ranges is the range error: the LF2 minimises this error and also corrects for trunnion tilt. It is, as a result, an accurate, rapid and silent ranging system which permits the weapon system to achieve a high probability of a first round hit at long ranges.

MANUFACTURER:

Barr & Stroud Limited, Caxton Street, Anniesland, Glasgow, W.3., Scotland.

2403.193
AFV No. 52 GUNNER'S SIGHT

DESCRIPTION:

This daylight sight has been designed for use on light armoured vehicles and is installed in the British Army Fox (**5064.102**) vehicle.

AFV No. 52 Gunner's Sight is a binocular instrument giving X1 and X10 magnifications and is particularly suitable for use in poor light conditions. In addition to the changeover facility from X1 to X10, provision is made for the insertion of a circular graticule into the X1 field of view which approximately outlines the corresponding X10 field.

Care has been taken to ensure that the drive lever which connects the sight to the gun mounting follows the line of sight accurately over the full range of movement in the vertical plane.

A washer/wiper system is fitted to maintain clear vision through the external face and the whole equipment has been designed to a stringent environmental specification.

CHARACTERISTICS:

Magnification: X1 or X10
Focus: Infinity
Eyepiece: Exit pupil diameter 6.1 mm. Eye clearance: Full field 29 mm. Focus: −0.75 dioptre to within 0.25 dioptre (fixed focus)
Eyepiece heaters: 30 W, thermostatically controlled
Field range: 14° depression to 41° elevation
High power graticule: In right eye system only. (Graticule adjustable ± 10 mils)
Graticule edge illumination: 0.8 amp bulb, variable control
Injected graticule in X1 magnification mode: 18 W bulb, variable control

MANUFACTURER:

The M.E.L. Equipment Company Ltd, Defence Systems Division, Manor Royal, Crawley, Sussex.

2404.193
AFV Nos. 68/71/75 COMMANDERS SIGHTS

DESCRIPTION:

These daylight sights have been designed for use on light armoured reconnaissance vehicles and are installed in the British Army Scorpion (**5040.102**) and Fox (**5064.102**) vehicles.

AFV Nos. 68/71/75 Commanders' Sights are binocular instruments giving both X1 and X10 magnifications and are particularly suitable for use under poor light conditions. The change from one magnification mode to another is by means of a 'flip' control: a coloured filter can be inserted if required.

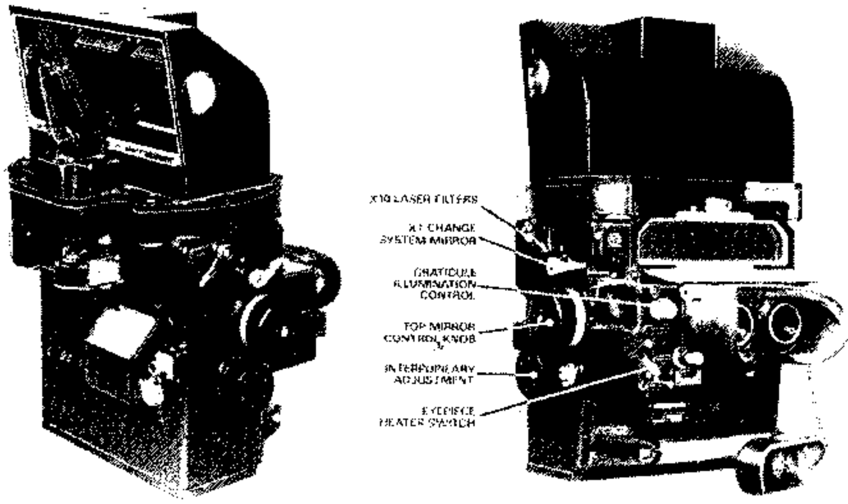
A washer/wiper system is fitted to maintain clear vision through the external face and the whole equipment is designed to a stringent environmental specification.

CHARACTERISTICS:

Magnification: X1 to X10
Focus: Infinity
Eyepiece: Exit pupil diameter: 6.1 mm. Eye clearance: full field 29 mm
Focus: −0.75 dioptre to within 0.25 dioptre (fixed focus)
Eyepiece heaters: 30 W thermostatically controlled
Field range: −14° to +41°
High power graticule: In right eye system only
Graticule edge illumination: 0.8 amp bulb, variable control

MANUFACTURER:

The M.E.L. Equipment Company Ltd, Defence Systems, Manor Royal, Crawley, Sussex.



AFV No 68 Commander's Sight

2433.193
INFRA-RED BINOCULAR SIGHTS
CU-10 & CU-13

DESCRIPTION:

The Infra-red Vehicle Sights Types CU-10 and CU-13 permit night driving of military vehicles without using visible lights.

Filters, covering the vehicle's headlamps, transmit only the infra-red wavelengths to irradiate the terrain in front of the vehicle, and the reflected radiation is converted by the sight into visible light. The optical specification of these systems ensures that the sights give a driving performance at night which is comparable with that achieved using normal headlamps, even when turning.

CU-10 and CU-13 are binocular periscope instruments with unit magnification, wide field of view and large aperture eyepieces resulting in high optical efficiency and comfort of vision. The eyepieces are either horizontal or inclined to suit the driving position in the vehicle this being the principal difference between the two.

A prism in the top of the periscope, external to the vehicle, reflects the infra-red into the separate optical objectives in each limb of the instrument. These objectives focus the beams on to the photocathodes of two image converter tubes which, when subjected to an E.H.T. potential between anode and cathode, form visible images on their fluorescent screens. These images are then magnified by the eypieces of the periscope which can be focused individually to suit the driver's vision.

The E.H.T. voltage is supplied to the image converter tube through a transistorised oscillator and multiplier circuit contained within the periscope casing and energised from the vehicle supply of batteries.

The instruments have been designed to meet army requirements for servicing and replacement of parts. They have been fully environmentally tested and accepted for military service.

CHARACTERISTICS:

Optical System:
Over-all magnification: X1
Field of view: Horizontal 51°, vertical 34°, objective aperture ratio f/1.4
Graticule: As required
Image converter tube: CV6914
Power Supply:
E.H.T.: Nominal output at 20°C. 16kV + 0.5kV
L.T.: Nominal input voltage (vehicle supply or batteries) 24V d.c. (or as required)
Dimensions: Width 30 cm, depth 21 cm, height 35 cm, weight 10.5 kg

MANUFACTURER:

Barr & Stroud Ltd, Caxton Street, Anniesland, Glasgow, W.3., Scotland.

2434.193
LONG-RANGE VIEWER CU-15

DESCRIPTION:

The function of the Image Intensifier Long-Range Viewer Type CU-15 is to provide an observer with a visual image of objects at low light levels, the maximum range depending on scene illuminations.

The instrument embodies a catadioptric system of high aperture which collects light from a target and brings it to a focus on the photocathode of a three stage image intensifier tube. The resultant electron beam is focused onto the fluorescent screen of the image intensifier tube, and the visual image is viewed through a convenient magnifying eyepiece.

The viewer is located on a mounting which provides movement in elevation and azimuth and can have tripod, bridge rail or other type of support. The objective and eyepiece are separately focused on to the intensifier cathode and screen respectively. The high power objective has a focusing range of 50 metres to infinity, which is controlled from a small lever on the front plate of the instrument. The low power objective is pre-set at a range of 800 metres.

The optical system, which is of dual magnification, has a highly corrected cassegrain system with a meniscus lens front element for high power, and a telephoto lens for low power, both of which work in conjunction with a 7½x eyepiece.

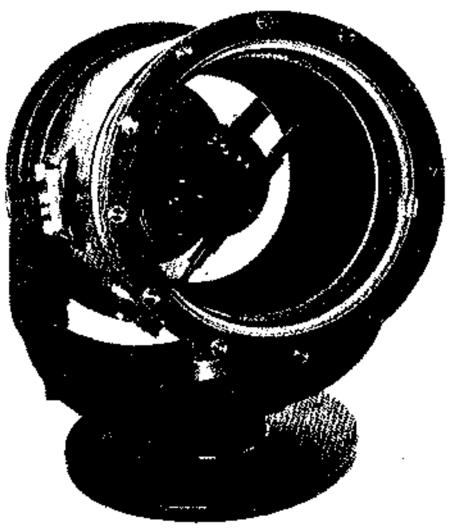
Power for the intensifier tube type 8586/1.4706 is contained within the training handle and replacement batteries can be fitted without re-desiccating the instrument.

CHARACTERISTICS:

Magnification: 5.907X (H.P.) 1.2X (L.P.)
Angular field: 7° (H.P.) 35°20' (L.P.)
Aperture diameter: 203.5 mm (H.P.) 146.1 mm (L.P.)
Effective relative Aperture: f/0.9866 (H.P.) f/1.432 (L.P.)
Tube: Image intensifier Type 8586/1.4706 or equivalent
Overall length: 586.7 mm
Weight of viewer (excluding mount): 25.4 kg (approx)
Weight of Bridge Rail Mount: 4.1 kg

MANUFACTURER:

Barr & Stroud Ltd, Caxton Street, Anniesland, Glasgow, W.3., Scotland.



CU15 Long-range viewer

2436.193
MEL INFRA-RED SIGHTS FOR TANKS

DESCRIPTION:

These two sights (commander's and gunner's) were designed for use with the Chieftain tank but have also been adapted for use with other types of AFV.

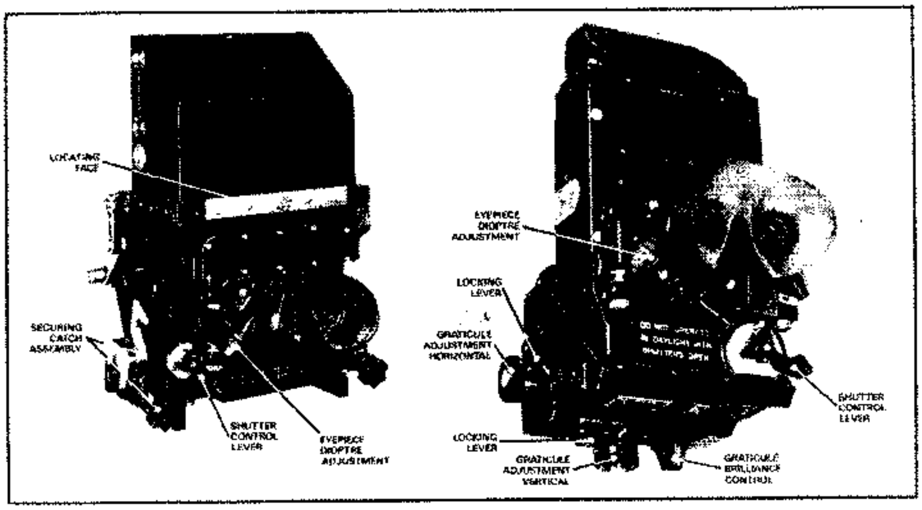
Both the commander's and gunner's sights are of the binocular periscope type and have been designed for rapid interchange with the normal Chieftain daylight instruments. Illumination is provided by the tank searchlight, or other special purpose lamp, fitted with I.R. filters.

Effective range is dependent on I.R. visibility and the contrast between the target and its background. Engagements can be fought at 1,000 metres under conditions of total darkness.

The two instruments are complementary to each other in use and have identical optical elements and performance. Many of the mechanical and electronic parts are also common; but the field of view in the Commander's Sight may be elevated and depressed over a wide angle so that the Commander can survey a large area of ground whereas the Gunner's Sight has a fixed field with an illuminated graticule. Graticules of any required pattern can be supplied.

The sights have been designed to meet a stringent environmental specification, requirements for ease of operation under severe climatic conditions and ease of maintenance in the field.

CHARACTERISTICS:
Magnification: X2.8
Field of view: 13° (205 mils)
Depth of focus: 30 m to infinity at normal focus of 400 m
Image converter tubes: Mullard CV 6099 (NATO 6923)
Objective: Focal length 70.5 mm, transmission 79% at 900-1,050 microns
Eyepiece: Focal length 19.4 mm, setting ±2 dioptres, transmission 78% at 500-600 microns
Service temperature range: —40°C to 70°C
Commander's sight: Line of sight movement —11°/195 mils) t0 +47° (835 mils)
Gunner's sight graticule: Adjustment (Azimuth and Elevation) ±18 mils. Illumination, brightness controlled by stepped potentiometer
Overall dimensions: Commander's sight 43 cm × 33 cm × 28 cm.
Gunner's sight 43 cm × 23 cm × 27 cm
Weights: Commander's sight 19½ kg.
Gunner's sight 12¼ kg
MANUFACTURER:



Commander's and Gunner's Infra-red sights

The M.E.L. Equipment Company Ltd, Defence Systems Division, Manor Royal, Crawley, Sussex.

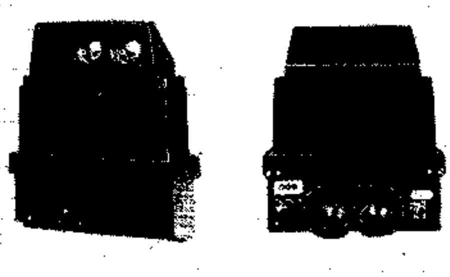
2405.193
PASSIVE NIGHT DRIVING PERISCOPES
DESCRIPTION:
The passive binocular night driving periscope has been designed to be used under starlight conditions. It can also be used at illumination levels up to, and including daylight, the image brightness being adjustable to suit the user. An automatic electronic limiter device protects the instrument against excessive image brightness.

The sight provides a wide field of true stereoscopic vision, enabling the vehicle to be driven at normal speeds. The objective and eyepiece have both been critically designed and corrected, the objective to give optimum performance in the 0.4 – 0.7 micron wavelength range and the eyepiece to be used with a P20 Phosphor. The exit pupil of the eyepiece is 20 mm. Electrical heating coils are built into each eyepiece assembly to prevent misting and condensation.

The periscope has been designed to facilitate rapid interchange with the normal daylight sights from within the vehicle. It is both dust and waterproof, and in the event of damage the head prism can be replaced without affecting the sealing.

With slight differences this instrument is produced in versions for the Chieftain tank, FV 430 Series of vehicles, and the CVR range.

CHARACTERISTICS:
Magnification: X1
Horizontal field of view: 890 mils (50°)
Vertical field of view: 710 mils (40°)
Illumination range: 10^{-3} to 10^{3} lux
Range: 5 cm to 100 m when focussed at 20 m
Exit pupil of eyepiece: 20 mm
Weight: 10 kg approx
DEVELOPMENT:
Jointly by M.E.L. and Philips Usfa.
MANUFACTURERS:
Equipment: The M.E.L. Equipment Company Ltd, Defence Systems Division, Manor Royal, Crawley, Sussex.
Image Intensifier and EHT unit supplied by Philips.



MEL Passive night driving periscope

2431.193
AFV CUPOLA No. 22
DESCRIPTION:
No. 22 Cupola has been designed as a replacement for Nos. 2, 4 and 6 cupolas which are fitted to the Centurion Tank Mk 3, 5, 7, 8 and 10. It incorporates many of the improvements which were introduced on the No. 15 Mk 2 Cupola fitted to the Chieftain Tank and offers a simple method of bringing the facilities provided to a Centurion tank commander up to modern standards.

Vision Devices:
9 unit power periscopes are mounted around the fixed ring of the cupola body, together with the Commander's Sight. All ten instruments can be removed and replaced from inside the vehicle. Periscopes and sight have all been designed so that the sun's rays cannot be reflected in the horizontal plane. Washers and wipers are provided for each external optical surface to maintain clear vision under adverse conditions. The external window of the Commander's Sight is protected by a rigid steel cover.

The Sight is coupled mechanically to the Commander's machine gun so as to follow its movements in the vertical plane up to 45°. Further elevation of the gun is then directly controlled through the sighting block in the hatch. The Commander's Sight can also be used to lay the tank's main armament by using the built-in Reticle Image Projector ("Collimator") on the underside of the cupola. This instrument injects the Gunner's Sight graticule pattern into the Commander's Sight when the two sights are in optical alignment.

For night operations either a 7 inch or a 9 inch diameter spot light is provided on the cupola roof, the spotlight being linked to the machine gun to ensure synchronisation with its movements.

Alternatively, the No. 37 Daylight Sight can be replaced by the M.E.L Type-A 1200-A Infra-red Sight, the spot light, in this case, being fitted with a suitable filter.

Armament:
A 7.62 mm general purpose machine gun is mounted on the left hand side of the cupola and rotates with it. A mechanical elevating gear enables the gun to cover a vertical arc from 10° depression to 95° elevation.

The machine gun can be loaded, cocked, laid and fired from within the cupola with the hatch closed, firing being controlled by an electrical solenoid switch. A further sensing device isolates the solenoid and stops firing when the ammunition belt reaches the point at which a new belt must be connected. The ammunition compartment will accept either the standard 200 rounds box or the NATO 230 rounds box.

Traverse and Fire Control:
Under normal conditions the cupola is rotated relative to the main turret by a handwheel through a gearbox, pinion and circular rack. Arrangements have also been made for the Tank Commander to over-ride the Gunner's turret power traverse system in order to bring the vehicle's main armament on to a target which the Commander has selected. In this mode of operation an automatic contra-rotating gear maintains the cupola's bearing relative to the vehicle.

Hatch:
The hatch is of 25 mm minimum thickness steel armour and is fitted with a torsion bar counterbalance. It can be locked in any one of 4 different positions:
Closed with full sealing against N.B.C. agents and water entry.
Lifted vertically in the "umbrella" configuration so as to give a 50 mm opening round the entire periphery. (75 mm lift is available).
Swung back on its hinge and locked in a position 15° past the vertical.
Fully opened through 180°.

CHARACTERISTICS:
Armour: 25 mm minimum thickness
Height above roof plate: 610 mm
Cupola outside diameter: 1,168 mm
Swept radius: 914 mm
Cupola bearing: 865 mm Cooper Cross Roller
Approximate weight: 770 kg
Turret roof aperture: 863 mm diameter.
Commander's sight: AFV No. 37 or A-1200-A Infra-Red
Unit power periscopes: AFV No. 40 Mk 2
Machine gun elevation: —10° to 95°
Traverse: Manual and power operated
Sealing: N.B.C. and 4.6 m of water
Armament: 7.62 mm GPMG L7 or L8
MANUFACTURER:
The M.E.L. Equipment Company Ltd, Defence System Division, Manor Royal, Crawley, Sussex.

2430.193
LIGHTWEIGHT AFV CUPOLA No. 16

DESCRIPTION:

The No. 16 cupola is intended either as a retrofit APC improvement or for original installation. The cupola is fitted with one, forward-facing, AFV No. 68, X1/X10 periscope sight for the machine gunner, with provision for fitting a night sight, to make up a combined day/night sight. Additionally unit power periscopes are mounted around the cupola rotating ring and disposed so as to give the vehicle Commander virtually a 360° field of view, without having to rotate the cupola.

The sights are designed with their incident and emergent faces angled downwards so that there is no risk of the sun's rays being reflected off them horizontally and betraying the vehicle's position. Washers and wipers are provided for each sight's external face to maintain clear vision under adverse weather conditions.

A 7.62 mm general purpose machine gun is mounted externally on the right hand side of the cupola. It rotates the full 360° with the cupola and can fire a vertical arc from 10° depression to 45° elevation. The gun is loaded, cocked, laid and fired from inside the vehicle, with the cupola hatch shut if required. An interrupter device is fitted which prevents the machine gun, whilst in the depressed position, firing at projections on the vehicle hull.

The ammunition compartment can hold either a 200 round British Army ammunition box, or a 230 round NATO box. When the ammunition belt reaches the point at which a fresh one must be coupled on, a sensing switch automatically opens the electrical firing circuit to the gun. Optionally if required, spent cases can be collected in a fitted box attached to the outside of the cupola. The cases can then be dumped as required by the Commander from inside the vehicle by rotating the cupola over a suitably positioned cam.

Although minor stoppages can usually be cleared by cocking the gun from under armour, more serious incidents may require the Commander to reach outside and handle the gun. In these circumstances he can rotate the cupola to the "3 o'clock" position, open the hatch and lock it in the vertical plane where it will provide a substantial measure of protection for the back of his head and shoulders.

The machine gun, its sight, and a spotlight are all interconnected by a mechanical linkage which ensures that the sight graticule and spotlight beam accurately follow vertical movements of the gun. The spotlight can be fitted with an infra-red filter if required.

CHARACTERISTICS:

Armour: Vertical walls not less than 16 mm. IT90 steel. Horizontal plate not less than 13 mm IT90 steel. Hatch 25 mm L.M. 25 aluminium alloy
Overall height above roof plate: 546 mm
Cupola outside diameter: 787 mm
Cupola flange diameter: 819 mm
Swept radius: (Corner of M/G cradle) 594 mm
Swept radius: To end of M/G muzzle 814 mm
Vehicle roof aperture required: 760 mm diameter
Cupola bearing diameter: 750 mm cross roll race
All-up weight: (Excluding m/g and No. 62, but including lighting and vision equipment) 340 kg
Periscopes: 8-X1 AFV No. 42
Machine gun sight: X1-X10 periscopic, AFV No. 69
Machine gun: 7.62 mm L37, L7 or L8 GPMG.
Elevation: −10° (180 mils) to +55°F (800 mils) through a hand-operated gearbox giving 72.84 mils movement per handwheel revolution (non-linear system).
Traverse: 360° through hand-operated gearbox giving 160 mils movement per handwheel revolution
Sealing: Full NBC protection and proof against 4.6 m head of water.

DEVELOPMENT:

The cupola was designed by MEL in conjunction with the British Military Vehicle and Engineering Establishment and was originally intended to replace the commander's cupola on the American M113 APC. It will be fitted to production Spartan and Striker vehicles (**5040.102**) in 1973. It can, however, also be fitted to the British FV430 series Saracen (**5001.102**) and the Ferret Mk II (**5002.102**).

MANUFACTURER:

The M.E.L. Equipment Company Ltd, Defence Systems Division, Manor Royal, Crawley, Sussex.

1021.293
MARCONI 323 SERIES MILITARY TV EQUIPMENT

DESCRIPTION:

A complete range of militarised CCTV equipment suitable for assembly into systems such as missile tracking and guidance, low-light level applications etc. The principal modules of the 323 Series are the V323 Camera Channel, picture display unit and remote control unit. The former may be equipped with a number of optical systems and any of the daylight and low light sensor tube and intensifier combinations, based on the one-inch vidicon tube. Control and display arrangements also can be supplied to meet user requirements. The existing range of equipment, described in detail below, is that produced for the missile guidance system described in the Systems entry for the Seacat missile.

Camera Channel Type V323:

The camera channel consists of two basic units, the camera and the camera control unit. Modular construction of the equipment allows the camera to be fitted with the vidicon; SEC-vidicon; Electron Bombardment, Inducted Conduction (EBIC) vidicon, or any combination using one of these tubes and image intensifiers. To ensure accurate alignment of the camera tube with the centre line of the optical system, the camera tube scanning and focusing yoke is attached directly to the chosen optical system.

Depending on the sensor combination fitted, the camera channel will operate in either daylight conditions, or from daylight down to starlight illumination.

Television Display Type V6132:

This unit is equipped with a rugged cathode-ray tube having electro-magnetic deflection and electrostatic focusing, producing high resolution at high brightness levels. The display consists of two-main sub-assemblies, the tube module and the power supply unit. These sub-units may be either combined to form a single unit or separated, by up to 4.5 m, and interconnected by multi-way cable.

Optical System

The 'building block' design of the camera system enables any suitable optical system to be fitted to the camera with the minimum of alteration. A typical requirement would be an optical system providing wide and narrow angle fields of view, with some form of reference graticule or cross-wire that may be required to show black in daylight and be illuminated at night. The optical system also normally includes automatic protection for the camera tube to protect it from excessive exposures, due to bright objects such as the sun.

Marconi ST 801 naval search and tracking radar equipped with 323 Series TV camera

Remote Control Unit

The Remote Control Unit enables the operator to control the operational functions incorporated in the camera, optical system and camera housing from a protected position. It may be supplied as a separate unit in its own case or combined with the Display Unit to form a compact control and observation console, in addition to providing controls for such in connection with target identification and kill assessment.

DEVELOPMENT:

Development of this range of equipment originates in studies carried out by Marconi with the Royal Navy from 1960 onwards, and embraces some of the technology acquired in the course of Marconi's work on the TV-guided version of the Martel air-to-surface missiles. Sea trials by the RN of the system used with the Seacat missile are believed to have started in 1967.

STATUS:

The first series of trials is reported to have been successfully completed early in 1969. 323 Series systems have been sold to Contraves for use with Sea Hunter fire control systems to be supplied to two "Northern" navies. In April 1972 a UK MoD contract worth £1 million was announced for the production of two versions for the Royal Navy. One is for fitting on general purpose frigates and guided weapon destroyers, and the other for Type 21 frigates. The first installations are now operational.

MANUFACTURERS:

The Marconi Co Ltd, Electro-Optical Systems Division, Basildon, Essex, England.

1371.393
EMI LOW LIGHT TELEVISION SYSTEM

An extremely versatile, high performance low light television camera is used, capable of producing pictures at lighting levels in which normal television cameras would be unable to operate.

The camera can be supplied in two versions The C2 Ebitron or the C2H Ebitron. The former is capable of producing pictures in half moonlight (or equivalent) and the latter in near dark conditions. Even further sensitivity can be obtained by fitting an additional image intensifier to a fibre optic version of the Ebitron. The Ebitron tube works on the principle of electron bombardment induced conduction, and was specially developed for military purposes. The system can be permanently mounted or a portable version can be supplied using 12 volt DC supplies. A video tape recorder is also available to enable a complete record to be kept of the pictures taken by the camera. This also is available for AC or DC operations. The system is used to replace night and day security patrols, for unobtrusive observation at night and for verification of alarms. For outdoor use, weatherproof housings are provided complete with remote control Pan and Tilt, zoom lens etc.

MANUFACTURER:
EMI Electronics Ltd, Systems and Weapons Division, Victoria Road, Feltham, Middlesex, England.

THE UNITED STATES OF AMERICA

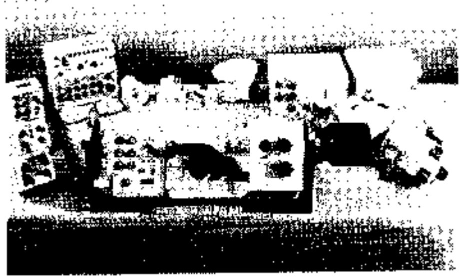
1803.193
TANK LASER SYSTEMS AN/VVS-1

DESCRIPTION:
This system was developed by Hughes for the US Army M60A1 main battle tank. It consists of a laser rangefinder integrated with a complete fire control system which includes its own computer and the relevant sensors for ballistic calculations. The project was undertaken in the early 1970s to increase the first-round hit capability of the M60A1's 105 mm gun, against both standing and moving targets.

The target range data is processed in the solid-state computer together with crosswind component, powder grain temperature, gun trunnion cant, bore wear, air temperature, altitude, and tracking rate to provide the correct azimuth and elevation firing values. The computer can provide computation for nine types of ammunition, and the system incorporates self-test facilities.

DEVELOPMENT:
Hughes has produced several batches of lasers and computer systems under contracts from both the US Army's Frankford Arsenal and from Chrysler Defence Engineering who produce the M60A1 tank.

MANUFACTURER:
Hughes Aircraft Company, Los Angeles, California 90009, USA.



AN/VVS-1 tank laser rangefinder

1008.393
XM76 – ANTI-OSCILLATION SIGHTING SYSTEM

DESCRIPTION:
Telescopic target acquisition and identification equipment, providing stabilisation against vibrating environments such as helicopters, vehicles, boats and ships.

OPERATION:
The sighting system senses motion in two axes by means of rate gyros, and the resulting signals are used to control torque motors acting upon a fluid prism optic system to compensate for the sensed motion, thus stabilising the image of the desired field of view. There are separate, and virtually identical, servo loops for each axis of control. The motion signals measured at the optical head are applied to a control module as error signals, and are then demodulated, amplified and stabilised, power amplified and fed to the torque motors as correction signals. The polarity and magnitude of the corrective signals determines the direction and speed of the torque motors to compensate for the motion of the optical head.

The optical device responsible for effecting motion correction is a fluid prism. This is a variable geometry, liquid-filled prism enclosed by a flexible opaque bellows and two optical flats, front and rear. The flats are movable, transparent windows which serve as the prism faces. There is one flat for each channel, or axis of motion, and each is connected by a linkage to its respective torque motor. Movement of the flat varies the optical geometry of the fluid prism, thereby varying the refraction of light through the prism. These controlled changes result in stabilisation of the image.

The Anti-oscillation Sighting System has also been adapted to armed helicopter fire control. There have been two applications. The first was to improve the accuracy of fire by providing the gunner a stabilised image and X1.5 to X12 optics on the gun sight. The second was also to provide a further increase in accuracy by incorporating resolvers into the optical servo loop, and thus slaving the turret to the optical line of sight of the XM76 mounted on the sighting station in the cockpit.

The sight also incorporates a monocular zoom lens, controlled by two push buttons on the unit. These control the direction of zoom; the X1.5 for zoom-out (decreased magnification) and the X12 for zoom-in (increase magnification). Speed of zoom is determined by the detent to which the X1.5 or X12 button is pressed: first detent for slow zoom, second detent for fast zoom.

DEVELOPMENT:
The XM76 was started as a private venture in 1966 and evaluation quantities were delivered in November of that year.

STATUS:
Orders for 800 units have been placed and deliveries began in February 1969, over 650 having been delivered by May, 1970. Users include the US Army, USAF, US Marine Corps, US Navy and the Government of Israel. Vehicles fitted with the XM76 sighting system include the OV-2, AHIG, OH6A, OH-58A, and UH-1 series helicopters for observation, target acquisition, attack and damage assessment.

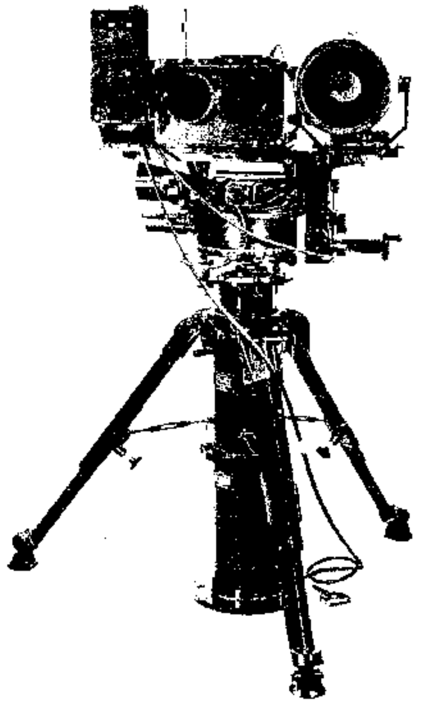
MANUFACTURER:
Dynasciences Corpn, Township Line Road, Blue Bell, Philadelphia 19422, USA.

2668.193
INTEGRATED OBSERVATION SYSTEM (IOS)

DESCRIPTION:
The purpose of the Integrated Observation System (IOS) is to permit the location of military targets accurately under day or night situations and to determine range to targets and, when required, allow for pulse coded designation of those selected targets. This integrated system is mounted on a tripod and consists of an RCA-developed optical equipment mount, an RCA-developed neodymium laser rangefinder/designator, a government furnished binocular and a government furnished night vision device.

STATUS:
Being developed for the United States Marine Corps by RCA Aerospace Systems Division, under contracts totalling $3.2 million.

MANUFACTURER:
RCA Corporation, Aerospace Systems Division, PO Box 588, Burlington, Mass 01803, USA.



AN/UUS-2 laser range finder

2796.193
STABILISED ARMAMENT STATION
DESCRIPTION:

This is a Stabilised Armoured Cupola complete with vision blocks and sights that has been developed by Cadillac Gage for use with AFVs.

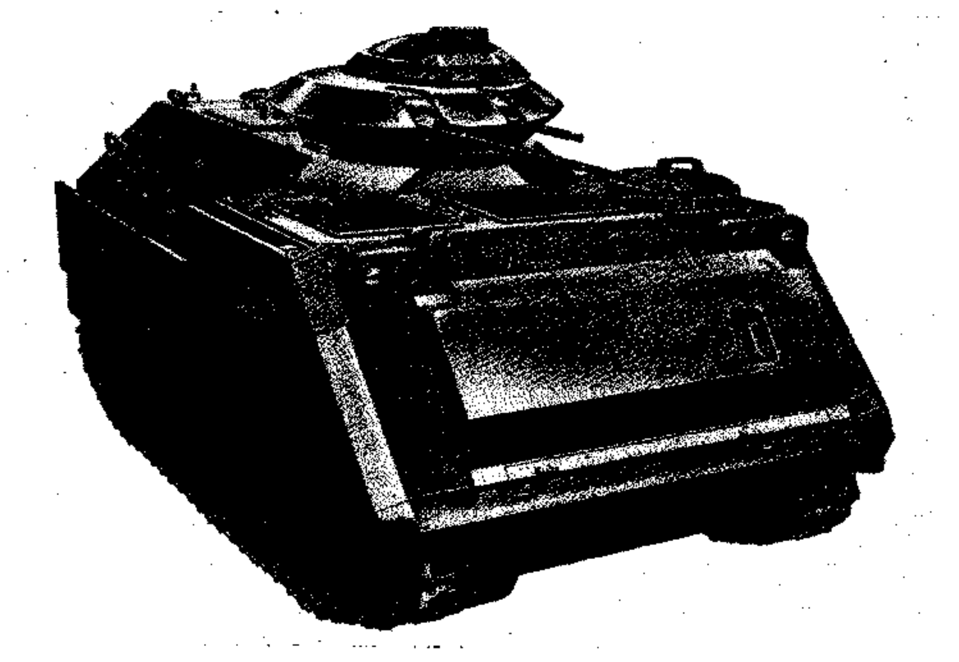
The gunner rides in a basket suspended beneath the cupola and the stabilisation system automatically counteracts movements of the gun platform relative to the weapons so that accurate firing is possible even when moving over rough terrain. The gunner has complete all-round vision, through eight ballistic vision blocks spaced uniformly around the cupola, and is equipped with two gunsights. One of these is a X6 or X8 monocular sight for accurate aiming at long range: the other is a X1 wide-angle sighting and viewing device. The latter has a projected reticle to give eye relief and improve target acquisition. Mounting brackets, drive linkage and bore-sighting adjustments are provided for an externally mounted night sight.

The cupola can accommodate a 20 or 25 mm cannon (or a 40 mm grenade launcher) and one of several different kinds of machine gun. Provision is made in the gunner's basket for the storage of 400 rounds of 20 mm ammunition (or equivalent) and 1,000 rounds of 7.62 ammunition (or equivalent). Also located in the basket are the electronic modules and gun controls and the hydraulic power supply.

Train and elevation motion of the guns is electrohydraulically powered and rate-controlled by the gunner. A manual pump is fitted to provide sufficient hydraulic power to move the guns in the event of electrical power failure.

CHARACTERISTICS:

External power requirements: 24V dc
Sight: 6- or 8-power monocular with unity periscope
Vision blocks: Eight-laminated glass
Armament-main: M139 20 mm cannon



Cadillac Cage armament station installed on XM 765 armoured personnel carrier

Secondary: M73 7.62 mm machine-gun
Cupola ring diameter: 1 metre
Weight: Varies with ballistic requirements
Crew: One man
Superstructure material: XAR-30 welded ballistic plate
Power: Electro-hydraulic
Method of firing: Main: Electro-hydraulic. Secondary: Electrical, emergency manual
Ready ammunition: 400 rounds 20 mm; 1,000 rounds 7.62 mm
Elevation, maximum: 60°
Depression, maximum: 15°
Slew and elevation rate, maximum: 60° per second
Tracking rate, minimum: 1/4 mil per second
Stabilisation: Vertical and horizontal axes

DEVELOPMENT:

Developed as a private venture by the Cadillac Gage Company, Cadillac Gage also make a variety of other armoured turrets and have installed more than 400 of their Universal Machine Gun Turrets on M113 vehicles.

MANUFACTURER:

Cadillac Gage Company, PO Box 3806, Detroit, Michigan 48205.

1630.393
HONEYWELL HELMET SIGHT
DESCRIPTION:

The Honeywell Helmet Sight has been evolved with the related objectives of simplifying target acquisition for airborne weapons, and also improving this function by utilising the wide search-angle and flexibility of the human eye. This is accomplished by arranging for the pilot's line of sight to be determined in relation to all three aircraft axes. This data can be used as pointing information for a wide range of aircraft systems (AI radar, cameras, infra-red seekers, etc.) and for weapon aiming.

The Honeywell Helmet Sight System consists of the following major elements: Helmet Mounted Unit (HMU), Light Source Units (LSU), Sensor Electronics Unit (SEU), and controls mounted on the instrument panel and control stick.

The system operates as follows: one or two light source units, rigidly mounted to the airframe and aimed in the pilot's direction emit fan-like beams of infra-red light rotating at constant velocity. The light beams sweep over a reference photo sensor and two pairs of helmet-mounted photo sensors (one pair on each side of the pilot's helmet). The time intervals between the pulses from the helmet photo sensors and the reference pulse are a measure of the angular position of the pilot's head relative to the XYZ reference axes of the aircraft. The photo sensor outputs are transmitted to the sensor electronics unit where the angular computations are performed and converted into azimuth and elevation information. Additional digital computations such as fire control and missile launch envelopes may easily be incorporated in the sensor electronics unit with little or no increase in system complexity. In versions being supplied to the US Navy, a Honeywell HDC-202 digital computer is included.

DEVELOPMENT:

Development was initiated in 1963 and evaluations have been carried out by all three American Services in a total of eleven aircraft types.

STATUS:

Under USN development and production contracts amounting to $9.3 million, 450 systems are being produced for fitting in F-4J aircraft.

MANUFACTURER:

Honeywell Government and Aeronautical Products Division, 2600 Ridgway Parkway, Minneapolis, Minnesota 55413, USA.

2806.353
SERIES 2500 FIBRESCOPE NIGHT VISION SYSTEM

This is a fibre optic arrangement for the remote viewing of an image intensifier in a night vision system. A coherent fibre optic bundle 25 mm in diameter is used to relay the image and is sufficiently flexible to accommodate bends of an inside radius of as little as 15 cm. Remoting is possible up to 4.5 metres.

DEVELOPMENT:

Begun in 1965 as a private venture, the project was subsequently supported by the US government. The first prototype was completed in 1967. The equipment is currently in service and is used in conjunction with the Iroquois Night Fighter and Tracker System (INFANT) and the stabilised Night Sight (SNS), which have both reached the pre-production stage.

MANUFACTURER:

American Optical Corporation, Fibre Optics Division, Box 1, Southbridge, Massachusetts 01550, USA.

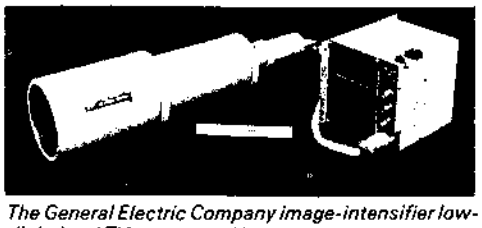
1384.393
GE LOW LIGHT LEVEL TV CAMERA
DESCRIPTION:

This is a lightweight, compact television camera with special applications in airborne surveillance, reconnaissance, weapon delivery and target designation under night conditions. This is possible by use of a vidicon tube preceded by a three-stage image intensifier tube. The power requirement of the camera is 12 W, sufficient for a 500 TV line highlight resolution.

OPERATION:

An automatic target control allows the camera to operate without any adjustment in a wide range of light levels. It is interesting to note that the vidicon tube used in this camera is of hybrid design, with magnetic focussing and electrostatic deflection. By this method virtually any voltage/time waveform can be used for deflection, and the entire spectrum of simple to exotic scanning techniques can be utilised.

DEVELOPMENT:



The General Electric Company image-intensifier low-light level TV camera and its associated electronics unit

Work on the basic camera began in 1966; this was followed in 1967 by the addition of the intensifier stages.

STATUS:
This camera is in current use with the United States Navy and Air Force.

MANUFACTURER:
General Electric Company (USA), Aircraft Equipment Division, Utica, New York, USA.

1641.393
RCA ADS 3000 SERIES TV CAMERAS

DESCRIPTION:
The ASD 3000 range of television cameras for military applications are low light level equipments based on the use of RCA silicon intensifier target tubes. In addition to high performance in near total darkness, these tubes can withstand bright light without damage to a large extent. Four models have been announced for airborne reconnaissance and weapon delivery applications in aircraft and drones. Designations of the four are ASD 3100, ASD 3200, ASD 3300, and ASD 3400. The last of these is the most sensitive, and also incorporates all the necessary circuitry to permit synchronised operation with covert pulsed illumination sources beyond the frequencies visible to the unaided eye. This mode of operation is known as ITV, Illuminated Television.

Ground versions of the RCA cameras are self-contained for tripod mounting, and with all controls on the rear of the case. The airborne configuration is designed for gimbal mounting and with the controls located on a remote control box.

MANUFACTURER:
RCA Aerospace Systems Division, Burlington, Massachusetts, USA.

7007.393
UVR-700 TV TRACKER SYSTEM

DESCRIPTION:
An all-purpose day-night stabilised television tracking system, suitable for such applications as ground target surveillance from an aircraft or helicopter, or accurate angle and rate sensor for weapon delivery.

OPERATION:
The four basic functional elements of the system are: an intensified UVR-700 camera, an electronic video contrast tracker, two-axis gyro stabilised platform, and a display.

The heart of the system is the electronic video contrast tracker. This type of tracker follows the selected target automatically within its field of view, and produces electrical output signals which indicate the position of the target relative to the centre of the field of view. A video gate is generated by the electronics and indicated on the operator's display. When a target is detected, the operator positions the gate over the target on the display using the joystick mounted on the control unit. The system is then switched to the closed loop automatic angle track mode.

In this mode, the signal representing the centroid of the target is processed to determine its position within the gate 60 times a second. The gate is then automatically centred on the centroid signal. Thus the gate tracks the target, and output signals are derived from the gate position within the raster. The output signal, which is proportional to the position of the target relative to the centre of the field of view, is fed into the appropriate gimbal servo which causes the optical line of sight to be centred on the target. The tracker is a two-loop control system which will automatically track the target in both azimuth and elevation.

DEVELOPMENT:
Development began in 1968 as a private venture by General Electric.

MANUFACTURER:
Aircraft Equipment Division of the General Electric Co, French Road, Utica, New York 13503, USA.

1806.353
TISEO-TARGET IDENTIFICATION SYSTEM, ELECTRO-OPTICAL AN/ASX-1

DESCRIPTION:
TISEO is a stabilised airborne camera equipment able to track air and ground targets at ranges beyond unaided visual range. The system comprises a vidicon-tubed television camera with a zoom lens to enable positive visual identification. Two instantaneous fields of view are provided for target recognition and identification, and target acquisition, respectively. The system normally is housed in a tubular shaped housing projecting forward from the leading edge of the aircraft wing.

STATUS:
Fitted to USAF F-4E aircraft and subsequently considered for use with a variety of other types including the F-14, P-3 and helicopters.

MANUFACTURER:
Northrop Corporation, USA.

SIMULATORS AND TRAINERS

BELGIUM

1775.193
SABCAFIT SIMULATORS

DESCRIPTION:

Sabcafit simulators are produced in two versions, Scholafit and Talafit, both being for the training and practice of tank gunner, the former principally at armour schools and the latter for use with qualified tank units as a means of maintaining skills.

Scholafit (School Level Aiming and Firing Trainer), consists of the following main units:

Firing station
Instructor's station
Simulator sub-assembly
Electronic simulation and logic rack

The gunner is installed in a dummy turret containing all controls and instruments normally found in a tank. A standard gunsight is fitted, normally EMES or OIP, depending upon which, the instructor's station is located to the left or right of the gunner's position. The instructor is provided with a sight bore-sighted on the gunner's sight, enabling the former to see exactly what the gunner has in view. The instructor can over-ride the gunner's controls for demonstration or corrective purposes, and he also has the necessary controls for operation of the simulator and variation of the simulated operational parameters. These include lighting, the amount of vibration encountered, and control of targets. Throughout an exercise the gunner's performance is monitored and recorded for subsequent analysis.

Four scenes are incorporated against which exercises can be run, and simulated target size, speed, distance etc can all be varied by the instructor. Fixed or moving targets can be be selected to suit the level of competence attained and either stationary or firing on the move conditions can be simulated. Provision is also made for instruction in the use of tracer.

TALAFIT (Tank Level Aiming and Firing Trainer) has been derived from the Scholafit and is intended for attachment to a tank to enable it to be used for indoor gunnery practice in a hangar. Most of the facilities available with Scholafit are available with the exception of tracer and the system malfunctions which can be introduced into the dummy turret installation of Scholafit. The Talafit is installed on the gun turret of the tank, in front of the gunsight window. The gunner is presented with a battlefield scene with stationary and moving targets which he has to detect, identify and engage.

DEVELOPMENT:

Development was undertaken by Société Anonyme Belge de Constructions Aéronautiques in accordance with directives set out by the Belgian Ministry of Defence.

MANUFACTURER:

Société Anonyme Belge de Constructions Aéronautiques, Chausee de Haecht 1470 – 1130 Bruxelles, Belgium.

CANADA

1735.393
SUBMARINE SIGNAL SIMULATOR

DESCRIPTION:

Developed by CAE Electronics Ltd, the Submarine Signal Simulator (SSS), is an electronic device which generates submarine-like signals, simulating the actual submarine magnetic signature, for injection directly into an aircraft MAD equipment. The SSS can be used either while airborne, on the ground, or in a simulated system trainer.

By means of rotary controls on the front face, the SSS can be made to simulate three different submarines' magnetic moments (from small to nuclear size), aircraft speeds from 50 to 300 knots, and aircraft-to-submarine separations from 500 to 3,000 feet. Each of the above conditions can be simulated for five different representative submarine signal shapes corresponding to the various combinations of aircraft and submarine headings.

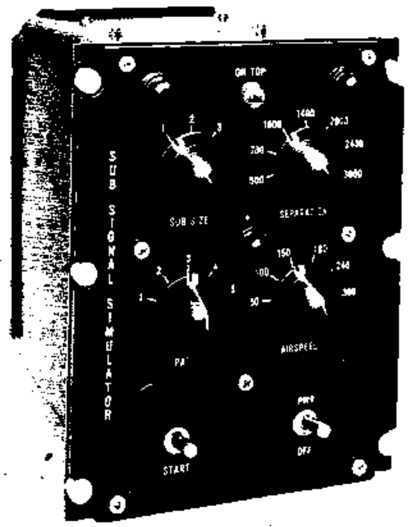
The simulator is simple to operate. Once the various controls have been set to select the desired conditions with respect to separation, airspeed, etc., the simulated signal is then started by means of a toggle switch. When the simulated signal reaches the point where the "aircraft" has passed closest to (or over) the "submarine" an "ON TOP" lamp is illuminated, allowing the operator or (instructor) to determine how "late" he was in recognising the submarine signal.

Since the simulator generates an electrical analogue of the submarine signal, it may be used either in the air with actual background geological and geomagnetic noise or on the ground with simulated background noises. The CAE SSS is compatible with all existing MAD magnetometers.

For realistic MAD operator training, the SSS is usually operated by someone other than the MAD operator (possibly the co-pilot) so that true operator training and performance evaluation may be effected. It is also a very useful tool in evaluating and grading overall MAD performance since it provides a stable signal reference with which detection range capability may be evaluated. The most significant aspect of the equipment is that it eliminates the necessity of tying up a submarine for MAD training purposes.

MANUFACTURER:

CAE Electronics Ltd, PO Box 1800, St Laurent, Montreal 379, PQ, Canada.



Submarine signal simulator for MAD operator training

FRANCE

1520.193
SINTRA-EF SIMULATORS

The SINTRA organisation produces a very wide range of simulation equipment and systems. The following paragraphs contain details of the principal military installations that have been supplied.

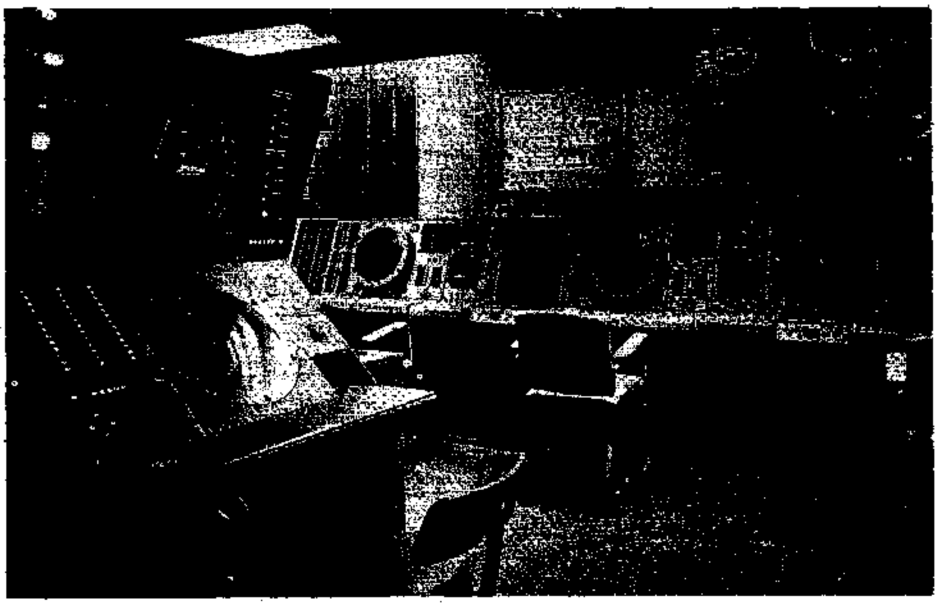
STFG-1

This is a very large system providing for tactical training, tactical and operational research, analysis and utilisation studies of new weapons. It is used by French Navy command teams at the Centre d'Entrainment Synthétique. The STFG-1 simulator has a capacity of 128 vehicles (which can represent any of 16 types) of which 32 are controlled from the simulated 'own ship' cubicles. Each of these has access to a maximum of 16 data sources (radar, sonar, etc), and up to 32 weapon combinations. Exercises are pre-programmed into the control computer by punched tape. The computer automatically simulates the environment for each vessel taking part in an exercise.

SRFG-3

This is a simulator for the training of naval radar operators. It has a capacity of 14 radar targets, three carrier vessels, two surveillance radars, and one height finder radar.

The system consists of a hybrid computer and



Part of a large SINTRA-EF simulator

simulation control unit. A digital central processor controls the targets and detection methods, while repetitive computations are left to specialised peripherals. The simulation is controlled from a set of standardised alpha-numerical control units for 'piloting' the targets, and a graphic display console for the exercise commander.

The simulator drives three (extendable to five) displays, and represents two surveillance/search radars complete with noise, clutter, jamming, fading and IFF, and one height-finding radar. The 14 targets can be increased to 20, and can be aircraft, surface vessels or submarines.

DUFZ-6

This type of simulator is for the training of anti-submarine warfare teams. Surface vessels and submarines are simulated and the system has a target capacity of 13 manoeuvrable vehicles, 16 dummy radar stations, and a full range of sensor data. The Type DUFZ-6 is in service with the French Navy.

RU 503

Simulators of this type are used for the training of air defence radar operators and ground controlled interception personnel. One primary and one secondary radar are simulated, and up to 12 manually-controlled targets can be simulated.

MANUFACTURER:

SINTRA-EF, 26 rue Malakoff, 92600-Asnières, France.

1645.193
LMT SIMULATORS

Le Matériél Telephonique (LMT) has been a supplier of military simulators since 1960, and has produced systems for training the crews of combat and transport aircraft, helicopters, and armoured fighting vehicles. Other simulation activities by this concern include radar land mass simulators, interface equipment for a digital submarine simulator, and a number of specialised research systems. Digital techniques have been employed since the late 1960s.

Aircraft Simulators

The first combat aircraft simulator produced by LMT was for the Mirage IIIC, and this entered French Air Force service in 1962. A total of 24 simulators for various versions of the Mirage have been produced or ordered, eight for use by the French forces, and 16 for export.

Specific Mirage variants covered are: Mirage IIIC, IIIE, IIIR, F1 and 5. Both fixed and trailer-housed mobile versions are produced. For radar-fitted Mirage types, the LMT flight simulators include interception radar facilities, and air-to-ground functions are also provided in some simulators. Earlier Mirage simulators were analogue systems, but for some years digital methods have been used based on the CII 10 020 computer, a French-built version of the SDS Sigma 2 machine.

In the early 1960s LMT supplied the French Fleet Air Arm with a number of Entendard IV flight simulators, these systems additionally having a CCTV visual system for simulating carrier take-off and landing. A Transall C160 digital flight simulator was delivered to the French military in 1969. Four Jaguar simulators are on order for the French services, delivery starting in 1972.

Helicopter Simulators

The fact that digital techniques allow the use of elaborate mathematical models was utilised by LMT in the solution of the special problems associated with the different flight phases of a helicopter, resulting in 1970 in two SA 330 helicopter flight simulators for the French forces. These are installed in air-conditioned semi-trailers and provide for the simulation of helicopter flight, engines, navaids, systems and malfunctions. A high-definition CCTV visual system provides training facilities for the difficult take-off, hover, and landing phases. The computer used is the same as that in most LMT simulators, the CII 10 020.

Instructor's console and pupil driver's cabin of LMT AMX 30 tank simulator

AFV Simulators

LMT has, or is under contract to supply at least 26 land vehicle simulators of various types to French and foreign forces. Of this total, 18 are for export. Vehicles simulated include: the AMX 10, AMX 30, and Leopard main battle tanks, Panhard LAV and Scorpion AFVs. These systems are for driver training and do not incorporate the gunnery aspects of instruction. The main equipment of the tank simulators consists of a replica of the driver's cabin, a CCTV high-definition visual system and terrain model, instructor's console, analogue computer, and ancillary services. The cabin is mounted on a motion system, which with a noise generation system, provides for realism in instruction.

STATUS:

The French armed forces have received or placed orders for a total of 32 LMT simulators; Etendard IV (2), Mirage IIIC (2), Mirage IIIE (3), Mirage IIIR (1), Mirage FI (2), Jaguar (4), SA 330 (2), Transall (1), multi-purpose air navigation trainer (1), AMX 30 (6), AMX 10 (6), Panhard LAV (2). Exports include: Mirage III (8), Mirage 5 (6), Mirage F1 (2), AMX 10 (3), AMX 30 (4), Leopard (5), Scorpion (6), Panhard LAV (4).

MANUFACTURER:

LMT, Division Simulateurs et Systèmes Electronique, 3 Avenue Albert Einstein, 78190-Trappes, France.

1776.193
TANK GUNNERY TRAINER TYPE DX.150

DESCRIPTION:

The DX.150 Tank Gunnery Trainer is a new tank-borne simulator controlled by a digital wired-programme computer. The installation consists of the central computer unit and three optical heads, one for the tank commander, one for the gunner and one for an instructor. The tank commander's and gunner's optical heads are mounted on the tank's normal sighting equipment. A spot of light in each optical head is superimposed on the real landscape, representing the tracer of a fired round. The considerable advantage of the DX.150 over former trainers is that the point of impact with the ground is correctly indicated whenever the target, which may be stationary or moving, is missed, enabling the crew to make realistic fire corrections. The shape of the terrain and target position are loaded in a very simple manner into the computer, which determines if the point of impact is on target or not, and in the latter case calculates the point of impact and whether or not it is masked by terrain features or the target itself. Smoke, flash and sound effects are also simulated. Any unprepared object, such as a vehicle or building, may be used as a target, and gunnery training is not limited to special firing ranges.

STATUS:

In production.

MANUFACTURER:

Givavions Dorand, 5 rue Jean Macé, 92153 Suresnes, France.

SWEDEN

2351.193
BT 16 & BT 17 FIELD SCORERS

These two scorers are designed to give a simple and rapid indication of a hit on a target in field exercises involving the use of anti-tank or similar guns or missiles fired at visual ranges. By using either of these devices the need for observers to enter the target area to record hits is eliminated – thus speeding up the exercise and reducing the risk to range personnel.

BT 16 Flashing Scorer

Of the two, the BT 16 is the simpler, comprising one or more transducers – which are attached to the target and detect the impact – a delaying amplifier, a battery and an indicating light. The battery and amplifier are contained in a strong case which can be stowed in a sheltered position close to the target and can accept inputs from up to three transducers. When the target is hit the indicating lamp is caused to light for one second and is bright enough to be seen clearly by day as well as by night.

Dimensions of the battery/amplifier box are 30 × 17 × 18 cm and the weight, including 12 1.5V batteries, is approximately 7 kg.

BT 17 Smoke Producing Scorer

BT 17 is similar in operating principle to BT 16 but includes provision for the emission of a puff of (red or white) smoke when the target is hit. To produce the smoke the equipment contains a 5-

litre air bottle (200 atmospheres pressure), and a hermetic plastic powder pack. The equipment can be set to produce puffs having durations of 0.5, 1.0 or 1.5 seconds and there is sufficient capacity in a single filling to produce a total puff duration of 60 seconds. Like the BT 16, the BT 17 can accept inputs from up to 3 transducers and it is provided with an output socket for an indicator light which can be used instead of the smoke for night exercises.

Dimensions of the BT 17 equipment container are 23 × 63 × 65 cm and the all-up weight is approximately 30 kgs.

TARGETS:

Targets for use with either equipment need to be made of rigid material so that a clear hit signal is picked up by the transducers. Old vehicles are suitable and provide more realistic simulation than silhouettes. Targets may be fixed or mobile and either equipment may be used in conjunction with the remote-controlled BT1 8S tank target. The sensitivity of the amplifier can be adjusted to suit the type of target and the calibre of the weapon used.

MANUFACTURERS:

Saab-Scania AB, Jönköping, Sweden, who have developed the equipment in co-operation with the Royal Swedish Army Ordnance Administration.

2352.193
BT 19 & BT 19A GUNFIRE SIMULATORS

These two simulators are designed to enhance the realism of field training by simulating the noise of automatic weapons (BT 19) or the noise and muzzle flame of heavier weapons (BT 19A)

BT 19 Machine Gun Simulator

This device uses compressed air to operate a horn which produces a realistic simulation of machine gun fire at a rate of about 500 "rounds" per minute. The unit is compact and portable and can be operated by remote control to produce between 1,200 and 1,500 shots from one filling.

Dimensions (excluding the horn) are 60 × 30 × 30 cm and the all-up weight is approximately 30 kg. Two air bottles (each 5 litres at 200 atmospheres) are used and the control valves are operated by a 12-18V d.c. supply.

Added realism can be achieved by combining this equipment with a remotely operated silhouette target – as can be done by adding the BT 18 Vanishing Target to the system. Both this unit and the BT 19 can be remotely controlled by the BT 22 radio remote control system or by wires.

BT 19A Gunfire Simulator

This is a remote-controlled unit, the purpose of which is to create a realistic simulation of a nozzle-flame and the sound of gunfire. The simulation is achieved by means of electrically-fired pyrotechnic shells.

BT 19A is a light, transportable unit containing a magazine that holds 30 shells, each in its own barrel. The unit also contains the electric firing circuits that enable the shells to be fired one at a time, control being exercised either by direct wire link or by radio.

Dimensions of equipment are 90 × 50 × 28 cm and the all-up weight is approximately 27 kg.

The operating voltage is 12-18V d.c. as for the other units in the SAAB BT series of targets and simulators: the equipment can thus be associated conveniently with such training aids as the BT 18S Tank Target and the BT 16 and BT 17 scorers (**2351.193**). The BT 18S target can be raised or lowered at varying speeds giving duration of from 3 to 10 seconds for raising or lowering: it can thus be used to simulate the gradual appearance or disappearance over the horizon of a moving vehicle. Coupled with the BT 19A simulator, therefore, with its simulation of gunfire and production of a 1-2 metre muzzle-flame the complete installation is capable of a high degree of realism for exercises involving anti-tank weapons.

MANUFACTURER:

Saab-Scania AB, Jönköping, Sweden 1, who have developed the equipments in association with the Royal Swedish Army Ordnance Administration.

1777.193
BT 33 ARTILLERY FIRE CONTROL SIMULATOR

DESCRIPTION:

The BT 33 is an indoor simulator for the training of artillery and mortar fire controllers. It consists of the following main units: projection screen, two terrain view projectors, target projector, two or three burst projectors, and the main control unit.

The terrain view projectors are standard colour slide projectors (6 × 6 cm). One of them shows a view of a terrain area as seen by a fire controller from an observation post, whilst the other simulates the effect of a star shell over the same terrain at night.

Targets appearing in the terrain view can by symbolized in different fashions. Hostile troops under cover, seen at long distance, are practically invisible, and consequently the target then consists simply of a certain area in the terrain picture. Moving target effects (including tanks, or even helicopters) can be projected onto the terrain view by means of the target projector.

Burst projectors are used for simulation of firing into a terrain area or at targets of opportunity. They are capable of projecting different types of burst symbols into the target terrain view, representing ground burst, air burst, shrapnel impact, rising burst cloud, and concealed burst. If the projectile bursts behind a hill, a "B observation" is automatically produced (sound of explosion only). If the hill is not very high, the burst will also become apparent through a cloud of smoke rising from behind the hill. The size of the bursts (which depends on the observation range) and their appearance, possible smoke in case of a concealed burst, and shrapnel hitting the ground in the case of air bursts give the fire controller valuable information on the location of the burst with respect to the target.

The simulator is equipped with a synthetic sound system. Before the burst, the sound of the projectile in its trajectory is heard for a few seconds. The burst explosion is then heard, delayed in accordance with the actual observation range. Both the time and the intensity of the explosion sound vary automatically.

A simulated exercise is under the control of the instructor, who operates the requisite controls on the main control unit. In addition to the operating controls, this contains: an analogue computer for the calculation of simulated projectile trajectories; a core memory of 4096 16-bit words for the target terrain topography; and automatic control units for the burst projectors and the sound system. A magnetic tape is prepared to correspond with each terrain view used, this being necessary to make the appropriate allowances for the effects on fall-of-shot, whether a burst would be visible or not, etc due to the height of the terrain portrayed.

The imaginary trajectory can be regarded as a straight line which, when seen from above, crosses a number of sectors and ends in a burst point. Computation of the burst point requires signals representing the projectile trajectory and the height variation of the terrain in the firing direction, as well as a device for determining when these two signals are equal. Signals containing the terrain height data are obtained from the terrain memory of the simulator, and the trajectory of the projectile is represented by a signal generator with an output signal proportional to the height of the projectile in the imaginary trajectory. The initial height at the time of entering the picture area and the rate of descent are dependent on the artillery piece.

The burst projector is then trained by servo control at the correct burst point in the picture.

In case of a ground burst (i.e. when the signals are equal) the terrain memory will yield information on whether the burst shall be visible or not, or whether it shall be shown above any concealing terrain features.

Air detonation can be produced by means of time fuses or zone fuses. Timed detonation with time fuses can be simulated by using the comparing device to compare the trajectory signal with a constant signal corresponding to a certain timing. Fire with zone fuses can be simulated by comparing the trajectory signal with the terrain signal plus an additional constant signal representing the desired bursting height.

In case of an air burst, the burst point signal is compared with a visual obstruction signal representing the line of sight from the observation point over any intervening concealing terrain features. Should the air burst occur at less than 7 metres below the line of sight, a burst cloud will be released above the concealing terrain, and should the burst occur lower than 7 metres below the line of sight, no visual burst indication will be obtained. The fire controller will receive an audio observation, but whether shrapnel shall be seen or not will depend on information obtained from the terrain memory.

DEVELOPMENT:

Development was undertaken by Saab-Scania's Computer and Electronics Group to meet a requirement formulated in 1967 by the Swedish Army.

STATUS:

Over a year of prototype testing has been completed at the Swedish Artillery Training School and 20 series production models have been ordered by the Swedish Forces Material Department for delivery during 1974. The first export order was placed by Norway.

MANUFACTURER:

Saab-Scania AB, Jönköping, Sweden.

SWITZERLAND

1646.193
FLORETT

DESCRIPTION:

Initially intended for training up to 40 AA gunners, simultaneously, in the engagement of low-flying fast aircraft. A single target aircraft is tracked by a ground radar (type unknown) and this data is fed into two Honeywell 316 computers. The latter are also linked to all the 40 fire positions, and presumably data fed back to the processors includes such things as gun azimuth and elevation and 'firing' data. It is claimed that all 40 guns can engage the target simultaneously and the system will be able to record in virtual real-time the individual performance of each gunner against single target. It is understood that other inputs to the computers include meteorological and appropriate ballistic information.

DEVELOPMENT:

The system was developed for the Swiss Government under a contract worth DM5.7m. More systems are to follow. There is a possibility that the Swiss Government may be joined by other nations in the ensuing programme. Unofficially, larger Honeywell machines will be used in later systems. The Florett system clearly has the potential for development into a ground AA fire control system, although no-one is saying this officially.

MANUFACTURER:
Honeywell GmbH, West Germany.

THE UNITED KINGDOM

7005.193
DIRECT FIRE WEAPON EFFECTS SIMULATOR (SIMFIRE)

DESCRIPTION:

The Simfire equipment, originally designed to operate on tanks and armoured cars, simulates direct fire weapons by means of a laser light projector. It is in use, widely, throughout the world in two roles:

1. As a gunnery trainer, by allowing tank crews to practice their techniques against live targets with far greater realism than is possible with live ammunition against mock targets on a range.
2. As a tactical trainer, by introducing into peacetime training exercises the effects of long-range high accuracy weapon systems. Its forces use all the participants of an exercise to react as if they are under the threat of live attack.

In these two roles its use has brought an increasing awareness of the importance of the skills of the individual tank crews on the success or failure of a simulated battle. One of its most important features has been to identify good from indifferent crews, and to highlight failures in training. Trials with many armies throughout the world have proved, not only that Simfire has brought much needed and long awaited realism to field exercises, but also that at all levels its use generates a new understanding on the part of crews and instructors, of the importance of good training and the need to keep tanks and their gun control equipment in good repair. During peacetime, when severe restrictions are necessarily imposed on the use of live ammunition for training, Simfire is a material help in maintaining crews and their equipment at a high state of combat readiness.

The title Simfire refers to the simulation of direct fire weapons such as tanks and armoured cars. However, other variations have evolved which rely upon the basic idea of laser light projection:

SIMRAY: Developed as an umpires' aid, is a laser ray gun which has both civil and military applications. The British Army intend using the device as an Umpires' Gun with which an umpire can discover whether participants of an exercise are 'cheating' by obstructing the operation of their Simfire equipment. A user of Simray can simulate minefields, and fire from both anti-tank and artillery weapons by knocking out vehicles that stray into danger zones.

SIMKILL: A target Simfire system which can be fitted to mobile or static targets to represent a range layout and provide realistic gunnery training for tank and gun crews without the limitation of range safety areas.

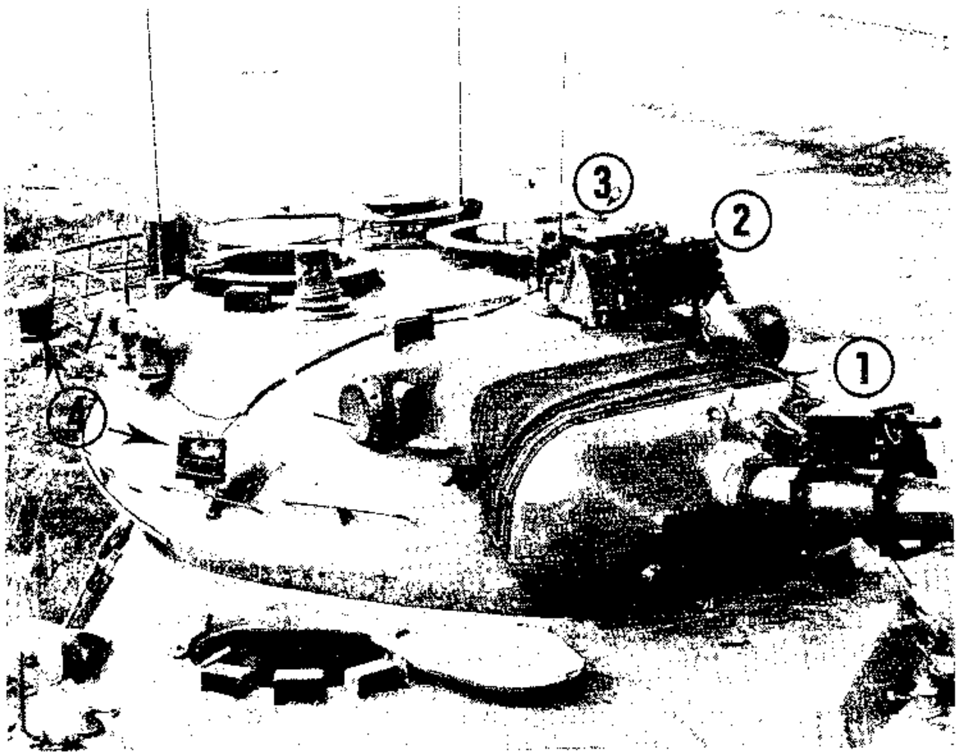
SIMSTRIKE: An air-to-ground attack simulation designed to represent the effect of gun and missile attack by aircraft at ground targets equipped with Simkill.

SIMFLASH: A Flash Generator System linked to the firing switch which provides the visible and audible effects of a gun firing.

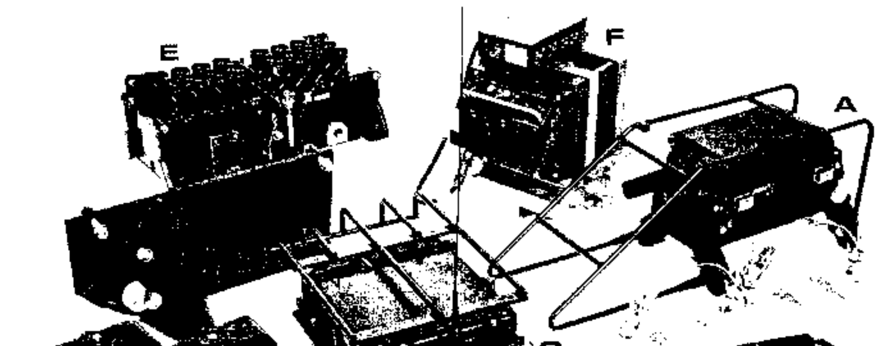
SIMFLAK: A ground-to-air attack simulation designed primarily for helicopter pilot training.

SIMGUN: A rifle version of Simfire under development for the British Army. Associated with the 'firing' equipment will be a target system worn by a man on a webbing harness so that soldiers may be trained to react quickly and accurately to swiftly moving targets within a realistic tactical framework.

The basic Simfire equipment can be mounted on any tank or armoured car in the world including the Scorpion light tank which is having world wide success. The major armies of the Western World have all bought the equipment or are in the process of evaluating it. Tactical exercises have taken on a completely new significance and many



A German Army Leopard tank with Simfire fitted. (1) Laser projector fitted to gun barrel. (2) The flash generator which controls the 'bang, flash and smoke' effects. (3) The radio transmitter/receiver which responds to the Simfire attack signal. (4) Two of the four detectors which pick up the laser attack signal



Complete Simfire equipment for a British Army Chieftain tank:

(A) Laser projector with tree guard.
(B) Smoke pyrotechnic holder—this is ignited once the vehicle has been 'killed'.
(C) Commander's and gunner's eyepieces which indicate the fall of a shot by a series of lights.
(D) Detector's units which gather the laser signal.
(E) Flash generator—this forms the basic part of the SIMFLASH system and controls the "bang, flash and smoke" effects.
(F) Control unit which is mounted internally and enables the crew to select ammunition, range and the correct information for engaging moving targets. It also contains the umpire switches under a sealed flap.
(G) Radio transmitter—receiver which responds to the Simfire attack signal.

theories of modem armoured warfare are given a severe test under very realistic conditions.

Simfire helps to reduce the amount of live ammunition needed to achieve a fully trained crew and thereby significantly reduces training costs. Worthwhile field exercises can be conducted using Simfire on small training areas which are not normally considered suitable for armoured training. The British Army trials report summed up the value they placed on the use of this equipment by stating it to be an essential training aid.

DEVELOPMENT:

The simulator was developed as a private venture project by Solartron and was started early in 1967. Throughout development Solartron worked in close association with the British Ministry of Defence.

MANUFACTURER:

The Solartron Electric Group Limited, Farnborough, Hampshire, England.

Simray, the 'Umpire's Gun'. The control unit is carried on the man's back

1647.193

REDIFON SIMULATORS

The Redifon organisation has produced a large range of simulation systems and equipment for military applications. These generally come within one of three groups, flight simulators, radar simulators, and naval training simulators.

Flight Simulators

Almost 100 military flight simulators have been supplied by Redifon, of which 59 are for use by the UK forces, and 48 for foreign services. Aircraft types simulated for UK users include: VC-10, Nimrod, Buccaneer, Phantom, Lighting (Mks 1, 2, and 3), Comet (2 and 4), Argosy, Meteor, Hunter, Javelin, Gnat, Gannet, Scimitar, Wessex helicopter, Valiant, Vulcan, and Victor. Aircraft types simulated for overseas forces include: Buccaneer, Agusta Bell 204B helicopter, C-130, Canadair CC106, Transall C160, CHSS-2 helicopter, F-5, Aer Macchi MB326, Lightning Mk 53, Sabre, Canberra Mk 58, Hunter, and Saab A35XD.

Initially, analogue computation was employed, but current production employs analogue, hybrid and digital techniques as appropriate to the requirement and cost specification for specific simulator projects. Digital computers used have included the products of several manufacturers, but most of the later Redifon simulators incorporate machines produced by Redifon itself. The majority of the more recent simulators also incorporate multi-axis motion systems of Redifon design and CCTV colour visual systems.

PHANTOM:

This flight simulator provides aircrew with equipment which simulate the entire flight handling characteristics and systems performance of the Phantom aircraft and also the navigation and weapon attack systems with which it is equipped. It is used in support of conversion training and squadron continuation training both by the Royal Navy and Royal Air Force. It is a "full mission" flight simulator in which aircrew can be instructed in, and practise all the roles in which the Phantom aircraft is employed.

The flight simulator is powered by a digital computer and the simulator fuselage consists of complete replicas of the Phantom aircraft cockpits. The simulator fuselage is mounted on a three axis motion system which provides motion cues in roll, pitch and heave axes. An instructor's station is provided which is designed to be operated by two instructors, and their consoles incorporate instrumentation and controls which enable them to set up and monitor simulated exercises, insert faults and malfunctions and control conditions of ambient lighting, visibility and wind strength and direction. Track and approach recorders are also provided.

The simulator is also equipped with a radar land mass attachment which permits realistic simulation of the mapping radar presentation in the navigator's cockpit.

A closed-circuit television camera scanning a three dimensional model presents a picture of the outside scene to the pilot in full colour through projectors on to a screen mounted in front of his cockpit on the simulator fuselage.

Redifon Buccaneer flight simulator, showing motion system and triple projectors and screen for colour visual systems

An airfield model provides the ability to carry out taxying, take-off, circuits, approaches and landings, and through different scaling on two further models low, medium and high level navigation, target identification and navigation attack and weapon delivery techniques can be carried out.

Five Phantom simulators have been manufactured, a Phantom F4K and four Phantom F4M simulators.

BUCCANEER:

Redifon manufactured simulators for the Buccaneer aircraft are "full mission" simulators powered by digital computers and equipped with three axis motion systems. Visual systems for both airfield and tactical operations are provided.

NIMROD:

Four flight simulators for the Nimrod maritime reconnaissance aircraft have also been manufactured for the Royal Air Force. These are digital powered simulators representative of the Nimrod flight deck with three axis motion, and visual systems. They are designed to train the flight crew of the Nimrod and to be coupled to a maritime crew trainer which simulates the essential navigation, search, location and attack equipment with which the tactical compartment of the aircraft is equipped and in which the tactical crew can be trained and practised on the various tactical operating techniques. When coupled, the flight simulator and maritime crew trainer can operate in conjunction with each other, or separately as the training requirements may demand.

Radar and other Military Simulators:

TYPE C8021 SHIPBORNE HELICOPTER AND AIRCRAFT DIRECTION TRAINER:

Radar simulators offer useful savings in training costs, but are inherently large and relatively costly items. Target simulation using an existing radar installation offers most of the facilities of a full radar simulator with appreciable reductions in size and cost. The C8021 system offers training in Aircraft Direction at modest price and in compact form. The trainer is designed for shipboard use and integrates completely into the ship's radar system. It can be installed in any radar-equipped vessel, for training in aircraft direction and vectored attack procedures, without the use of helicopters, aircraft or landing platforms. The trainer produces two target tracks; additional units may be used in parallel to produce further targets as required.

TYPE C846 SUPER-FLEDERMAUS SIMULATOR:

The C846 simulator is a trailer-mounted gunnery training aid for use in front line tactical instruction. In conjunction with the Super Fledermaus gunnery control radar it enables operators to be trained in the acquisition and tracking of attacking target aircraft flying at speeds of up to Mach 2. Complete realism is maintained on the simulated targets, characteristics of the real radar being faithfully reproduced in the echo configurations. The simulated targets are under the control of the instructor, either locally at the simulator equipment, or by remote control from the gun equipment. Four targets (or optionally two targets) are provided, fully controllable in speed, direction turn and climb/descend rates, with the effects of wind simulated. To allow training for the unexpected the targets may be sequenced or 'programmed' to enter the area of observation at preset intervals. Simulated echoes may be mixed directly with echoes from real targets to give added complexity to an exercise. Realistic jamming returns are produced including noise, pulse and window which may, at the instructor's will, be associated with any target. A mass raid of many aircraft flying in close formation is also simulated.

TYPE C880 MARINE RADAR SIMULATOR:

The Redifon C880 Marine Radar Simulator is a multi-purpose navigation and radar trainer which provides facilities for initial training or continuation training of navigation radar and ships' operations room personnel. It is used as a procedure trainer, for radar control of ships, fixed wing aircraft, helicopters and hovercraft; using the basic capabilities of the system it provides training in navigation, radar fixing, plotting and tracking of all kinds of contracts.

The following features are simulated:

1. The coastline in any area is reproduced with high resolution for inshore working in bays, estuaries or channels, and training in map comparison, contact plotting and navigation.
2. Up to eight echoes each of which can be controlled independently to simulate any contact from an aircraft to a navigation buoy.
3. The land indications, because of the variable intensity and shadow facility could also be used to simulate pack-ice and other similar phenomena, convoys, or fishing fleets.

TYPE C8012 DIGITAL MULTI-CRAFT RADAR SIMULATOR:

This system provides facilities necessary to train and examine officers and men in aspects of proper operation of radar, navigation and radar plotting, including the following:

1. Contact plotting of ships, hydrofoils, helicopters, hovercraft and maritime aircraft.
2. Radar fixing from land points.
3. Tracking of targets and relative fixing (contact to contact).
4. Simulation of features such as ice-edge, pack-ice and cloud returns as an optional extra.
5. Recognition of interference patterns from sources such as sea and rain clutter and other radars, also various malfunctions and common design limitations of radar may be demonstrated.

When simulating military exercises, it can be used to train personnel in most tactical procedures including:

1. Vectored attacks.
2. Anti-submarine exercises (Instructor supplying sonar information).
3. Convoy escort and associated procedures.
4. Interceptions.
5. Shadowing operations.
6. Practice attacks, using targets as torpedoes or missiles.

ACTION SPEED TACTICAL TEACHER AND WEAPONS TRAINER TYPES C805 AND C873:

This is a tactical teacher and weapons training complex which can be used to provide complete detailed simulation of most command tactical problems involving the deployment of ships, submarines, aircraft, helicopters and hovercraft. The trainer comprises an auditorium, where the instructional staff can automatically record and control exercise progress, and because of the programming and read-off facilities, it can also be used for comprehensive debriefings. The system also has cubicles, simulating ships, submarines, aircraft, helicopters, etc, and most of the drive systems, indicators, sensors and weapons normally carried. It can be used for all kinds of training from basic to the fully operational.

Depending on user requirements, the complex can be provided incorporating either analogue (C805) or digital (C863) techniques.

ACTION SPEED OPERATIONS TRAINER TYPE C863:

This digital complex combines all the facilities of the Action Speed Tactical Teacher plus additions such as coastline effects, many more targets of different types and larger more versatile convoy sizes. It can be used to train operations staff in all aspects of control and direction, both tactically and strategically.

MANUFACTURER:

Redifon Flight Simulation Ltd, Gatwick Road, Crawley, Sussex, England.

Redifon Radar Simulator Division, Kelvin Way, Crawley, Sussex, England.

1293.193
AVIMO WEAPON SIMULATORS

DESCRIPTION:

A series of simulators for use in the classroom or in the field has been developed in UK by Avimo Ltd. These instruments are for the selection and training of operators for line-of-sight guided weapons. Typical applications for these simulators are in training operators for the Vigilant and Cobra anti-tank infantry guided missiles.

Initial selection and training of missile operators is achieved by use of a classroom machine. Selection is necessary because although any service personnel can be trained to launch and guide a line-of-sight missile some have greater natural aptitude for the task and are consequently cheaper to train.

In the training role the simulator reproduces as accurately as necessary the launch and flight characteristics of the missile which is represented as a spot of light moving against a typical battle scene background. The movement of the light spot is controlled by using the actual missile controller, the output signals of the controller being processed in an analogue unit so that the light spot moves as the actual missile would move under the conditions simulated. A wide range of engagement conditions can be catered for and the realism of the simulation is good. The increasing range of the missile as it flies is represented by the decreasing size of the light spot. Variable sensitivity is available so that simpler control tasks can be set for the initial training phase.

The classroom system consists of three components in addition to the missile controller. These are the screen carrying the landscape which is usually projected from a conventional slide projector; the Spot Projection Unit which contains the optical system and the Analogue Unit which is built into the spot projector in the classroom machines.

Provision is made to change analogue units readily so that different missile characteristics can be accommodated. This is particularly valuable when the user has to select or train operators for a number of different systems.

A wide range of parameters can be simulated and adjusted to give the operator a full range of operational possibilities. These parameters include all variations in launching conditions including launching from a moving vehicle; wind gust effects and missile drift; target range and a variety of missile control systems including the well known velocity and acceleration types.

The field simulators are designed for outdoor training in conditions very closely approximating to actual battle. Live targets can be used. The field equipment is simpler and less sophisticated than the classroom simulator and its primary role is for tactical and refresher training. The equipment is of rugged construction to withstand the environmental conditions.

Two basic units comprise the field simulator system in addition to the standard missile controller. These are a viewing head for the infantry missiles and a rugged analogue unit having electrical characteristics the same as for the classroom machine. The viewing head is necessary to place the simulator light spot in the operator's field of view and normally he views the panorama before him through this unit. An eyepiece is provided for the instructor to monitor the trainee's performance. In use the operator sees his target in the scene in front of him through the viewing head. On firing the missile the spot of light appears superimposed on the scene and he guides this onto the target as if it were a missile. The viewing head can be mounted on vehicles or helicopters if required.

For applications with systems where an optical sight is used, it is usual for the viewing head and the weapon sight to be combined, increasing realism still further.

STATUS:

Classroom and field simulators are in production and in service with the British Army and several other armies.

MANUFACTURER:

Avimo Limited, Taunton, Somerset, England.

1778.193
LINK-MILES SIMULATORS

DESCRIPTION:

Link-Miles is an independent operating Division of the Singer Company (U.K.) Limited, and is closely associated with Singer's Flight Simulation Operations in New York, U.S.A. Prior to its amalgamation with Singer the firm had gained a great deal of military experience, having designed and manufactured flight simulators for the RAF's Belfast and Hercules aircraft. These were followed by full mission simulators for the Sea King helicopter and the Hawker Harrier.

Under its new title, Link-Miles Division was awarded contracts for four full mission simulators for the Anglo-French Jaguar. This contract is one of the biggest military orders placed in recent years. An order for a fifth Jaguar simulator has now been placed. This is a mobile version, the entire complex being contained in a number of road trailers and containers.

The "trailerised" flight simulator is increasingly favoured by military operators, because it can be quickly repositioned to accommodate changes in the strategy of front-line squadron dispersal. Link-Miles has conducted intensive research into this approach and is now able to encapsulate a full mission simulator, including visual and motion systems, instructor's consoles, briefing rooms and workshops. Recent military simulator contracts awarded to Link-Miles Division, include the following:

SEA KING HELICOPTERS:

One for the Royal Navy, now in service, using analogue computation and one for the Royal Australian Navy, using two digital computers, scheduled for delivery in early 1976. The simulator comprises two separate parts, a cockpit section, mounted on a three-axis motion system and a rear crew compartment, each under the control of its own instructor. Full anti-submarine warfare missions are simulated, including operation of the following systems:

1. Navigational doppler
2. Search radar
3. Transponder interrogation radar
4. Submersible sonar transducer
5. Weapons release system

HARRIERS:

Three for the Royal Air Force. The flight simulator is designed to reproduce the flying, handling and systems characteristics of the Hawker Siddeley Harrier aircraft throughout its operational envelope, including the simulation of malfunctions and emergencies. It is intended for conversion training at RAF Operational Conversion Units and for continuation training with operational squadrons.

The flight simulator consists of a detailed replica of the fuselage and cockpit of the Harrier aircraft, mounted upon a four-axis, hydraulically operated motion system. Motion cues in the roll, pitch, sway (lateral translation) and heave (vertical translation) axes are provided in response to operation of the flying controls. The visual system is based on the principle of a closed-circuit television camera scanning a model surface, the resultant picture being projected in natural colour, onto a screen in front of the pilot. Full daylight, dusk and night effects are provided. There are three separate scale models: an airfield area, a low flying area and a weapon delivery area. Transition from one to the other is smooth and natural.

Cockpit instruments and indicators are fully simulated, including the inertial navigation system, weapons system and head-up displays. All performance parameters are calculated by a digital computer complex which accepts inputs from the simulator, solves the flight equations and routes the necessary signals back to the cockpit instruments. Training exercises are controlled from a separate instructor's console which incorporates all monitoring facilities, environment controls (wind, visibility, etc) and switches for inserting faults and malfunctions. Track, approach and weapon attack result recorders are included.

The following pilot-training facilities are provided:

(a) Cockpit familiarisation, checks and drills
(b) Taxying
(c) Take-off (conventional and VTOL/STOL)
(d) Circuit flying
(e) Hovering and transitional flight
(f) Radio-navigation, communications and air traffic control procedures
(g) Emergency drills, procedures and manoeuvres
(h) Navigation, including map reading at low level and operation of the Inertial Navigation/Attack System
(i) Weapon attacks, using all attack modes and all specified weapons
(j) Reconnaissance procedures
(k) Landing (conventional and VTOL/STOL)

Two of these simulators are now in service with the RAF and the third is completed and awaiting delivery.

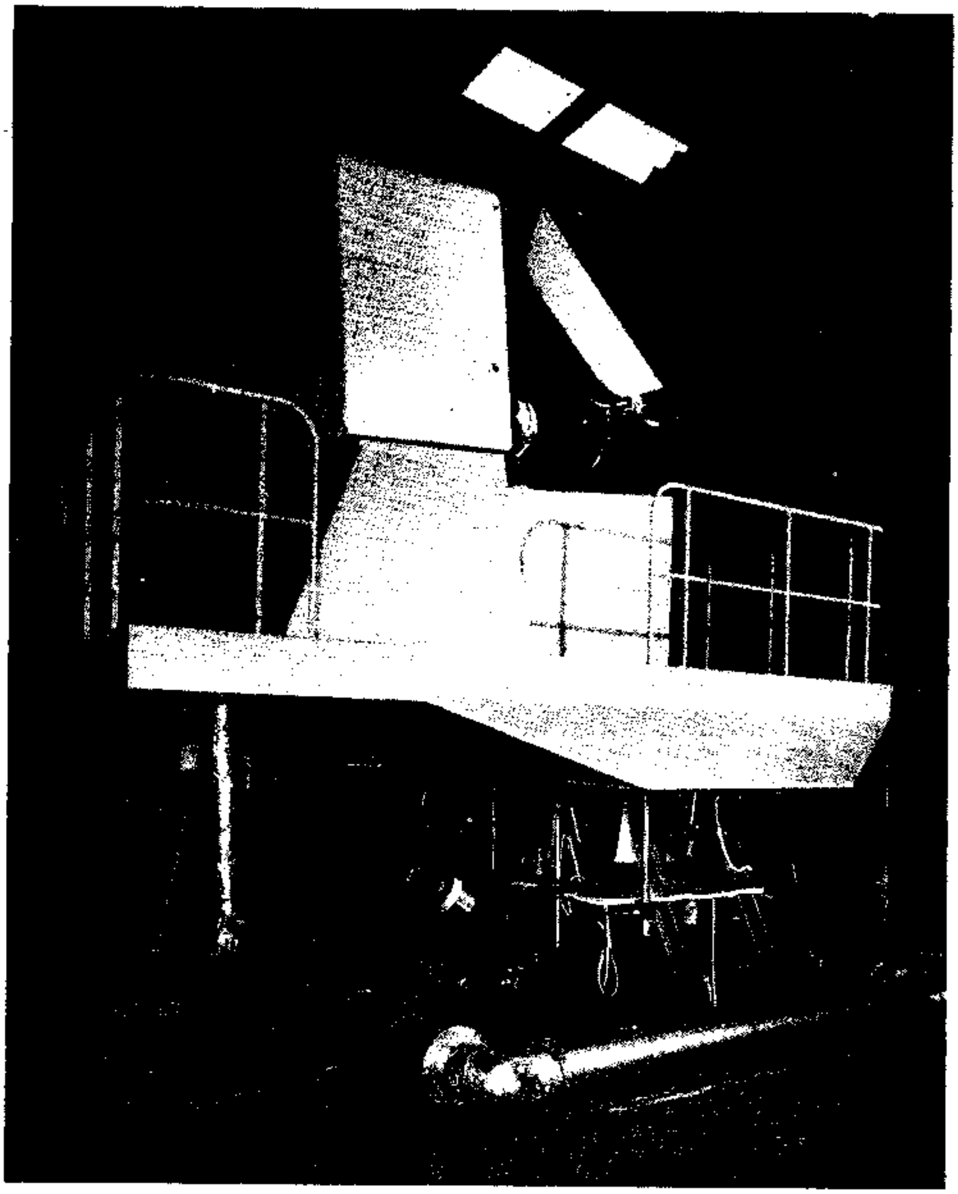
A simulator for the AV8A, the United States Marine Corps version of the Harrier was delivered in late 1973. Designed to meet the special training requirements of the Marine Corps, the simulator is installed in a mobile road trailer, which permits it to be operated at various sites in the USA. The complex incorporates an automated instructor's station, a feature of which is the Performance Assessment Monitor. This enables the instructor to call up various operational procedures, in tabulated form, on a CRT presentation; the computer then assesses the student's performance of the selected procedure against the correct standard and indicates any errors or omissions.

ANGLO-FRENCH JAGUAR:

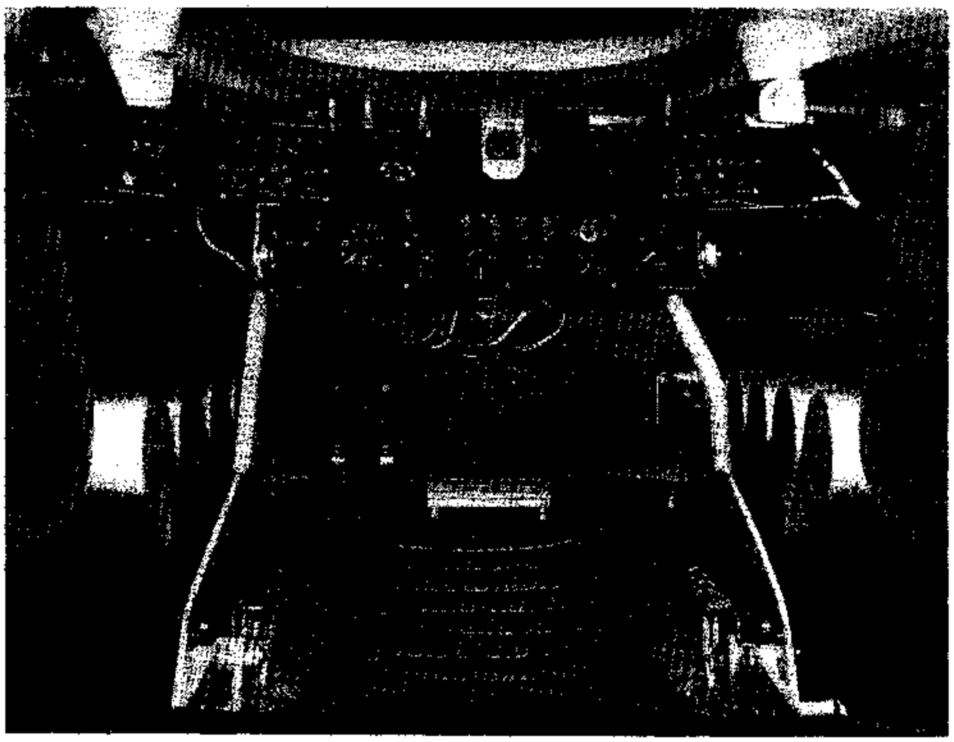
Five for the Royal Air Force. This simulator combines all the mission training facilities described for the Harrier, except that it is mounted on a standard Link-Miles three-axis motion system. The first Jaguar simulator was scheduled for delivery in early 1974, whilst the fifth is scheduled for early 1975. The last of the series is designed to be transported in a number of road trailers, reflecting the current military preference for mobility.

JETSTREAM:

One for the Royal Air Force. This is scheduled for delivery in late 1975. The Jetstream, as supplied to the RAF, is a twin-engined advanced pilot training aircraft. The flight simulator complex, in-



Jaguar Flight Simulator on 3-axis motion system with wide-angle collimated visual display unit



Interior of Chieftain Tank Driving Simulator, designed and manufactured by Link-Miles Division of the Singer Company (U.K.) Ltd cluding the cockpit and motion system, is housed entirely in one trailer, in a similar manner to the fifth Jaguar and the AV8A. Computation is by a PDP 11/45 digital computer, reproducing the flying and handling characteristics of the Jetstream aircraft throughout its operational range. The complex is designed to accommodate the retrospective fit of a visual flight system.

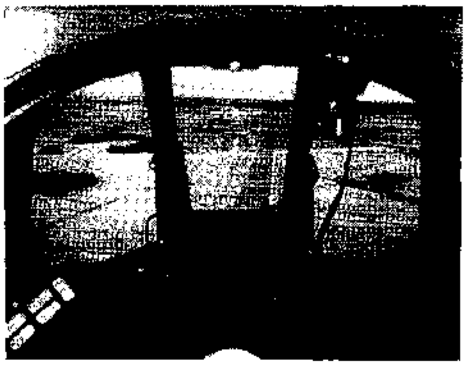
FIGHTING VEHICLE SIMULATORS:

Since the early 1960's, Link-Miles has applied its flight simulator experience to the design and development of driving simulators for specific types of fighting vehicles. The first of these was a Chieftain tank simulator, supplied to the British Army in 1965, which comprised a true facsimile of the driver's compartment fitted with a monochrome closed-circuit television visual system. Computation was by the Link-Miles standard analogue computer, Since 1965 the firm has made rapid progress in this field and is now able to offer driving trainers of any type with 2 or 3-axis motion systems, full colour collimated visual displays and digital computation.

Recent contracts include the following.

Chieftain Tank Mk. III for the British Army, delivered in 1971.

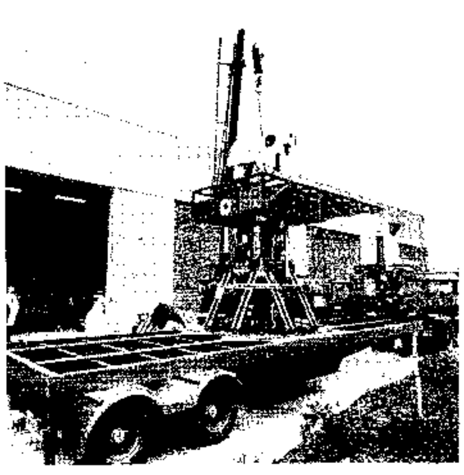
An FV 32 and an FV 433 for the British Army, delivered in 1972.



View through cockpit windscreen of a Jaguar flight simulator. The visual scene is presented via a Link-Miles optical display system which collimates the image to infinity. The Head Up Display is generated by an actual aircraft system and superimposed upon the presentation

Chieftain Tank Mk. III for the Iranian Army, delivered in 1972.

Chieftain Tank Mk. V for the Iranian Army, scheduled for delivery in 1974.



Jaguar Flight Simulator 3-axis motion system in process of installation on trailer chassis

MANUFACTURER:

Link-Miles Division, The Singer Company (UK) Ltd, Churchill Industrial Estate, Lancing, Sussex BN15 8UE, England.

2401.293
FRIGATE ASW COMMAND AND OPERATOR TRAINER

This equipment is designed for training sonar teams in the operation of surface ship sonar sets and to train the ship's command in the tactics employed in the use of sonar and radar data in the co-ordination and direction of anti-submarine weapons.

The equipment can simulate an exercise involving two manned surface ships against an unmanned submarine or one manned surface ship and an unmanned consort against an unmanned submarine.

Attacking ships will respond realistically to the demands of speed and helm and the target submarine will perform realistic manoeuvres under the control of the instructor or under pre-programmed conditions.

Standard naval equipment is fitted in compartments providing working conditions for the trainees similar to those found in normal exercise. Equipment control is exercised by an Argus digital computer and operator actions produce realistic system responses.

TYPICAL SIMULATION:

The degree of complexity of an exercise depends upon the requirements of the team under training. However, the following is typical of the type of exercise which might be mounted.

Two ships are set to patrol a wide sea area in a co-ordinated search for a reported enemy submarine. The submarine is set on a pre-programmed course, or controlled by the instructor. The Command sonar teams and fire control teams of the ships are manned by the trainee crews.

The submarine is first located on a search sonar and the Command alters course to intercept the submarine. The appropriate course is set into the computer at the helmsman's console and the sonar, etc. respond accordingly under computer control. The two ships communicate and co-operate via the RT link, and any of the Weapons Systems are employed.

The success of the attack depends on the accuracy of the final aiming data and appropriate miss-distances are shown on the instructor's tabular displays.

MANUFACTURER:

Ferranti Limited, Military Systems Department, Simonsway, Wythenshawe, Manchester, M22 5LA, England.

2402.393
HELICOPTER ASW CREW TRAINER

The purpose of this equipment is to train anti-submarine warfare helicopter crew members in the use of on board radar and sonar sensor equipments and to give integrated operational training in the techniques of co-ordinated ASW search and attack procedures. The trainer derives all of its own 'movement' parameters from an instructor's console. The complete equipment and each of the three simulated helicopter cabins is therefore capable of being operated independently and 'moved' at will within the three dimensional playing area.

DESCRIPTION:

The trainer can simulate an exercise involving a team of up to three ASW helicopters, four surface consorts (unmanned), and one submarine target (unmanned).

Crew compartments are represented by cubicles fitted with the actual helicopter equipment which is driven by an Argus digital computer. The students are presented with realistic displays and the student actions cause system responses which accurately represent those occurring in practice.

The instructor's console uses a CRT display system for data presentation. Facilities are provided for the instructor to initiate tracks, control target movement, 'fly' the helicopters, inject faults and monitor student actions. Controls are connected to the computer and the displays are computer driven.

Annotated large screen tactical displays are provided under computer control enabling the instructor and observers to readily follow the course of the exercise.

A tape deck is provided to record digital data as an exercise progresses. The complete exercise including vehicle tracks, student actions, etc. can be recorded and the tape can then be subsequently replaced into the system producing a complete picture of the original exercise, enabling detailed debriefing to take place.

MANUFACTURER:

Ferranti Limited, Military Systems Department, Simonsway, Wythenshawe, Manchester, M22 5LA, England.

2449.493
SUBMARINE COMMAND TEAM TRAINER

This equipment is for training attack team personnel and sonar teams in the full use of their equipments and to train the submarine command in the co-ordination and direction of attacks or defensive manoeuvres.

DESCRIPTION:

The equipment can simulate an exercise involving two manned submarines and up to five other unmanned vessels of types which can be selected at the start of an exercise and can be either surface ships or submarines.

Submarines can attack in consort or can oppose each other, or two separate exercises can be conducted simultaneously with the five unmanned vessels shared between the two submarine exercises.

During the course of the exercise, the instructor can control the manoeuvring of the unmanned vessels and can also initiate an attack against the submarines, using torpedoes, mortars and other weapons as appropriate.

The major components of the equipments fitted in the submarines are:

- Underwater telephone system
- Bathythermograph
- Passive sonars
- Active sonars
- Intercept sonar set
- Plotting tables
- Control consoles
- Fire control equipments, including wire-guided torpedo control equipment
- Attack periscopes

Tape recording equipment is provided and can be used either for pre-recording of unmanned vehicle movements, initial conditions etc, or for recording the exercise as it progresses and subsequent replay for debriefing.

TYPICAL SIMULATION:

A submarine is detailed to search and attack a convoy of up to five vessels, which sail on a pre-programmed course or manoeuvre under instructor control. The command, sonar team and fire control team in the submarine are manned by the trainee crews. The submarine's course, depth, etc, are set into the computer at the helmsman's console as required by the command.

The convoy is located on the search sonars of the submarine and the submarine command alters course accordingly. The submarine commander uses the periscope if he wishes, and representative views are presented to him, correctly correlated with the information presented on the sonars.

The periscope data and/or sonar data is fed into the fire control equipment and finally, torpedoes are launched. The success of the attack depends upon the accuracy of the aiming data and the appropriate miss distances are presented to the instructor and any audience on the tabular displays.

MANUFACTURER:
Ferranti Limited, Military Systems Department, Simonsway, Wythenshawe, Manchester, M22 5LA, England.

THE UNITED STATES OF AMERICA

1649.193
TACDEW

DESCRIPTION:
TACDEW (Tactical Advanced Combat Direction and Electronics Warfare) is the largest of the US Navy's computerised command and control training systems. Two of these systems one at each of the Fleet Anti-Air Warfare Training Centres in San Diego, California and Dam Neck, Virginia, provide for synthetic training in a wide range of naval tactics. These include:

1. Anti-aircraft operations
2. Anti-submarine warfare
3. Amphibious operations
4. Strike operations
5. Electronic Warfare
6. Air intercept control
7. Weapons direction
8. Shore bombardment
9. Carrier air traffic control
10. Surface operations

The simulator elements for these may be used separately or in combination within the overall system to provide for simultaneous individual specialist training programmes or for large scale exercises involving most or all of the elements. Replica systems of actual USN operational hardware are provided for the Navy Tactical Data System (NTDS), Airborne Tactical Data System (ATDS) aircraft, non-NTDS ships, the Carrier Controlled Approach System, and a range of ship's systems. Environmental conditions and parameters, such as the performance of ships, aircraft, and their systems, and sea and weather conditions are inserted in the form of computer software.

1734.193
LASER GUNNERY TRAINER

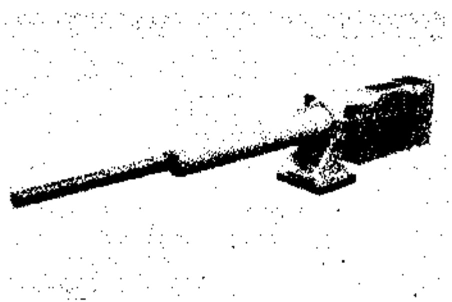
DESCRIPTION:
The Laser Tank Gunnery Trainer has been developed for training tank crews in firing the main tank gun, in lieu of the former method of using a co-axially mounted machine gun to simulate firing of the main armament.

The trainer is a gas laser weapon fire simulator consisting of a plasma tube, sealed collimating optics, controls, and a self contained-power supply. It produces a visible output in both flash and CW modes of operation. Hits are scored by noting reflections from training targets.

DEVELOPMENT:
The Laser Tank Gunnery Trainer was developed and produced under a $275,000 contract from the US Naval Training Devices Centre in 1970.

STATUS:
Quantity deliveries have been made and the equipment is in use by the US Army.

MANUFACTURER:
Kollsman Instrument Company, 575 Underhill Boulevard, Syosset, New York 11791, USA.



The Kollsman Laser Gunnery Trainer is designed to simulate the M73 machine gun in gunnery training

LAND BASED RADAR

Designation	Entry No.	Remarks	Manufacturers
DENMARK			
DR 513	**1576.153**	Artillery radar.	Terma
DR 810	**2286.153**	Ballistic Radar	Radartronic
M/532	**1577.153**	Doppler radar for projectile velocity measurement.	Terma
Pointer	**1573.153**	Portable Independent Terma Radar X-band	"
TSSR	**1574.153**	Terma Splash Spotting Radar.	"
FRANCE			
Adour	**2056.153**	TH.D 1215 automatic multi-mission missile tracking radar, 200 km range on passive target.	Thomson-CSF
Antares	**2060.153**	High precision 3-D S-band monopulse radar with electronic scan, in elevation.	"
Aquitaine II	**2062.153**	Precision missile/satellite tracking monopulse radar. Angular accuracy seven seconds; range accuracy two metres.	"
Arabelle	**2066.153**	Portable transponder.	"
Artois	**2063.153**	(Under development) Missile tracking radar, using electronic scanning techniques, with capacity to track several targets simultaneously.	"
Bearn	**2065.153**	Precision missile/satellite tracking radar with digital range-finder working to an accuracy of three metres in 4,000 km and with an angular accuracy of 20 seconds of arc.	"
Bretagne	**2067.153**	TH.D 1801 tracking radar.	"
Champagne	**2069.153**	Missile tracking radar, using 300 km range on 1 sq. m. passive target and to measure target speed to the nearest 10 cm/sec. Radar will use pulse compression techniques and will have low-noise receiver with 12 metre diameter "cold aerial".	"

Designation	Entry No.	Remarks	Manufacturers
Domino 20	**2073.153**	L-band surveillance radar. Coherent, pulse-doppler; 17 km range; 10° beamwidth; coherent pattern.	Thomson-CSF
Domino 30	**2083.153**	As Domino 20, but 6.5° beamwidth and 30 km maximum range.	,,
Domino 40N	**2084.153**	As Domino 20 but 3° pencil beam and 80 km maximum range.	,,
Eldorado	*2080.151* *2082.153*	X-band tracking radar for light anti-aircraft operations against low-flying targets. Associated with MIRADOR surveillance radar as mobile combination.	,,
ER-116-A	**2157.153**	IFF interrogator.	,,
LDTR	–	C-band scanning radar for special application. Designed to work under high level ECM conditions, it has an exceptionally narrow aerial beam.	,,
LP23 (TRS 2050)	**2100.153**	Long-range L-band surveillance radar.	,,
Matador	**2102.153**	3-D S-band radar (Mobile And Tridimensional Air Defence Operations Radar). Range about 250 km. Electronic elevation scan for accurate height measurement.	,,
Mirador	*2080.151* *2116.153*	Pulse-doppler surveillance and target designation radar. S-band; 18 km range; pencil beam 5.6° wide. Associated with ELDORADO tracking radar for mobile operations for defence against low-flying aircraft.	,,
Mirador II	**2080.151** **2075.131** **2117.153**	Mobile S-band pulse-doppler surveillance radar for defence against low-flying aircraft. Associated with tracking radar (name unknown) in Crotale surface-to-air guided weapons system. Dual, back-to-back, 4° beamwidth aerials. Range 18 km.	,,
Oeil Noir	**2129.153**	L-band pulse-doppler surveillance radar. 10° cosecant pattern beam. Range 15 km. Mounted on AMX-30 tracked AFV with twin 30 mm cannon to form mobile anti-aircraft system.	,,
Olifant	**2131.153**	Lightweight battlefield radar.	,,
Olifant II	**2132.153**	Lightweight man-portable battlefield patrol radar.	,,
Palmier	–	20MW 3-D S-band surveillance radar.	,,
Perceval	**2120.153**	Helicopter recovery radar.	,,
Picador	**2119.153**	Mobile 3-D radar.	,,
Racine	*2136.153*	X-band non-recurrent pulsed Doppler surveillance and target acquisition radar.	LCT
RALF	**2152.153**	Lightweight X-band low altitudes surveillance radar using Racine techniques.	,,
Rapace	**2137.153**	Ku-band AFV-mounted surveillance radar.	EMD
Rasit	*2142.153*	X-band portable medium-range battlefield surveillance radar.	,,
Rasit 72S / Rapière	**2141.153**	X-band battlefield surveillance radar. 20 km range.	LCT
Rasit 72B	**2153.153**	Lightweight version of Rasit 72A.	,,
Rasit 72C	**2154.153**	Short-range (10 km) version of Rasit 72A.	,,
Rasura	**2143.153**	X-band portable or vehicle-mounted battlefield surveillance radar.	Thomson-CSF
Ratac	**1528.153**	Battlefield surveillance. Also produced in USA and West Germany.	LCT
RS 660	–	Secondary radar interrogator using AS 309 aerial which is suitable either for independent operations or for mounting on the primary radar aerial.	Thomson-CSF
TH.D 1012	**2133.153**	Precision Approach Radar.	,,
TH.D 1013	**2098.153**	Light Precision Approach Radar.	,,
TH.D 1021	**2058.153**	Airfield Surveillance Radar.	,,
TH.D 1060	–	L-band medium-range surveillance radar. Transportable and suitable for use as a gap-filler or as surveillance element of GCA system. 200 km range on small targets; digital MTI system; 2-beam aerial.	,,
TH.D 1940	–	Low-cost 3-D surveillance radar with electromechanical elevation sweep. Transportable by cargo aircraft, helicopter or truck.	,,
TH.D 1955	**2155.153**	High-power 3-D S-band monopulse stacked-beam radar for surveillance or GCI. 400 km range capability.	,,
Tiger	**2156.153**	S-band lightweight surveillance radar for the detection of high-flying targets.	,,
TRS 2050	**2100.153**	See LP 23.	,,
TRS 2055	**2104.153**	2 MW Terminal Area surveillance radar. MTI system. Uses aerial type TH.D-284B.	,,
TRS 2060	**2121.153**	Mobile or static S-band surveillance radar.	,,
TRS 2065	**2059.153**	ATC Approach Radar.	,,

Designation	Entry No.	Remarks	Manufacturers
Volex III	2160.153	Medium-range two beam 3-D radar. Fast electromechanical elevation sweep with narrow (2° × 2°) beam gives good elevation measurement accuracy.	Thomson-CSF
–	–	L-band panoramic radar with double beam AT 431HB (9 m × 13 m) aerial; 400 km range; high ECM resistance.	..
–	–	Phased array 3-D radar for air defence and ballistic missile detection. Possible replacement for PALMIER radar	..
–	–	400-600 MHz surveillance radar for special applications. Range better than 1,000 km.	..
GERMANY			
Marder	–	Fire control radar for light anti-aircraft guns. Suitable for vehicle or tank mounting.	AEG-Telefunken
PAR-T4	–	Precision approach radar.	..
SRE-A4	–	10 cm S-band medium-range surveillance radar. 500 kW.	..
SRE-A5	–	Medium-range (60 nm) surveillance radar.	..
SRE-LL1	–	23 cm L-band long-range surveillance radar. Back-to-back 14.5 × 9 m reflectors 2 × 2.25 MW. Range 255 nm.	..
SRE-M2B	–	23 cm L-band long-range surveillance radar. 1MW. Range 245 nm.	..
SRT-2	–	Secondary surveillance radar.	..
–	–	Surveillance radar for anti-aircraft fire control system.	Siemens
INTERNATIONAL			
Zenda	*2198.153*	Project for SP AFV-mounted battlefield radar. Believed to have been abandoned.	EMI and others

NPM-510	2298.153	Mobile 3-D radar electronic elevation scan	..
NETHERLANDS			
L4/5 AA Weapon Control System	–	Weapon control system for use with 40 mm anti-aircraft guns for close air defence. Search and tracking radar aerials on compound mounting which, together with transmitter-receivers computer and displays is mounted on single trailer. Search radar employs FASCAN principle to achieve early detection of very low-flying aircraft.	Signaal
LAR, 8GR200	–	Long-range air surveillance radar for civil or military applications.	..
LDTR		Long dwell time radar.	..
SLAM	1557.153	Signaal Low Air-defence Module.	..
Star, 8GR 550	1556.153	Terminal area radar with single transmitter receiver.	..
Star, 8GR 552	1556.153	Terminal area radar with dual diversity transmitter-receiver.	..

Designation	Entry No.	Remarks	Manufacturers
Stola	–	Target acquisition system for use against very low flying aircraft. Believed to be X-band with back-to-back aerial arrangement. Aerials mounted on telescopic mast which can raise them (apparently) about 10 metres to give good low-angle cover and clear obstructions.	Signaal
Tank Radar	**2302.153**	Integrated radar system for 35 mm AA tank.	,,
VI, SGR 104	–	Height-finding radar.	,,
VI, 8GR 551	–	Automatic height-finding and long-range tracking radar.	,,
–	–	Gap-filling radar.	,,
POLAND			
AVIA B	**2340.153**	23 cm L-band surveillance radar. Two 1.5 MW transmitter/receivers in frequency diversity. Range 240 km.	Industrial Institute of Telecomms, Warsaw
SWEDEN			
Domti	*2354.153*	Mobile coherent C-band pulse doppler search radar for use with AA guns or missiles.	L.M. Ericsson
Ecstra	**2357.153**	X-band coherent search and fire control radar for AA gun or missile systems. Separate search and tracking aerials.	,,
Isidor	**2481.153**	X-band portable intrusion radar.	,,
PE-48/T	**2325.153**	Mobile X-band AA fire control radar.	,,
PE-452/T	**2327.153**	X-band range-only AA fire control radar.	,,
PE-453/T	**2328.153**	Mobile X-band AA fire control radar	,,
Mareld	–	X-band coastal defence radar with closed-circuit TV for visual tracking and 30 km range laser rangefinder (by L.M. Ericsson).	Philips Teleindustri
PS-70/R	**2329.153**	Mobile C-band search radar.	,,
PS-171/R	**2326.153**	Mobile S-band search radar.	,,
Peder II	**2355.153**	Ku-band monopulse fire control tracking radar.	,,
UAR 1021	**2357.153** **2377.151**	X-band combined search and track pulse Doppler radar.	,,
UAR 1022	**2356.153**	Tracking sub-system of the UAR 1021.	,,
9GR 600	**1549.153**	Frequency-agile 200 kW search radar.	,,
SWITZERLAND			
CONAR	**2551.153**	Artillery Radar Fire Control System.	Contraves
Skyguard	**2377.151**	Solid-state successor to the Superfledermaus; uses separate search and tracking radars whose aerials are concentrically mounted on a single pedestal, as with Sea Hunter Shipborne tactical air defence system. Radar is by Ericsson; computer and control circuits by Contraves.	Contraves/Ericsson
Superfledermaus	**2376.151**	Anti-aircraft fire control system incorporating tracking radar by Albiswerk with visual attachment. Equipment uses valve circuits and has an analogue computer. Latest version has MTI addition by Ericsson.	Contraves/Albiswerk/Ericsson
UNITED KINGDOM			
AA No. 3 Mk 7	–	Mobile AA fire control radar. Lock and follow.	AEI
ACR-6	–	Medium-range 10 cm S-band search radar. Similar to CR 787 but with additional display and processing facilities.	Cossor
ACR-7c	–	Mobile short-range X-band surveillance radar.	,,
AR-1	**1140.153**	S-band medium-range surveillance radar. 650 kW. Single or dual transmitter/receivers with frequency diversity. Range 75 nm.	Plessey
AR-5	**2416.153**	L-band long-range surveillance radar. 2 MW. Single or dual transmitter/receivers. Range 200 nm.	,,
AR-15	**2456.153** and **1141.153**	S-band medium-range surveillance radar similar to and superseding AR-1. Available in static (**2456.153**) or mobile (**1141.153**) versions.	,,
CR 21	–	Medium-range 10 cm S-band surveillance radar. Similar to CR 787 but less microwave pre-amplifier.	Cossor
Coastal Artillery Radar	–	3 cm X-band target acquisition and fire control radar for use with several coastal batteries.	Decca
CR 787	–	Medium-range 10 cm S-band surveillance radar.	Cossor
CR 901	–	23 cm L-band long-range high-cover surveillance radar. 2 MW.	,,
CRI 600	–	Microminiature IFF Mk 10 interrogator.	,,
Cymbeline	**1018.153**	Mortar locating radar.	EMI
DASR-1	–	10 cm S-band back-to-back long-range/high-cover surveillance radar. Two 800 kW transmitter/receivers. Range 110 nm.	Plessey formerly Decca

Designation	Entry No.	Remarks	Manufacturers
DASR-3	–	Improved performance version of DASR-1 2.5 MW transmitter/receivers. Range 150 nm.	Plessey formerly Decca
FCE.AA No. 7	–	Anti-aircraft fire control radar for use with guns or missiles at close range.	EMI
Firelight	**2413.153**	Type 86 (which see) target illuminating radar.	Ferranti
Green Archer (FA No. 8 Mk 1)	**2412.153**	Mortar locating radar.	EMI
GS No. 14 Mk 1	**2490.153**	See ZB 298	Marconi
GS No. 18 Mk 1	**2483.153**	Infantry Combat Radar. Successor to ZB 298.	,,
HF 200	**1142.153**	S-band height finder radar. 2.5 MW. 10.6 × 2.4 m aerial.	Plessey
IFF 800	**2410.153**	Solid-state military IFF/SIF secondary surveillance radar developed from SSR.700.	Cossor
LC 150	–	10 cm S-band low cover coastal surveillance radar. 800 kW. (10.6 m aerial.	Decca
Mk 10 IFF/SIF	**2418.153**	IFF Mk 10 (SIF) interrogation and passive and active decoding equipment.	Plessey
Rapier	**2424.183**	Search and target acquisition radar for Rapier AA missile system.	Decca
Rapier	**2439.153**	Tracking Radar (Blindfire) for Rapier AA missile system.	Marconi
S 105	–	3 cm X-band fixed or mobile harbour and coastal surveillance radar. 70 kW.	,,
S 244	-	10 cm S-band height finder radar. 2.5 MW 12.2 × 2.1 m aerial.	,,
S 247/S 266	**2458.153**	Back to back early warning radar. Two 2.25 MW transmitter/receivers, one 10 cm S-band, one 23 cm L band.	,,
S 259	**2480.153**	Air transportable L-band 2 MW tactical radar with limited ground mobility.	,,
S 264		Range of 50 cm L-band long-range surveillance radars.	,,
S 314		10 cm S band coastal defence radar. 800 kW. 8.8 × 3 m aerial. 40 nm range.	,,
S 330	**2463.153**	Land mobile tactical surveillance radar. Uses two low-profile back to back aerials, S band and L-band plus IFF.	,,
S 404	**2463.153**	Land mobile C-band height finder radar.	,,
S 505		3 cm X-band harbour and coast watch radar. 20 kW.	,,
S 600 Series 600	**1168.153**	Modular system of transmitter/receivers, static and mobile aerial heads, displays and processing equipment capable of deployment to produce a wide range of air defence radar systems. The main elements of the S 600 Series are as follows:	,,
Aerial Heads:			
S 1006	–	10 cm S-band static height-finder aerial. 2.4 × 12.1 m cylindrical parabolic reflector with linear slotted feed.	,,
S 1010	–	10 cm S band transportable surveillance aerial. 5.48 × 1.8 m single curvature parabolic reflector. linear feed, frequency diversity capability.	,,
S 1011		10 cm S-band static surveillance aerial. 13.7 × 4.57 m parabolic reflector. Can be used in back-to-back configuration.	,,
S 1012	–	10 cm S band static surveillance aerial. 13.7 × 4.57 m cosecant-squared reflector. Can be used in back-to-back configuration.	,,
S 1013		23 cm L-band static surveillance aerial. 13.7 × 4.57 m parabolic reflector. Can be used in back-to-back configuration.	,,
S 1014		23 cm L-band static surveillance aerial. 13.7 × 4.57 m cosecant-squared reflector. Can be used back-to-back.	,,
S 1015	–	10 cm S-band transportable surveillance aerial. 5.48 × 1.8 m cosecant squared reflector	,,
S 1016	–	23 cm L-band transportable surveillance aerial. 5.48X 1.8 m cosecant squared reflector.	,,
S 1017	–	5.5 cm C-band transportable height finder aerial. 4.27 × 1.3 m double curvature, point fed reflector.	,,
Transmitter/receivers:			
S 2010		1 MW 10 cm S-band transmitter/receiver. Tunable within band.	,,
S 2011	–	2 MW 23 cm L-band transmitter/receiver. Tunable within band.	,,
S 2012	–	2.5 MW 10 cm S-band transmitter/receiver.	,,
S 2013		1 MW 5.5 cm C-band transmitter/receiver.	,,
S 613	**2479.153**	C band mobile/transportable heightfinding radar. 1 MW	,,
S631/S647	**2458.153**	S- and L-band back-to-back 2-plus MW surveillance radars.	,,
S 650	–	50 cm L band surveillance radar. 16 × 3.7 m reflector. 600 kW. 150 160 nm range	,,
S 654	**2459.153**	23 cm L band surveillance radar 11 × 4.6 m reflector. 2 MW, 90 nm range.	,,

Designation	Entry No.	Remarks	Manufacturers
S669	**2462.153**	S-band 2.25 MW 150 nm height-finding radar.	Marconi
S670	–	50 cm L-band surveillance radar 20.7 × 3.7 m reflector. 500 kW. 180 nm range.	"
S841/S842	**2464.153**	"800-series" mobile coastal defence X-band surveillance radars. Type S842 has tunable transmitter.	"
ST850	**2466.153**	"800-series" X-band tracking radar with TV for use with Tigercat AA missile system (**2465.131**).	"
SLA-3C	–	Precision approach radar.	STC
Scorpion (Type 87)	**2428.153**	Target tracking and illuminating radar for Bloodhound II surface-to-air missile system.	Marconi
Shrimp	**2482.153**	J-band battlefield surveillance radar.	Marconi/RRE
Stingray (Type 83)	–	Target acquisition, tracking and illuminating mobile radar for use with Bloodhound I and Thunderbird surface-to-air missiles. Used by UK, Swedish and Australian Forces.	Marconi
Type 13	–	Height finder.	–
Type 80	–	Long-range surveillance radar. Range 200 nm plus. Probably L-band.	Plessey, formerly Decca
Type 82	–	'Volumetric', stacked beam 3-D surveillance radar. Used for tactical control of Bloodhound I surface-to-air missiles.	Marconi, formerly AEI
Type 83	–	Mobile target tracking and illuminating radar for Bloodhound I.	"
Type 84	**2457.153**	High-power L-band surveillance radar.	"
Type 85	**2457.153**	High power stacked beam 3-D surveillance radar similar to AEI 4502. Used in Linesman/Mediator UK air defence/ATC system.	"
Type 86 (Firelight)	**2413.153**	Mobile CW target illuminating radar for Bloodhound II surface-to-air missiles.	Ferranti
Type 87 (Scorpion)	**2428.153**	Target tracking and illuminating radar for Bloodhound II. CW.	Marconi, formerly AEI
Type 200	**1142.153**	S-band height finder radar. 2.5 MW. 10.6 × 2.4 m aerial.	Decca
Type 430	**2420.153**	Airfield radar.	Plessey
ZB 298	**2490.153**	Man-portable non-coherent X-band pulsed doppler battlefield surveillance infantry radar for location of men and vehicles out to 10 km.	Marconi
4502	–	Stacked beam 3-D long range surveillance radar. 10 cm S-band. 12 lobes. Elliptical parabolic reflector. 13.7 × 6.6 m. 4 MW.	Marconi, formerly AEI
40 Series	**2478.153**	Range of 3-D radars developed from 4502.	"
USA			
ADAR	**2506.153**	Advanced design array radar. Electronically steered beam for tracking multiple targets.	Hughes
AN/-	–	US joint service nomenclature for many of the systems listed below uses the AN/- prefix. For convenience this prefix has been omitted. Thus AN/CPN-6 is listed simply as CPN-6.	–
ASR-7	–	S-band surveillance radar giving 100 km range on 3 sq. metre target. All digital signal processor. Frequency diversity and 1 MW transmitter available.	Texas Instruments
AWCS	**2533.181**	Air weapons control system. Code number 412L, otherwise known as QUICKDRAW. Mobile control and warning system.	General Electric
BMEWS	**2525.181**	Ballistic missile early warning system to give warning of ICBM/IRBM attacks on USA/UK. Sites at Thule, Greenland (equipped with FPS-49 and FPS-50); Clear, Alaksa (equipped with FPS-50 and FPS-92); and Fylingdales Moor, UK (equipped with FPS-49) System code 474L.	General Electric, RCA and Western Electric
CPN-18	–	ATC surveillance radar.	Bendix
CPS-5	–	ATC radar.	"
DEW	**2567.181**	Distant early warning system. Code number 413L.	Western Electric
EMS	–	Emergency mission support system. Air transportable, system designed to set up ATC, communications and varied facilities to support operations in areas where such facilities are not available. Code number 842L. Also known as Project FOUR WHEELS. Radars used TPN-14 TPS-35.	Chu Associates, ITT Gilfillan
FAAR	**1526.153**	Forward area alerting radar. Detects very low-flying high-speed aircraft; checks IFF identification; and relays data by VHF link to anti-aircraft sites equipped with Chaparal Redeye or Vulcan. Mobile system with high-mast aerial.	Sanders Associates
FPN-16	–	GCA-radar.	ITT Gilfillan
FPN-34	–	Long-range L-band ATC radar.	Bendix
FPN-36	–	QUAD radar. Tactical GCA system.	ITT Gilfillan

Designation	Entry No.	Remarks	Manufacturers
FPN-47		S-band medium-range ATC radar (ASR-5).	Texas Instruments
FPN-52	–	GCA PAR system based on FPN-16.	ITT Gilfillan
FPQ-6	2508.153 2846.153	MIPIR (Missile Precision Instrumentation Radar) C-band monopulse missile tracking radar. Transportable version is TPQ-18.	RCA
FPS 3, 3A		L band long range radars	Bendix
FPS-5		Long-range radar.	Hazeltine
FPS-6, 6A, 6B	2492.153	S-band long-range heightfinding radars. Superseded by FPS-89. Mobile version is MPS-14.	General Electric
FPS-7, 7A, 7B, 7C, 7D	2526.153	10 MW 3-D search/GCI radar. Cosecant elevation pattern with 7 stacked beams. Search range 500 km. Elevation cover 45 km. MTI. Frequency diversity. Part of SAGE system.	.. ..
FPS-8	2493.153	L-band long-range search radar with MTI. Superseded by FPS-88. Mobile version is MPS-11.	.. ..
FPS-10	–	See FPS-27.	
FPS-14	2527.153	S-band 400 kW medium-range (110 km) search radar used in SAGE system.	Bendix
FPS-16	–	C-band monopulse missile-tracking combined primary/secondary radar. Transportable version is MPS-25.	RCA
FPS-17	–	Long-range early warning radar for missile detection.	General Electric
FPS-18	2527.153	1.2 MW S-band search radar used in SAGE.	Bendix
FPS-19	–	DEW LINE radar.	Raytheon
FPS-20, 20A, 20B	2528.153	Long-range, dual-channel search and GCI radar with MTI, 2 MW, L-band; range 350 km. FPS-20 is used in SAGE, FPS-20A in AWCS and FPS-20B in both. GPS-4 is mobile version.	Bendix
FPS-24	2494.153	Long-range search radar, used in SAGE.	General Electric
FPS-26	–	Long-range heightfinder for SAGE. Possible application as early warning radar for SLBM after modification.	Avco
FPS-27	–	Replacement for FPS-10. Search radar for SAGE.	Westinghouse
FPS-28	–	Search radar for SAGE.	Raytheon
FPS-30	–	Long-range duplex search radar	Bendix
FPS-35	–	Long-range SAGE or ATC surveillance radar.	Sperry
FPS-36	2723.131	Nike-Hercules radar. Others are FPS-56, FPS-61, FPS-69-71, FPS-75-76.	Raytheon
FPS-37	2499.153 2723.131	High-power acquisition radar for Nike-Hercules.	General Electric
FPS-46	–	Long-range electronically steerable array radar (ESAR). See FPS-85.	Bendix
FPS-49	2509.153	Very long-range tracking radar for missile early warning (BMEWS) and satellite tracking (SPADATS).	RCA
FPS-50	2511.153	BMEWS surveillance radar.	General Electric
FPS-56	2723.131	See FPS-36.	
FPS-59	–	Tracking radar.	.. ..
FPS-60	–	SAGE heightfinding radar.	–
FPS-61	2723.131	See FPS-36.	
FPS-63	–	DEW line gap-filler, being modified to FPS-74.	Budd
FPS-64, 65, 66, 67, 67A	–	Search radars for SAGE. FPS-67A is also used in AWCS.	Bendix
FPS-69, 70, 71	2723.131	See FPS-36.	
FPS-74	–	See FPS-63.	
FPS-75, 76	2723.131	See FPS-36	
FPS-78, 79, 80	–	Tracking radars. FPS-79 and FPS-80 are part of SPACETRACK.	General Electric
FPS-85	2546.153	L-band 3-D phase array radar for satellite detection, identification and tracking. Based on FPS-46 and part of SPADATS/SPACETRACK.	Bendix
FPS-88, 89	2512.153 2513.153	Modernised versions of FPS-6, FPS-8.	General Electric
FPS-92	2509.153	BMEWS scanner/tracker radar. Improved version of FPS-49.	RCA
FPS-95	–	Tracking radar.	..
FPS 100	–	Modernised FPS-20.	Bendix
FPS 105(V)	2847.153	C band Range instrumentation radar.	RCA
FPT-5, 7	–	Long-range surveillance and tracking radar transmitters.	Ling Temco Vought
FSS-7	2538.153	Radar surveillance central for SLBM system.	Avco Cincinatti
GPN-6		S-band ATC surveillance radar 150 km range.	LFE
GPS-4		See FPS 20.	
GPS-57A		Surveillance radar.	Bendix
HIPAR	2499.153	High-power acquisition radar for Nike Hercules. See FPS-37.	General Electric

Designation	Entry No.	Remarks	Manufacturers
MPN-1, 11, 13, 14, 15	-	Mobile GCA radars.	ITT Gilfillan
MPQ-4	**2497.153**	Mortar-locating radar.	General Electric
MPQ-10A	**2500.153**	S-band Mortar locating radar	-
MPQ-12, 18	-	S-band 300 km range missile tracking radars.	Reeves
MPQ-25	-	Trailer-mounted radar for Corporal missile system.	ITT Gilfillan
MPQ-29	-	Drone control radar.	Sperry
MPQ-31	-	S-band 4,000 km range 3-D tracking and guidance radar.	Canoga
MPQ-32	-	Field detection and tracking radar.	Sylvania
MPQ-33	**2640.131**	CW illuminator for Hawk missile system. Also MPQ-39.	Raytheon
MPQ-34	**2640.131**	CW target acquisition radar for Hawk.	"
MPQ-25	**2640.131**	Pulse target acquisition radar for Hawk.	"
MPQ-37	**2640.131**	Range radar for Hawk.	"
MPQ-39	**2640.131**	See MPQ-33.	
MPQ-43	**2723.131**	HIPAR mobile high-power acquisition radar for Nike-Hercules.	General Electric
MPQ-49	**1526.153**	See FAAR.	
MPQ-501	-	Mortar locating radar. Used in Canada.	Raytheon
MPS-3, 4	-	Height-finding radars.	"
MPS-4, 4A, 4C	-	Height-finding radars.	Hazeltine
MPS-7	-	Long-range L-band search radar.	Bendix
MPS-9	-	S-band drone and missile control radar. Range 300 km.	Reeves
MPS-11, 11A	**2493.153** **2495.153**	See FPS-8.	
MPS-14	**2942.153** **2496.153**	See FPS-6.	
MPS-16	-	Nodding height-finder for AWCS C-band; 300 km range.	Crosley
MPS-21	-	3-D search radar. See also TPS-34.	Sperry
MPS-23	-	FRESCAN-elevation frequency scanning 3-D search radar.	Hughes
MPS-24	-	See TPS-28.	
MPS-25	-	See FPS-16.	
MPS-30	-	Mobile surveillance radar; trailer-mounted TPS-25.	Hazeltine, FMC
MPS-36	**2514.153**	Missile tracking radar.	"
MSQ-35	-	300 km range X-band tracking radar.	Reeves
MSR	**2791.153** **2798.131**	Missile site radar for Safeguard ABM system. Phased array type. Prototype at Kwajalein test area.	Raytheon
MSW-1	**2723.131**	Acquisition radar for Nike Ajax and Nike-Hercules systems.	-
MTTS	-	Mobile target tracking system for drone tracking.	Epsco
PAR	**2790.153** **2798.131**	Perimeter Acquisition Radar for Safeguard ABM system. Under development.	-
PPS-3	-	Portable surveillance radar.	Sperry
PPS-4	-	Silent Sentry portable forward area surveillance radar.	"
PPS-5	**2540.153**	Transistorised versions of PPS-4.	AIL
PPS-6	-	Portable battlefield surveillance radar.	General Instrument Corp.
PPS-9	-	Portable battlefield surveillance radar.	RCA
PPS-55	-	Portable forward area surveillance radar.	-
RCA 2019 M2	**2783.153**	X-band hand-held tactical radar. System weight 4 kg; T / R weight 1 kg; range 500 metres on 0.5 sq metre target. Resolution 25 metres. Aural output.	RCA
RCA 4019 M2	**2783.153**	X-band hand-held tactical radar. System weight 6.35 kg including accessories; T / R weight 3.6 kg; range 1,500 metres, resolution 25 metres. Aural and / or visual output.	"
SAGE	**2803.181**	Semi-automatic ground environment system for detecting, identifying and tracking aircraft threats to North America and directing weapon interception. Code number 412L.	Western Electric, System Development Corp., Burroughs
SAM-D	**2800.131**	Phased array radar for SAM-D guided missile system now under development.	Raytheon
Site Defence Radar	**2792.153**	Phased-array radar similar in purpose to the MSR but smaller	General Electric
SLBM	-	Sea-launched ballistic missile detection system. Purpose is to detect and identify missile attack on North America and warn NORAD and SAC. Code number 474N.	Avco
Spacetrack	**2825.181**	USAF worldwide detection, identification, tracking and reporting system. Records data on all space objects. Spacetrack is US section of NORAD SPADATS system. Spacetrack code number 496L.	General Electric, Philco-Ford, RCA, Bendix, System Development Corp.
SPADATS	**2825.181**	NORAD space object detection and recording system of which SPACETRACK is a large part.	-
TPN-12	-	ATC GCA.	LFE, Bendix
TPN-14	-	Transportable GCA for EMS.	ITT Gilfillan, RCA

Designation	Entry No.	Remarks	Manufacturers
TPN-17	–	Air transportable landing control central.	IFF
TPN-19	**2537.153**	All-weather transportable tactical ATC radar with S band terminal area surveillance and X-band, dual-mode (search and track) 6 target. PAR. Cassegrain feed aerial.	Raytheon
TPQ-10	**2498.153**	Transportable radar course direction central for control of close support bombing operations.	General Electric
TPQ-14, 15, 16	**2640.131**	Transportable versions of MPQ 33, 34, 35	Raytheon
TPQ-18	**2846.153**	Transportable version of FPQ 6.	RCA
TPQ-19	**2640.131**	Transportable version of MPQ-39.	Raytheon
TPQ-28	–	Omnidirectional mortar-locating radar.	ITT Gilfillan
TPQ-32	**1526.153**	See FAAR.	
TPQ-36	**2848.153**	Electronically-scanning mortar locating radar	Hughes
TPQ-39	**2849.153**	C-band digital instrumentation radar	RCA
TPS-10D	–	X-band height-finder. 220 km range.	..
TPS-21	**2529.153**	Portable X-band battlefield surveillance and reconnaissance radar. Range 9 km. Also TPS-33.	Admiral
TPS-22	–	Tactical early warning radar for AWCS system. Complemented by TPS-27.	Westinghouse
TPS-25, 25A	–	Battlefield surveillance radars.	Hazeltine
TPS-27	*2515.153*	3-D tactical radar for AWCS. Complemented by TPS-22.	Westinghouse
TPS-32	**2516.153**	Automatic 3-D tactical long-range surveillance radar.	ITT
TPS-33	**2515.153**	See TPS-21.	
TPS-34	**2530.153**	3-D (V-beam) tactical long-range early warning radar.	Sperry
TPS-35	–	L-band 500 km surveillance radar for EMS. Modernised version of UPS-1.	RCA
TPS-37	–	Transportable version of MPS-16.	Avco
TPS-43	**2517.153**	Transportable 3-D tactical tracking radar measuring range, altitude and azimuth plus IFF identification ECM-resistant for forward area operation.	Westinghouse
TPS-44	**2518.153**	Transportable tactical surveillance radar.	Cardion Elec.
TPS-48	**2519.153**	Transportable 3-D tactical radar.	Westinghouse
TPS-61	**2520.153**	Tactical surveillance radar.	..
TPX-19, 20, 22	–	Mark X IFF interrogator-responsors.	Raytheon
TPX-42	–	ATC surveillance radar.	Whitaker
TSW-5	–	Tactical approach radar.	RCA
TTQ-28	–	Mortar-locating radar.	ITT Gilfillan
UPS-1	–	Gap-filler radar for AWCS. See also TPS-35.	RCA, Bendix
UPW-1	–	Drone tracking and control radar	Ford, Sperry
UPX-6	–	Mark X IFF interrogator-responsor.	Raytheon
VPS-2, 5	**2547.153** **2844.153** **2850.131**	Vulcan air defence system radar.	Lockheed
U.S.S.R. Military Radars	**2860.153** to **2895.153**	Little information is available concerning these radars. The reader is referred to the entries in the USSR subsection of the Ground Radar section.	–

1332.254
NAVAL RADAR

(Additional details of those radars for which an Entry Number is given will be found in the Naval Radar Section of Section Three of this volume.)

DENMARK			
–	**1575.253**	X-band navigation radar.	Terma
FRANCE			
ELI 4	**1688.253**	Naval IFF interrogator.	LMT
Triton	**1062.253**	C-band 5 cm air and surface surveillance radar. Used with Castor or Pollux in Vega Series. 200 kW.	Thomson-CSF
Castor	**1063.253**	X-band target tracking radar used in some versions of Vega Series fire control systems. 20 kW.	..
Pollux	**1064.253**	X-band target tracking radar used in some versions of Vega Series fire control systems. 200 kW.	..
Pollux II	**1686.253**	Improved version of Pollux.	..

Designation	Entry No.	Remarks	Manufacturers
Calypso II	1240.453	TH.D 1030. X-band submarine radar for surveillance and navigation. 70 kW.	Thomson-CSF
Jupiter	1236.253	TH.D 1077 Long range-surveillance radar. L-band. 2 MW	..
Ramses	1239.253	TH.D 1022. Short-range navigational and surveillance radar. X-band. 35 kW. 60 nm range.	..
Lynx	1238.153	TH.D 1051. Dual radar coastal mine-watching system	..
Saturne	1237.253	TH.D 1041 S-band medium-range air and surface surveillance radar. 1 MW peak.	..
Sea Tiger	1687.253	Surveillance radar.	..
DRBC 32	1894.253	Series of gun fire control radars. A, B, C, D and E versions fitted in verious classes of French ships	–
DBRI 10	1593.253	S-band 3-D air surveillance radar. Robinson scanner.	Thomson-CSF
DRBV 13	1893.253	S-band pulse-doppler air search radar. Multi-mode operation.	–
DRBV 20	1892.253	Long-range metric air surveillance radar. A and C versions in service	–
DRBV 22	1891.253	Search radar. A, C & D versions in service on French and foreign vessels.	–
DRBV 23	1594.253	L-band long-range air search radar.	Thomson-CSF
DRBR 51	1177.231 1890.253	X-band tracker and target illuminator. Three scanners. Part of Masurca surface-to-air missile system.	..
DRBI 23	1177.231 1889.253	Three-dimensional surveillance and target designator radar. L-band 23-cm. Stacked-beam system.	..
INTERNATIONAL			
Ex 77 Mod 0	1578.253	Director radar group for NATO Seasparrow.	NATO Consortium
ITALY			
Argus 5000	–	High-power ship's early warning radar. 5 MW peak power.	Selenia
Orion 250	–	X-band fire control radar. Used in NA9 system. Conical scan. 200 kW.	..
Orion RTN-10X	1368.253	Fire control radar. Used by RN.	..
Orion RTN-16X	1367.253	X-band monopulse fire control radar.	..
RAN-2C	1700.253	C-band dual purpose air and surface surveillance radar.	..
RAN-3L	1364.253	L-band early warning radar. Digital signal processing.	..
RAN-7S	1527.253	10 cm air and surface search radar	..
RAN-10S	1699.253	S-band dual purpose air/sea search radar.	..
RAN-11L/X	1365.253	L- and X-band system for air warning and weapons control on small ships.	..
RAN-13X	1701.253	X-band search radar.	..
RAN-14X	1366.253	X-band low altitude and surface search radar.	
Sea Hunter	1704.253	Search radar.	Contraves
SEA Hunter	1705.253	Tracker radar.	..
SPQ-2D	1703.253	X-band search radar	SMA
NETHERLANDS			
LW.02	1256.253	Long-range L-band air surveillance. 23-cm. 500 kW peak power.	Signaal
–	1257.253	S-band height-finder. Probably naval version of SGR.109.	..
–	1258.253	C- or X-band surface warning radar.	..
M20	1590.253	Small vessel fire control system.	
M40	1591.253	Fire control system.	..
DA.05	1554.253	S-band medium-range air and surface surveillance radar.	..
LW.04	1553.253	L-band long-range air search radar.	..
ZW.06	1555.253	X-band surface search and navigation radar.	..
3D MTTR	1589.253	Three-dimensional multi-target search and tracking radar.	..
SWEDEN			
SUBFAR	1545.453	X-band submarine radar.	Philips
9GR 600	1546.253	X-band. Frequency-agile 200 kW.	..
9LV 200	1547.253	Ku-band monopulse frequency-agile tracking radar	..
UNITED KINGDOM			
AWS-1	1139.253	Naval version of land-based AR-1.	Plessey
AWS-2	1751.253	Improved version of AWS-1.	..
Cossor IFF	1571.253	Naval IFF Mk 10 (SIF) 800 Series, 825, 825M	Cossor
MRS*/GWS 22	1563.253	Seacat and gun fire control radar.	Sperry
PTR 461	1896.253	Shipborne IFF transponder.	..
S604 HN	1895.253	Search radar.	Marconi
S810	1754.253	Surveillance radar	..

Designation	Entry No.	Remarks	Manufacturers
SNG 20	–	Fire control system.	Marconi
SNW 10	–	Metric wavelength early warning radar.	,,
SNW-12	–	Early warning radar. 150 cm. 450 kW. 4.28 × 2.14 m scanner.	,,
SNW-20	–	Early warning radar.	–
ST801	1508.253	Lightweight fire control radar.	Marconi
TM626	–	Small navigational radar.	Decca
Type 262	–	Short-range anti-aircraft fire control radar.	EMI
Type 277	–	Nodding height-finder radar.	–
Type 293	–	Nodding height-finder radar.	–
Type 901	1752.253	Seaslug missile target tracking and guidance radar.	–
Type 909	1559.253	Target tracker and illuminating radar for Sea Dart missile system (GWS 30). 8 ft Cassegrain aerial.	Marconi
Type 910	1562.253	Tracking radar for Seawolf missile.	,,
Type 912	1558.253	RN designation of Selenia RTN-10X	–
Type 944	–	IFF.	–
Type 965	1560.253	Primary search radar.	–
Type 967	1561.253	Compact air surveillance radar. Combined in Sea Wolf system	Marconi
Type 968	1561.253	Surface surveillance radar.	,,
Type 975	1253.253	Lightweight X-band high definition surface warning radar. 50 kW.	Kelvin Hughes
Type 975ZW	1253.253	Mine-hunting version of Type 975. True motion display plus sonar contract working.	,, ,,
Type 978	1254.253	Probably X-band, 3 cm navigational radar. Double-cheese scanner. Successor to Type 974.	Decca
Type 979	–	Similar to 978 but with additional B-scope display.	–
Type 982	–	Aircraft direction radar.	–
Type 983	–	Nodding height-finder radar.	–
Type 984	1041.253	Three-dimensional air surveillance long-range radar.	Marconi
Type 992	1255.253	Long-range surveillance radar. Obsolescent.	EMI
Type 992Q	1753.253	Solid-state general purpose radar.	Marconi
Type 993	–	S-band search radar.	–
Type 1006	1394.253	Successor to Type 975. Solid-state. 305 mm display. Max range 64 nm.	Kelvin Hughes
USA			
RTN-10	1245.253	X-band fire control radar for Sea Sparrow III.	Raytheon.
SPA-72	–	Three-dimensional fixed planar array surveillance radar.	Hughes
SPG-49	1749.253	Guidance radar for Talos and Terrier surface-to-air missiles. Used with SPW-2.	Sperry
SPG-51	1247.253	Tartar missile guidance radar. X-band. Part of Mk 73 FCS.	Raytheon
SPG-55	1748.253	Terrier missile fire control radar. C-band.	Sperry
SPG-56	1750.253	Talos fire control radar. C-band.	,,
SPG-59	–	Typhon missile radar. Performs all functions. Luneberg lens.	Westinghouse
SPQ-5	–	Long-range tracking and guidance radar for Terrier. C-band.	Sperry
SPQ-9	–	Track-while-scan surface fire control radar used in Mk 86 FCS. Housed in 300 cm radome.	–
SPQ-55	–	Terrier tracking and guidance radar.	Sperry
SPQ-60	–	Pulse doppler air target tracking radar used in Mk 86 FCS.	–
SPS-3	–	Surveillance radar.	Sylvania
SPS-4	–	Air and surface surveillance radar.	Raytheon
SPS-5	–	Surface surveillance radar.	,,
SPS-6	1744.253	Search radar.	RCA
SPS-10	1564.253	C-band surface search radar.	Sylvania
SPS-12	1566.253	L-band medium / long-range surveillance radar.	RCA
SPS-17	–	Long-range surveillance radar.	General Electric
SPS-23	–	Height-finder.	,, ,,
SPS-29	–	Air surveillance radar for guided missile destroyers.	Westinghouse
SPS-30	1745.253	Long range height-finder.	General Electric
SPS-32	1250.253	Three-dimensional fixed planar array electronic scanning air and surface search radar.	Hughes Hughes
SPS-33	1251.253	Three-dimensional fixed planar array electronic scanning target tracking radar.	,,
SPS-34	–	Shipborne version of FPS-7 stacked-beam three-dimensional radar.	General Electric

Designation	Entry No.	Remarks	Manufacturers
SPS-37	1565.253	Air search radar.	Westinghouse
SPS-39	1249.253	'Frescan' hybrid three-dimensional air target search radar.	Hughes
SPS-40	1746.253	Air search radar. 'A' version has IFF.	Lockheed
SPS-42	–	Hybrid electronic scanning three-dimensional radar.	Hughes
SPS-43	1747.253	Air search radar.	Westinghouse
SPS-48	1252.253	S-band long-range frequency scanned search and target acquisition radar. Similar to SPS-52.	Gilfillan
SPS-52	1248.253	Rotating planar (hybrid) three-dimensional surveillance radar. Probably S-band.	Gilfillan
SPS-55	1697.253	X-band surface radar radar.	Raytheon
SPS-58	1359.253	L-band air search radar.	Westinghouse
SPW-2	–	Talos guidance radar. Used with SPG-49.	Sperry
SPY-1	1570.253	Multi-function array radar for Aegis system. Electronic scan.	RCA / Raytheon
USSR			
Band Stand	–	Search radar group on Nanuchka missile corvettes. Housed in large radome. Used with SSN-9 surface-to-surface missile.	–
Big Net	1608.253	Long-range air surveillance.	–
Boat Sail	1507.253	Air search radar for submarine pickets.	–
Cylinder Head	1596.253	Gun fire control group on optical director	–
Cross Bird	–	Obsolescent early warning radar.	–
Dead Duck	–	IFF system.	–
Don	–	X-band navigation radar.	–
Drum Tilt	–	X-band fire control. Enclosed scanner.	–
Egg Cup	–	Splash spotting radar mounted on gun turrets.	–
Eye Bowl	–	Missile guidance radars on Krivak class destroyers.	–
Fan Song E	–	Missile control and tracker group for Guideline SAM on Dzerzhinski.	–
Flat Span	1321.353	Long-range air search radar.	–
Hair Net	1607.253	General-purpose search radar.	–
Half Bow	–	X-band torpedo target designation radar.	–
Hawk Screech	1325.253	Gun fire control radar.	–
Headlight	1328.253	Missile fire control group.	–
Head Net A	1318.253	Long-range air surveillance radar.	–
Head Net B	1319.253	Back-to-back installation of two Head Net A for low and high cover.	–
Head Net C	1320.253	Dual V-beam high three-dimensional installation of Head Net A	–
High Lune	1606.253	Nodding height finder.	–
High Pole	–	IFF antenna.	–
High Seive	–	Surface search radar.	–
Horn Spoon	–	Navigation radar.	–
Knife Rest B	–	Long wavelength early warning radar.	–
Long Bow	–	X-band target designation radar for torpedoes or guns.	–
Low Seive	–	Surface search radar.	–
Muff Cob	1611.253	Gun fire director radar.	–
Neptune	–	Navigation radar.	–
Owl Screech	1325.253	Gun fire control radar.	–
Peel Group	1323.253	Missile fire control group for Goa.	–
Plinth Net	1609.253	Medium-range general purpose search radar.	–
Pop Group	1897.253	Fire control radar group for SAN-4 missile system.	–
Post Lamp	–	X-band target designation radar.	–
Pot Drum	1613.253	Short-range surface search radar.	–
Pot Head	1613.253	Short-range surface search radar.	–
Scoop Pair	1324.253	Twin radar group for SSM.	–
Sea Gull	–	P-band long-range air search radar.	–
Skin Head	1614.253	Surface target detection radar for torpedo boats.	–
Ski Pole	–	IFF antenna. On Osa missile boats.	–
Slim Net	1322.253	High definition surface target radar.	–
Snoop Plate	–	Submarine surveillance radar.	–
Snoop Slab	–	Submarine surveillance radar.	–
Snoop Tray	–	Submarine surveillance radar.	–
Square Head	1595.253	IFF interrogator array.	–
Square Tie	1329.353	General purpose search radar.	–
Strut Curve	1331.253	Lightweight search radar.	–
Sun Visor	1326.253	Optical director-mounted gun fire control radar.	–
Top Bow	–	Target acquisition radar for naval guns.	–

Designation	Entry No.	Remarks	Manufacturers
Top Sail	1327.253	Long-range three-dimensional air surveillance radar.	–
Top Trough	1610.253	High-definition surface target radar.	–
Witch Five	–	IFF system.	–

1194.354

AIRBORNE RADAR

(More detailed information for those radars having an Entry Number will be found in Section Three, Airborne Radar.)

FRANCE

Designation	Entry No.	Remarks	Manufacturers
Agave	1672.353	X-band helicopter radar.	Thomson-CSF/EMD
Aida I	–	Boresight ranging radar. Fitted French Navy Etendard IVM. X-band.	Electronique Marcel Dassault
Aida II	1211.353	Improved version of Aida I.	.. .. ..
Antilope	–	All weather strike radar. Ku-band. 4-lobe Cassegrain aerial. Terrain following, mapping, ground attack.	.. .. ..
Antilope II	–	Simplified version of Antilope for light aircraft.	.. .. ..
Cobra	–	Low-level strike and terrain following Experimental system. Some features used in Cyrano III.	Thomson-CSF
Cyrano I bis (RA 536)	1050.353	Monopulse fire control radar. Used in Mirage IIIC. X-band.	..
Cyrano II (RA 537)	1051.353	Monopulse fire control radar. Cassegrain aerial. Used in Mirage IIIE. X-band.	..
Cyrano III (RA 538)	1052.353	There are nine models in this range, which is also known as the Series 30, providing a number of options up to full multi-role capability including air and ground attack and terrain following.	..
Cyrano IV	1396.353	Attack radar, air-air/air-ground Used in Murol system	..
DRAA-2B	–	ASV and navigation radar for Atlantic ASW aircraft.	..
DRAC-25	–	X-band fire control radar used in French Vatour fighters.	..
Madrague	–	Pulse doppler early warning radar.	Electronique Marcel Dassault
NR-A1-3-A	1674.353	Airborne IFF interrogator.	LMT
ORB-31	1793.353	Helicopter and light aircraft X-band ASV, navigation and met radar	Omera-Segid
Oryx	1351.353	Ku-band terrain following and attack radar.	Electronique Marcel Dassault
Rafal	–	X-band coherent sideways looking radar Under development.	Thomson-CSF
RH 370	1395.353	X-band helicopter ASV radar.	..
Saiga	1352.353	Helicopter terrain avoidance radar. Ka-band.	Electronique Marcel Dassault
Saiga II	–	Simplified, lightweight version of Saiga	.. .. ..

INTERNATIONAL

Designation	Entry No.	Remarks	Manufacturers
APS-503	1784.353	Helicopter ASV, search, and navigation radar X-band.	AIL/Litton Canada

SWEDEN

Designation	Entry No.	Remarks	Manufacturers
DAX-100/200 Series	1741.353	Fire control radars.	L.M. Ericsson
PS-03/A	1208.353	X-band AI radar, conical scan Cassegrain aerial. Used in J35B and J35D Swedish Air Force Drakens.	..
PS-01/A	1209.353	Improved version of PS-03/A. Used in J35F Draken.	..
PS-011/A	1209.353	Version of PS-01/A used with S71 N IR search and track set in J35F.	..
PS-37/A	1210.353	X-band. Monopulse. Modes include search, ground ranging, mapping and obstacle avoidance.	..

L M. Ericsson has also produced three models of AI radars for the J32 Lansen aircraft. Airborne radars for export carry designations running LAX-100, LAX-200 etc. X-band and Ku-band sets are produced.

UNITED KINGDOM

Designation	Entry No.	Remarks	Manufacturers
UK AIR	1785.353	UK Airborne Interception Radar. Development for RAF interceptor version of MRCA.	Marconi-Elliott
Airpass I	1031.353	X-band AI radar. Search, tracking and ranging. Used in RAF Lightning interceptors. Produced in four versions. RAF designation AI23.	Ferranti
Airpass II	1033.353	Development of Airpass I with added air-to-ground modes.	..
Airpass III	1032.353	Surface strike radar for Buccaneer aircraft. Multi-mode X-band Cassegrain aerial.	..
AI-18	–	X-band fire control radar for RN Sea Vixen aircraft	GEC (UK)
ARI 5955/5954	1027.353	X-band system for use in ASW helicopters. Enables helicopter to be used as tactical control centre for ASW operation. Secondary radar capability. Fitted RN Sea King's	Ekco Electronics

Designation	Entry No.	Remarks	Manufacturers
ASV-21D	-	Air-to-Surface vessel search radar used in HS 801 Nimrod maritime aircraft.	EMI Electronics
Cossor IFF	**1572.353**	Airborne IFF transponders.	Cossor
E290M	**1028.353**	Combined weather and tactical radar. RCAF.	
LRR	**1035.353**	Lightweight ranging radar. Air and ground ranging. Terrain warning.	Ferranti
P111	-	Coherent pulse multi-mode strike, AI and terrain following radar. Developed for classified project.	Marconi-Elliott
P 391	**1023.353**	Q-band sideways looking recce radar. Used in UK Phantom recce pod. Licensed to Electronique Marcel Dassault. Originally developed for TSR-2 strike aircraft. This company has also produced an X-band SLR which was also intended for the TSR-2.	EMI Electronics
SATF	**1216.353**	Strike and Terrain Following Radar. X-band Multi-mode.	Ferranti
Seaspray	**1342.353**	X-band helicopter ASV radar.	"
Searchwater	**1740.353**	ASV and maritimt eradar.	EMI
AEW	**1740.353**	UK development for airborne Early Warning radar. Announced March 1969, suspended August 1970.	"
USA			
APD-7	-	Sideways looking radar. Used RA-5C.	Westinghouse
APD-8	-	Sideways looking radar for RF-111A.	"
APG-22	-	CW ranging radar. USN.	Raytheon
APG-31	-	Ranging radar. USAF	"
APG-43	-	CW AI radar.	"
APG-59	-	Fire control radar, USN, USAF.	Westinghouse
APG-63	**1765.353**	Multi-mode fire control radar for F-15.	Hughes
APN-59	-	Search and mapping radar.	Sperry
APN-170	**1037.353**	Terrain following radar.	General Dynamics
APQ-55	-	Surveillance mapping radar. US Army.	
APQ-56	-	Sideways looking radar for RB-47E. USAF.	Westinghouse
APQ-67	-	AI radar. USAF.	Raytheon
APQ-72	-	X-band AI radar. Target illuminator for Sparrow III missile. Fitted F-4B.	Westinghouse
APQ-83	-	Fire control radar for Sidewinder missile.	Magnavox.
APQ-86	-	Sideways looking battlefield surveillance radar.	Texas Insts.
APQ-92	**1489.353**	Search radar used in USN A-6A aircraft.	Norden.
APQ-94	-	Fitted in F-8D aircraft.	Magnavox
APQ-97	**7014.353**	Sideways looking radar. US Army	Westinghouse
APQ-100	-	Fire control radar. Used in F-4C.	"
APQ-102A	-	Recce radar. Used by USAF, USMC RF-4Cs. Modified version fitted to some W. German RF-104Gs	Goodyear
APQ-109	-	Fire control radar for F-4D.	Westinghouse
APQ-110	-	Ku-band terrain following and avoidance radar for F-111A. Mounted below APQ-113.	Texas Insts.
APQ-112	**1490.353**	Tracking radar on A-6A. Used with APQ-92 search radar.	Norden
APQ-113	-	Fire control, ground ranging radar for F-111A.	General Electric (US)
APQ-114	-	Airfield radar.	Plessey
APQ-116	-	Fire control radar. Ground ranging, terrain following AI. Used on A-7A.	Texas Insts.
APQ-119	-	Modified version of APQ-113. Limited procurement for F-111 programme.	General Electric (US)
APQ-120	**1310.353**	AI Terrain following radar for F-4E.	Westinghouse
APQ-122	**1487.353**	Dual frequency X- and Ka-band radars for AWADS C-130 aircraft.	Texas Insts.
APQ-124	-	Doppler AI ranging radar. USN.	Magnavox
APQ-125	-	Doppler ranging order for F-8J.	"
APQ-126	-	Used in USN A-7 aircraft.	Texas Insts.
APQ-127	-	Forward looking radar.	Sperry
APQ-128	-	F-111 terrain following radar.	"
APQ-130	-	F-111D attack radar for Mk II avionics.	Autonetics
APQ-136	-	Nose radar for AC-119 Gunship.	Texas Insts.
APQ-137	**1401.353**	Ka-band MTI radar for detection of ground targets.	Emersion
APQ-139	**1486.353**	Ku-band AMTI terrain avoidance / mapping radar. Used in Tropic Moon 3 programme.	Texas Insts.
APQ-140	**1488.353**	Ku-band multi-mode electronic scan radar.	Raytheon
APQ-148	**1567.353**	Ku-band multi-mode radar for A-6E aircraft.	Norden
APQ-152	-	All-weather topographic mapping radar set.	Goodyear

Designation	Entry No.	Remarks	Manufacturers
APQ-153	1675.353	Fire control radar.	Emerson
APS-20	–	Airborne warly warning radar.	
APS-42	–	Navigation and search radar.	Bendix
APS-45	–	Airborne early warning radar.	–
APS-49	–	High scan-rate ASV	Hazeltine
APS-70	–	Airborne early warning radar.	General Electric (US)
APS-73	–	Series of SLARs developed for USAF and flown on C-97, B-58, and C-135 aircraft for test and evaluation of coherent, focused, synthetic aperture side-looking radars.	Goodyear
APS-81	–	Nose radar for B-52.	–
APS-85	–	Sideways looking MTI radar.	Motorola
APS-88A	–	ASV search radar for S-2E Tracker aircraft.	–
APS-91	–	Airborne early warning radar.	–
APS-94	1484.353	Long-range sideways looking radar. X-band.	Motorola
APS-96	1781.353	Airborne early warning radar for E-2A.	General Electric (US)
APS-111	1782.353	Early Warning radar for detection of aircraft targets against surface background. Used in E-2A.	,,
APS-113	–	Lightweight helicopter radar.	,,
APS-115	–	ASV search radar for P-3C ASW aircraft. X-band.	Texas Insts.
APS-116	1485.353	ASV search radar for S-3A ASW aircraft. X-band.	,,
APS-120	1783.353	Airborne Early Warning radar for E-2C aircraft.	Goodyear
APX-83	1569.353	Airborne IFF interrogator for E-2C aircraft.	AIL
ASG-14	–	Fire control radar for nuclear armed F-104A.	Texas Insts.
ASG-15	–	Rear fire control radar for B-52.	Arma
ASG-17	–	Fire control radar. Nuclear weapons.	–
ASG-18	–	Fire control radar for AIM-47A and AIM-54 missiles. Fitted FY-12A.	Hughes
ASG-19	–	Fire control radar for F-105D. (Thunderstick).	General Electric (US)
ASG-25	–	Fire control radar. Non-nuclear arms.	–
ASQ-112	–	MTI radar. USN.	Norden
AWG-9	1100.353	Missile fire control radar system. F-111B.	Hughes
AWG-10	–	AI-terrain avoidance, mapping radar for F-4J. High PRF pulse doppler.	Westinghouse
AWG-11	–	Version of AWG-10 for RN Phantoms.	,,
AWG-12	–	Version of AWG-10 for RAF Phantoms.	,,
UPD-4	1676.353	Side looking radar. Used on USAF RF-4Cs and Japanese RF-4E.	Goodyear
UPD-6	–	Reconnaissance radar for W. German Air Force.	,,
AWACS	1585.353	Airborne early warning radars.	Hughes/Westinghouse
Cobra	1706.353	Fire control radar.	Hughes
ESAIRA	1491.353	Experimental electronic scanned antenna.	,,
MERA	–	Molecular Electronics for Radar Applications. Experimental phase scanning system.	Texas Insts.
NASARR	1568.353	North American search and ranging radar for F-104.	Autonetic/NATO
F15	–	Monopulse. AI, mapping, terrain avoidance, ground ranging Also known as NASARR-North American Search and Ranging Radar.	Texas Insts.
R14	–	AI, mapping, ground ranging. F-105	Autonetics
R-21G	–	Solid-state version of F.15 Italian F-104.	,,
R-45	–	Ku-band. Micromin. Cassegrain aerial. Multi-mode. Believed experimental only.	,,
R-47	–	Ku-band. Micromin. Cassegrain aerial Terrain following.	,,
R-101	–	Ku-band. AI, ground ranging. Intended for Mk 2 F-111 avionics.	,,
RARF	–	Radome, Antenna, RF. Refractive lens phase scanning. Ku-band radar. Experimental.	Emerson
RARF	–	Radome, Antenna, RF. Reflecting len phase scanning. X-band and Ku-band versions under development.	Raytheon
WX Series	1673.353	Fire control radar series.	Westinghouse
USSR			
Look Two	1475.353	X-band bombing and navigation radar.	–
Pull Ball	1476.353	X-band search radar used in Bison aircraft.	–
Scan Fix	1477.353	AI radars for MiG-17 and 19 interceptors.	–
Short Horn	1478.353	Ku-band bombing and navigation radar.	–
Scan Odd	1479.353	X-band AI radar for MiG-19.	–
Scan Three	1480.353	X-band AI radar for Yak-25.	–

Designation	Entry No.	Remarks	Manufacturers
Skip Spin	1481.353	X-band AI radars used in Su-11 and Yak 28.	–
Spin Scan	1482.353	Series of AI radars used in Su-9 and MiG 21	

1521.454

SONAR EQUIPMENT

(More detailed information on those equipments having an Entry Number will be found in Section Three, Sonar and Underwater Equipment.)

Designation	Entry No.	Description	
AUSTRALIA			
Barra	**1791.453**	Project Barra. RAAF/RAN project to develop advanced sonobuoy and airborne detection system	Amalgamated Wireless
Mulloka	**1790.453**	Sonar project for RAN	–
CANADA			
HS-1000	**1636.453**	Lightweight search/attack sonar. Hull mounted and towed versions	Canadian Westinghouse
SQS-505	**1792.453**	Medium search/attack sonar	Canadian Westinghouse
SQS-507 (Helen)	**2038.243**	Lightweight variable-depth towed sonar	Canadian Westinghouse
FRANCE			
Diodon	**1725.253**	Surface vessel sonar	Thomson-CSF
DUBA-3A	*1157.253*	Surface vessel attack sonar	CIT-ALCATEL
DUBM-20A	**1357.253**	Active mine hunting sonar	Thomson-CSF
DUBM-40	**1358.253**	Active mine hunting sonar, towed	Thomson-CSF
DUBV-23D	**1159.253**	Active surface vessel search/attack sonar	CIT-ALCATEL
DUBV-24A	**1217.253**	Low-frequency panoramic search/attack sonar	CIT-ALCATEL
DUBV-43B	**1334.453**	Variable depth towed sonar. Active or passive. Used with DUBV-23	CIT-ALCATEL
DUBY-24C	**1355.453**	Active submarine sonar. Panoramic, sector or tracking modes	Thomson-CSF
DUUA-1	*1161.453*	Submarine sonar. A, B and C versions	CIT-ALCATEL
DUUA-2A	**1634.453**	Simultaneous search and attack sonar for modernised Daphne class submarines	CIT-ALCATEL
DUUX-2	**1162.453**	Passive submarine detection system	CIT-ALCATEL
DUAV-4	**1631.353**	HS-71 helicopter sonar	CIT-ALCATEL
DUAV-18	**1160.353**	Helicopter sonar. Superseded by HS.70	CIT-ALCATEL
HS.70	*1219.353*	Helicopter sonar	CIT-ALCATEL
Pascal	**1633.253**	Surveillance and tracking sonar for small and medium ships	CIT-ALCATEL
Piranha (DUBM 41)	**1726.453**	Submarine sonar	Thomson-CSF
Premo	*1218.253*	Panoramic search/attack sonar	CIT-ALCATEL
SQS-17A	*1158.253*	Panoramic sonar. Superseded by Premo	CIT-ALCATEL
TSM 2400	**1724.253**	Surface vessel sonar	Thomson-CSF
ITALY			
IP64-MD64	**1720.453**	Submarine sonars	USEA
UNITED KINGDOM			
MS26/27	**7002.253**	Lightweight search/attack sonar	Plessey
MS32	**1221.253**	Active panoramic sonar	Plessey
MS35	**1788.453**	Small frigate digital sonar. In development	Plessey
MS70	**1374.253**	Solid-state version of Type 193 mine hunting sonar	Plessey
Project 35	**1788.453**	Advanced fleet escort sonar. In development	Plessey
SADE	**1788.453**	Sensitive Acoustic Detection Equipment. Intruder detection system	Plessey
T17164	**1787.453**	Mark Ic active sonobuoy	Plessey
Type 162M	**1755.453**	Side-looking sonar	Kelvin Hughes
Type 186	–	Submarine sonar	EMI
Type 187	–	Submarine sonar	EMI
Type 193	**1373.253**	Mine hunting sonar of RN Mk 1 system	–
Type 193M	**1374.253**	Solid-state improved version of Type 193 mine hunting sonar	Plessey
Type 195	**1373.253**	Helicopter sonar based on MS 26/27	Plessey
Type 199	**2447.253**	Variable depth towed sonar	EMI
Type 719	–	Submarine sonar	EMI
USA			
AQS-13	**1637.353**	Helicopter sonar	Bendix
BQG 1/4	–	Submarine passive fire control sonars	Sperry/Raytheon
BQQ-1	–	Search and fire control sonars	Raytheon

Designation	Entry No.	Description	Manufacturers
BQQ-2	–	Sonar for Subroc system	Raytheon
BQQ-5	–	Towed sonar	Hughes/GE
BQR-2	–	Submarine passive sonar	Raytheon
BQR-3	–	Submarine passive sonar	Raytheon
BQR-7	–	Passive sonar. Part of BQQ-2 system	Raytheon
BQR-15	–	–	Western Electric
BQR-19	–	Submarine sonar	Raytheon
BQR-21	–	Submarine passive detection and tracking set	Honeywell
BQS-6	–	Active submarine sonar. Part of BQQ-2 system	Raytheon
BQS-8	–	Under-ice navigation sonar	Hazeltine
BQS-13	–	Submarine search sonar. Passive/active	–
BQS-15	–	–	Amtek
SQA-10	–	Variable depth sonar	Litton
SQA-13	–	Variable depth sonar	–
SQA-14	–	'Searchlight' sonar	Raytheon
SQA-16	–	'Searchlight' sonar	Raytheon
SQA-19	–	Variable depth sonar	Litton
SQG-1	–	Anti-submarine attack sonar	Raytheon
SQQ-14	**1789.453**	Mine hunting and classification sonar	GE
SQQ-23	–	Sonar for A/S patrol ships	–
SQR-14	–	Surface sonar	–
SQS-4	–	Short-range active sonar	Sangamo/GE
SQS-23	–	Long-range active sonar	Sangamo
SQS-26	**2636.253**	Bow-mounted, 'bottom bounce' mode sonar to replace SQS-23	Edo/GE
SQS-29/32	–	Surface vessel active sonars. Numbers relate to differing frequencies 'B' models are associated with a variable depth sonar	Sangamo
SQS-35	–	Variable depth towed sonar	–
SQS-36	**2534.253**	Medium-range hull sonar	–
SQS-38	**2534.253**	Medium-range hull sonar	–
SQS-53	–	–	GE
SQS-56	**1807.453**	Lightweight sonar under development for USN PF (Patrol Frigate) ships	Raytheon
SSQ-41	–	Sonobuoy	Magnavox
SSQ-47	–	Sonobuoy	Spartan
SSQ-53	–	Sonobuoy	Spartan
SSQ-62	–	Sonobuoy	Spartan
UQS-2	–	Mine hunting sonar	GE
610	**2580.253**	Long-range hull sonar	Edo
700 Series	**2581.253**	Medium-range. Hull and variable depth versions	Edo

STATUS	DIAMETER/LENGTH	NOTES	BOOK ENTRY
Service	21-inch × 4.29 m	Passive acoustic homing. Contact and magnetic fuse	1163.441
Service	550 mm × 6.0 m	As E14 but 300 kg charge instead of 200 kg	1164.441
Service	21-inch × 4.32 m	Active acoustic homing. Contact and magnetic fuze. 200 kg charge	1165.441
Service	550 mm × 4.3 m		
Service	21-inch × 3.13 m	Circular search. Active acoustic homing. Contact and acoustic proximity fuse	2096.441
Service	21-inch	Active/passive acoustic homing. Direct attack or programmed search. Torpedo weight 1,000 kg.	2122.441
Service	21-inch	As Mod 1 but torpedo weighs 1,300 kg	
Discontinued	-	Intended as successor to L4 but project discontinued at experimental stage	2144.441 (1973/74)
-	550 mm × 7.2 m	Programmed sinuous attack course. Remote depth control. Magnetic end contact fuse. 300 kg charge	2146.441
Discontinued	400 mm × 2.45 m	Active acoustic homing. Contact or acoustic fuse. Small charge. Project discontinued	2097.441 (1972/73)

Service	21-inch	Wire-guided; acoustic homing. Torpedo sonar linked to shipborne FCS.	2000.441
Service	21-inch	As SST 4. The two torpedoes are believed to be identical	2000.441
-	21-inch	Similar to SST 4 but deep diving	2178.441

Service	21-inch × 6.0 m	Acoustic homing. Cable depth-setting	2001.441
Service	21-inch × 6.2 m	Carries US Mk 44 torpedo (licence-built) Cable depth-setting	2002.441
Development	21-inch × 6.0 m	Wire-guided, automatic acoustic homing successor to G6e	2003.441
Development	324 mm × 2.7 m	Acoustic homing. Shallow water capability. Probable replacement for US Mk 44 in Italian service	2004.441

Service	21-inch	Wire-guided, non-homing	-
Service	400 mm × 2.5 m	Active homing in azimuth and depth. Shallow water capability Impact and proximity fuse. Electric propulsion. All-up weight 250 kg	2323.441
Service	21-inch × 7.0 m	Wire-guided, fast, long-range. 250 kg charge. Peroxide/fuel propulsion	2367.441
Development	400 mm × 2.5 m	Successor to Type 41 with helicopter-launch capability	2323.441

Obsolescent	21-inch	1930s design. Compressed air propulsion, free-running. In RN service certainly to 1973. May still be in service elsewhere	2474.441
Service	21-inch × 4.11 m	Passive sonar homing (depth and azimuth). Electric propulsion. Mechanical course settings. 91 kg charge. 244 m homing depth	-
Production	21-inch × 4.11 m	As standard Mark 20 but with cable-set course angles	2471.441
Discontinued	21-inch	Project abandoned	-
Discontinued	21-inch	Redeveloped as Tigerfish	2472.441
Service	21-inch × 6.46 m	Wire-guided plus active/passive acoustic homing. Impact and proximity fuse. Torpedo computer coupled to submarine FCS. Electric propulsion	2440.441
Discontinued	–	Intended replacement for US-designed Mk 44 Project cancelled in 1972 because delays had invalidated design. US Mk 46 bought as stopgap	2473.441 (1972/73)
Study		New project to replace US Mk 44/46. Successor to Mark 31 development	2448.441
Service		Drill/practice round for training in handling US pattern Mk 44 torpedoes	2491.441

STATUS	DIAMETER / LENGTH	NOTES	BOOK ENTRY
Obsolescent	21-inch × 5.25 m	1930s design. Free-running. Compressed air propulsion. Weight 1,780 kg. Withdrawn from USN service in 1973 but still in service elsewhere	2813.441
Obsolescent	21-inch × 6.25 m	Fuel / peroxide thermal engine. Weight 2,180 kg. Charge 400 kg. Status as for Mark 14	2814.441
Obsolescent	–	1942. First mass-produced electric torpedo: based on German design. No longer in USN service but may survive elsewhere	2815.441
Discontinued	–	1943. First all-electric torpedo. Development quantity only built	–
Discontinued	–	1943. Acoustic homing. Development quantity only built	–
Discontinued	–	Development quantity only built	–
Discontinued	–	" " " "	–
Obsolescent	19-inch × 3.23 m	Passive acoustic homing. Electric propulsion. Used in USN service as training round prior to Mk 37 introduction but some warshot torpedoes sold elsewhere	2831.441
Probably Obsolete	21-inch × 6.25 m	Passive acoustic homing and pattern running. 2,000 built	2816.441
Service	19-inch × 3.52 m	Active / passive acoustic homing. Electric dual-speed propulsion. Warshot weight 648 kg. Mod 3 is improved version	2817.441
Service	19-inch × 4.09 m	Wire-guided. Electric dual-speed propulsion. Warshot weight 766 kg. Mod 2 is improved version	2818.441
Service	19-inch × 4.09 m	Updated version (minor modifications) of Mod 1	2818.441
Service	19-inch × 3.52 m	Updated version (minor modifications) of Mod 0	2817.441
Service	{19-inch × 3.52 m / 19-inch × 4.09 m}	Improved versions of Mark 37 Mods 2 and 3. Better speed, range and acoustic performance including shallow water capability. Sold to Canada and Netherlands	2830.441
Service	254 mm × 2.35 m	Electric propulsion. Weight 120 kg	2819.441
Obsolete	254 mm	Special helicopter-launched version. Probably generally similar to Mod 1 but now regarded as obsolete	2819.441
Service	324 mm × 2.56 m	Two versions differing slightly in length and both weighing about 233 kg. Active acoustic homing. Electric propulsion. Replaced by Mk 46 in USN service but still in service elsewhere	2820.441
Service	19-inch × 5.76 m	16 km range, deep-diving, wire-guided. Nuclear warhead. Weight about 1,310 kg	2821.441
Service	324 mm × 2.67 m	Deep-diving, high-speed, active / passive acoustic homing. Weight about 258 kg. First US torpedo with solid-fuel propulsion	2822.411
Service	324 mm	As Mod 0 but slightly larger and with liquid mono-propellant (OTTO) motor	2822.441
Production	324 mm	Mk 46 torpedo inserted in a mine casing and released when target detected. Entering service with USN in mid-1975	2541.441
Discontinued	21-inch	AS-only version. Superseded during development by Mod 2	2823.441
Service	21-inch × 5.8 m	Deep-diving (914 m) high-speed (93 km / h) active / passive acoustic homing, wire-guided, long-range (46 km) weapon. Weight about 1,600 kg. Said to be the most complex torpedo ever designed	2823.441
Discontinued	21-inch	Competing against Mod 1 which was selected after comparison at pilot production stage	2823.441
R & D	–	–	2793.441
Production	19-inch × 4.83 m	Private-venture development. Wire-guided, pattern-running, electrically propelled. Contact fuse. Warshot weight 1,237 kg. Charge 295 kg. Range 11 km. Adapts to 21-inch tubes	2618.441
Production	19-inch × 4.83 m	AS Mod 0 but with long-range homing system	2618.441

STATUS	DIAMETER / LENGTH	NOTES	BOOK ENTRY
Service	21-inch	Standard fit for submarines. Alternatives available for surface vessel launching	2995.441
Service	–	–	2996.441
Service	406 mm × 5.0 m approx	Trainable deck launchers	2997.441

1498.094

US ELECTRONIC INTELLIGENCE AND MONITORING EQUIPMENT

Designation	Category	Description	Service	Manufacturer(s)
ALA-5	Analyser	Airborne signal analyser	USAR	–
ALA-6	Analyser	Airborne pulse analyser	USAF	–
ALH-2	Recorder	Airborne ECM recorder	USAF	–
ALM-48	Analyser	Airborne spectrum analyser	USAF	General Electric
ALQ-61	Elint (airborne)	Fitted RA-5C, RF-4C, RF-4B. Receiver system	USN	AIL
ALQ-78	Surveillance	Airborne surveillance system for P-3C	USN	Loral
ALQ-86	Surveillance	Airborne surveillance system. Modified version of ALQ-53. Fitted EA-6A	USN	Bunker Ramo
ALR-5	Receiver	Airborne ECM receiver	USAF	–
ALR-7	Receiver	Airborne panoramic intercept receiver	USAF	Raytheon
ALR-18	Receiver	Airborne ECM receiver	USAF	General Electric
ALR-20	Panoramic receiver	Airborne monitoring and recording system used on B-52 bomber and RB-66 recce aircraft	USAF	
ALR-25	Elint (airborne)	Airborne receiver	USAF	Sanders
ALR-27	Panoramic receiver	Airborne panoramic receiver	USAF	Loral
ALR-28	Receiver	Airborne receiver	–	Loral
ALR-29	Receiver	Airborne receiver	USN	Sanders
ALR-35	Monitoring / recording	Airborne Elint HF and VHF communications monitoring and recording system	USAF	Sanders
ALR-40	Monitoring / recording	Airborne multi-band surveillance and recording system. Fitted EA-3B, 3C, Sea Wing system	USN	Sylvania
APA 74	Analyser	Airborne ECM pulse analyser	USAF	Loral
APM-83	Analyser	Airborne spectrum analyser	USN	Raytheon
APR-14	Receiver	Airborne panoramic reconnaissance receiver	USAF	Raytheon
APR-17	Receiver	Airborne intercept receiver	USAF	Loral
ARR-88	Receiver	Airborne ECM reconnaissance receiver	USAF	–
ASM-13	Analyser	Airborne antenna pattern analyser	USAF	Bendix
ASQ.96	Surveillance	Airborne system for location and classification incorporates Honeywell Alert computer. Fitted EB-66E	USAF	TRW
FLR-3	Receiver	Fixed ECM receiver	USAF	General Electric
FLR-12	Receiver	Fixed ECM receiver system. Part of 466L programme	USAF	ITT
GLH-1	Recorder	Fixed ECM reconnaissance recorder	USAF	–
GLH-9	Recorder	Fixed radar recorder reconnaissance system	USAF	Ampex
GLR-1	Receiver	Fixed passive detection system. Part of 466L programme	USAF	–
GLR-9	Receiver	Panoramic receiver 20 MHz to 4 GHz	–	ACL
MSM-63	Analyser	Ground mobile spectrum analyser system	USAF	Sperry
QRC-213	Surveillance	Airborne reconnaissance and analysis system	USAF	
QRC-259	Panoramic receiver	YIG-tuned airborne Elint receiver system. Fast sweep speed. Fitted KC-135	USAF	Watkins-Johnson
QRC-334	Elint (airborne)	System, with QRC-374 and QRC-385, for detection and location of radiators by time of arrival techniques	USAF	IBM
QRC-374	Elint (airborne)	See QRC-334. Used in Vietnam	USAF	AIL
QRC-385	Elint (airborne)	See QRC-334. Used in Vietnam	USAF	IBM
SLA-2	Surveillance	Ship's intercept and analysis system	USN	–
SLR-2	Receiver	Ship's ECM receiver	USN	–
SLR-12	Receiver	ECM receiver used on destroyers	USN	–
SLR-14	Receiver	ECM receiver used on destroyers	USN	–
WLR-1	Receiver system	Counter measure receivers extensively used on surface ships	USN	–
WLR-6(V)	Recce system	Submarine reconnaissance collection system. Also on some destroyers	USN	Sylvania

1499.094

US ELECTRONIC WARFARE DIRECTION FINDING EQUIPMENT

Designation	Description	Ser	Manufacturer(s)
ALD-2	Airborne direction finder	USN	Avco
ALQ-111	Electronic emitter locator system (EELS) for A-6A	USN	
ALR-17	Intercept receivers used with photo recce systems for identification of radars on photo-maps. Fitted RF-4C	USAF	Electronic Specialty
ALR-31	Radar homing and warning receiver	USAF	Loral
ALR-34	DF system	USAF	Sanders

Designation	Description	Service	Manufacturer(s)
ALR-37	Radiating site target acquisition system	USAF	Sylvania
ALR-39	Improved version of ALR-31 for F-111	USAF	Loral
ALR-41	Improved version of ALR-39. Used in F-111	USAF	Loral
APR-9	Airborne direction finder	USAF	Loral
APR-14	Panoramic reconnaissance receiver	USAF	Raytheon
APR-17	Early warning intercept receiver	USAF	Loral
APR-25	Radar warning crystal video receiver. Gives coarse bearing of threat. Fitted F-100, F-105, RF-4C and others	USAF/Army	Itek
APR-26	Missile launch warning receiver, used with APR-25	USAF/Army	Itek
APR-27	Surface-to-air missile launch warning receiver. Fitted F-4B. USN equivalent of APR-26	USN	Magnavox
APR-30	Radar homing and warning set for A-6A and A-4	USN	Melpar
APR-32	Radar homing and warning system	USN	Magnavox
APR-35	Search and homing receiver. Fitted F-105. For detection and location of HF and low VHF comms.	USAF	Itek
APR-36	Radar warning receiver. Fitted F-4D, F-4E, A-7D. Improved APR-25	USAF	Itek
APR-37	Surface-to-air missile launch warning receiver. Improved APR-26	USAF	Itek
APS-57	X-band search radar intercept set	–	Loral
APS-105	Radar homing and warning set for B-52	USAF	Dalmo-Victor
APS-107	Radar homing and warning system for F-105, F-4D	USAF	Bendix
APS-109	Radar homing and warning system for F-111	USAF	Dalmo-Victor
APS-118	Target identification and acquisition system for use with Standard Anti-Radiation Missile. Monopulse DF	USN	IBM
ASQ-93	Part of THAWS (Tactical Homing and Warning System) for F-14	USN	RCA
FRD-10	Fixed detection finding system. HF band	USN	GTE
SLA-15	Shipborne detection and DF system	USN	Cubic

1500.094

US NOISE JAMMERS

Designation	Description	Service	Manufacturer(s)
ALQ-31	Used on A-1, A-4, EA-6A	USN	McDonnell-Douglas
ALQ-55	VHF data link jammers	USN	Sanders
ALQ-59	VHF data link jammer. Fitted B-52, F-105	USAF	Hallicrafters
ALQ-67	Pod-mounted ECM system	Army	Sylvania
ALQ-70	Used on RC-135A	USAF	Raytheon
ALQ-71	Barrage jammer pod containing dual C, S, and L-band transmitters	USAF	Hughes
ALQ-72	X-band jammer pod for use against A1 radars	USAF	Hughes
ALQ-75	Jammer for B-52	USAF	–
ALQ-76	Jamming pod used with ALQ-86 reconnaissance system on EA-6A	USN	Raytheon
ALQ-77	Jammer for B-52	USAF	–
ALQ-80	Used on CV-2, OV-1	Army	Hallicrafters
ALQ-87	Barrage jammer pod with carcinotron source. Used on F-4, F-100, F-101, F-105	USAF	General Electric
ALQ-89	Communications jammer. Used on RA-5C	USN	Sanders
ALQ-91	Part of Thaws (Tactical Homing and Warning System) for F-14. Communications jammer	USN	Sanders/Magnavox
ALQ-92	Communications jammer. Used on EA-6B	USN	Sanders
ALQ-93	Ku-band jammer	USAF	Raytheon
ALQ-98	Integrated ECM system for use against anti-ship missiles. Fitted in helicopters	USN	General Instrument
ALQ-102	Pod mounted version of ALQ-98	USN	General Instrument
ALT-6	Airborne jammer	USAF	General Electric
ALT-7	Airborne jammer	USAF	–
ALT-13/28	Carcinotron source. Fitted B-52	USAF	Hallicrafters
ALT-15/32	Jammer for B-52	USAF	Hallicrafters
ALT-16/31	Barrage jammer. Travelling wave tube source. Fitted B-52	USAF	Hallicrafters
ALT-22	Jammer for B-52	USAF	General Electric
APT-16	Airborne jammer	USAF	Raytheon
SLQ-12	Automatically tuned shipboard jamming system	USN	Scope
SLQ-13	ECM buoy	USN	General Instrument
SLQ-17	Shipboard jamming system for protection against air and missile threats	USN	Hughes
SLQ-19	Shipboard shelter-housed jamming system for destroyers	USN	RCA
SLQ-21	Automatic shipboard jamming system	USN	American Electronic Labs
SLT-5	Shipboard jammer	USN	Raytheon
SLQ-8	Shipboard jammer transmitter. Version of ALT-27	USN	Litton

1501.094

US DECEPTION JAMMERS

Designation	Description	Service	Manufacturer(s)
ALQ-41	X-band track breaker. Fitted A-6A	USN	Sanders
ALQ-49	Track breaker used on A-3, A-4, RA-5C, RF-101. A-6A	USN	Sanders
ALQ-51	S-band deception jammers. Also provides some radar warning. Track breaker. Used on A-3, A-4, RA-5C, RF-101	USN / USAF	Sanders
ALQ-53	Track breaker. Used on EA-6A	USN	Loral
ALQ-58	Radar deception jammer	USAF	Litton
ALQ-63	Radar deception jammer	USAF	Litton
ALQ-81	Track breaker, pod-mounted with ALQ-83	USN	Sanders
ALQ-83	Track breaker, pod-mounted with ALQ-81	USN	Sanders
ALQ-94	Multi-band system X, C, and S-bands. Used F-111	USAF	Sanders
ALQ-99	Integrated ECM set. Fitted EA-6B. Incorporates IBM 4-pi computer. Raytheon transmitters	USN	AIL (prime)
ALQ-100	Multiband track breaker. Fitted A-6, A-7, A-4, and F-14. C and S-bands	USN	Sanders
ALQ-101	Combined noise and repeater jammer. Travelling wave tube source. Fitted F-4, RF-4C	USAF	Westinghouse
SLQ-13	ECM buoy	USN	General Instrument
ULQ-5	Guidance interference jammer. Shipboard. Deception repeater	USN	RCA / General Instrument
ULQ-6	Guidance interference jammer. Shipboard. Deception repeater	USN	RCA / General Instrument

1502.094

US CHAFF DISPENSER EQUIPMENT

Designation	Description	Service	Manufacturer(s)
ADR-8A	Chaff rocket carried by B-52. Fired from ALE-25 pod	USAF	Revere Copper & Brass
ALE-1	Electro-mechanical metal foil cutter / dispenser. Fitted B-47, B-52, B-66	USAF	Various
ALE-2	Electro-mechanical metal foil cutter / dispenser. Used on RB-57, T-33, F-100 and NATO aircraft	USAF / NATO	Various
ALE-16	Pneumatic dispenser	–	General Dynamics
ALE-18	Pneumatic dispenser	USN	Prime Co / Piqua Eng
ALE-24	Electro-mechanical dispenser for B-52G and H	USAF	Lundy
ALE-25	Rocket pod for ADR-8A chaff rocket launch from B-52	USAF	Boeing
ALE-27	Re-packaged version of ALE-24	USAF	Lundy
ALE-28	Pneumatic dispenser for F-111	USAF	General Dynamics
ALE-29	Pyrotechnic dispenser. 60 tube capacity	USN / USMC	Tracor / Electrospace
ALE-30	Dispenser for A-6A	–	Lundy
ALE-32	Electro-mechanical dispenser fitted EA-6A. Pod-mounted	USN	Lundy
ALE-33	Electro-mechanical dispenser for BQM-34 drone	–	Lundy
ALE-35	Pyrotechnic dispenser for F-4. Larger capacity than ALE-29	USN / USMC	–
ALE-36	Dispenser pod	USAF	–

NATO DESIGNATIONS OF SOVIET SYSTEMS AND EQUIPMENT

Alkali	Air-to-air missile
Anab	Air-to-air missile
Ash	Air-to-air missile
Atoll	Air-to-air missile
Awl	Air-to-air missile
Backfire	Tupolev VG bomber
Back Net	Early warning and GCI radar
Badger	Tu-16 bomber / reconnaissance aircraft
Band Stand	Naval radar for SSN-9 missile
Barlock	P-50 Twin scanner land-mobile early warning and GCI radar
Bear	Tu-20 bomber aircraft
Big Bar A	Early warning and GCI radar
Big Mesh	Early warning and GCI radar
Big Net	Naval surveillance radar
Bison	Mya-4 bomber-reconnaissance aircraft
Blinder	Tu-22 bomber aircraft
Boat Sail	Submarine radar
Brewer	Yak-28 attack aircraft
Candid	Il-76 transport aircraft
Careless	Tu-154 transport aircraft
Cat	An-10 transport aircraft
Charger	Tu-144 supersonic transport
Classic	Il-62 transport aircraft
Cleat	Tu-114 transport aircraft
Clod	An-14 general purpose aircraft
Cock	An-22 transport aircraft
Codling	Yak-40 transport aircraft
Coke	An-24 / 26 transport aircraft
Colt	An-2 general purpose aircraft
Cookpot	Tu-124 transport aircraft
Coot	Il-18 transport aircraft
Cross Bird	Naval early warning radar
Cross Slot	Ground radar
Crusty	Tu-134 transport aircraft
Cub	An-12 transport aircraft
Cuff	Be-30 transport aircraft
Curl	An-26 transport aircraft
Cylinder Head	Ship's gun fire director radar
Dead Duck	Naval IFF
Doghouse	Phased-array missile and space tracking radar
Don	Naval navigation radar
Drum Tilt	AA fire control radar
Dumbo	VHF early warning and search radar
Egg Cup	Ship's splash spotting radar
Eye Bowl	Naval missile guidance radar
Faithless	Mikoyan STOL fighter aircraft
Fan Song A	S-band tracking radar
Fan Song B	Target tracking radar
Fan Song E	C-band target tracking radar
Fan Song Series	Range of electro-mechanically scanned target tracking radars
Fiddler	Tu-28 strike aircraft
Firebar	Yak-28P all-weather fighter aircraft
Fire Can	Land-mobile S-band AA fire control radar
Fire Wheel	AA fire control radar
Fishbed	MiG-21 interceptor aircraft
Fishpot	Su-9 interceptor aircraft
Fitter	Su-7 interceptor aircraft
Flagon-A	Su-11 all-weather fighter aircraft
Flagon-B	Sukhoi STOL fighter
Flap Wheel	AA fire control radar
Flashlight	Yak-25 all-weather interceptor
Flat Face	P-15. Land mobile target acquisition radar
Flat Spin	Naval air search radar
Long Track	Search and acquisition radar
Look Two	Bombing and navigation radar
Flogger	Mikoyan variable-geometry fighter (MiG-23)
Foil Two	Ground based IFF
Foxbat	MiG-25 interceptor aircraft
Freehand	Experimental VTOL aircraft
Frog-1	Surface-to-surface missile
Frog-2, 3, 4, and 5	Surface-to-surface missiles
Frog-7	Surface-to-surface missile
Gage	Ground target acquisition radar
Gainful	Surface-to-air missile
Galosh	Surface-to-air missile
Ganef	Surface-to-air missile
Goa	Surface-to-air missile
Goblet	San-3 naval missile
Grail	Man-portable AA missile
Griffon	Surface-to-air missile
Guideline	Surface-to-air missile
Guild	Surface-to-air missile
Gun Dish	AA fire control radar
Hair Net	Naval search radar
Half Bow	Naval target designation radar
Harke	Mi-10 helicopter
Hawk Screech	Naval fire control radar
Headlight	Naval fire control radar
Head Net	Naval surveillance radar
Hen Egg	Ballistic missile early-warning radar
Hen House	Ballistic missile early-warning radar
Hen Nest	Ballistic missile early-warning radar
High Lune	Ship's nodding height-finder
High Pole	Ship's IFF
High Sieve	Naval search radar
Hip	Mi-8 helicopter
Homer	Mi-12 helicopter
Hoodlum	Ka-26 helicopter
Hook	Mi-6 helicopter
Hormone	Ka-25 helicopter
Horn Spoon	Ship's navigation radar
Hound	Mi-4 helicopter
Kangaroo	Air-to-surface missile
Kelt	Air-to-surface missile
Kennel	Air-to-surface missile
Kipper	Air-to-surface missile
Kitchen	Air-to-surface missile
Knife Rest A, B, C	P-10 Series. VHF truck-mounted early warning radars
Long Bow	Naval target designation radar
Plinth Net	Target acquisition radar
Pop Group	Naval radar for SAN-4 missile
Post Lamp	Naval target designation radar
Pot Drum	Naval fire control radar
Pot Head	Submarine surface search radar
Puff Ball	Airborne X-band search radar
Rock Cake	Height finder radar
Rod Mat	Ground-based IFF
Sagger	Anti-tank missile
Salish	Coastal Defence Missile
Samlet	Surface-to-surface version of Kennel missile
Sandal / Shyster	Surface-to-surface missile
Sasin	ICBM
Savage	ICBM
Sawfly	Submarine-launched ballistic missile
Scaleboard	Surface-to-surface missile
Scamp	IRBM
Scan Fix	AI radar
Scan Odd	AI radar
Scan Three	X-band AI radar
Scapegoat	IRBM
Scarp	ICBM
Scoop Pair	Naval target acquisition radars
Score Board	Ground-based IFF
Scrag	ICBM
Scrooge	IRBM
Scrubber	Naval anti-shipping missile
Scud A and B	Surface-to-surface missiles
Sea Gull	Long-range naval search radar
Sea Net	Naval search radar
Serb	Submarine-launched ballistic missile
Shaddock	Naval surface-to-surface missile
Sheet Bend	Naval search radar
Sheet Curve	Naval search radar
Short Horn	Ku-Band bombing and navigation radar
Side Net	Height finder radar
Skean	IRBM
Skin Head	Target acquisition radar for torpedo boats
Ski Pole	Ship's IFF
Skip Spin	X-band AI radar
Slim Net	Naval search radar
Snapper	Anti-tank missile
Snoop Plate	Submarine surveillance radar
Snoop Slab	Submarine surface search radar
Snoop Tray	Submarine surveillance radar
Spin Scan	AI radar
Sponge Cake	Height finder radar
Spoon Rest A	P-12 VHF early warning radar
Square Head	Naval IFF
Square Tie	Target acquisition radar
Squint Eye	Surveillance radar
Stone Cake	Height finder radar
Stop Light	Broad-band passive radar
Strut Curve	Naval search radar
Styx	Naval anti-shipping missile
Swatter	Anti-tank missile
Token	Early warning GCI radar
Top Bow	Naval radar
Top Sail	Naval long-range search radar
Top Trough	Naval surface target radar
Track Dish	Ground tracking radar
Wasp Head	Ship's fire control radar
Watch Dog	Submarine passive radar
Whiff	AA fire control radar
Witch Five	Naval IFF
Witch Series	IFF ground radars
Yo Yo	Target tracking radar

COMPARATIVE MILITARY STRENGTHS

Introduction

The following pages have been compiled to show diagrammatically the relative strengths of most of the armed forces of the world. Because of the enormous disparity between the armies, navies and air forces of the "superpowers" and those of smaller countries, certain special techniques have been used to present the information available in a consistent manner: these are described below and the reader is advised to familiarise himself with them before attempting to interpret the diagrams.

Sizes of Armed Forces

The armed forces of each country have been divided into four groups, denoted by four rectangles, which are (from top to bottom) Army, Navy, Air Force and a miscellaneous group comprising reserves, militia, gendarmerie and other para-military forces. The imprecise nature of this fourth group is regretted, but there is such a wide variety of forces appropriate to this classification that sub-classification within the compass of this survey is virtually impossible. Where separate figures for marines are known they have been added to the naval strength.

The four rectangles denote the numbers of personnel in each classification. To encompass the wide range of variation of these numbers, however, the areas of the rectangles have been made proportional, not to the numbers of personnel, but to the square roots of those numbers. The vertical dimensions of the rectangles are constant for each classification, so that if, say, the "army" rectangle for one country is three times as wide as that for another country this indicates that the army of the first country has a numerical strength nine times as great as that of the other country. Although the relationship has been chosen largely for convenience of presentation, however, it has also some practical validity; because after taking command structure and lines of communication into account the front line combatant strength of a military unit is probably more nearly proportional to the square root of its numerical strength than to the numerical strength itself.

The vertical dimensions of the rectangles have been chosen in such a way that if a country's armed forces are all of average size, or all some multiple of that average size, the four rectangles will all be of the same width. It is thus possible to see at a glance whether any country has a disproportionately large army or a disproportionately small navy and so forth.

Additional information

Superimposed upon some of the rectangles are various horizontal bars. These denote selected characteristics of the armed forces such as numbers of tanks, size of the submarine fleet, numbers of combat aircraft and so forth. The purpose of these bars is to indicate, in a general way, the degree of sophistication of the various forces; and in determining their lengths, processes of calculation have been used that are broadly similar to those used in determining the widths of the basic rectangles. For tanks and aircraft, for example, the lengths are simply proportional to the square roots of the numbers involved: the surface fighting vessels and submarines the lengths have been chosen proportional to the tonnages: for naval missiles both the number of launchers and the numbers of missile-armed vessels have been taken into account.

It must be stressed that comparisons between lengths of bars can be made only between one country and another and not between one parameter and another: it is not possible to determine, for example, the relative numbers of tanks and aircraft of one country by comparing the appropriate bar lengths.

Nuclear Weapons

No attempt has been made to indicate nuclear weapon power in these diagrams. The main reasons, for this are lack of precise information on the one hand and the ready availability of published estimates on the other. The estimates of gun and missile fire power therefore, relate only to "conventional" warheads.

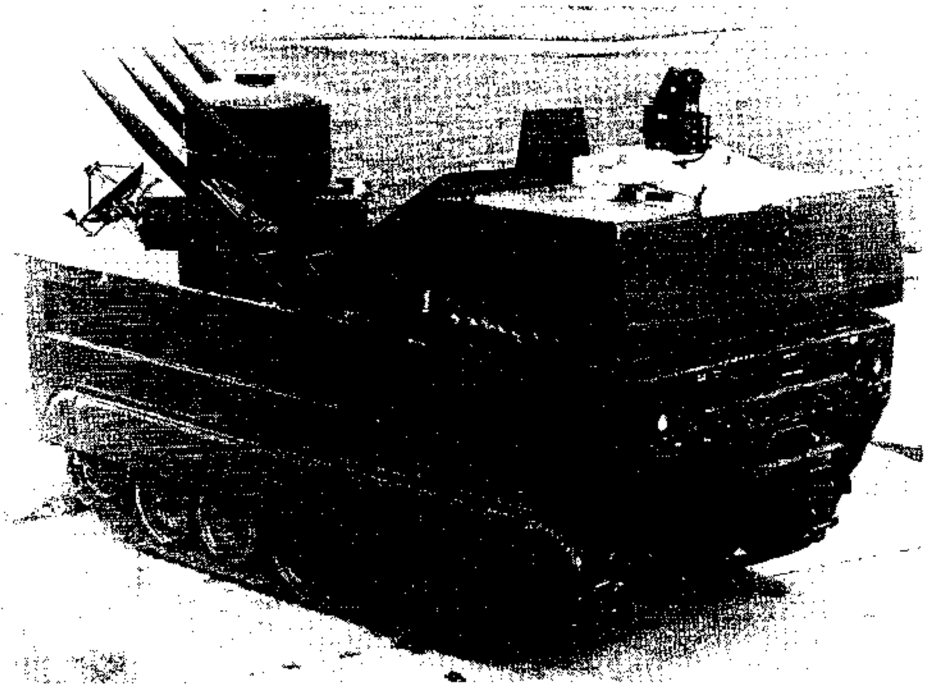
MISSILES

The following notes are a brief record of the most significant developments in the missile sector of defence equipment since the main body of this volume was consigned to the press. The information contained in these notes in most cases is supplementary to more extensive descriptions which appear in one or more entries in the appropriate sections of the book.

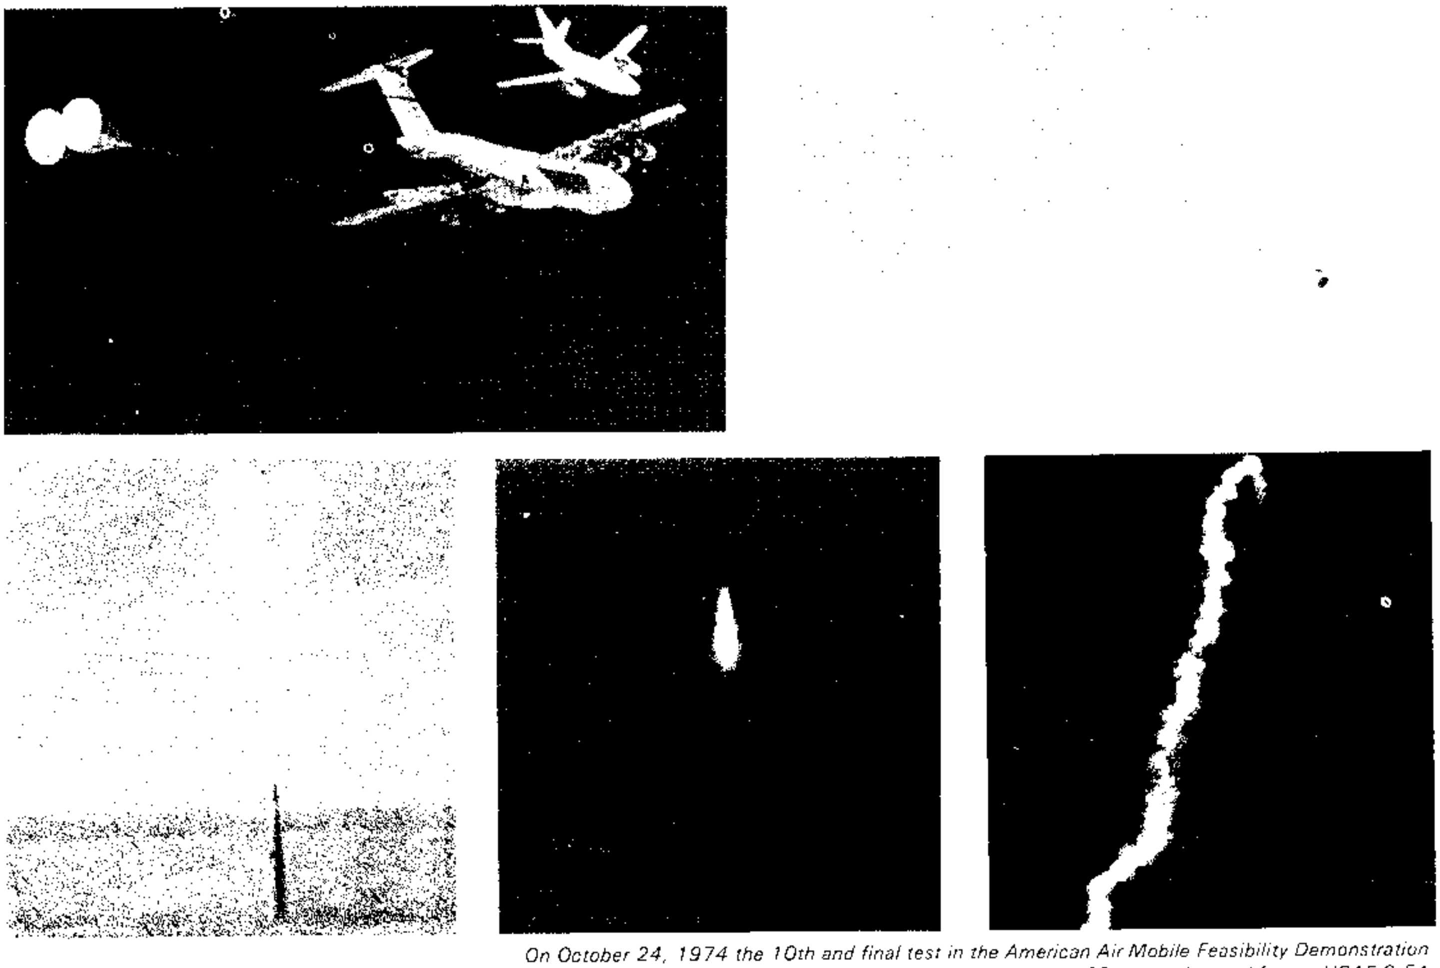
Rapier: In addition to British Forces, this low-level anti-aircraft missile system is on order for at least four foreign countries: Iran, Oman, Abu Dhabi, and an African state which has not been named but is thought to be Zambia. In September 1974 it was revealed that an agreement covering the joint development of the Rapier system, mounted on one of the M.113 family of tracked vehicles, had been concluded by BAC and the Iranian Department of Defence.

Magic: The R.550 Magic, air-to-air dogfight missile has been ordered by six countries in addition to the French Navy and Air Force, according to Matra.

Gabriel: Although Israeli sources have not named any of the foreign purchasers of the Gabriel anti-ship missile, it was reported in late 1974 that South Africa is among the customers for the weapon.



Rapier mounted on an M548 cargo carrier, a member of the US Army M113 family of tracked vehicles



On October 24, 1974 the 10th and final test in the American Air Mobile Feasibility Demonstration programme was successfully completed, when a Minuteman I ICBM was dropped from a USAF C-5A transport aircraft at the Western Test Range off California. The above sequence of five photographs shows (1) the Minuteman being extracted from the aircraft by drogue parachutes, (2) separation of the missile from its cradle, (3) the Minuteman I in stabilised descent beneath its own parachutes, (4) accelerating vertically, and (5) falling into the Pacific Ocean. A first stage motor burn of about 30 seconds only was programmed, of which 10 seconds was at full thrust. This took the Minuteman from an altitude of 8,000 feet at ignition to over 20,000 ft at cut-off.

The air-mobile ICBM is one of several concepts under study in the USA under the overall MX programme. More information appears in Entries Nos. **1767.311, 2707.111, 2718.111**, *in Section One of this volume. The Oct. 24 test had been preceded by two releases of inert Minuteman I missiles from a C 5A, and by seven drops of concrete slabs of varying masses, to establish the feasibility of deploying such large loads safely from the C 5A. The first eight drops (seven concrete, one Minuteman) were carried out at the National Parachute Test Range at El Centro, California, and the remaining two at the Western Test Range*

RS-80: In December 1974 the British Minister of Defence, Mr. Roy Mason, stated that the UK would withdraw from this programme. This was one of a number of measures proposed as part of a plan to reduce UK defence expenditure over the next decade.

Roland: In January 1975, Hughes Aircraft Company, as the US licensee for the German/French Roland system, was awarded a contract valued at

£47.1 million to develop this anti-aircraft missile system for US Army use. Hughes and Boeing will be jointly concerned with US production of Roland.

Dual-Mode Condor: Deletion of funding by the US Congress resulted in termination of Rockwell International's contract for a dual-mode (TV/radar) seeker for the Condor air-to-surface missile. The dual-mode seeker adds an active radar capability to the Condor's existing television guidance to permit night and all-weather operations. The development was being undertaken for US Naval Air Systems Command.

Maverick: The USAF revealed in late 1974 that testing of a new version of the Maverick air-to-surface missile had started. Designated AGM-65B, the Scene Magnification Maverick has improved optics to permit target acquisition at greater ranges. These are supplied by the Perkin-Elmer Corporation and Pacific Optical Company. A series of eight flights are planned, extending into 1975. If successful, at least 2,000 Mavericks of the 17,000 on order at October 1974 would be delivered in the Scene Magnification version.

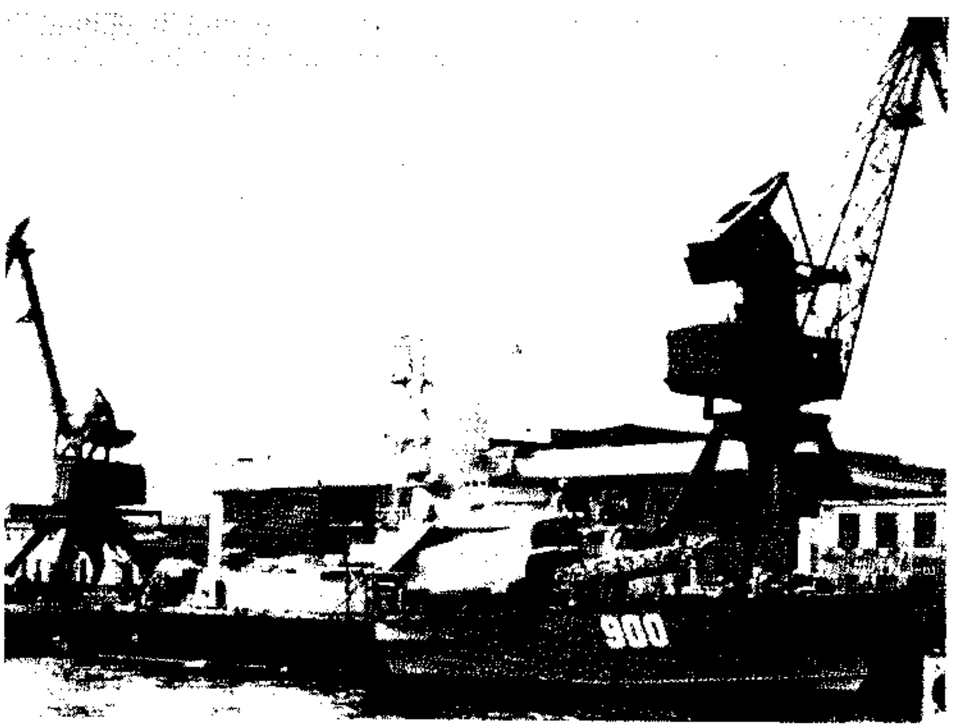
Brazo: The US Navy announced the second of a series of test firings of the Brazo air-to-air anti-radiation missile in October 1974. Launched from a USAF F-4D Phantom, the Brazo destroyed a BQM-34A target drone, in the first long-range test of the missile. The attack was made from head-on and was a "look-down" intercept.

DME-Lance: A version of Lance to enable Distance Measuring Equipment (DME) guidance techniques to be used to enhance accuracy is under study by the US Army and LTV Aerospace. Four canard vanes controlled by modified HOBO guided bomb actuators would be employed to steer the warhead. A master station, relay station, and target position are all located within a common co-ordinate system. The DME stations make continuous precision measurements of the Lance missile position throughout flight. The master station computes cross-range and down-range deviations from constant radius path through target position. Guidance commands are sent from the master station to the missile to adjust its trajectory to intercept the target.

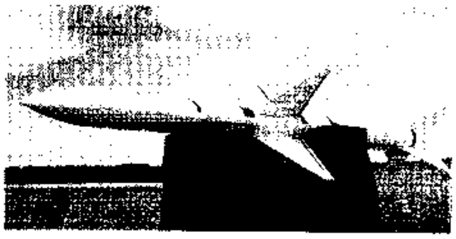
Laser-Pershing: The first test firings by the US Army of Pershing surface-to-surface missiles, with a new laser unit for guidance system alignment, took place in October 1974 at the White Sands Missile Range. The laser is part of a new Automatic Reference System which provides automatic alignment of the missile on the firing azimuth without reference to pre-surveyed points. The ARS combines the laser in an automatic optical link, and a precision north-seeking gyro for initial orientation of the Pershing's inertial guidance platform and "aims" the missile immediately prior to erection and lift-off. Also evaluated was a Sequential Launch Adapter developed by Martin which enables a Pershing commander to count down and launch up to three missiles with a single programmer test station without disconnecting and reconnecting cables between each launch, as was previously necessary.

LVRJ: The USN Low Volume RamJet propulsion system test vehicle made its first free flight on December 2, 1974. It was launched from a USN A-7 attack aircraft over the Pacific Missile Range. The first separation test had taken place in June 1974 at the China Lake, California test facility.

The LVRJ is being developed as a potential propulsion system for new generation high performance missiles, this work being carried out by LTV Aerospace Corporation of Dallas under contract to the Naval Air Systems Command. It combines an integral rocket/ramjet engine in a single motor case. Boosted to high speed by the solid propellant rocket, it then uses the empty motor case as a combustion chamber to burn ramjet fuel for long-

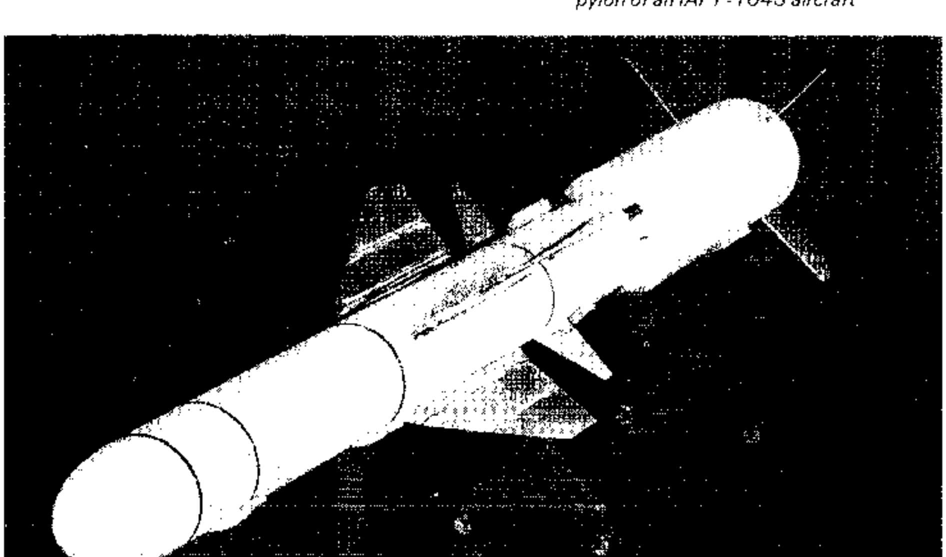


Soviet "Nanutchka"-class missile boat receiving attention in a Russian naval base. Details which can be discerned include the SAN-4 missile launcher on the foredeck and the associated Pop Group radar assembly. Loading cradles for the vessel's surface-to-surface missiles are also in evidence



First picture to show the configuration of the XJ521, or UK Sparrow, which is at the advanced development and initial production stage by Hawker Siddeley Dynamics

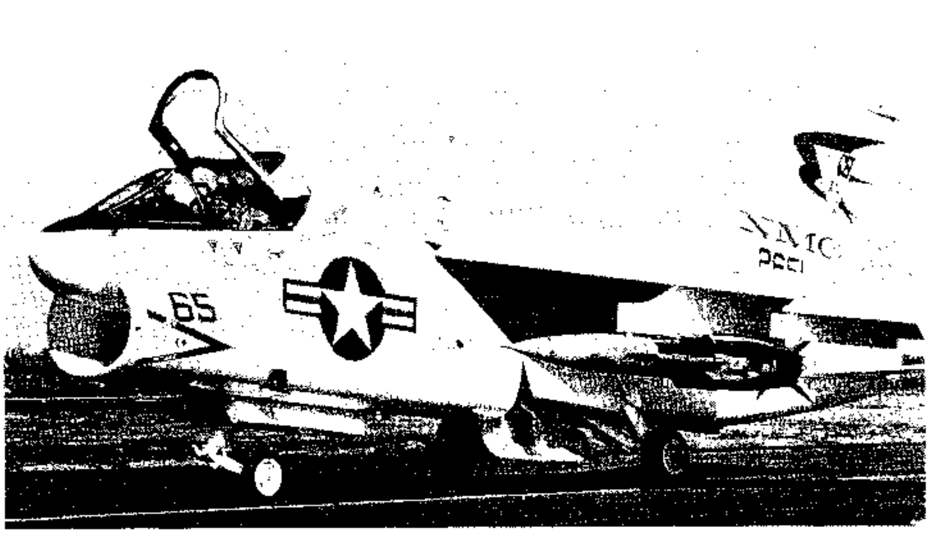
Flight trials of the Italian Aspide-1A multi-role missile began in 1974. It is seen here on the wing pylon of an IAF F-104S aircraft



The USGW, Underwater to-Surface Guided Weapon, under development by Hawker Siddeley Dynamics. It is derived from the Anglo-French Martel air-to-surface tactical weapon. USGW is embarked, stowed, loaded and discharged as if it were a torpedo er duration flight. Once the vehicle reaches ramjet takeover speed with the solid booster, port covers are blown in from four intakes at the rear of the vehicle allowing ram air to enter and mix with fuel to support combustion.

In the December 1974 flight the 13.7 m × 38 cm diameter LVRJ was released at about 4,000 metres and a speed of 965 km/h. Accelerated by the rocket motor for approximately five seconds, the LVRJ then changed to ramjet propulsion for a distance of over 56 km, reaching speeds in excess of Mach 2.0. Test officials said that while the system is capable of considerably higher speeds and range, performance was intentionally limited for the initial flight.

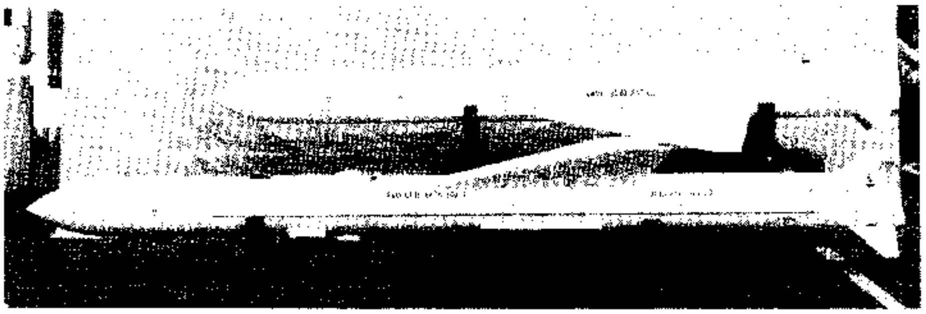
No attempt was made to recover the test vehicle, and this test flight was the first in a series of six which is expected to extend into 1976. Flight test was conducted by the US Naval Missile Centre; the rocket booster was designed and loaded by the Naval Weapons Centre at China Lake; the combustion chamber was fabricated by the Naval Ordnance Plant at Louisville, Ky; and the ram burner/fuel control system was provided by United Aircraft Research Laboratory at East Hartford, Conn.



The USN Low Volume RamJet (LVRJ) test vehicle mounted on an A-7 Corsair II prior to its first flight in December 1974

Exocet: The highly successful Exocet anti-ship missile programme has been expanded appreciably since the main body of this volume was sent to press. In addition to the air-launched versions already described, the Exocet family of weapons now includes two new surface-launched models, and a submarine-launched version is under some consideration in France. Another significant development is a much more compact and lighter, tubular, launcher-container which offers either increased missile fire-power for larger vessels, or the possibility of deploying Exocet on lighter craft than was previously possible.

The complete range of Exocet models is now as follows:



This picture of the AM 39 and MM 38 versions of the Exocet side by side shows the difference in size and in the wing and tail surfaces

MM 38: This is the original surface-to-surface anti-ship weapon and is described in some detail in Entry No. **1158-221.** At the end of 1974 orders for more than 700 examples of this version had been secured from eleven navies: France, UK, West Germany, Argentina, Brazil, Chile, Ecuador, Greece, Malaysia, Peru, and an un-named NATO nation believed to be Turkey.

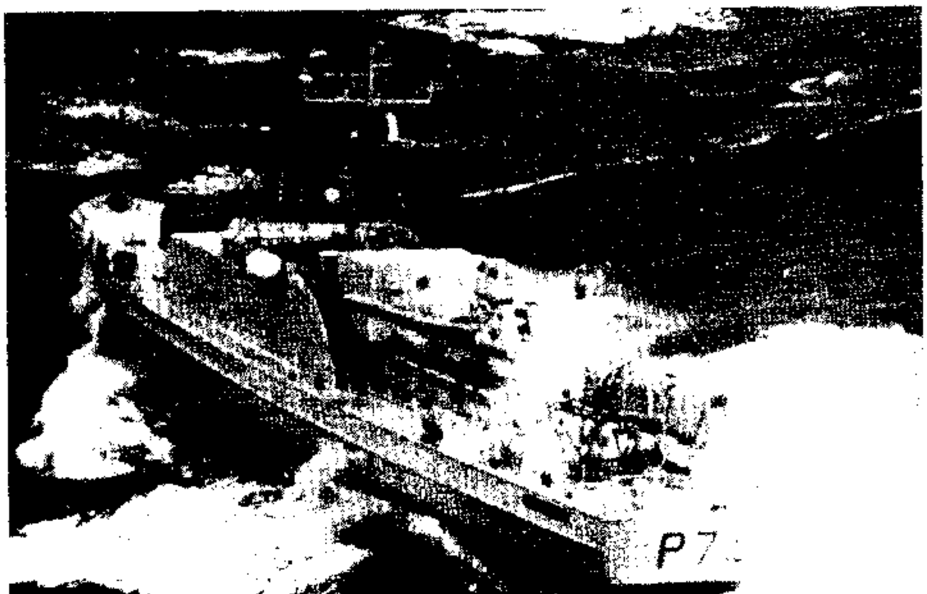
AM 38: This designation refers to the original air-launched version, intended principally for helicopter operations, and was virtually the same missile as the MM 38. This model has been superseded by the AM 39.

AM 39: This version is described (with the AM 38) in Entry No **1770.321** in Section One of this edition of Jane's Weapon Systems; the following notes are concerned with information since that entry was compiled. The AM 39 is lighter and has smaller dimensions than the MM 38, as shown in the following table:-

	MM 38	AM 39
Weight:	735	650 (kg)
Length:	5.212	4.69 (m)
Diameter:	35	35 (cm)
Span:	104	100 (cm)

Other significant differences are a slightly altered wing planform and a modified Electronic Marcel Dassault ADAC homing head on the AM 39, and variations in the propulsion arrangements. The latter give the AM 39 a booster burning time of 2 seconds with a sustainer time of between 130 and 150 seconds, which compares with the MM 38's 2.4 seconds and 120 seconds. Depending upon launch conditions (height and airspeed) the AM 39 range is between 52 & 70 km.

MM 39: This is a shipborne derivative of the AM 39. Dimensions, weight and propulsion arrangements are the same, but folding wings to enable the missile to be accommodated in the new type of glass-fibre launcher-containers are employed instead of the conventional wings of the AM 39. The dimensions of the new container, which is of tubular configuration, are such that four can be accommodated in the same volume as that required for a single conventional MM 38 metal housing. Range of the MM 39 is quoted as 50 km, as against the standard MM 38 range of 42 km.



Launch of an MM 38 Exocet from a fast patrol craft in a lively sea

MM 40: The MM 40 version of Exocet has the same weight and dimensions as the MM 38 model and the same launcher-container is employed. However, the later motor technology is used to give a boost phase of 2.4 seconds followed by a sustainer burn time of 220 seconds. The longer cruise phase – about 100 seconds over that of the MM 38 – is sufficient to extend maximum range, surface-to-surface, to about 70 km. For over-horizon operations at such ranges, the co-operative use of helicopters is envisaged. This version of Exocet is reported to be under development on behalf of an unspecified South American Navy.

SM 39: The folding wing and container/capsule technology involved in the MM 39 Exocet is seen as a step towards the evolution of a submarine launched version. Such a possible development is said to be under consideration.

The AM 39, MM 39, and MM 40 versions of Exocet are all expected to be ready for service before the end of 1977. The MM 40 is proposed for use as a coastal defence weapon in addition to its use in the ship-to-ship role, and a mobile version of the MM 38 for coastal defence has also been developed.

Soviet Strategic Missiles: In the course of 1974 the pace of Soviet strategic missile development was maintained at a high rate, and this was sustained until the final weeks of the year. The following notes are intended to supplement the entries for individual Soviet weapons in this category that appear in Section One of this volume.

SSN-8: Two of these long-range Submarine-Launched Ballistic Missiles were launched on October 3, 1974 from what are thought to have been Soviet "Delta"-class submarines positioned in the Barents Sea. Re-entry was in the Pacific Ocean, representing a range of some 4,300 nautical miles. Single re entry vehicles apparently were carried by each SSN-8.

SS-X-16: Two ICBMs, believed to be solid-fuelled SS-X-16s, were launched from an un-named site in the Soviet Union and re-entered in the Pacific Ocean on December 12, 1974. Single re-entry body payloads were carried.

SS-X-17: Test firings of the SS-X-17 ICBM from the Tyuratam launch site were made on October 21 and 23, 1974. In both cases re-entry was in the Pacific Ocean in an area north of Midway Island, a distance of more than 5,000 nautical miles. Multiple re-entry vehicles, believed to be four in number, were carried on each flight. American sources claim that the re-entry vehicles are large compared with US types.

SS-X-18: In January 1975 the US Secretary of Defence, Dr James Schlesinger, reported to Congress that there was "confirmed evidence" that the new SS-(X)-18 ICBM was being deployed in the Soviet Union. Dr Malcolm R. Currie, US Director of Defence Research and Engineering stated in November 1974 that, "The new SS-18 has been flown with a single large re-entry vehicle but also with eight RVs that not only are larger than those on the SS-19 but also are quite accurate. We have information suggesting the possibility of a quarter-mile CEP although I personally feel that that may be somewhat overstated. Obviously, however, the SS-18 could make an excellent hard-target killer if fully deployed."

SS-19: In his January 1975 report to Congress, Dr. Schlesinger said there were "indications" that the SS-19 was being deployed by the USSR. Dr. Currie (Nov 1974) had previously stated, "We know that the SS-19 can carry six fully MIRVed re-entry vehicles. That's twice as many, each twice as big, as the Minuteman III provides."

French Strategic Missiles

SSBS: The decision to deploy a third unit of nine SSBS (Sol-Sol Balistique-Stratégique) missiles in the Plateau d'Albion has been suspended for reasons of economy, it was announced in December 1974 by the French Ministry of Defence.

French MIRV: At the opening ceremony of the 11th Session du Centre des Haute Etudes de l'Armement (CHEAR) in October 1974 it was stated that in the course of the next decade Multiple Independently targeted Re-entry Vehicle (MIRV) capability will be provided for the French Forces nuclear arm.

IMPROVED POINT DEFENCE/TARGET ACQUISITION SYSTEM

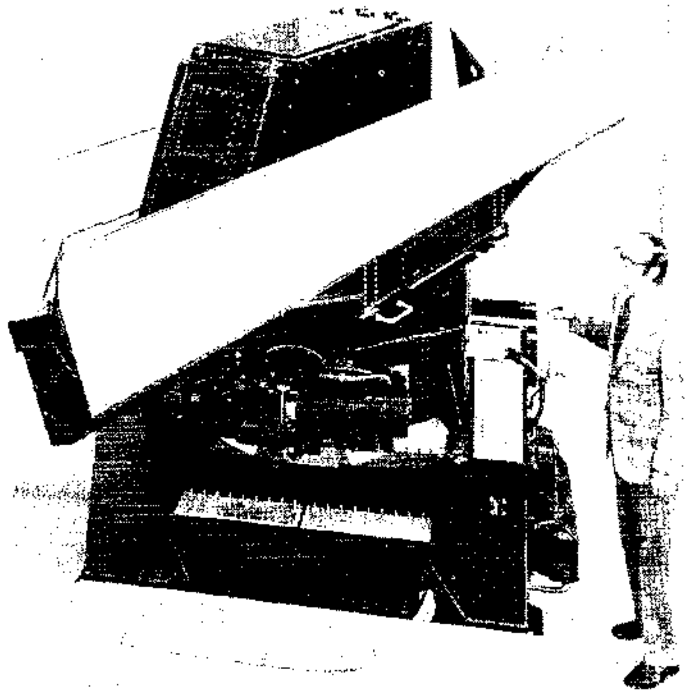
GENERAL:

Shore testing of a combined radar and infra-red target tracking system for use in ships' anti-aircraft and anti-missile defence systems was successfully carried out by Hughes Aircraft in late 1974. Air target data from radar and infra-red sensor are correlated by the integrated system which is designated IPD/TAS (Improved Point Defence/Target Acquisition System). Combined with the NATO Seasparrow weapon system it will be employed in the USN Improved Point Defence Surface Missile System which is intended to provide ships with a quick reaction, short-range air defence capability. The IPD/TAS is the outcome of $30-million R & D contract awarded by the US Naval Ordnance Systems Command.

The infra-red sub-system provides a passive means of obtaining azimuth and elevation bearing data on targets, while the high data rate, wide-band radar gives target range and closing speed. The sensors are mounted on a single stabilised mount and a rotation rate of 30 RPM is reported. Coverage in elevation is 75 degrees.

Five versions of IPD/TAS are being developed, the first being the integrated IR/radar model with computer, data displays and associated equipment. The remaining four are single sensor derivatives providing for automatic and manual versions of the IR or radar sensor types. Manual versions do not have a computer and different displays are used.

US Navy Operational Evaluation of all five on board USS *Downs* is planned to take place during 1975



The combined radar/infra-red sensor assembly developed by Hughes for the US Navy's Improved Point Defence/Target Acquisition System

MSI-70U SUBMARINE FIRE CONTROL SYSTEM

Royal Norwegian Navy submarines of the "Kobben" class are now equipped with a new tactical data processor and weapon control system, the MSI-70U produced by A/S Kongsberg Vapenfabrikk. There are 15 submarines of the "Kobben" class and all are expected to be fitted with the MSI-70U by the end of 1975.

Based on a Kongsberg SM 3 general purpose digital computer, the system has as its main functions, target tracking, torpedo guidance, and the presentation of the tactical situation on a tactical display. The tracking and guidance problems are solved automatically and/or interactively (man/computer), with the MSI-70U computer working as a data bank in the interactive mode. In addition to these main functions, there are a number of supplementary facilities provided by the system. These include:

Computation and display of sound path data.

Display markers for attack and navigational purposes.

Simulator programmes for crew training.

Recording of all data necessary for a complete reconstruction and analysis of an attack.

Maximum utilisation of every target observation is obtained by means of an advanced tracking process and appropriate data presentation, and the tracking system can use data from all available sensors at any time and in any sequence. Each sensor contributes to the solution according to its accuracy, and the overall reliability of the target solution is indicated on the target tracking display.

To permit the submarine to operate and attack employing passive sensors only, the system is so designed with this mode of operation (ie. passive) as the normal one. It may also be noted that in the passive mode the MSI 70U system automatically will establish tracks on targets which are changing course and speed. Special features for early warning of target manoeuvres are incorporated and new target data can be established with minimum delay after the manoeuvre.

The tracking and display systems are combined with a flexible torpedo salvo control, making it possible to engage targets which had hitherto

The console of the Norwegian MSI-70U submarine fire control system been considered beyond range or otherwise impossible. Any combination of automatic and manual guidance is possible and change of target may be performed instantly and at any time, including when the torpedoes are running.

The MSI-70U operating console is designed for two-man operation, but can be manned by one crew-member only. It is provided with the displays and controls necessary for complete control of the system. Within the console are the interface equipment, power supply modules, and the SM-3 computer. Modular construction permits it to be taken aboard via standard hatchways.

DEVELOPMENT:

Development was undertaken by Kongsberg in co-operation with the Norwegian Defence Establishment (NDRE), following an extensive evaluation of the fighting potential of the "Kobben" class submarine carried out in the mid-1960's by the RNoN and NDRE. The development contract was awarded in 1969, a prototype equipment being delivered and installed for sea trials a year later. These lasted for almost a year and production specifications were laid down in 1971. The first operational system was delivered in late 1972. Since then production has been at an approximate rate of one set per month.

MANUFACTURER:

A/S Kongsberg Vapenfabrikk, Postbox 25 N-3601, Kongsberg, Norway.

9AU-300 FIRE CONTROL SYSTEM

DESCRIPTION:

The 9AU 300 is a shipborne fire control system for surface vessels operating in the anti-submarine role. The system is built around a general purpose digital computer with CPU, store and input/output units. The ASW plot contains one PPI, an alpha-numeric display, officers' and operators' panels. The same computer and display techniques are employed as those of the Philips 9LV 200 series of naval weapon control systems (Entry No. **1542.281**).

The main tactical functions of the system are:-

(1) Search and target tracking in association with the ship's sonar system.

(2) Presentation of sound path propagation on a sound path indicator presentation, integrated with the ASW plot (ie. on the same CRT display as the PPI).

(3) Continuous presentation of the combat situation.

(4) Evaluation of target data and prediction of future target position.

(5) Calculation of control signals for an A/S rocket launcher.

(6) Calculation of collision course and dead run, and setting of top and bottom search levels for A/S homing torpedoes.

(7) Calculation of own ship's course and time to fire charges for depth charge attack.

The last two facilities are options, and the 9AU 300 system is designed for control of the Bofors 375 mm twin A/S rocket system with all available types of A/S rockets including Erika and Nelli. Any type of A/S homing torpedo can be accommodated if this option is specified.

Sonar is the principal sensor and various models of different manufacture may be employed. Other inputs to the system are the ship's gyro reference system, and the ship's log.

No other details are available at the time of printing.

MANUFACTURER:

Philips Teleindustri AB, Fack, S-175 20 Järfälla 1, Sweden.

KALLE FIRE CONTROL SYSTEM

DESCRIPTION:

Kalle is an electro-optical fire control system for light anti-aircraft guns. It provides facilities for tracking air targets with an automatic TV tracker and a laser range-finder. For the aiming of two AA guns, the predicted motion of the target and gun ballistics are computed. Gun control and aiming signals are transmitted via a simple two-wire data link to two guns.

No other firm details have been obtained, beyond the information that additional sensor options include a FLIR tracker (Forward Looking Infra-Red) and a LLLTV (Low Light-Level Television) camera.

MANUFACTURER:

Philips Teleindustri AB, Fack, S-175 20 Järfälla 1, Sweden.

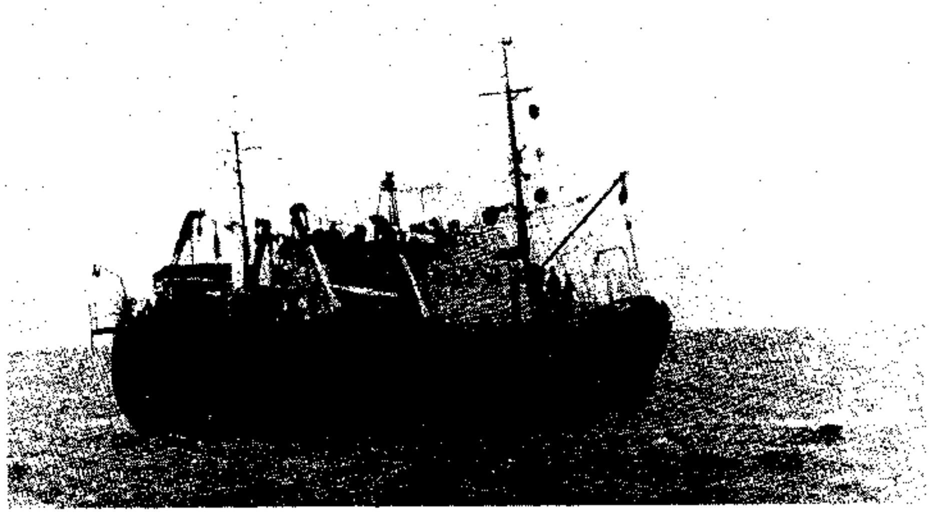
SC 74 ASW CONTAINER WEAPON SYSTEM

GENERAL:

The SC 74 is a containerised anti-submarine weapon system devised by CIT-Alcatel to enable merchant ships or naval vessels, otherwise not equipped for ASW, to be simply and quickly equipped with A/S detection and short and medium range weapons. The system is also suitable for installation on wharves or similar waterside locations to provide protection for harbours etc.

Three containers comprise the complete system: (1) Detection, (2) Weapon, and (3) Power Supply.

The first of these includes all the equipment necessary to use the DUAV4/HS71 helicopter sonar, (Entry No. **1631.353**) the transducer head of which is deployed from the container by means of a folding crane jib mounted on top. The winch for raising and lowering the transducer is housed in the detection container, as is the transducer during transit. The HS71 sonar and signal processing equipment permit detection in a back scattering medium in shallow water and under unfavourable propagation conditions. The transducer unit can be lowered to depths of 130 metres, and use of the optional SCC01 sonar coverage computer assists in determining optimum sonar depth. A single operator mans the detection container and provides target range, azimuth and radial speed data by telephone to the operator in the weapon container.



A Soviet "trawler" at work in the English Channel. The Zvezda has a multiplicity of antennas and there are submersed sensors suspended from davits at the bow and stern of the vessel, possibly for underwater monitoring of sonar signals

This is equipped with an L3 torpedo and launch tube, (Entry No. **1165.441**) and the necessary electronics and control panels for operation of this weapon on the basis of data supplied by the detection container operator. It is not necessary to train the torpedo launch tube as the L3 torpedo is provided with means for directing toward the target under gyro command. Subsequent guidance is by means of the torpedo's active homing head.

FRENCH NAVAL OPTO-ELECTRONIC SYSTEMS

GENERAL:

For the French Navy opto-electronic systems are seen as providing valuable assistance to the present systems for detection, tracking, guidance, display and thermal imaging, and DTCN (the Technical Department for Naval Construction) is energetically continuing R & D along several lines. These include the use of lasers for telemetry, guidance, aiming, illumination and communications; passive infra-red for guidance, tracking, detection, thermal imaging and surveillance. Light intensification and low light-level television techniques are being studied, as are the uses of thermal imaging for surveillance, target designation and guidance.

Laser programmes in progress for DTCN consist of one rangefinder for naval guns, and two projects concerned with laser tracking and guidance.

TAON:

TAON (Télémétrie d'Artillerie Optronique pour Navire) is a laser rangefinder for ships. It is designed as a compact and low data rate unit for installation on all old and new rangefinding turrets to provide accurate range information which can be used directly by the gunnery control computer under the supervision of a single operator at the gun fire control console. A fleet compatible prototype of this laser range-finder has been built by Compagnie Générale d'Electricité to STCAN specifications. TAON equipment is designed for TTAC remote aiming turrets. Its main functions are ranging on shore targets and low speed targets afloat. Range-finding is possible between 1.5 and 16 km to an accuracy of plus or minus 5 metres. Beamwidth is one milliradian, pulse rate 30 pulses/min. The equipment weighs about 40 kg.

LIDAR:

LIDAR (Light Detection And Ranging), or laser radar, is being sponsored by DTCN as a tentative development. With French Naval Headquarters, the STCAN has laid down the main characteristics of a fleet-compatible model for assisting the tracking radar of a 100 mm weapon system and has entrusted Thomson-CSF with the task of building a prototype.

The system will consist of a laser transmitter coupled to a suitable antenna (and possibly a transmission sweep system), and a receiving antenna, receiver, analysis system, with perhaps a detector and processor. This will provide deflection measurement data on a target together with its range, and speed if required. Purpose of the system is the acquisition and tracking of attacking missiles at low elevations within a range of 10 km.

With radar assistance, the field of acquisition is 1.5 milliradian × 20 or 30 mrd; the tracking range 1.5 mrd × 1.5 mrd; sampling time 80 or 60 ms; and operating wavelength 1.06 micron.

IRDAR:

DTCN is already considering a LIDAR using a 10.6 micron (ie. infra-red laser) source and a heterodyne or homodyne receiver. This would be a pulse doppler laser radar operating in the infra-red. Although the source and receiver are still at the design stage, DTCN expects that the advantages of such a system will be considerable.

Passive infra-red developments pursued by DTCN include the VAMPIR system for surveillance and detection, PIRANA for guidance and tracking, and ADMAR for missile guidance.

VAMPIR:

The designation VAMPIR derives from the French for Infra-red Panoramic Air-Sea Surveillance – Veille Air Mer Panoramique Infra-Rouge. It is a low field and low altitude panoramic detection system intended for the detection of anti-ship missiles at ranges of 10 km or more, even during radar silence. The stabilised, rotating head weighs about 50 kg.

DTCN is sponsoring development work undertaken by SAT (Société Anonyme de Télécommunications) of a VAMPIR system and a feasibility model has been tested.

PIRANA:

The PIRANA (Pointeur Infra-Rouge pour l'Artillerie Navale) is an infra-red aiming unit for naval guns, designed by STCAN and constructed by SAT. The dimensions specified permitted simple mounting on existing French Navy gun fire control radars. Its function is to permit these radars to continue tracking at low elevation angles when sea clutter might otherwise obscure the target. This also allows for continued tracking in the face of ECM or under radar silence. The field of view is about one degree, operating wavelength four microns, and the tracking range against a head-on aircraft target is quoted as more than 10 km.

ADMAR:

ADMAR (Auto-Directeur Marine) is a compact infra-red detection system capable of tracking ship targets. The existence of two versions has been revealed: ADMAR I, which gives target elevation and azimuth data, and measures 15 × 15 × 15 cm. ADMAR II, which provides single axis data only and measures 10 × 10 × 10 cm. Initial tests at Toulon have indicated that vessels are susceptible to IR tracking, and IR homing for low-level anti-ship missiles show considerable promise.

Low light-level television (LLLTV) is being studied by DTCN for a variety of naval applications associated with weapon control functions.

CONDOR:

CONDOR is the French acronym for radar target designation optronic night camera, and its function is to replace turret operators, to enable a target to be designated and identified, and enable a laser to be laid on. In addition, and in the context of comprehensive integration with the radar, it can provide sighting facilities or automatic tracking in the event of radar failure, radar silence, or loss of track at low elevation due to sea clutter and/or ECM.

The DTCN has developed two LLLTV systems for evaluation, a Super-Esicon built by Thomson-CSF to study integration in radar gunnery control, and an ISIT camera built by SEREL.

In addition to these lines of research, DTCN is studying potential applications for light amplification and image intensification techniques such as night surveillance from ships and commando operations. In order to increase the capabilities of conventional submarine periscopes, STCAN is designing and developing a new periscope head permitting night vision and possibly laser range finding.

Thermal imaging by infra-red has appreciable potential, especially where hot-spots and temperature contrasts can be expected, and there is considerable interest in this area of opto-electronics also. DTCN has designed, and had constructed by TRT, a thermal imaging camera operating at 4 and 10 microns to measure the IR 'signatures' of vessels with a view to counter-measures and identification. This equipment has a 35 deg × 11 deg field of view, picture rate of 25 frames/sec, thermal resolution of 0.2 deg C, and is steerable between 5 and 45 degrees in elevation and 90 degrees in azimuth.

CLIO-BS OTOMAT FIRE CONTROL SYSTEM

GENERAL:

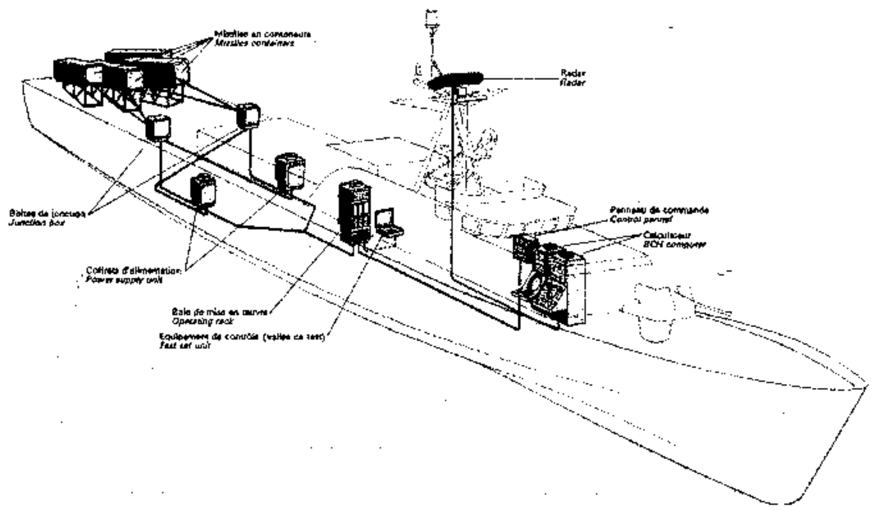
Under the designation CLIO-BS (Conduite de Lancement Intégrée Otomat – Bâtiments de Surface) an integrated fire control system for surface ships fitted with the Otomat surface-to-surface missile was disclosed at the 4th French Exposition Navale which took place at Le Bourget in October 1974.

The system provides for pre-launch preparation and automatic firing of Otomat under the control of a single operator. The firing sequence requires only a 30-second interval from the instant of putting the system to the "ready" status. The integrated fire control for Otomat is compatible with existing target designation systems.

The installation comprises seven units:-

(1) Control Panel
(2) BCH computer
(3) Operating rack
(4) Missile start power supply
(5) Missile general power supply
(6) Junction box
(7) Test set.

There is also a missile container which serves for both quayside storage and as an on-board launcher-housing.



Schematic diagram of the CLIO-BS Otomat fire control system

The control panel is specifically for launch control of the Otomat and provides for the operation of up to four missile launchers. The panel houses all necessary manual controls, signal lamps etc., and a safety arming key for preparing the system. The BCH computer provides each missile with local attitude and orientation data prior to launch, calculates the course heading and time of flight, determines if a given target is within the Otomat's launch/range field, and also computes the firing 'window'.

The operating rack contains the necessary sequencing circuitry and relays for the correct start-up and launch operations of the missiles. It also provides for appropriate read-out and indication of the various stages of the sequence as an aid to monitoring operation or fault-finding.

The two power supplies provide the high current 27-volt DC power for start-up of the Otomat's turbojet motor, and a lower current supply (also 27-volt DC) for the various missile systems. The latter is used for such purposes as gyro run-up, electronics etc., prior to activation of the Otomat internal power supplies.

Either one or two junction boxes will be installed, each capable of linking two Otomats with the CLIO-BS. They provide for the transmission of all data originating in the system to the missiles, and also serve as the link between the umbilical cables and the permanent installed wiring of the system. The test set acts as a 'fifth missile' to permit a check-out of the complete system.
