# Understanding the Nervous System

## Structure of the Nervous System

The nervous system is intricately structured with two main parts: the central nervous system (CNS), comprised of the brain and spinal cord, and the peripheral nervous system (PNS), which connects the CNS to limbs and organs.

## Function and Communication

Communication within the nervous system occurs via neurons that transmit signals throughout the body. These signals are essential for initiating and coordinating movements, as well as processing sensory information for balance.

## Neuroplasticity

One of the remarkable features of the nervous system is its plasticity, the ability to reorganize itself by forming new neural connections. This adaptability is the foundation for rehabilitation practices such as Neuro Balance Therapy.
